When L2CAP is the channel establishment protocol being used for the requested service, an L2CAP connection response signaling packet shall be sent by the responding device containing a pending result code following receipt of an L2CAP connection request and prior to initiating security procedures which can result in prompting the local user for input (e.g., pairing using a PIN or Secure Simple Pairing using either the Passkey entry or Numeric Comparison association models). This will stop the L2CAP RTX timer on the remote device (which may be as short as 1 second) and will invoke the ERTX timer on the remote device, which is a minimum duration of 60 seconds.

See [Vol 3] Part A, Section 6.2 for additional information on L2CAP RTX and ERTX timers. See also [Vol 3] Part A, Section 4.3 and [Vol 3] Part A, Section 4.26 for additional information on the L2CAP connection response signaling packets and the defined result codes.

Higher layer channel establishment protocols should be designed to restrict timeouts to be 30 seconds or longer to allow for user input, or provide mechanisms to dynamically extend timeouts when user input may be required.

If authentication or pairing fails when a remote device is attempting to access a local service, the local device shall send a negative response to the channel establishment request (L2CAP connection request or application-specific channel establishment request) indicating a security issue if possible. If the channel

establishment protocol is L2CAP, then the result code in the L2CAP connection response shall be set to indicate that the connection was refused due to security reasons. If an L2CAP_CONNECTION_RSP is being sent, then the result code shall be set to 0x0003 (connection refused - security block). If an L2CAP_CREDIT_BASED_CONNECTION_RSP is being sent, then the result code shall be set to 0x0005 (All connections refused - insufficient authentication), 0x0006 (All connections refused - insufficient authorization), 0x0007 (All connections refused - encryption key size too short), or 0x0008 (All connections refused - insufficient encryption).

If the remote device has indicated support for Secure Simple Pairing, a channel establishment request is received for a service other than SDP, and encryption has not yet been enabled, then the local device shall disconnect the ACL link with error code 0x05 - Authentication Failure.

5.2.2.2.1 Pairing required for access to local service by remote device

When a remote device attempts to access a service offered by a Bluetooth device that is in security mode 4 and pairing is required due to the link key being absent or insufficient, the local device shall perform pairing procedures and enable encryption after the channel establishment request is received and before a channel establishment confirmation (L2CAP connection response with result code of 0x0000 or a higher-level channel establishment response such as that of RFCOMM) is sent.

See Section 5.2.2.6 for details on determining whether or not a link key is sufficient.

If pairing does not succeed, then the local device shall not send a channel establishment confirmation. The local device may retry pairing up to three (3) times. If pairing fails three consecutive times, then the local device shall disconnect the ACL link with error code 0x05 - Authentication Failure.

If the link-key generated is not at least as good as the expected or required type or if enabling encryption does not result in the correct encryption type (i.e. AES-CCM or E0), then the local device shall fail the channel establishment and may disconnect the ACL link with error code 0x05 - Authentication Failure.

5.2.2.2.2 Authentication required for access to local service by remote device

See Section 5.2.2.6 for details on determining whether or not a link key is sufficient.

If authentication does not succeed, then the local device shall not send a channel establishment confirmation. The Host may at this point notify the user and offer to perform pairing.

A Bluetooth device in security mode 4 shall respond to authentication and pairing requests during link establishment when the remote device is in security mode 3 for

backwards compatibility reasons. However, authentication of the remote device shall be performed after the receipt of the channel establishment request is received, and before the channel establishment response is sent.

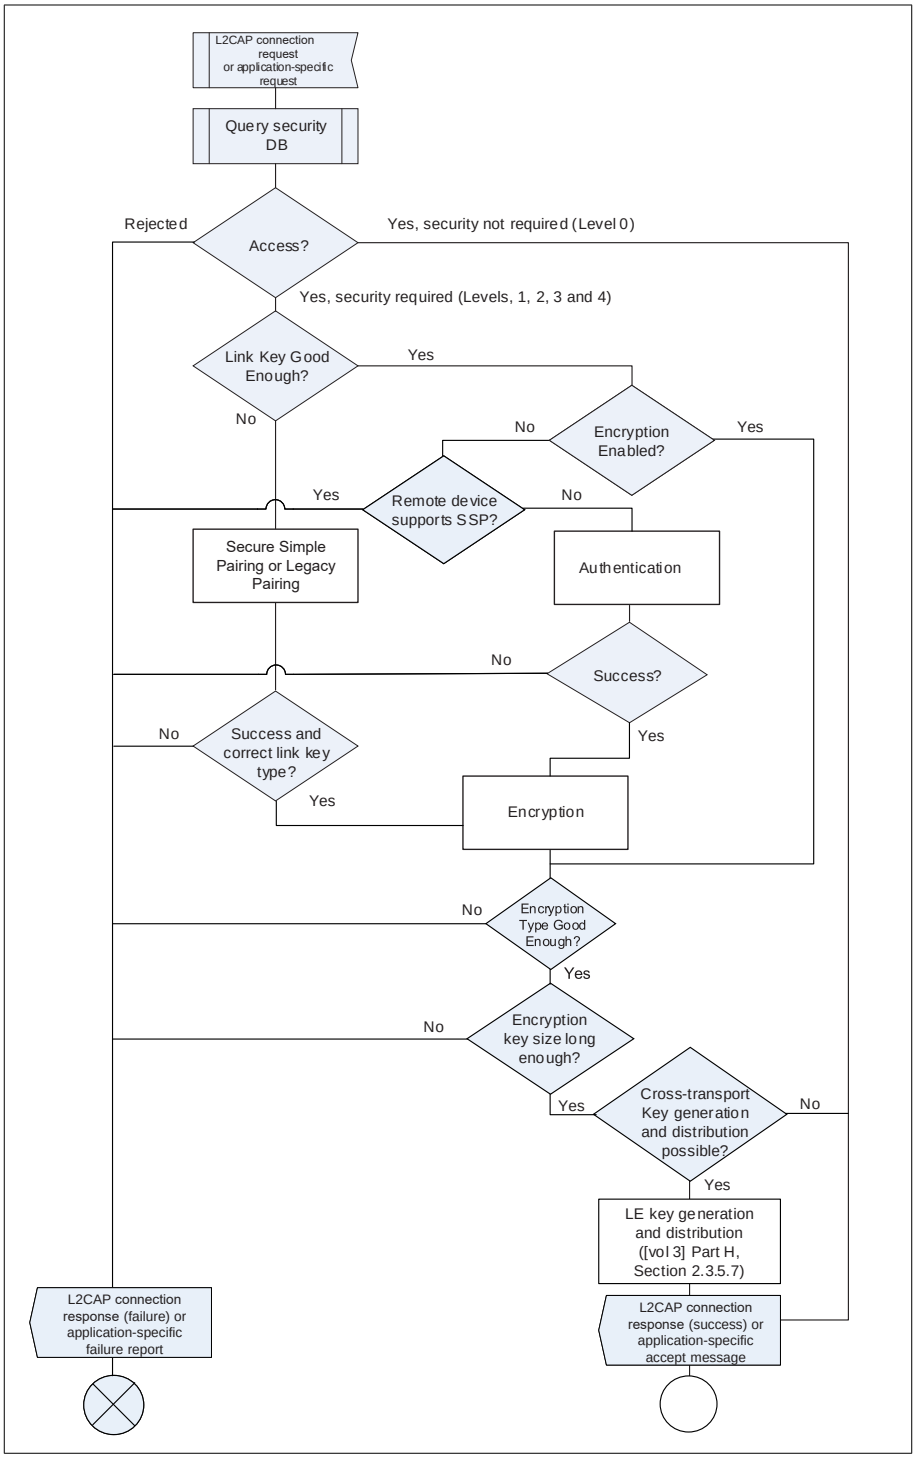

Figure 5.5: Channel establishment using security mode 4 for the responding side

5.2.2.2.3 Cross-transport key generation and distribution

After encryption is enabled and both devices support cross-transport key generation, the Central of the BR/EDR transport may perform LE key generation and distribution ([Vol 3] Part H, Section 2.3.5.7). The Peripheral shall not perform LE key generation and distribution.

If a role switch gets performed after enabling encryption but before the LE keys can be generated and distributed, the new Central may perform LE key generation and distribution once the role switch has completed. The new Peripheral shall not perform LE key generation and distribution once the role switch has completed.

5.2.2.3 Secure Simple Pairing after authentication failure

When both devices support Secure Simple Pairing all non-SDP connections are encrypted regardless of whether security was required or whether the devices are bonded or not. The initial connection between the two devices will result in a link key through Secure Simple Pairing. Depending on whether or not bonding was performed and the security policy of the initiating device, the link key may be stored. When the link key is stored, subsequent connections to the same device will use authentication but this may fail if the remote device has deleted the link key. Table 5.2 defines what shall be done depending on the type of the link key and whether bonding was performed or not.

Link Key Type	Devices Bonded?	Action to take when Authentication Fails
Combination	No	Depends on security policy of the device: • Option 1: Automatically initiate pairing • Option 2: Notify user and ask if pairing is ok Option 2 is recommended.
Combination	Yes	Notify user of security failure
Unauthenticated	No	Depends on security policy of the device: • Option 1: Automatically initiate secure simple pairing • Option 2: Notify user and ask if secure simple pairing is ok. Option 1 is recommended.
Unauthenticated	Yes	Notify user of security failure

Link Key Type	Devices Bonded?	Action to take when Authentication Fails
Authenticated	No	Depends on security policy of the device: • Option 1: Automatically initiate secure simple pairing • Option 2: Notify user and ask if secure simple pairing is ok Option 2 is recommended.
Authenticated	Yes	Notify user of security failure

Table 5.2: Secure Simple Pairing after authentication failure

Non-bonded authenticated or unauthenticated link keys may be considered disposable by either device and may be deleted at any time.

5.2.2.4 IO capabilities

Once a connection is established, if the Host determines that security is necessary and both devices support Secure Simple Pairing, the devices perform an IO capability exchange. The purpose of the IO capability exchange is to determine the authentication algorithm used in the Authentication stage 1 phase of Secure Simple Pairing.

The input and output capabilities are described in Table 5.3:

Capability	Description
No input	Device does not have the ability to indicate 'yes' or 'no'
Yes / No	Device has at least two buttons that are mapped easily to 'yes' and 'no' or the device has a mechanism whereby the user can indicate either 'yes' or 'no' (see note below).
Keyboard	Device has a numeric keyboard that can input the numbers '0' to '9' and a confirmation. Device also has two buttons that can be easily mapped to 'yes' and 'no' or the device has a mechanism whereby the user can indicate either 'yes' or 'no' (see Note below).

Table 5.3: User input capabilities

Note: 'yes' could be indicated by pressing a button within a certain time limit otherwise 'no' would be assumed.

Capability	Description
No output	Device does not have the ability to display or communicate a 6 digit decimal number
Numeric output	Device has the ability to display or communicate a 6 digit decimal number

Table 5.4: User output capabilities

5.2.2.5 Mapping of input / output capabilities to IO capability

The individual input and output capabilities are mapped to a single IO capability which is later used to determine which authentication algorithm will be used.

		Local Output Capability	
		No Output	**Numeric Output**
Local Input Capability	**No input**	NoInputNoOutput	DisplayOnly
	Yes / No	NoInputNoOutput	DisplayYesNo
	Keyboard	KeyboardOnly	DisplayYesNo

Table 5.5: IO capability mapping

When a device has OOB authentication information from the remote device, it will indicate it in the LMP_IO_CAPABILITY_RES PDU. When either device has OOB information, the OOB association model will be used.

The Host may allow the Link Manager to ignore the IO capabilities and use the Numeric Comparison protocol with automatic accept by setting the Authentication_Requirements parameter to one of the MITM Protection *Not Required* options.

5.2.2.6 IO and OOB capability mapping to authentication stage 1 method

Determining which association model to use in Authentication stage 1 is performed in three steps. First, the devices look at the OOB Authentication Data Present parameter received in the remote IO capabilities. If either device has received OOB authentication data then the OOB association model is used. The event of receiving the OOB information is indicated by a device to its peer in the IO Capability Exchange step of Secure Simple Pairing.

		Device A	
		Has not received remote OOB authentication data	**Has received remote OOB authentication data**
Device B	**Has not received remote OOB authentication data**	Use the IO capability mapping table	Use OOB association with ra = 0 rb from OOB
	Has received remote OOB authentication data	Use OOB association with ra from OOB rb = 0	Use OOB association with ra from OOB rb from OOB

Table 5.6: IO and OOB capability mapping

Second, if neither device has received OOB authentication data and if both devices have set the Authentication_Requirements parameter to one of the MITM Protection Not

Required options, authentication stage 1 shall function as if both devices set their IO capabilities to DisplayOnly (e.g., Numeric comparison with automatic confirmation on both devices).

Finally, if neither device has received OOB authentication data and if one or both devices have set the Authentication_Requirements parameter to one of the *MITM Protection Required* options, the IO and OOB capabilities are mapped to the authentication stage 1 method as defined in Table 5.7. A Host that has set the Authentication_Requirements parameter to one of the *MITM Protection Required* options shall verify that the resulting Link Key is an Authenticated Combination Key (see [Vol 4] Part E, Section 7.7.24). Table 5.7 also lists whether the combination key results in an authenticated or unauthenticated link key.

		Device A (Initiator)			
		Display Only	**DisplayYesNo**	**KeyboardOnly**	**NoInputNoOutput**
Device B (Responder)	**DisplayOnly**	Numeric Comparison with automatic confirmation on both devices.	Numeric Comparison with automatic confirmation on device B only.	Passkey Entry: Responder Display, Initiator Input.	Numeric Comparison with automatic confirmation on both devices.
		Unauthenticated	Unauthenticated	Authenticated	Unauthenticated
	DisplayYesNo	Numeric Comparison with automatic confirmation on device A only.	Numeric Comparison: Both Display, Both Confirm.	Passkey Entry: Responder Display, Initiator Input.	Numeric Comparison with automatic confirmation on device A only and Yes/No confirmation whether to pair on device B. Device B does not show the confirmation value.
		Unauthenticated	Authenticated	Authenticated	Unauthenticated
	Keyboard Only	Passkey Entry: Initiator Display, Responder Input.	Passkey Entry: Initiator Display, Responder Input.	Passkey Entry: Initiator and Responder Input.	Numeric Comparison with automatic confirmation on both devices.
		Authenticated	Authenticated	Authenticated	Unauthenticated

		Device A (Initiator)			
		Display Only	**DisplayYesNo**	**KeyboardOnly**	**NoInputNoOutput**
	NoInputNoOutput	Numeric Comparison with automatic confirmation on both devices.	Numeric Comparison with automatic confirmation on device B only and Yes/No confirmation on whether to pair on device A. Device A does not show the confirmation value.	Numeric Comparison with automatic confirmation on both devices.	Numeric Comparison with automatic confirmation on both devices.
		Unauthenticated	Unauthenticated	Unauthenticated	Unauthenticated

Table 5.7: IO capability mapping to authentication stage 1

Note: The "DisplayOnly" IO capability only provides unidirectional authentication.

5.2.2.7 Out of Band (OOB)

An out of band mechanism may also be used to communicate discovery information as well as other information related to the pairing process.

The contents of the OOB data block are:

Mandatory contents:

- Length (2 bytes)
- BD_ADDR (6 bytes)

Optional contents:

- Class of Device (3 bytes)
- Secure Simple Pairing Hash C (16 bytes)
- Secure Simple Pairing Randomizer R (16 bytes)
- Local name (variable length)
- Other information

The length field includes all bytes in the OOB data block including the length field itself. The BD_ADDR will be a fixed field in the beginning of the OOB data block. Following the BD_ADDR will be zero or more EIR tag fields containing optional contents. The EIR tag format will be used for the optional contents. See Figure 5.6.

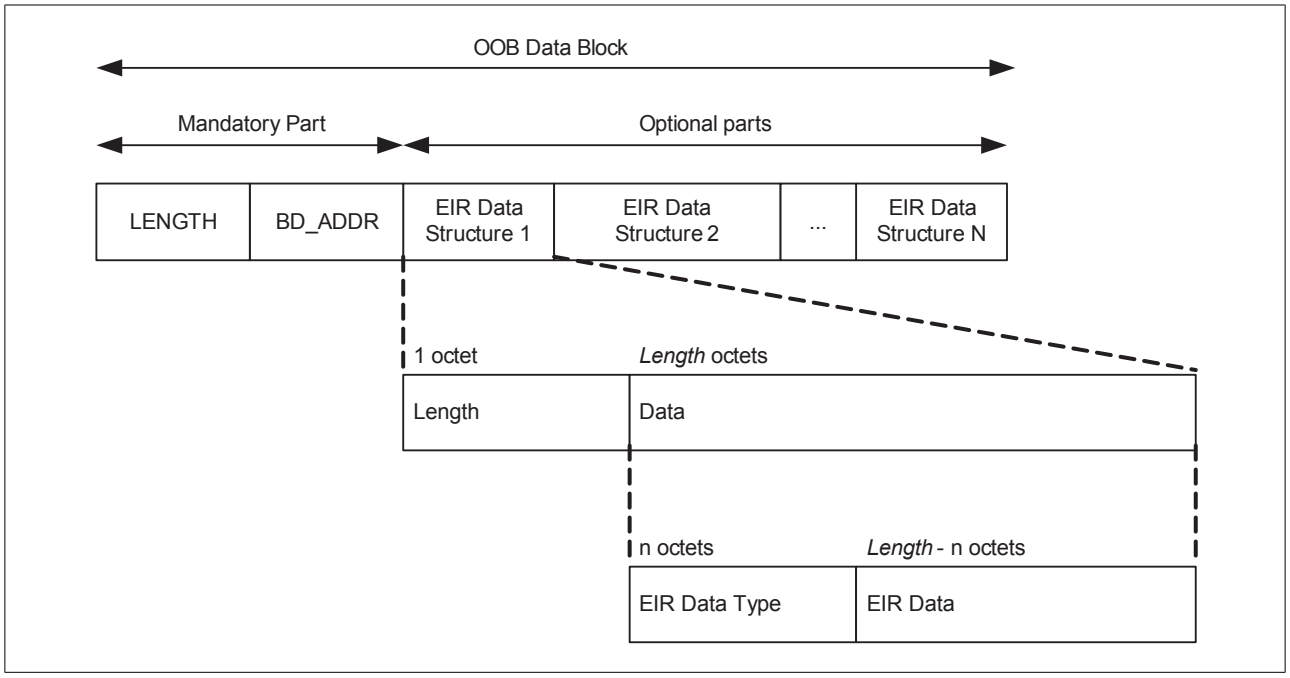

Figure 5.6: OOB data block format

If Secure Simple Pairing fails when one or both devices have OOB Authentication Data present, both devices shall discard the OOB Authentication Data and the device that originally initiated authentication shall re-initiate authentication. Although the user may get involved in authentication as defined by the IO capabilities of the two devices, falling back to the in-band association model will prevent deadlock conditions when one or both devices has stale OOB Authentication Data.

There is a MIME type defined for use with the OOB data format. The MIME type can be found from the following link: http://www.iana.org/assignments/media-types/application/vnd.bluetooth.ep.oob

5.2.2.8 Security database

A Bluetooth device in security mode 4 shall classify and enforce the security requirements of its services using the following levels attributes (in order of decreasing security) for use when pairing with remote devices supporting Secure Simple Pairing:

- Level 4, for services with the following attributes:

  Authentication of the remote device required

  MITM protection required

  128-bit equivalent strength for link and encryption keys required using FIPS approved algorithms (E0 not allowed, SAFER+ not allowed, and P-192 not allowed; encryption key not shortened)

  User interaction acceptable

- Level 3, for services with the following attributes:

  Authentication of the remote device required

  MITM protection required

  Encryption required

  At least 56-bit equivalent strength for encryption key should be used

  User interaction acceptable
- Level 2, for services with the following attributes:

  Authentication of the remote device required

  MITM protection not required

  Encryption required

  At least 56-bit equivalent strength for encryption key should be used
- Level 1, for services with the following attributes:

  Authentication of the remote device required when encryption is enabled

  MITM protection not required

  At least 56-bit equivalent strength for encryption key when encryption is enabled should be used

  Minimal user interaction desired
- Level 0: Service requires the following:

  Authentication of the remote device not required

  MITM protection not required

  No encryption required

  No user interaction required

  Security Mode 4 Level 0 shall only be used for:

  a. L2CAP fixed signaling channels with CIDs 0x0001, 0x0003, and 0x003F

  b. SDP

  c. broadcast data sent on the connectionless L2CAP channel (CID 0x0002)

  d. services with the combinations of Service Class UUIDs and L2CAP traffic types listed in Section 1 of [5].

The security level required for each service offered should be stored in a security database that is accessed to determine the type of link key and the encryption key size that is required for access to the respective service. The security level required for service data transmitted on an L2CAP connection-oriented channel may differ from

the security level required for service data transmitted on another L2CAP connection-oriented channel or on the connectionless L2CAP channel. Table 5.8 shows the type of link key required for each security level for both remote devices that support Secure Simple Pairing and for those that do not.

Security Level Required for Service	**Link Key type required for remote devices that support SSP**	**Link Key type required for remote devices that do not support SSP**	**Comments**
Level 4 • Authentication of the remote device required • MITM protection required • Encryption required • User interaction acceptable	Authenticated (P-256 based Secure Simple Pairing and Secure Authentication)	NA	Highest Security Only possible when both devices support Secure Connections
Level 3 • Authentication of the remote device required • MITM protection required • Encryption required • User interaction acceptable	Authenticated	Combination (16 digit PIN recommended)	High Security
Level 2 • Authentication of the remote device required • MITM protection not necessary • Encryption desired	Unauthenticated	Combination	Medium Security
Level 1 • Authentication of the remote device required when encryption is enabled • MITM protection not necessary • Encryption not necessary[1] • Minimal user interaction desired	Unauthenticated	None	Low Security

Security Level Required for Service	Link Key type required for remote devices that support SSP	Link Key type required for remote devices that do not support SSP	Comments
Level 0 • Authentication of the remote device not required • MITM protection not necessary • Encryption not necessary • No user interaction desired	None	None	Permitted only for SDP and service data sent via either L2CAP fixed signaling channels or the L2CAP connectionless channel to PSMs that correspond to service class UUIDs which are allowed to utilize Level 0.

Table 5.8: Security level mapping to link key requirements

[1]Though encryption is not necessary for the service for Level 1, the specification mandates the use of encryption for all services other than SDP when the remote device supports SSP.

An *authenticated* link key is a link key where either the numeric comparison, out-of-band, or passkey entry Secure Simple Pairing association models were used. An authenticated link key has protection against MITM attacks. To ensure that an authenticated link key is created during the Secure Simple Pairing procedure, the Authentication_Requirements parameter should be set to one of the *MITM Protection Required* options.

An *unauthenticated* link key is a link key where the “Just Works” Secure Simple Pairing association model was used (see [Vol 1] Part A, Section 5.2.4). An unauthenticated link key does not have protection against MITM attacks. To allow an unauthenticated link key to be created during the Secure Simple Pairing procedure, the Authentication_Requirements parameter may be set to one of the *MITM Protection Not Required* options.

When both devices support Secure Simple Pairing and at least one device does not support Secure Connections, the strength of the link key is 96 effective bits. When both devices support Secure Connections, the strength of the link key is 128 effective bits. Secure Connections does not change the protection against MITM attacks.

A combination link key is a link key where BR/EDR Legacy Pairing was used to generate the link-key (see [Vol 2] Part C, Section 4.2.2.4).

When both devices support Secure Simple Pairing, GAP shall require at least an unauthenticated link key and enable encryption for service traffic sent or received via connection-oriented L2CAP channels. A profile or protocol may define services that require more security (for example, an authenticated link key) or no security in the case

of SDP or service traffic sent via the L2CAP connectionless channel for services that do not require security.

When the device is in Bondable Mode, it shall enable Secure Simple Pairing mode prior to entering Connectable Mode or establishing a link.

A Bluetooth device in security mode 4 shall respond to authentication and pairing requests during link establishment when the remote device is in security mode 3 for backwards compatibility reasons. See Section 5.2.1.3 for more information.

The remote Controller's and remote Host's support for Secure Simple Pairing shall be determined by the Link Manager Secure Simple Pairing (Host Support) feature bit.

A previously generated link key is considered “sufficient” if the link key type is of the type required for the service, or of a higher strength. Authenticated link keys are considered higher strength than Unauthenticated or Combination keys. Unauthenticated link keys are considered higher strength than Combination keys.

A device shall enforce an encryption key with at least 128-bit equivalent strength for all services that require Security Mode 4, Level 4. For all other services that require encryption, a device should enforce an encryption key with at least 56-bit equivalent strength, irrespective of whether the remote device supports Secure Simple Pairing.

After encryption has been enabled, the Host should check the encryption key size using either the HCI_Read_Encryption_Key_Size command (see [Vol 4] Part E, Section 7.5.7) or a vendor-specific method.

6 IDLE MODE PROCEDURES – BR/EDR PHYSICAL TRANSPORT

The requirements for devices initiating the inquiry and discovery procedures (device A) are specified in Table 6.1. The requirements on the behavior of the responding device (device B) are specified in Table 4.1.

Procedure	Ref.	Support
General inquiry	6.1	C.1
Limited inquiry	6.2	C.1
Name discovery	6.3	O
Device discovery	6.4	O
Bonding	6.5	O
C.1: If initiation of bonding is supported, support for at least one inquiry procedure is mandatory, otherwise optional. Note: Support for LMP-pairing is mandatory (see [Vol 2] Part C, Section 4.2.2).		

Table 6.1: Requirements for initiating inquiry and discovery procedures

6.1 General Inquiry

6.1.1 Purpose

The purpose of the general inquiry procedure is to provide the initiator with the Bluetooth Device Address, clock, Class of Device, and extended inquiry response information of devices in either general discoverable mode or limited discoverable mode.

The general inquiry procedure should be used for general purpose discovery, i.e. to discover all discoverable devices regardless of whether they are in general discoverable mode or limited discoverable mode. A device which discovers devices using the general inquiry procedure and presents them to users in some fashion should distinguish devices in the limited discoverable mode from those in the general discoverable mode, e.g., by sorting them to the top of a list of discovered devices or highlighting them in some way.

Note: The rationale for distinguishing the devices in limited discoverable mode to the end user is that devices typically enter limited discoverable mode only after explicit action by the end user, indicating that the user's immediate goal is to discover and interact with that specific device.

6.1.2 Term on UI level

'Bluetooth Device Inquiry'.

6.1.3 Description

Figure 6.1 specifies the procedure.

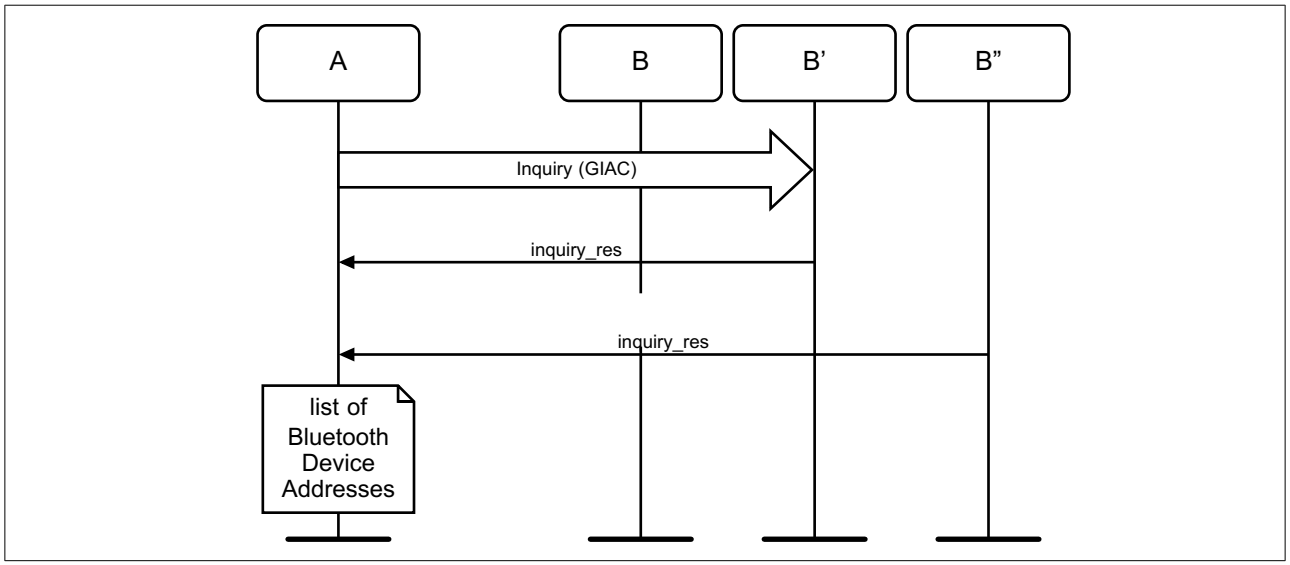

Figure 6.1: General inquiry, where B is a device in non-discoverable mode, B´ is a device in limited discoverable mode and B" is a device in general discoverable mode. (Note: All discoverable devices are discovered using general inquiry, independent of which discoverable mode they are in.)

6.1.4 Conditions

When general inquiry is initiated by a Bluetooth device, the INQUIRY state shall last $T_{GAP}(100)$ or longer, unless the inquirer collects enough responses and determines to abort the INQUIRY state earlier. The Bluetooth device shall perform inquiry using the GIAC.

In order for Device A to receive inquiry responses, the remote devices in range have to be made discoverable (limited or general).

6.2 Limited Inquiry

6.2.1 Purpose

The purpose of the limited inquiry procedure is to provide the initiator with the Bluetooth Device Address, clock, Class of Device, and extended inquiry response information of limited discoverable devices. The latter devices are devices that are in range with regard to the initiator, and set to scan for inquiry messages with the Limited Inquiry Access Code.

The limited inquiry procedure should only be used when it is known that the devices to be discovered are using limited discoverable mode. The general inquiry procedure (see Section 6.1) should be used for general purpose discovery when it is desired to discover all devices regardless of whether they are using limited discoverable mode or general discoverable mode.

6.2.2 Term on UI level

'Bluetooth Device Inquiry'.

6.2.3 Description

Figure 6.2 specifies the procedure.

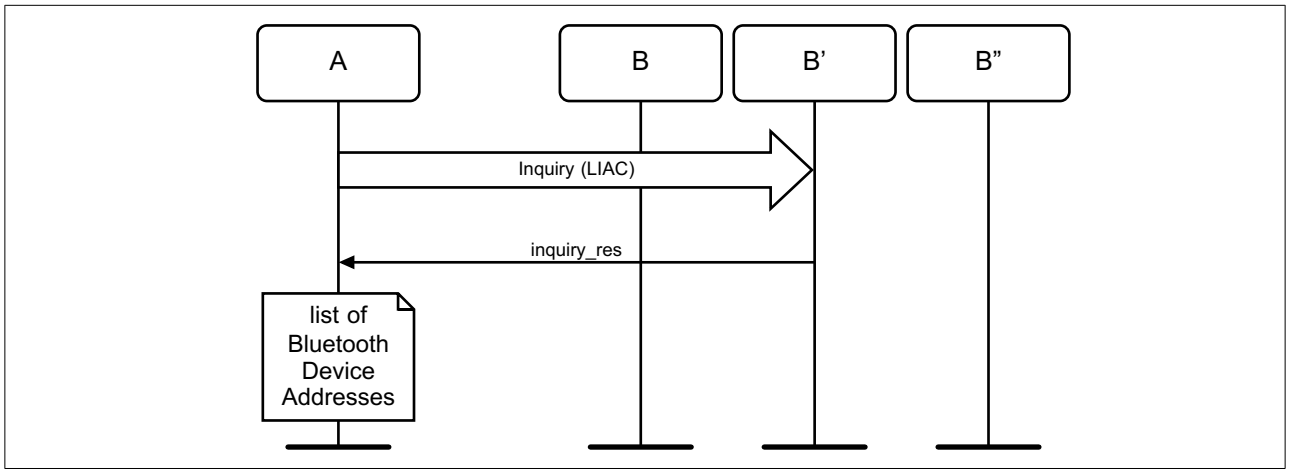

Figure 6.2: Limited inquiry where B is a device in non-discoverable mode, B' is a device in limited discoverable mode and B" is a device in general discoverable mode. (Note: Only limited discoverable devices can be discovered using limited inquiry.)

6.2.4 Conditions

When limited inquiry is initiated by a Bluetooth device, the INQUIRY state shall last $T_{GAP}(100)$ or longer, unless the inquirer collects enough responses and determines to abort the INQUIRY state earlier. The Bluetooth device shall perform inquiry using the LIAC.

In order for Device A to receive inquiry responses, the remote devices in range has to be made limited discoverable.

6.3 Name Discovery

6.3.1 Purpose

The purpose of name discovery is to provide the initiator with the Bluetooth Device Name of connectable devices (i.e., devices in range that will respond to paging).

6.3.2 Term on UI level

'Bluetooth Device Name Discovery'

6.3.3 Description

6.3.3.1 Name Request

Name request is the procedure for retrieving the Bluetooth Device Name from a connectable Bluetooth device. It is not necessary to perform the full link establishment procedure (see Section 7.1) in order to just to get the name of another device. Figure 6.3 specifies the procedure.

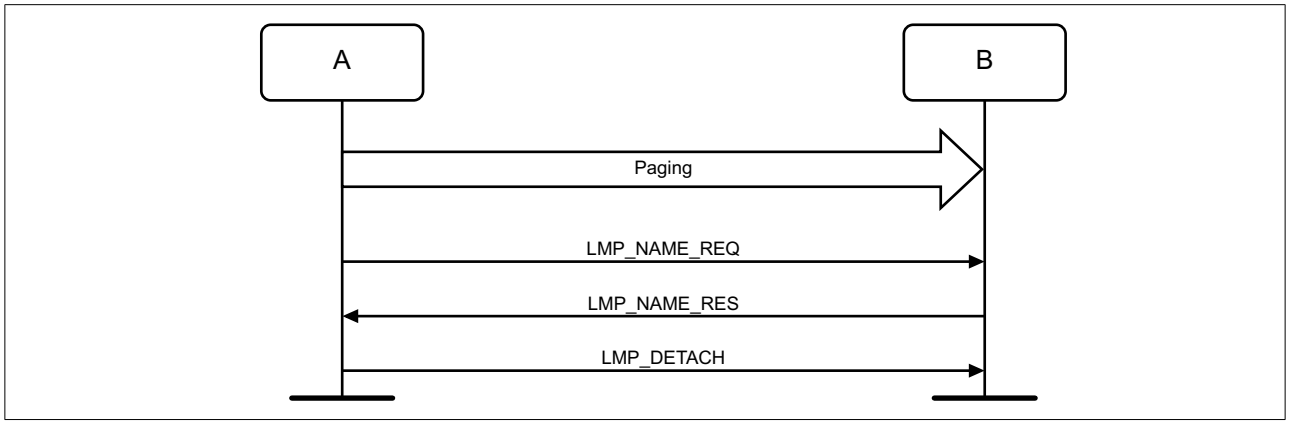

Figure 6.3: Name Request procedure

6.3.3.2 Name Discovery

Name discovery is the procedure for retrieving the Bluetooth Device Name from connectable Bluetooth devices by performing name request towards known devices (i.e., Bluetooth devices for which the Bluetooth Device Addresses are available). Figure 6.4 specifies the procedure.

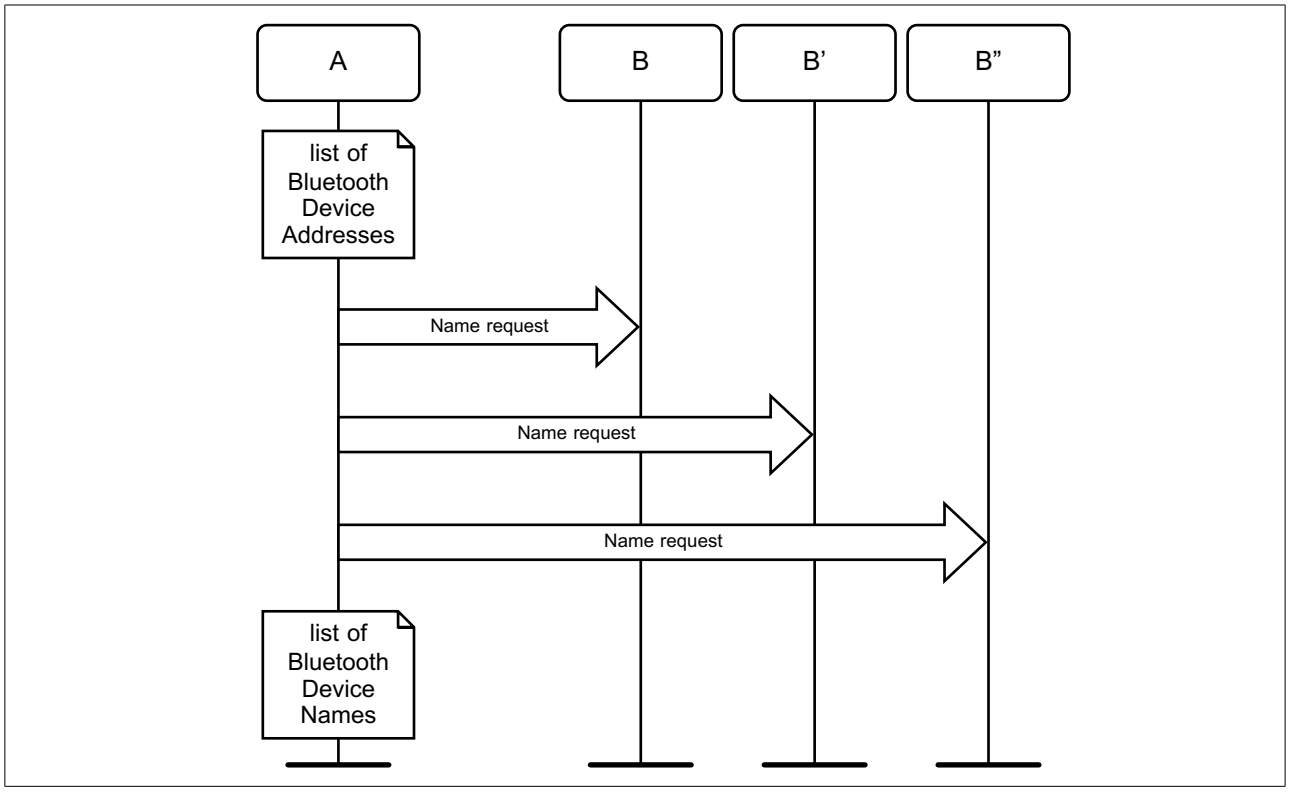

Figure 6.4: Name discovery procedure

6.3.4 Conditions

In the name request procedure, the initiator will use the Device Access Code of the remote device as retrieved immediately beforehand – normally through an inquiry procedure.

6.4 Device Discovery

This section only applies to BR/EDR-only and BR/EDR/LE implementations.

6.4.1 Purpose

The purpose of device discovery is to provide the initiator with the Bluetooth Device Address, clock, Class of Device, Bluetooth Device Name, and extended inquiry response information of discoverable devices.

6.4.2 Term on UI level

'Bluetooth Device Discovery'

6.4.3 Description

During the Device Discovery procedure, first an inquiry (either general or limited) is performed, and then name discovery is done towards some or all of the devices that

responded to the inquiry. If the initiator of the device discovery receives a complete local name or a shortened local name that is considered long enough, via an extended inquiry response from a remote device, the initiator should not do a separate name discovery for that device.

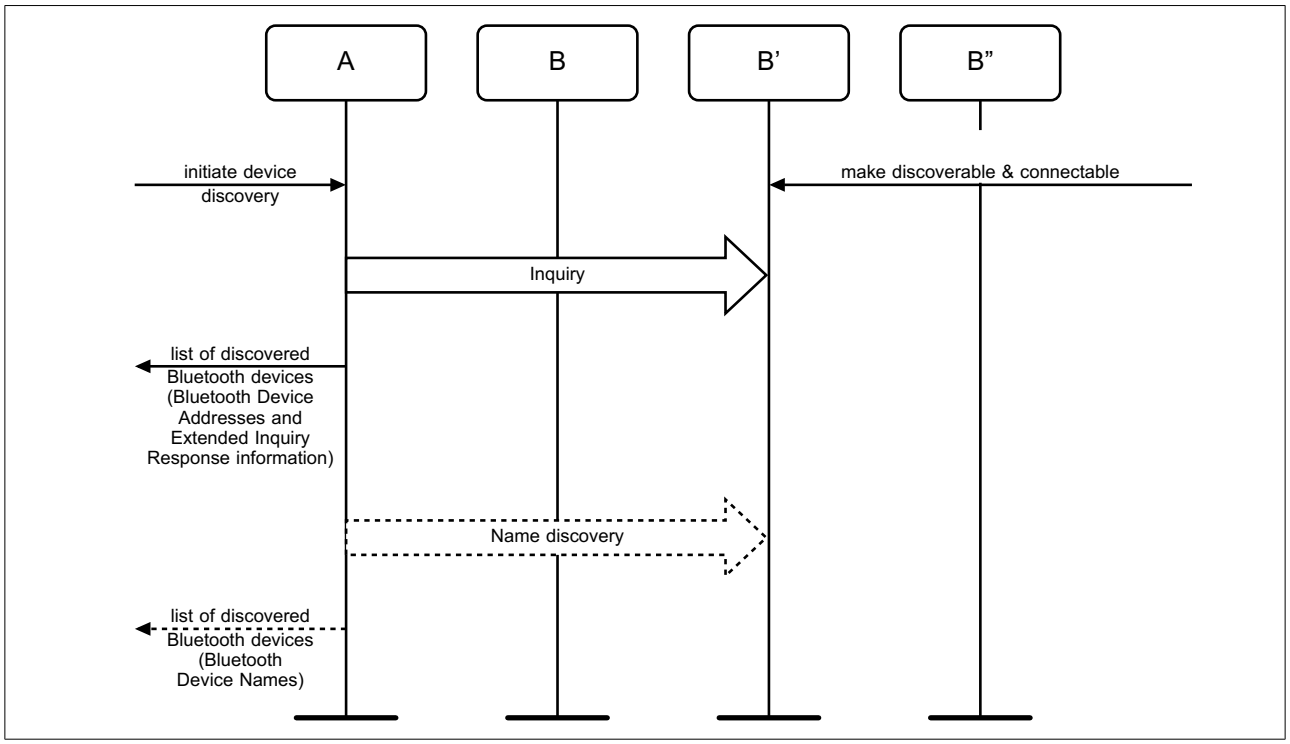

Figure 6.5: Device Discovery procedure

6.4.4 Conditions

Conditions for both inquiry (general or limited) and name discovery must be fulfilled (i.e., devices discovered during device discovery must be both discoverable and connectable).

6.5 Bonding

6.5.1 Purpose

The purpose of bonding is to create a relation between two Bluetooth devices based on a common link key (a bond). The link key is created and exchanged (pairing) during the bonding procedure and is expected to be stored by both Bluetooth devices, to be used for future authentication. In addition to pairing, the bonding procedure can involve higher-layer initialization procedures.

6.5.2 Term on UI level

'Bluetooth Bonding'

6.5.3 Description

Two forms of bonding are described in the following sections: General Bonding and Dedicated Bonding.

6.5.3.1 General Bonding

General Bonding refers to the process of performing bonding during connection setup or channel establishment procedures as a precursor to accessing a service. Figure 6.6 specifies General Bonding.

When the devices that are performing General Bonding both support Secure Simple Pairing, the Authentication_Requirements parameter should be set to MITM Protection Not Required – General Bonding unless the security policy of an available local service requires MITM Protection in which case the Authentication_Requirements parameter shall be set to MITM Protection Required – General Bonding. 'No bonding' is used when the device is performing a Secure Simple Pairing procedure, but does not intend to retain the link key after the physical link is disconnected.

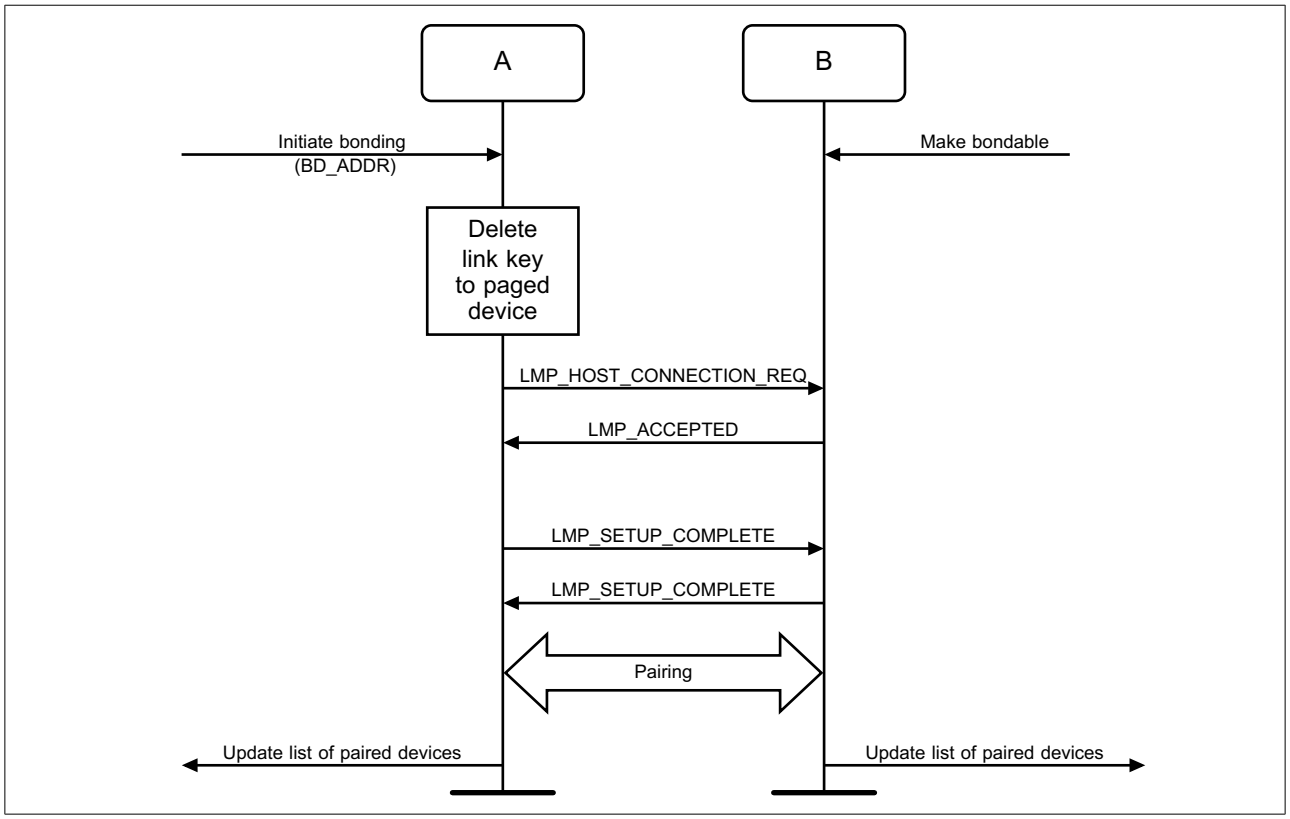

Figure 6.6: General Bonding procedure

6.5.3.2 Dedicated Bonding

Dedicated Bonding refers to a procedure wherein one device connects to another only for the purpose of pairing without accessing a particular service. Figure 6.7 specifies

Dedicated Bonding. The main difference with dedicated bonding, as compared to a pairing done during link or channel establishment, is that for bonding it is the paging device (A) that initiates the authentication.

When the devices that are performing Dedicated Bonding both support Secure Simple Pairing, the Authentication_Requirements parameter should be set to *MITM Protection Not Required – Dedicated Bonding* unless the security policy of an available local service requires MITM Protection in which case the Authentication Required parameter shall be set to *MITM Protection Required – Dedicated Bonding*. 'No bonding' is used when the device is performing a Secure Simple Pairing procedure, but does not intend to retain the link key after the physical link is disconnected.

As an exception to the normal process, device B shall also accept pairing before the exchange of LMP_SETUP_COMPLETE PDUs (this can only happen if device A conforms to a lower version of the specification).

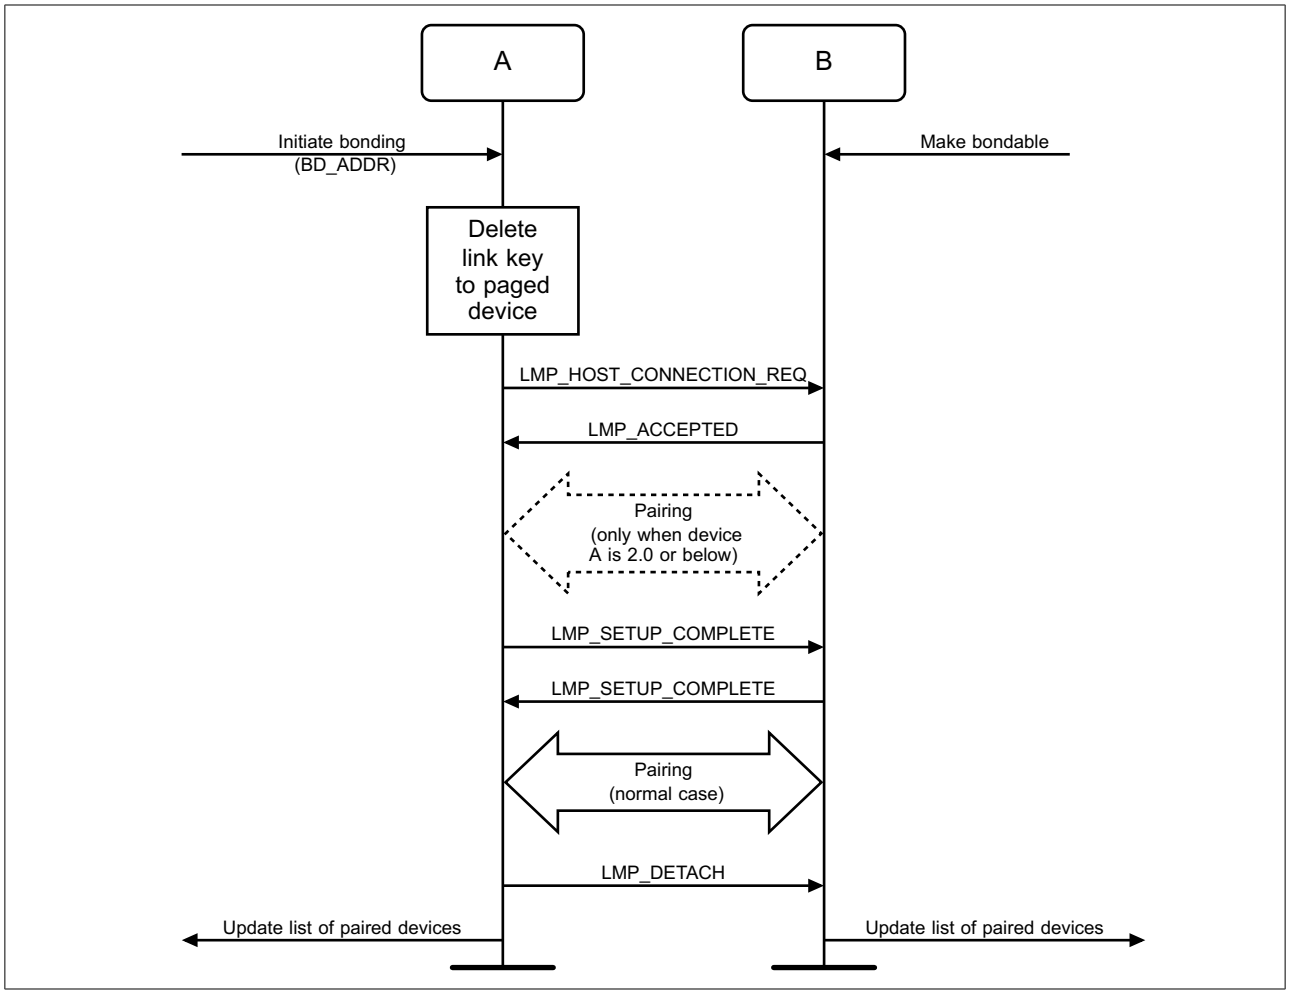

Figure 6.7: Dedicated Bonding procedure

6.5.4 Conditions

Before bonding can be initiated, the initiating device (A) must know the Device Access Code of the device to pair with. This is normally done by first performing device discovery. A Bluetooth Device that can initiate bonding (A) should use limited inquiry, and a Bluetooth Device that accepts bonding (B) should support the limited discoverable mode.

Bonding is in principle the same as link establishment with the conditions:

- The paged device (B) shall be set into bondable mode. The paging device (A) is assumed to allow pairing since it has initiated the bonding procedure.
- The paging device (the initiator of the bonding procedure, A) shall initiate authentication.
- Before initiating the authentication part of the bonding procedure, the paging device should delete any link key corresponding to a previous bonding with the paged device.

7 ESTABLISHMENT PROCEDURES – BR/EDR PHYSICAL TRANSPORT

Procedure	Ref.	Support in A	Support in B
Link Establishment	7.1	M	M
Channel Establishment	7.2	O	M
Connection Establishment	7.3	O	O
Synchronization Establishment	7.5	O	O

Table 7.1: Establishment procedures

The establishment procedures defined here do not include any discovery part. Before establishment procedures are initiated, the information provided during device discovery (in the FHS packet or the extended inquiry response packet of the inquiry response or in the response to a name request or in the synchronization train packet) must be available in the initiating device.

This information is:

- The Bluetooth Device Address (BD_ADDR) from which the Device Access Code is generated
- The system clock of the remote device

Additional information provided during device discovery that may be useful for making the decision to initiate an establishment procedure is:

- The Class of Device
- The Device name
- The supported Service Classes.

7.1 Link Establishment

7.1.1 Purpose

The purpose of the Link Establishment procedure is to establish a logical transport (of ACL type) between two Bluetooth devices using procedures from the Baseband Specification and Link Manager Protocol.

7.1.2 Term on UI level

‘Bluetooth link establishment’

7.1.3 Description

In this subsection, the paging device (A) is in security mode 3. During link establishment, the paging device cannot distinguish if the paged device (B) is in security mode 1, 2 or 4.

7.1.3.1 B in security mode 1, 2, or 4

Figure 7.1 specifies the procedure.

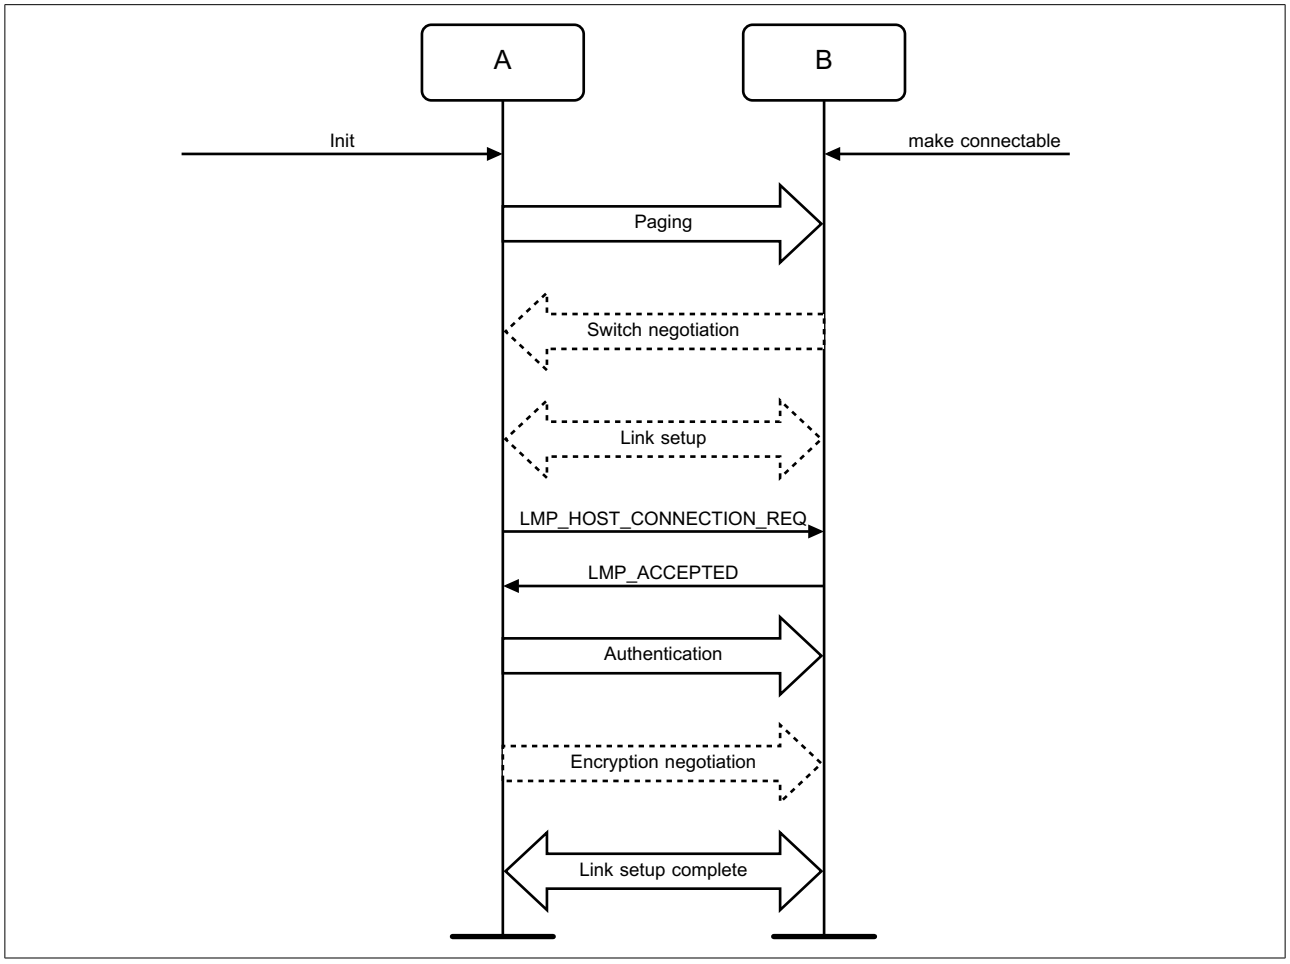

Figure 7.1: Link Establishment procedure when the paging device (A) is in security mode 3 and the paged device (B) is in security mode 1, 2, or 4

7.1.3.2 B in security mode 3

Figure 7.2 specifies the procedure.

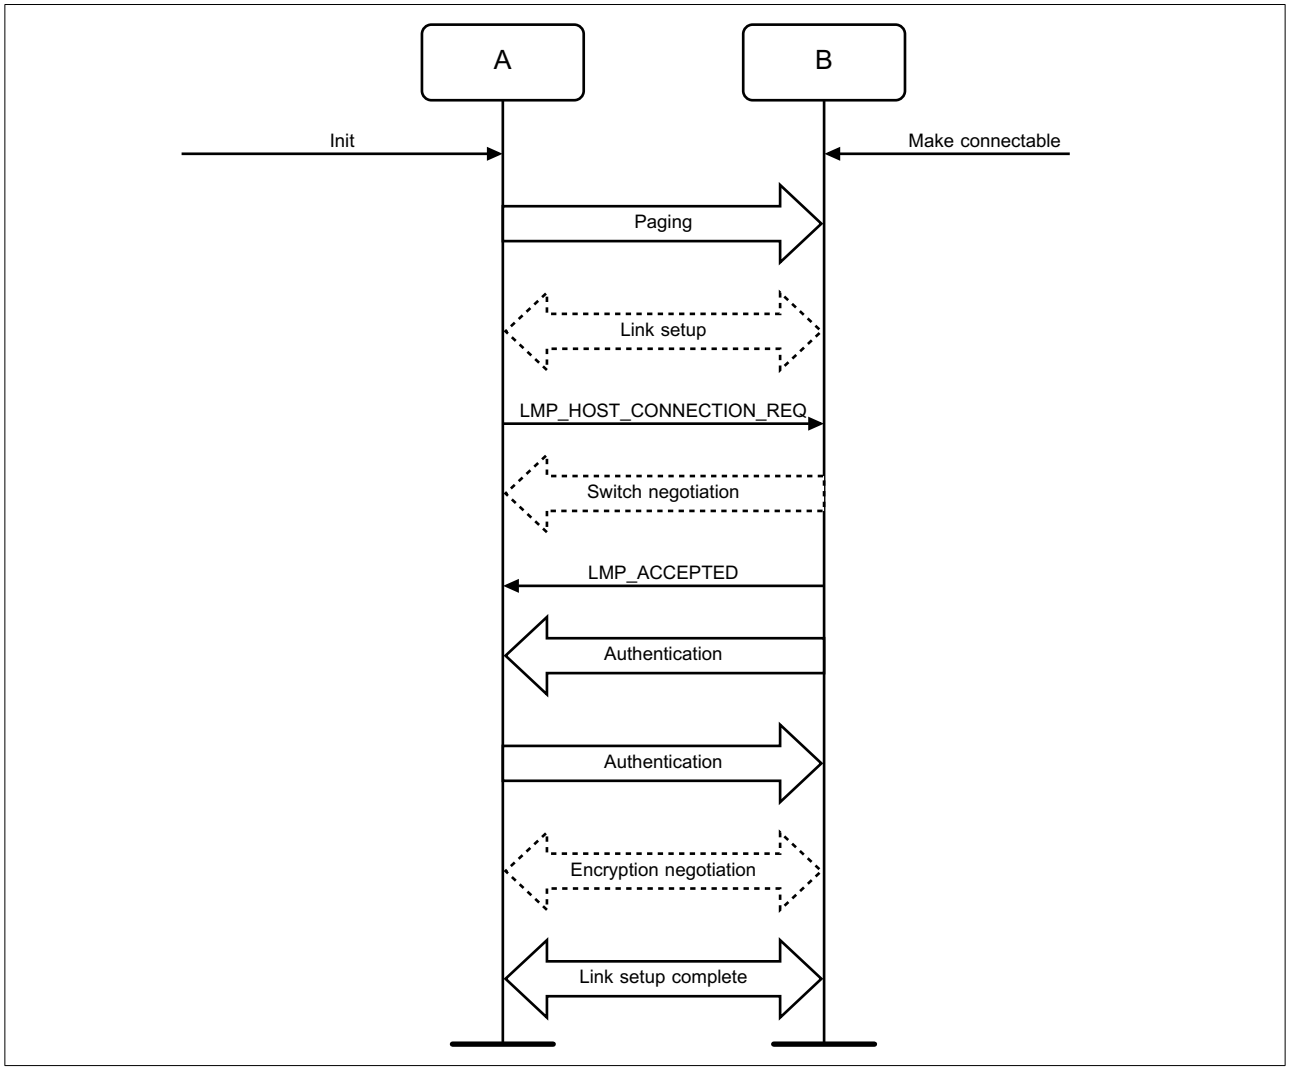

Figure 7.2: Link Establishment procedure when both the paging device (A) and the paged device (B) are in security mode 3

7.1.4 Conditions

The paging procedure shall be according to [Vol 2] Part B, Section 8.3 and the paging device should use the Device Access Code and page mode received through a previous inquiry. When paging is completed, a physical link between the two Bluetooth devices is established.

If role switching is needed it should be done as early as possible after the physical link is established. If the paging device does not accept the switch, the paged device has to consider whether to keep the physical link or not.

Both devices may perform link setup (using LMP procedures that require no interaction with the Host on the remote side). Optional LMP features can be used after having confirmed (using LMP_FEATURES_REQ) that the other device supports the feature.

When the paging device needs to go beyond the link setup phase, it issues a request to be connected to the Host of the remote device. If the paged device is in security mode 3, this is the trigger for initiating authentication.

The paging device shall send LMP_HOST_CONNECTION_REQ during link establishment (i.e., before channel establishment) and may initiate authentication only after having sent LMP_HOST_CONNECTION_REQ.

After an authentication has been performed, any of the devices can initiate encryption.

Further link configuration may take place after the LMP_HOST_CONNECTION_REQ. When both devices are satisfied, they send LMP_SETUP_COMPLETE.

Link establishment is completed when both devices have sent LMP_SETUP_COMPLETE.

7.2 Channel Establishment

7.2.1 Purpose

The purpose of the Channel Establishment procedure is to establish a Bluetooth channel (L2CAP channel) between two Bluetooth devices as described in [Vol 3] Part A, Section 4.2.

7.2.2 Term on UI level

'Bluetooth channel establishment'

7.2.3 Description

In this subsection, the initiator (A) is in security mode 3. During channel establishment, the initiator cannot distinguish if the acceptor (B) is in security mode 1 or 3.

7.2.3.1 B in security mode 2 or 4

Figure 7.3 specifies the procedure.

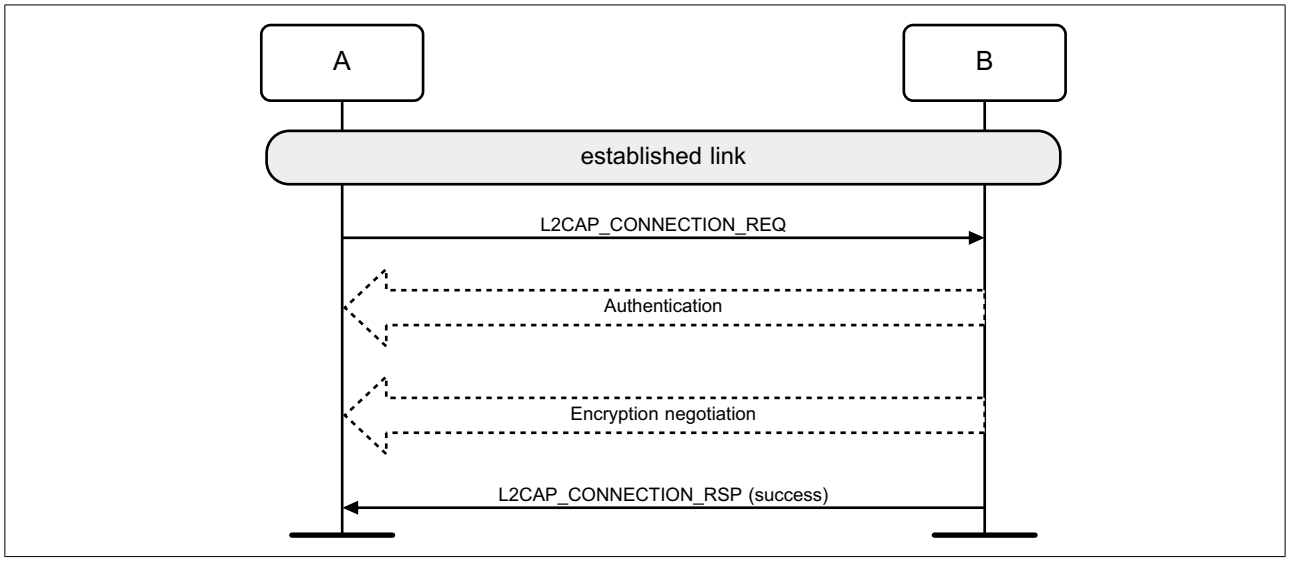

Figure 7.3: Channel Establishment procedure when the initiator (A) is in security mode 3 and the acceptor (B) is in security mode 2 or 4

7.2.3.2 B in security mode 1 or 3

Figure 7.4 specifies the procedure.

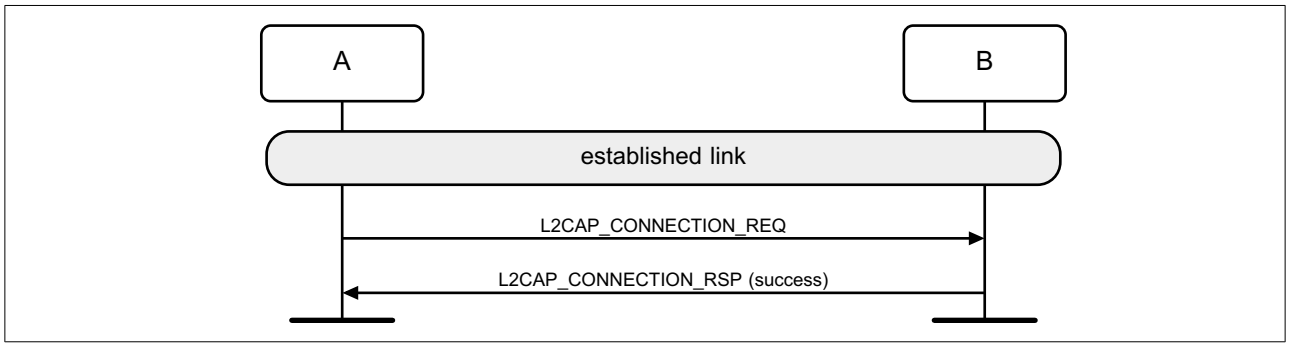

Figure 7.4: Channel Establishment procedure when the initiator (A) is in security mode 3 and the acceptor (B) is in security mode 1 or 3

7.2.4 Conditions

Channel establishment starts after link establishment is completed when the initiator sends a channel establishment request (L2CAP_CONNECTION_REQ).

Depending on security mode, security procedures may take place after the channel establishment has been initiated.

Channel establishment is completed when the acceptor responds to the channel establishment request (with a positive L2CAP_CONNECTION_RSP).

7.3 Connection Establishment

7.3.1 Purpose

The purpose of the Connection Establishment procedure is to establish a connection between applications on two Bluetooth devices.

7.3.2 Term on UI level

'Bluetooth connection establishment'

7.3.3 Description

In this subsection, the initiator (A) is in security mode 3. During connection establishment, the initiator cannot distinguish if the acceptor (B) is in security mode 1 or 3. The connection establishment request and accept messages are defined by the application protocol.

7.3.3.1 B in security mode 2 or 4

Figure 7.5 specifies the procedure.

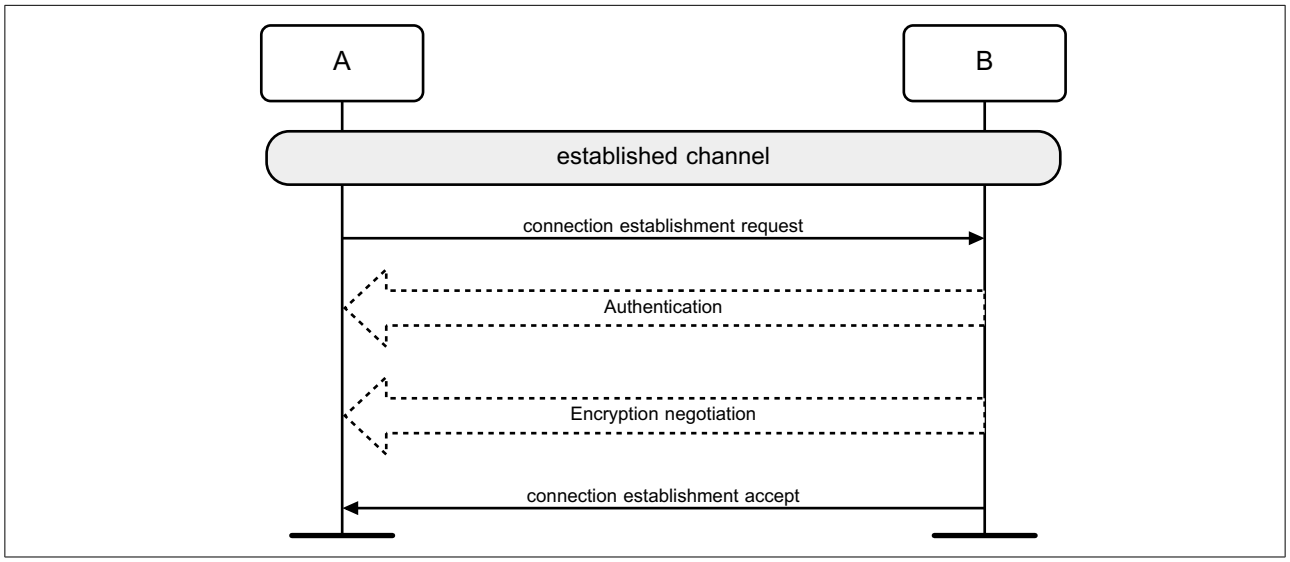

Figure 7.5: Connection Establishment procedure when the initiator (A) is in security mode 3 and the acceptor (B) is in security mode 2 or 4

7.3.3.2 B in security mode 1 or 3

Figure 7.6 specifies the procedure.

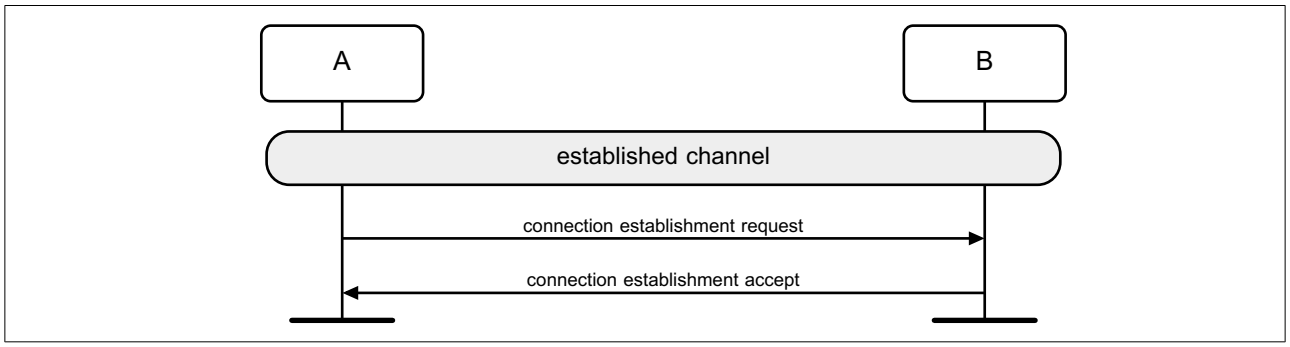

Figure 7.6: Connection Establishment procedure when the initiator (A) is in security mode 3 and the acceptor (B) is in security mode 1 or 3

7.3.4 Conditions

Connection establishment starts after channel establishment is completed, when the initiator sends a connection establishment request. This request may be a TCS SETUP message [2] in the case of a Bluetooth telephony application Cordless Telephony Profile, or initialization of RFCOMM and establishment of DLC [1] in the case of a serial port-based application Serial Port Profile (although neither TCS or RFCOMM use the term ‘connection’ for this).

Connection establishment is completed when the acceptor accepts the connection establishment request.

7.4 Establishment of additional connection

When a Bluetooth device has established one connection with another Bluetooth device, it may be available for establishment of:

- A second connection on the same channel, and/or
- A second channel on the same logical link, and/or
- A second physical link.

If the new establishment procedure is to be towards the same device, the security part of the establishment depends on the security modes used. If the new establishment procedure is to be towards a new remote device, the device should behave according to Active modes independent of the fact that it already has another physical link established (unless allowed co-incident radio and Baseband events have to be handled).

7.5 Synchronization Establishment

7.5.1 Purpose

The purpose of the Synchronization Establishment procedure is for a device to receive synchronization train packets using the procedures in [Vol 2] Part B, Section 2.7.3

7.5.2 Term on UI Level

'Bluetooth synchronization establishment'

7.5.3 Description

In Figure 7.7 the receiving device (B) is attempting to receive synchronization train packets from device (A).

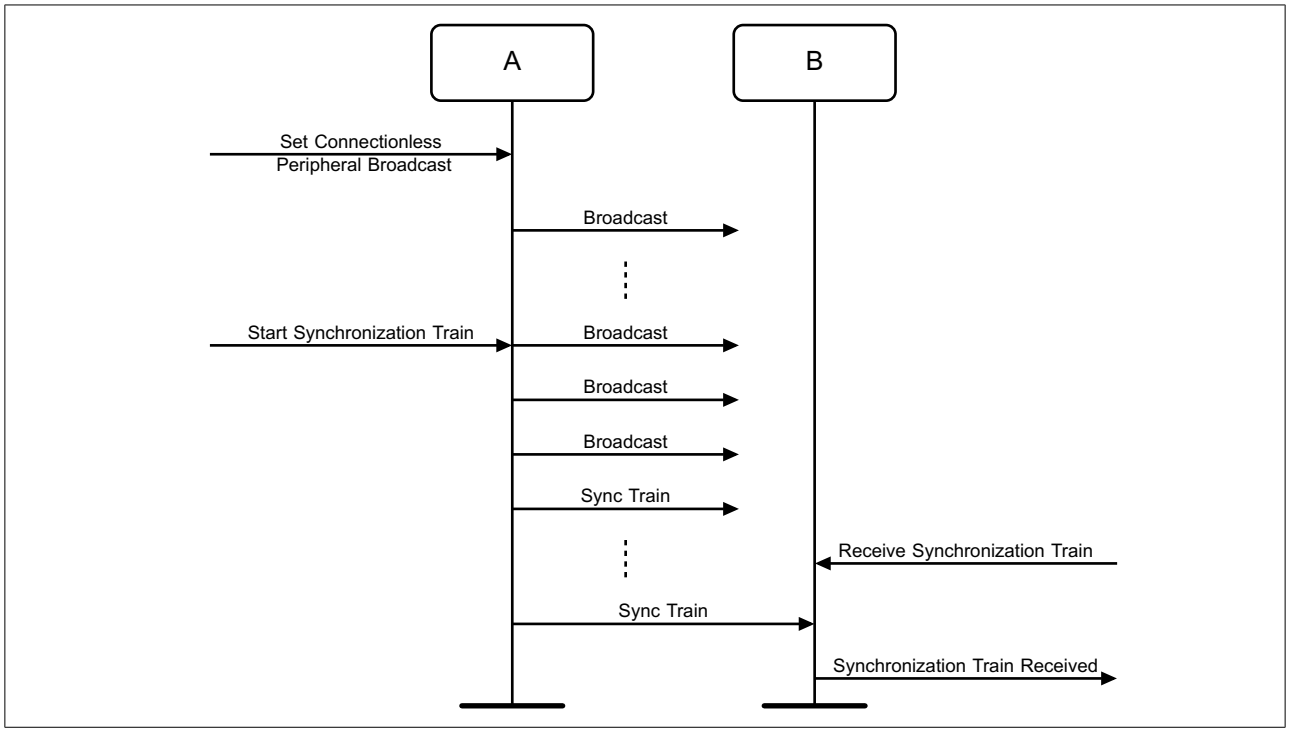

Figure 7.7: Synchronization Establishment procedure

7.5.4 Conditions

After receiving a synchronization train packet, the receiving device can listen to and receive profile data sent via Connectionless Peripheral Broadcast by device A.

Devices A and B may go through a separate Link Establishment procedure any time they desire to establish an ACL logical transport between each other. They may also use Connectionless Peripheral Broadcast procedures with an ACL logical transport already established.

The receiving device shall enter the Synchronization Scan substate using a scan interval of T_{GAP}(Sync_Scan_Interval) and a scan window of T_{GAP}(Sync_Scan_Window).

8 EXTENDED INQUIRY RESPONSE DATA FORMAT

The extended inquiry response data format is shown in Figure 8.1. The data is 240 octets and consists of a significant part and a non-significant part. The significant part contains a sequence of data structures. Each data structure shall have a length field of one octet, which contains the Length value, and a data field of Length octets. The first n octets of the data field contain the extended inquiry response (EIR) data type. The content of the remaining Length - n octets in the data field depends on the value of the EIR data type and is called the EIR data. The non-significant part extends the extended inquiry response to 240 octets and shall contain all-zero octets.

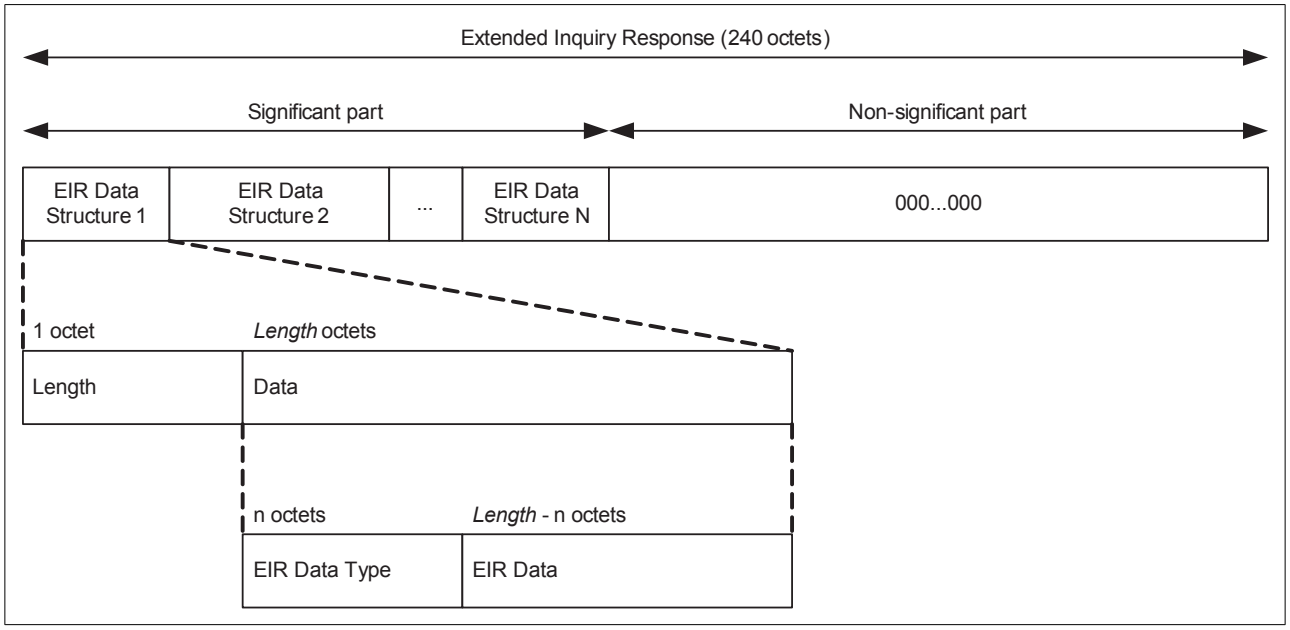

Figure 8.1: Extended inquiry response data format

The extended inquiry response data formats and meanings are defined in Section 1 of [4].The extended inquiry response data type values are defined in Assigned Numbers.

If the length field is set to zero, then the data field has zero octets. This shall only occur to allow an early termination of the tagged data.

To reduce interference, the Host should try to minimize the amount of EIR data such that the Baseband can use a 1-slot or 3-slot EIR packet. This is advantageous because it reduces interference and maximizes the probability that the EIR packet will be received. If applications on a Host provide more than 240 bytes of extended inquiry response data, it is up to the Host to limit it to 240 octets.

The EIR data shall be sent during the inquiry response state. In selecting the packet type to be used, FEC (DM1 or DM3) should be considered to maximize the range.

The Host shall include the device name in the EIR data according to the following rules:

1. If the device does not have a device name (i.e., no octets) and
    a. If there is no other data to be sent in the EIR packet, the Host shall send a name tag with zero length and the type field set to indicate that this is the complete name (i.e., total of 2 octets with length = 1).
    b. If there is other important data to be sent in the EIR packet and a zero octet name tag will not fit, the Host may avoid sending the name tag.
2. If the device has a device name (greater than zero octets) and
    a. If it is too long be included in the EIR packet (given the choice of packet type and any other data that is being sent), the Host may send a shortened version of the name (even no octets) and shall mark the name as 'shortened' to inform the receiver that a remote name request is required obtain the full name if the name is needed.
    b. If there are no other data to be sent in the EIR packet (given the choice of packet type selected), the Host shall maximize the length of the device name to be sent, this may be complete or shortened name (e.g., if DM1 packet is chosen and device name characters equates to greater than 15 octets, then Host sends first few characters that equates to 15 octets or less with shortened flag).

Note: It is not necessary to understand each and every EIR data type. If the Host does not understand a given EIR data type value it should just skip over Length octets and look for the next EIR data structure.

9 OPERATIONAL MODES AND PROCEDURES – LE PHYSICAL TRANSPORT

Several different modes and procedures may be performed simultaneously over an LE physical transport. The following modes and procedures are defined for use over an LE physical transport:

- Broadcast mode and Observation procedure
- Discovery modes and procedures
- Connection modes and procedures
- Bonding modes and procedures
- Periodic advertising modes and procedure
- Isochronous broadcast modes and procedures
- Channel Sounding procedures

Each of the above modes and procedures are independent from each other but are closely related since a combination of the modes and procedures are necessary for most devices to communicate with each other. Both the modes and procedures may be entered or executed respectively as a result of direct user action or autonomously by a device.

The Host shall configure the Controller with its local Link Layer feature information as defined in [Vol 6] Part B, Section 4.6 before performing any of the above modes and procedures.

The types of advertising used in these modes and procedures for each of the associated GAP roles are defined in Section 2.2.2 Table 2.1.

9.1 Broadcast mode and Observation procedure

The Broadcast mode and Observation procedure allow two devices to communicate in a unidirectional connectionless manner using the advertising events. The requirements for a device operating in a specific GAP role to support the Broadcast mode and Observation procedure are defined in Table 9.1.

Broadcast Mode and Observation procedure	Ref.	Peripheral	Central	Broadcaster	Observer
Broadcast mode	9.1.1	E	E	M	E
Observation procedure	9.1.2	E	E	E	M

Table 9.1: Broadcast mode and observation procedure requirements

9.1.1 Broadcast mode

9.1.1.1 Definition

The Broadcast mode provides a method for a device to send connectionless data in advertising events.

9.1.1.2 Conditions

A device in the Broadcast mode shall send data using non-connectable advertising events.

A device in the Broadcast mode may send non-connectable and non-scannable undirected or non-connectable and non-scannable directed advertising events anonymously by excluding the Broadcaster's address.

The advertising data shall be formatted using the Advertising Data (AD) type format as defined in Section 1.3 of [4]. A device in the Broadcast mode shall not set the ‘LE General Discoverable Mode’ flag or the ‘LE Limited Discoverable Mode’ flag in the Flags AD Type as defined in Section 1.3 of [4].

Note: All data sent by a device in the Broadcast mode is considered unreliable since there is no acknowledgment from any device that may have received the data.

The device may configure and enable multiple independent advertising sets. Each advertising set may have an independent advertising filter policy.

9.1.2 Observation procedure

9.1.2.1 Definition

The Observation procedure provides a method for a device to receive connectionless data from a device that is sending advertising events.

9.1.2.2 Conditions

A device performing the Observation procedure may use passive scanning or active scanning to receive advertising events.

A device performing the Observation procedure may use active scanning to also receive scan response data sent by any device in the Broadcast mode that advertises using scannable advertising events.

When a device performing the Observation procedure receives a resolvable private address in the advertising event, the device may resolve the private address by using the resolvable private address resolution procedure as defined in Section 10.8.2.3.

Note: In use cases where a device in the Broadcast mode sends dynamic data, the receiving device should disable duplicate filtering capability in the Controller so that the Host receives all advertising packets received by the Controller.

9.2 Discovery modes and procedures

All devices shall be in either non-discoverable mode or one of the discoverable modes. A device in the discoverable mode shall be in either the general discoverable mode or the limited discoverable mode. A device in the non-discoverable mode is not discoverable. Devices operating in either the general discoverable mode or the limited discoverable mode can be found by the discovering device. A device that is discovering other devices performs either the limited discovery procedure as defined in Section 9.2.5 or the general discovery procedure as defined in Section 9.2.6.

Some devices may only scan for advertising events using legacy advertising PDUs. It is therefore recommended that devices using advertising events with the extended advertising PDUs also use an advertising set with advertising events that use legacy advertising PDUs.

If the device is in one of the discoverable modes, and if multiple advertising sets are used with the same Identity Address or the same IRK, then those advertising sets shall also share the same advertising filter policy.

9.2.1 Requirements

Discovery modes and procedures	Ref.	Peripheral	Central	Broadcaster	Observer
Non-Discoverable mode	9.2.2	M	E	E	E
Limited Discoverable mode	9.2.3	O	E	E	E
General Discoverable mode	9.2.4	C.1	E	E	E
Limited Discovery procedure	9.2.5	E	O	E	E
General Discovery procedure	9.2.6	E	M	E	E
Name Discovery procedure	9.2.7	O	O	E	E
C.1: Optional if limited discoverable mode is supported, otherwise mandatory.					

Table 9.2: Device Discovery requirements

9.2.2 Non-discoverable mode

9.2.2.1 Description

A device configured in non-discoverable mode will not be discovered by any device that is performing either the general discovery procedure or the limited discovery procedure.

9.2.2.2 Conditions

A device in the non-discoverable mode may send advertising events. If the device sends advertising events, it shall not set the ‘LE General Discoverable Mode’ flag or ‘LE Limited Discoverable Mode’ flag in the Flags AD type (see Section 1.3 of [4]).

If the device sends advertising events, then it is recommended that the Host configures the Controller as follows:

- The Host should set the advertising filter policy for all advertising sets to either ‘process scan and connection requests only from devices in the Filter Accept List’ or ‘process scan and connection requests from all devices’.
- The Host should set the advertising intervals as defined in Section 9.3.11.

9.2.3 Limited Discoverable mode

9.2.3.1 Description

Devices configured in the limited discoverable mode are discoverable for a limited period of time by other devices performing the limited or general device discovery procedure. Devices typically enter the limited discoverable mode when a user performs a specific action.

There are two common reasons to use limited discoverable mode:

- Limited discoverable mode can be used to allow remote devices using the general discovery procedure to prioritize or otherwise identify devices in limited discoverable mode when presenting discovered devices to the end user because, typically, the user is interacting with them.
- Limited discoverable mode can also be used to allow remote devices using the limited discovery procedure to filter out devices using the general discoverable mode.

9.2.3.2 Conditions

A device in the limited discoverable mode shall send advertising event types with the advertising data including the Flags AD type as defined in Section 1.3 of [4] with all the following flags set as described:

- The LE Limited Discoverable Mode flag set to one.
- The LE General Discoverable Mode flag set to zero.
- For an LE-only implementation with all the following flags set as described:
  a. The ‘BR/EDR Not Supported’ flag to set one.
  b. The ‘Simultaneous LE and BR/EDR to Same Device Capable (Controller)’ flag set to zero.

The advertising data should also include the following AD types to enable a faster connectivity experience:

- TX Power Level AD type defined in Section 1.5 of [4].
- Local Name AD type defined in Section 1.2 of [4].
- Service or Service Class UUIDs AD type defined in Section 1.1 of [4].
- Peripheral Connection Interval Range AD type as defined in Section 1.9 of [4].

Devices shall remain in the limited discoverable mode no longer than T_{GAP}(lim_adv_timeout).

While a device is in limited discoverable mode the Host configures the Controller as follows:

- The Host shall set the advertising filter policy for all advertising sets that share the same Identity Address or the same IRK to ‘process scan and connection requests from all devices’.
- The Host should set the advertising intervals as defined in Section 9.3.11.

The device shall remain in limited discoverable mode until a connection is established or the Host terminates the mode.

Note: The choice of advertising interval is a trade-off between power consumption and device discovery time.

The device may configure and enable multiple independent advertising sets.

9.2.4 General Discoverable mode

9.2.4.1 Description

Devices configured in the general discoverable mode are discoverable for an indefinite period of time by devices performing the general discovery procedure. Devices typically enter general discoverable mode autonomously.

Devices in the general discoverable mode will not be discovered by devices performing the limited discovery procedure. General discoverable mode should not be used if it is known that the device performing discovery will be using the limited discovery procedure (see Section 9.2.5).

9.2.4.2 Conditions

A device in general discoverable mode shall send advertising events with the advertising data including the Flags AD data type as defined in Section 1.3 of [4] with all the following flags set as described:

- The LE Limited Discoverable Mode flag set to zero.
- The LE General Discoverable Mode flag set to one.
- For an LE-only implementation with all the following flags set as described:
  a. The ‘BR/EDR Not Supported’ flag set to one.
  b. The ‘Simultaneous LE and BR/EDR to Same Device Capable (Controller)’ flag set to zero.

The advertising data should also include the following AD types to enable a faster connectivity experience:

- TX Power Level AD type as defined in Section 1.5 of [4].
- Local Name AD type as defined in Section 1.2 of [4].
- Service or Service Class UUIDs AD type as defined in Section 1.1 of [4].
- Peripheral Connection Interval Range AD type as defined in Section 1.9 of [4].

While a device is in general discoverable mode the Host configures the Controller as follows:

- The Host shall set the advertising filter policy for all advertising sets that share the same Identity Address or the same IRK to ‘process scan and connection requests from all devices’.
- The Host should set the advertising intervals as defined in Section 9.3.11.

The device shall remain in general discoverable mode until a connection is established or the Host terminates the mode.

Note: Host data used in legacy advertising events that change frequently should be placed in the advertising data and static data should be placed in the scan response data.

Note: The choice of advertising interval is a trade-off between power consumption and device discovery time.

9.2.5 Limited Discovery procedure

9.2.5.1 Description

A device performing the limited discovery procedure receives the device address, advertising data and scan response data from devices in the limited discoverable mode only.

The limited discovery procedure should only be used when it is known that the devices to be discovered are using limited discoverable mode. The general discovery procedure (see Section 9.2.6) should be used for general purpose discovery when it is desired to discover all devices regardless of whether they are using limited discoverable mode or general discoverable mode.

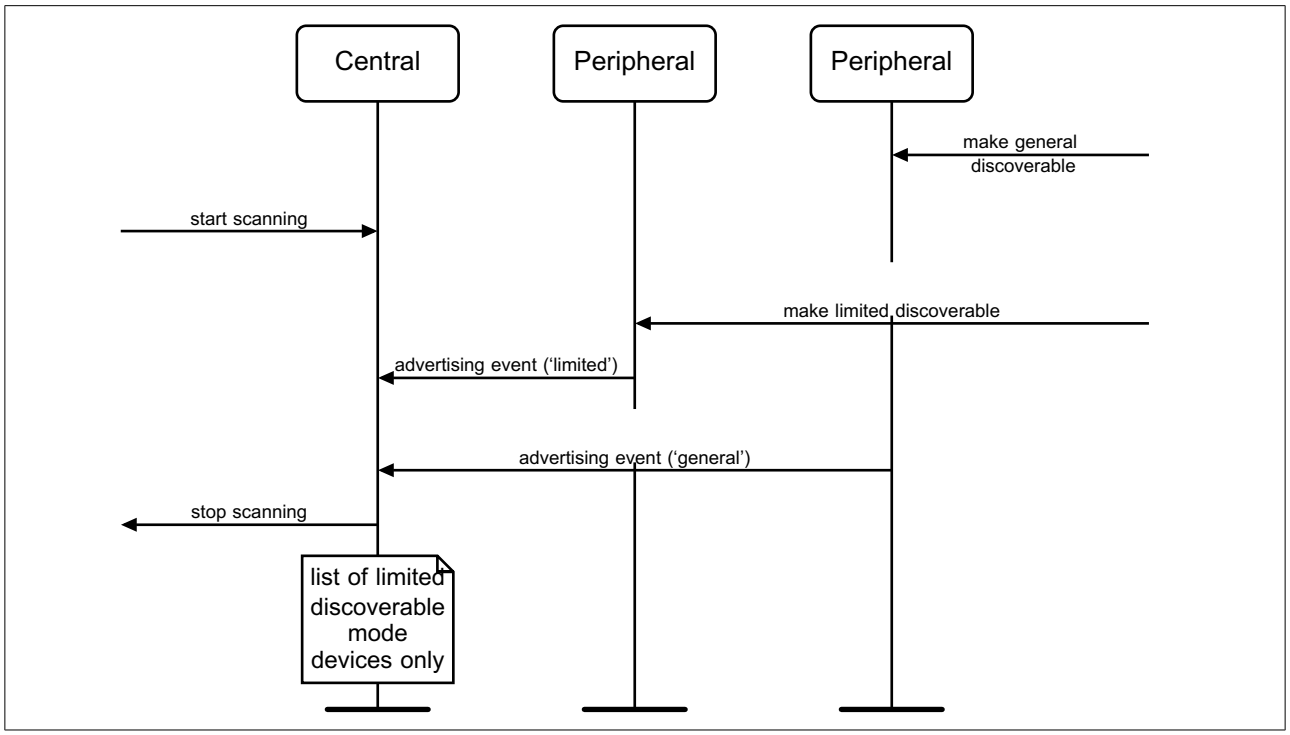

Figure 9.1: A Central performing limited discovery procedure discovering Peripherals in the limited discoverable mode

9.2.5.2 Conditions

It is recommended that the device scan on all the PHYs it supports.

When a Host performs the limited discovery procedure, the Host configures the Controller as follows:

1. The Host shall set the scanning filter policy to an unfiltered scanning policy (see [Vol 6] Part B, Section 4.3.3).
2. The Host should set the scan interval and scan window as defined in Section 9.3.11.
3. The Host should configure the Controller to use active scanning.

The Host shall begin scanning for advertising packets and should continue for a minimum of T_{GAP}(lim_disc_scan_min) when scanning on the LE 1M PHY and T_{GAP}(lim_disc_scan_min_coded) when scanning on the LE Coded PHY, unless the Host ends the limited discovery procedure.

The Host shall check for the Flags AD type in the advertising data. If the Flags AD type is present and the LE Limited Discoverable Flag is set to one then the Host shall consider the device as a discovered device, otherwise the advertising data shall be ignored. The Flag AD type is defined in Section 1.3 of [4]. The advertising data of the discovered device may contain data with other AD types, e.g. Service or Service Class UUIDs AD type, TX Power Level AD type, Local Name AD type, Peripheral Connection Interval Range AD type. The Host may use the data in performing any of the connection establishment procedures.

The Host shall ignore the 'Simultaneous LE and BR/EDR to Same Device Capable (Controller)' bit in the Flags AD type.

9.2.6 General Discovery procedure

9.2.6.1 Description

A device performing the general discovery procedure receives the device address, advertising data and scan response data from devices in the limited discoverable mode or the general discoverable mode.

The general discovery procedure should be used for general purpose discovery, i.e. to discover all discoverable devices regardless of whether they are in general discoverable mode or limited discoverable mode. A device which discovers devices using the general discovery procedure and presents them to users in some fashion should distinguish devices in the limited discoverable mode from those in the general discoverable mode, e.g., by sorting them to the top of a list of discovered devices or highlighting them in some way.

Note: The rationale for distinguishing the devices in limited discoverable mode to the end user is that devices typically enter limited discoverable mode only after explicit action by the end user, indicating that the user's immediate goal is to discover and interact with that specific device.

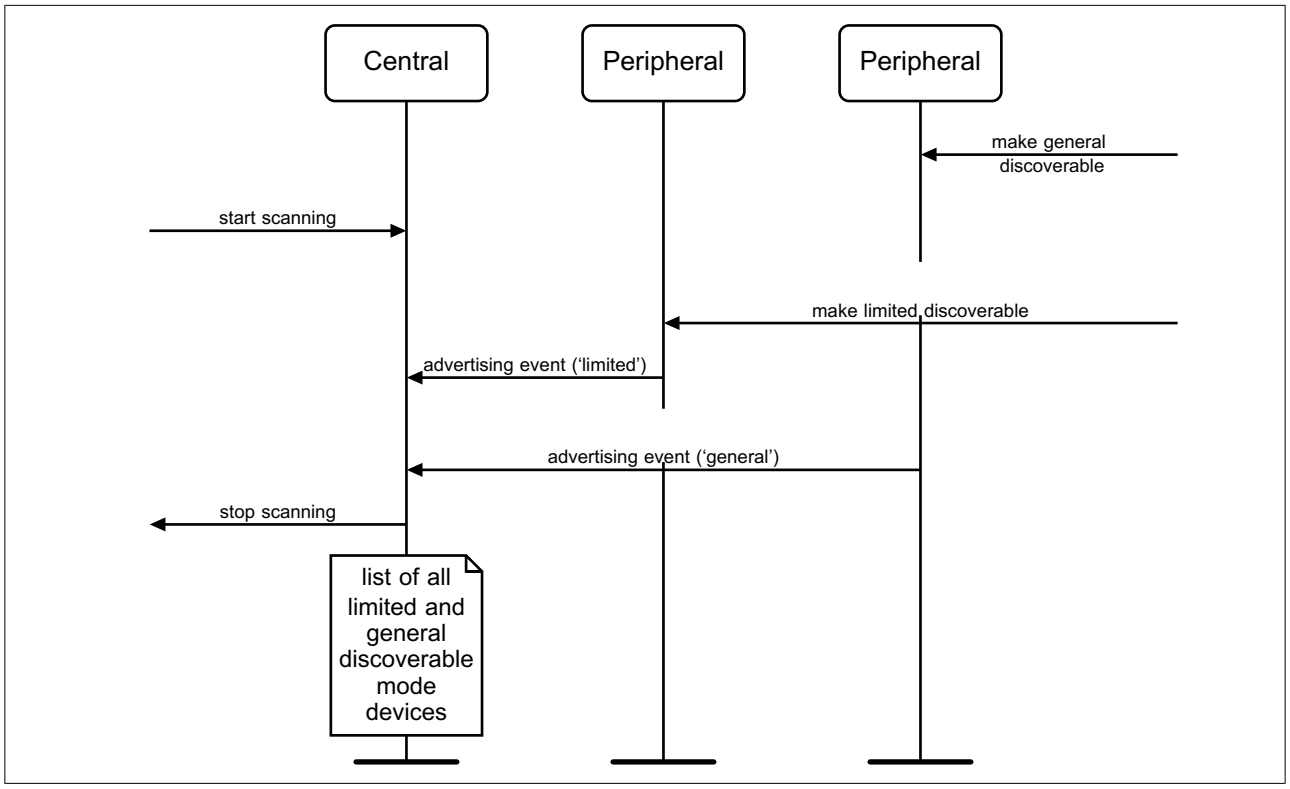

Figure 9.2: A Central performing General Discovery procedure discovering Peripherals in the Limited Discoverable mode and General Discoverable mode

9.2.6.2 Conditions

It is recommended that the device scan on all the PHYs it supports.

When a Host performs the general discovery procedure, the Host configures the Controller as follows:

1. The Host shall set the scanning filter policy to an unfiltered scanning policy (see [Vol 6] Part B, Section 4.3.3).
2. The Host should set the scan interval and scan window as defined in Section 9.3.11.
3. The Host should configure the Controller to use active scanning.

The Host shall begin scanning for advertising packets and should continue for a minimum of T_{GAP}(gen_disc_scan_min) when scanning on the LE 1M PHY and

T_{GAP}(gen_disc_scan_min_coded) when scanning on the LE Coded PHY. The procedure may be terminated early by the Host.

The Host shall check for the Flags AD type in the advertising data. If the Flags AD type (see Section 1.3 of [4]) is present and either the LE General Discoverable Mode flag is set to one or the LE Limited Discoverable Mode flag is set to one then the Host shall consider the device as a discovered device, otherwise the advertising data shall be ignored. The advertising data of the discovered device may contain data with other AD types, e.g., Service or Service Class UUIDs AD type, TX Power Level AD type, Local Name AD type, Peripheral Connection Interval Range AD type. The Host may use the data in performing any of the connection establishment procedures as defined in Section 9.3.

The Host shall ignore the 'Simultaneous LE and BR/EDR to Same Device Capable (Controller)' bit in the Flags AD type.

9.2.7 Name Discovery procedure

9.2.7.1 Description

The name discovery procedure is used to obtain the Bluetooth Device Name of a remote connectable device.

9.2.7.2 Conditions

If the complete device name is not acquired while performing either the limited discovery procedure or the general discovery procedure, then the name discovery procedure may be performed.

The name discovery procedure shall be performed as follows:

1. The Host shall establish a connection using one of the connection establishment procedures as defined in Section 9.3.
2. The Host shall read the device name characteristic using the GATT procedure Read Using Characteristic UUID [Vol 3] Part G, Section 4.8.2
3. The connection may be terminated after the GATT procedure has completed.

9.3 Connection modes and procedures

The connection modes and procedures allow a device to establish a connection to another device.

When devices are connected, the parameters of the connection can be updated with the Connection Parameter Update procedure. The connected device may terminate the connection using the Terminate Connection procedure. The requirements for a

device to support the connection modes and procedures are defined in Table 9.3. These requirements refer to the specific role a device is operating in. Devices supporting multiple roles shall support the specified modes and procedures for a given role while operating in that role.

9.3.1 Requirements

Connection Modes and Procedures	Ref.	Peripheral	Central	Broadcaster	Observer
Non-connectable mode	9.3.2	M	E	M	M
Directed connectable mode	9.3.3	O	E	E	E
Undirected connectable mode	9.3.4	M	E	E	E
Auto connection establishment procedure	9.3.5	E	O	E	E
General connection establishment procedure	9.3.6	E	O	E	E
Selective connection establishment procedure	9.3.7	E	O	E	E
Direct connection establishment procedure	9.3.8	E	M	E	E
Periodic Advertising Connection procedure	9.3.17	C.3	C.4	E	E
Connection parameter update procedure	9.3.9	O	M	E	E
Terminate connection procedure	9.3.10	M	M	E	E
Connected Isochronous Stream Central Establishment procedure	9.3.13	E	C.1	E	E
Connected Isochronous Stream Peripheral Establishment procedure	9.3.14	C.1	E	E	E
Connected Isochronous Stream Terminate procedure	9.3.15	C.1	C.1	E	E
Connection Subrate procedure	9.3.16	C.2	C.2	E	E

C.1: Mandatory if Connected Isochronous Streams are supported, otherwise excluded.

C.2: Mandatory if the Connection Subrating feature is supported, otherwise excluded.

C.3: Mandatory if the Periodic Advertising with Responses - Scanner feature is supported, otherwise Excluded

C.4: Mandatory if the Periodic Advertising with Responses - Advertiser feature is supported, otherwise Excluded

Table 9.3: Connection modes and procedures requirements

9.3.2 Non-connectable mode

9.3.2.1 Description

A device in the non-connectable mode shall not allow a connection to be established.

9.3.2.2 Conditions

A Peripheral in the non-connectable mode may send non-connectable advertising events. In this case it is recommended that the Host configures the Controller as follows:

- The Host should set the advertising filter policy to either ‘process scan and connection requests only from devices in the Filter Accept List’ or ‘process scan and connection requests from all devices’.
- The Host should set the advertising intervals as defined in Section 9.3.11.

The device may configure and enable multiple independent advertising sets. Each advertising set may have an independent advertising filter policy.

9.3.3 Directed Connectable mode

9.3.3.1 Description

A device in the directed connectable mode shall accept a connection request from a known peer device performing the auto connection establishment procedure or the general connection establishment procedure.

9.3.3.2 Conditions

A Peripheral shall send connectable directed advertising events.

The device may configure and enable multiple independent advertising sets. Each advertising set may have an independent advertising filter policy.

9.3.4 Undirected Connectable mode

9.3.4.1 Description

A device in the undirected connectable mode shall accept a connection request from a device performing the auto connection establishment procedure or the general connection establishment procedure.

9.3.4.2 Conditions

A Peripheral should follow the guidelines defined in Section 9.3.11. A Peripheral shall send either connectable and scannable undirected advertising events or connectable undirected advertising events.

The device may configure and enable multiple independent advertising sets. Each advertising set may have an independent advertising filter policy.

9.3.5 Auto Connection Establishment procedure

9.3.5.1 Description

The auto connection establishment procedure allows the Host to configure the Controller to autonomously establish a connection with one or more devices in the directed connectable mode or the undirected connectable mode. This procedure uses the Filter Accept List in the initiator to store the addresses of the devices that can be connected to. The Controller autonomously establishes a connection with a device with the device address that matches the address stored in the Filter Accept List.

9.3.5.2 Conditions

Figure 9.3 shows the flow chart for a device performing the auto connection establishment procedure.

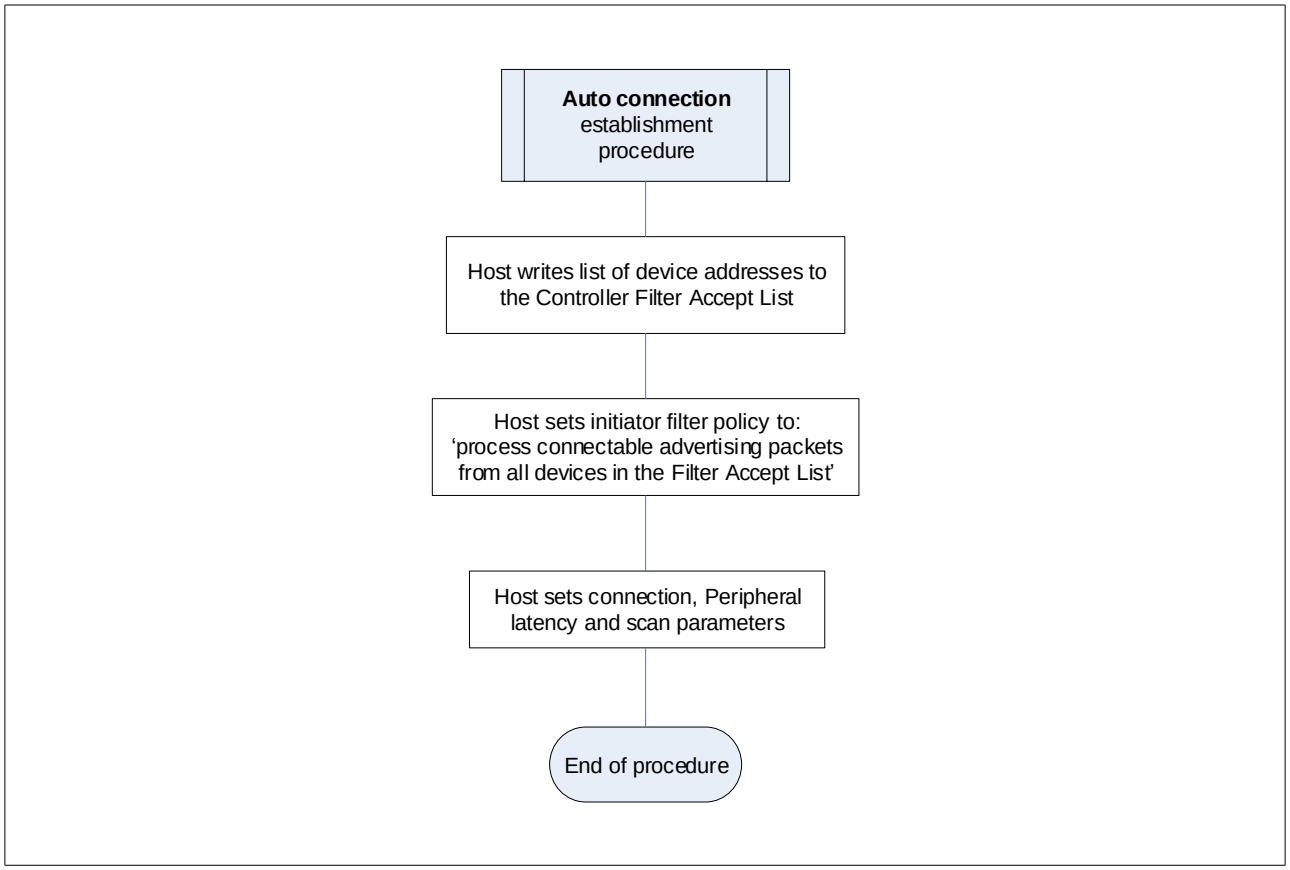

Figure 9.3: Flow chart for a device performing the Auto Connection Establishment procedure

When a Host performs the auto connection establishment procedure, the Host configures the Controller as follows:

1. The Host shall write the list of device addresses that are to be auto connected to into the Filter Accept List.
2. The Host shall set the initiator filter policy to 'process connectable advertising packets from all devices in the Filter Accept List'.
3. The Host should set the scan interval and scan window as defined in Section 9.3.11.
4. The Host should set connection parameters as defined in Section 9.3.12.

This procedure is terminated when a connection is established or when the Host terminates the procedure.

9.3.6 General Connection Establishment procedure

9.3.6.1 Description

The general connection establishment procedure allows the Host to establish a connection with a set of known peer devices in the directed connectable mode or the undirected connectable mode.

9.3.6.2 Conditions

Figure 9.4 shows the flow chart for a device performing the general connection establishment procedure.

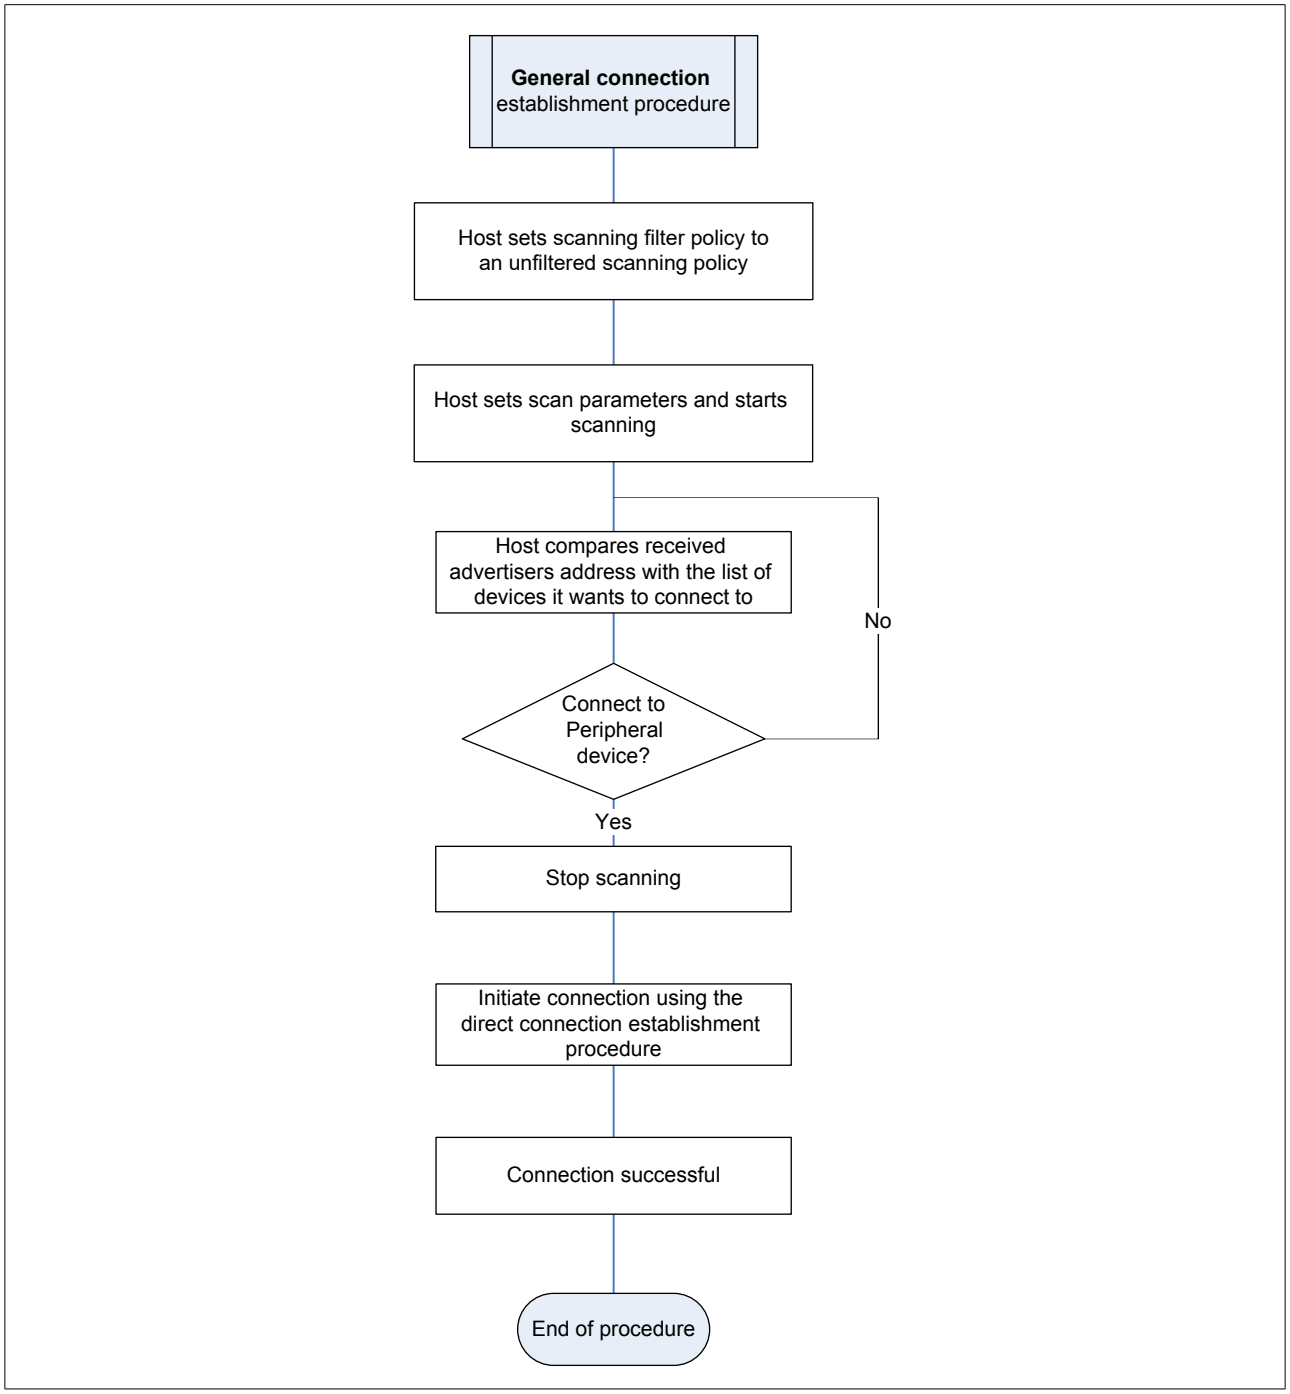

Figure 9.4: Flow chart for a device performing the General Connection Establishment procedure

When a Host performs the general connection establishment procedure, the Host configures the Controller as follows:

1. The Host shall set the scanning filter policy to an unfiltered scanning policy (see [Vol 6] Part B, Section 4.3.3).
2. The Host should set the scan interval as defined in Section 9.3.11.
3. The Host should set the scan window as defined in Section 9.3.11.
4. The Host shall start active scanning or passive scanning.
5. The Host should set connection parameters as defined in Section 9.3.12.

When the Host discovers a device to which the Host may attempt to connect, the Host shall stop the scanning, and initiate a connection using the direct connection establishment procedure.

This procedure is terminated when a connection is established or when the Host terminates the procedure.

9.3.7 Selective Connection Establishment procedure

9.3.7.1 Description

The selective connection establishment procedure allows the Host to establish a connection, using the Host selected connection configuration parameters, with any device whose address is stored in the Filter Accept List.

9.3.7.2 Conditions

Figure 9.5 shows the flow chart for a device performing the selective connection establishment procedure.

When a Host performs the selective connection establishment procedure, the Host configures the Controller as follows:

1. The Host shall write the list of device addresses that are to be selectively connected into the Filter Accept List.
2. The Host shall set the scanning filter policy to a filtered scanning policy (see [Vol 6] Part B, Section 4.3.3).
3. The Host should set the scan interval as defined in Section 9.3.11.
4. The Host should set the scan window as defined in Section 9.3.11.
5. The Host shall start active scanning or passive scanning.

When the Host discovers one of the peer devices it is connecting to, the Host shall stop scanning, and initiate a connection using the direct connection establishment procedure with the connection configuration parameters for that peer device.

This procedure is terminated when a connection is established or when the Host terminates the procedure.

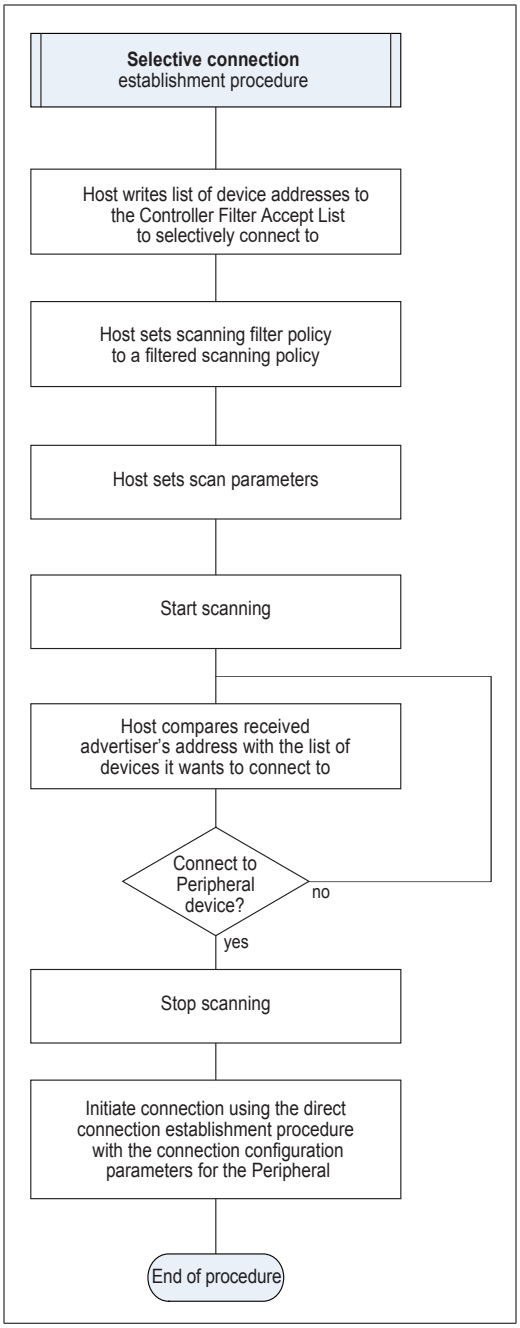

Figure 9.5: Flow chart for a device performing the Selective Connection Establishment procedure

9.3.8 Direct Connection Establishment procedure

9.3.8.1 Description

The direct connection establishment procedure allows the Host to establish a connection with the Host selected connection configuration parameters with a single peer device.

9.3.8.2 Conditions

Figure 9.6 shows the flow chart for a device performing the direct connection establishment procedure.

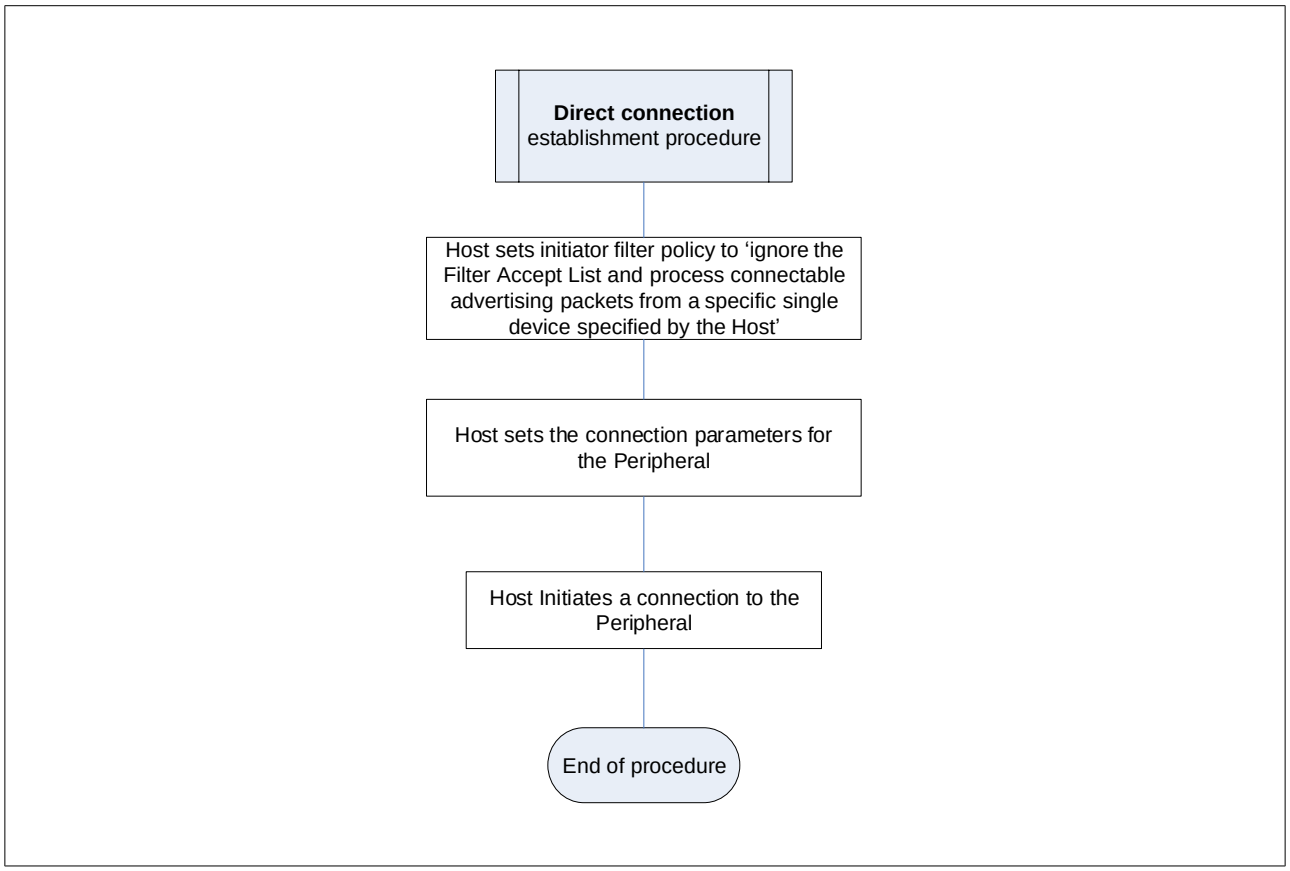

Figure 9.6: Flow chart for a device performing the Direct Connection Establishment procedure

When a Host performs the direct connection establishment procedure, the Host configures the Controller as follows:

1. The Host shall set the initiator filter policy to 'ignore the Filter Accept List and process connectable advertising packets from a specific single device specified by the Host'.
2. The Host shall set the peer address to the device address of the specific single device.

3. The Host should set connection parameters as defined in Section 9.3.12.
4. The Host shall initiate a connection.

This procedure is terminated when a connection is established or when the Host terminates the procedure.

9.3.9 Connection Parameter Update procedure

9.3.9.1 Description

The connection parameter update procedure allows a Peripheral or Central to update the parameters of an established ACL connection.

9.3.9.2 Conditions

A Central initiating the connection parameter update procedure shall use the Link Layer Connection Update procedure defined in [Vol 6] Part B, Section 5.1.1 with the required connection parameters if either the Central or the Peripheral does not support the Connection Parameters Request Link Layer Control procedure.

If both the Central and Peripheral support the Connection Parameters Request Link Layer control procedure, then the Central or Peripheral initiating the connection parameter update procedure should use the Connection Parameters Request Link Layer Control procedure defined in [Vol 6] Part B, Section 5.1.7 with the required connection parameters.

If either the Central or the Peripheral does not support the Connection Parameters Request Link Layer Control procedure, then the Peripheral initiating the connection parameter update procedure shall use the L2CAP_CONNECTION_PARAMETER_UPDATE_REQ command defined in [Vol 3] Part A, Section 4.20 with the required connection parameters. The Peripheral shall not send an L2CAP_CONNECTION_PARAMETER_UPDATE_REQ command within T_{GAP}(conn_param_timeout) of an L2CAP_CONNECTION_PARAMETER_UPDATE_RSP being received. When the Central accepts the Peripheral initiated Connection Parameter Update, the Central should initiate the Link Layer Connection Update procedure defined in [Vol 6] Part B, Section 5.1.1 with the required connection parameters within TGAP(conn_param_timeout).

If the requested or updated connection parameters are unacceptable to the Central or Peripheral then it may disconnect the connection with the error code 0x3B (Unacceptable Connection Parameters). Devices should be tolerant of connection parameters given to them by the remote device.

9.3.10 Terminate Connection procedure

9.3.10.1 Description

The Terminate Connection procedure allows a Host to terminate the connection with a peer device.

9.3.10.2 Conditions

The Host should first terminate any associated CIS(es) prior to terminating the ACL.

The Host initiating the terminate connection procedure shall use the Link Layer ACL Termination procedure defined in [Vol 6] Part B, Section 5.1.6.

9.3.11 Connection Establishment Timing parameters

9.3.11.1 Description

The connection establishment timing parameters are used during initial connection establishment between a Central and a Peripheral.

A Central should use one of the GAP connection establishment procedures to initiate a connection to a Peripheral in a connectable mode. The procedures and modes that may use these timing parameters are defined in Section 9.3.4 to Section 9.3.8.

9.3.11.2 Conditions

A Central starting a user-initiated GAP connection establishment procedure should use the recommended scan interval T_{GAP}(scan_fast_interval) and scan window T_{GAP}(scan_fast_window) for T_{GAP}(scan_fast_period) when scanning on the LE 1M PHY and should use scan interval T_{GAP}(scan_fast_interval_coded) and scan window T_{GAP}(scan_fast_window_coded) for T_{GAP}(scan_fast_period) when scanning on the LE Coded PHY.

A Central that is background scanning (i.e. as part of a GAP connection establishment procedure that is not user-initiated) should use the recommended scan interval T_{GAP}(scan_slow_interval1) and scan window T_{GAP}(scan_slow_window1) when scanning on the LE 1M PHY and should use scan interval T_{GAP}(scan_slow_interval1_coded) and scan window T_{GAP}(scan_slow_window1_coded) when scanning on the LE Coded PHY. Alternatively the Central may use T_{GAP}(scan_slow_interval2) and scan window T_{GAP}(scan_slow_window2) when scanning on the LE 1M PHY and should use T_{GAP}(scan_slow_interval2_coded) and scan window T_{GAP}(scan_slow_window2_coded) when scanning on the LE Coded PHY.

A Peripheral entering any of the following GAP Modes should use the recommended advertising interval T_{GAP}(adv_fast_interval1) for T_{GAP}(adv_fast_period)

when advertising on the LE 1M PHY and should use T_{GAP}(adv_fast_interval1_coded) for T_{GAP}(adv_fast_period) when advertising on the LE Coded PHY:

- Undirected Connectable Mode
- Limited Discoverable Mode and sending connectable undirected advertising events
- General Discoverable Mode and sending connectable undirected advertising events
- Directed Connectable Mode and sending low duty cycle connectable directed advertising events

A Peripheral when entering any of the following GAP Modes and sending non-connectable advertising events should use the recommended advertising interval T_{GAP}(adv_fast_interval2) for T_{GAP}(adv_fast_period) when advertising on the LE 1M PHY and should use T_{GAP}(adv_fast_interval2_coded) for T_{GAP}(adv_fast_period) when advertising on the LE Coded PHY:

- Non-Discoverable Mode
- Non-Connectable Mode
- Limited Discoverable Mode
- General Discoverable Mode

A Peripheral that is background advertising in any GAP Mode other than GAP Directed Connectable Mode with high duty cycle connectable directed advertising events should use the recommended advertising interval T_{GAP} (adv_slow_interval) when advertising on the LE 1M PHY and should use T_{GAP} (adv_slow_interval_coded) when advertising on the LE Coded PHY.

Note: When advertising interval values of less than 100 ms are used for non-connectable or scannable undirected advertising in environments where the advertiser can interfere with other devices, it is recommended that steps be taken to minimize the interference. For example, the advertising might be alternately enabled for only a few seconds and disabled for several minutes.

9.3.12 Connection interval timing parameters

9.3.12.1 Description

The connection interval timing parameters are used within a connection. Initial connection interval is used to ensure procedures such as bonding, encryption setup and service discovery are completed quickly. The connection interval should be changed to the value in the Peripheral Preferred Connection Parameters characteristic after initiating procedures are complete.

9.3.12.2 Conditions

The Central should either read the Peripheral Preferred Connection Parameters characteristic (see Section 12.3) or retrieve the parameters from advertising data (see Section 12.3).

The connection interval should be set to T_{GAP}(initial_conn_interval) when establishing a connection on the LE 1M PHY and to T_{GAP}(initial_conn_interval_coded) when establishing a connection on the LE Coded PHY and *connPeripheralLatency* should be set to zero. These parameters should be used until the Central has no further pending actions to perform or until the Peripheral performs a Connection Parameter Update procedure (see Section 9.3.9).

After the Central has no further pending actions to perform and the Peripheral has not initiated any other actions within T_{GAP}(conn_pause_central), then the Central should invoke the Connection Parameter Update procedure (see Section 9.3.9) and change the connection interval to that specified in the Peripheral Preferred Connection Parameters characteristic.

If the Central has not read the Peripheral Preferred Connection Parameters characteristic, then the Central may choose the connection parameters to be used.

After the Peripheral has no further pending actions to perform and the Central has not initiated any other actions within T_{GAP}(conn_pause_central), then the Peripheral may perform a Connection Parameter Update procedure (see Section 9.3.9). The Peripheral should not perform a Connection Parameter Update procedure within T_{GAP}(conn_pause_peripheral) after establishing a connection.

At any time a key refresh or encryption setup procedure is required and the current connection interval is greater than T_{GAP}(initial_conn_interval) when connected on the LE 1M PHY or LE 2M PHY or greater than T_{GAP}(initial_conn_interval_coded) when connected on the LE Coded PHY, the key refresh or encryption setup procedure should be preceded with a Connection Parameter Update procedure (see Section 9.3.9). The connection interval should be set to T_{GAP}(initial_conn_interval) when connected on the LE 1M PHY or the LE 2M PHY and T_{GAP}(initial_conn_interval_coded) when connected on the LE Coded PHY, *connSubrateFactor* should be set to 1, and *connPeripheralLatency* should be set to zero. This fast connection interval should be maintained until the key refresh or encryption setup procedure is complete. It should then switch to the value in the Peripheral Preferred Connection Parameters characteristic.

9.3.13 Connected Isochronous Stream Central Establishment procedure

9.3.13.1 Description

The Connected Isochronous Stream Central Establishment procedure allows the Host of a Central to establish a CIS with a Peripheral using the Host selected parameters.

9.3.13.2 Conditions

When two devices are connected, a Central may establish one or more CISes with a Peripheral. A CIS is established by the Central using the Connected Isochronous Stream Creation procedure (see [Vol 6] Part B, Section 5.1.15). The Central and or Peripheral may send isochronous data over the established CIS.

9.3.14 Connected Isochronous Stream Peripheral Establishment procedure

9.3.14.1 Description

The Connected Isochronous Stream Peripheral Establishment procedure allows the Host of the Peripheral to accept or reject the request from a Central to establish a CIS.

9.3.14.2 Conditions

When two devices are connected, the Peripheral may receive a request from the Central to establish a CIS. Once the request is received, the Host in the Peripheral shall either accept or reject the request. If it accepts the request, the CIS can be established using the Connected Isochronous Stream Creation procedure defined in [Vol 6] Part B, Section 5.1.15.

9.3.15 Connected Isochronous Stream Terminate procedure

9.3.15.1 Description

The Connected Isochronous Stream Terminate procedure allows a Host to terminate a CIS with a peer device. The CIS shall also be terminated when the ACL between the Central and Peripheral is terminated, using the Terminate Connection procedure (Section 9.3.10).

9.3.15.2 Conditions

The Host initiating the Connected Isochronous Stream Terminate procedure shall use the Connected Isochronous Stream Termination control procedure defined in [Vol 6] Part B, Section 5.1.16.

9.3.16 Connection Subrate procedure

9.3.16.1 Description

The Connection Subrate procedure allows a Peripheral or Central to modify the connection subrating and other connection parameters of an established ACL connection.

9.3.16.2 Conditions

The Central initiating this procedure shall use the Link Layer Connection Subrate Update procedure defined in [Vol 6] Part B, Section 5.1.19 and the Peripheral initiating this procedure shall use the Connection Subrate Request procedure defined in [Vol 6] Part B, Section 5.1.20.

If the requested subrate connection parameters are unacceptable to the Central then it may reject them. If the updated subrate connection parameters are unacceptable to the Peripheral it cannot reject them but may follow up by using the Connection Parameter Request procedure (see [Vol 6] Part B, Section 5.1.7) or the Connection Subrate Request procedure (see [Vol 6] Part B, Section 5.1.20) to change them. Devices should be tolerant of the connection parameters requested by the peer device.

9.3.17 Periodic Advertising Connection procedure

9.3.17.1 Definition

The periodic advertising connection procedure provides a method for a periodic advertiser to initiate a Link Layer connection with a synchronized device.

9.3.17.2 Conditions

A device performing the periodic advertising connection procedure shall initiate the Link Layer connection procedure using periodic advertising trains with responses (see [Vol 6] Part B, Section 4.4.2.12.2).

9.4 Bonding modes and procedures

Bonding allows two connected devices to exchange and store security and identity information to create a trusted relationship. The security and identity information as defined in [Vol 3] Part H, Section 2.4.1 is also known as the bonding information. When the devices store the bonding information, it is known as the phrases ‘devices have bonded’ or ‘a bond is created’.

There are two modes for bonding, non-bondable mode and bondable mode. Bonding may only occur between two devices in bondable mode. The requirements for a device to support the bonding modes and procedure are defined in Table 9.4.

9.4.1 Requirements

Bonding	Ref.	Peripheral	Central	Broadcaster	Observer
Non-Bondable mode	9.4.2	M	M	E	E
Bondable mode	9.4.3	O	O	E	E
Bonding procedure	9.4.4	C.1	C.1	E	E
C.1: Mandatory if Bondable mode is supported, otherwise Excluded.					

Table 9.4: Bonding requirements

9.4.2 Non-bondable mode

9.4.2.1 Description

A device in the non-bondable mode does not allow a bond to be created with a peer device.

9.4.2.2 Conditions

If a device does not support pairing as defined in the Security Manager section then it is considered to be in non-bondable mode.

If Security Manager pairing is supported, the Host shall set the Bonding_Flags to ‘No Bonding’ as defined in [Vol 3] Part H, Section 3.5.1 and bonding information shall not be exchanged or stored.

9.4.3 Bondable mode

9.4.3.1 Description

A device in the bondable mode allows a bond to be created with a peer device in the bondable mode.

9.4.3.2 Conditions

The Host shall set the Bonding_Flags to ‘Bonding’ as defined in [Vol 3] Part H, Section 3.5.1 during the pairing procedure.

9.4.4 Bonding procedure

9.4.4.1 Description

The bonding procedure may be performed when a non-bonded device tries to access a service that requires bonding. The bonding procedure may be performed for the purpose of creating a bond between two devices.

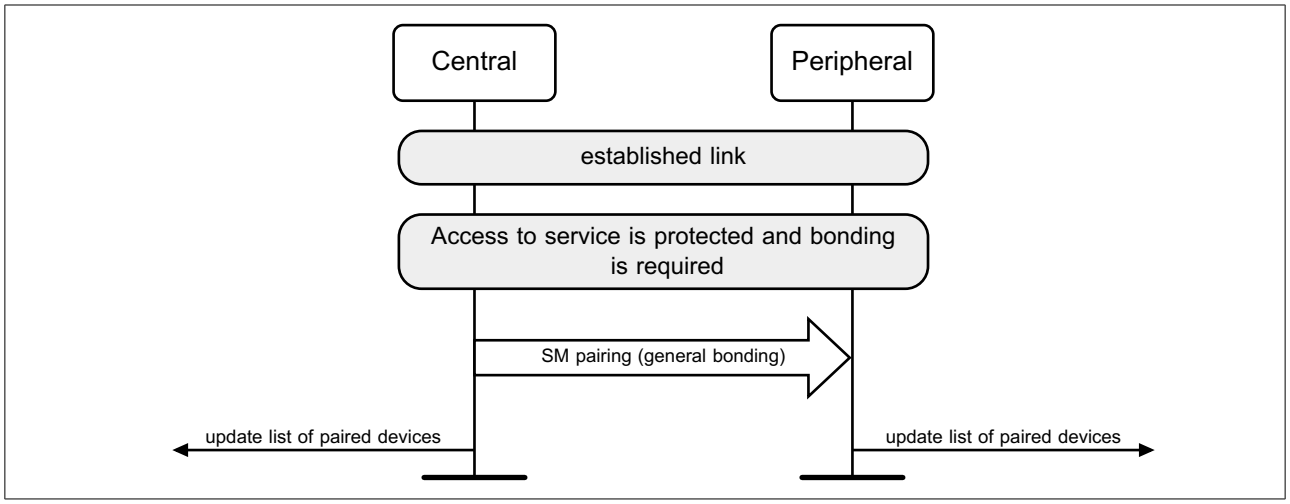

Figure 9.7: Bonding requirements

9.4.4.2 Conditions

The Central shall be in the bondable mode and shall initiate the pairing process as defined in Section 2.1. If the Peripheral is in the bondable mode, the devices shall exchange and store the bonding information in the security database.

If a device supports the generation of resolvable private addresses as defined in Section 10.8.2.2 and generates a resolvable private address for its local address, it shall send Identity Information with SMP, including a valid IRK. If a device does not generate a resolvable private address for its own address and the Host sends Identity Information with SMP, the Host shall send an all-zero IRK. If a device supports resolving resolvable private addresses as defined in Section 10.8.2.3, it shall request the peer device to send its Identity Information with SMP. The Host can abort the pairing procedure if the authentication requirements are not sufficient to distribute the IRK.

9.5 Periodic advertising modes and procedure

The periodic advertising modes and procedure allow two or more devices to communicate in a connectionless manner using extended advertising events and periodic advertising events. These modes and procedures can also make use of existing connections. The requirements for a device operating in a specific GAP role to support these modes and procedures are defined in Table 9.5.

Mode and Procedures	Ref.	Broadcaster	Observer	Peripheral	Central
Periodic Advertising Synchronizability mode	9.5.1	O	E	E	E
Periodic Advertising mode	9.5.2	C.1	E	E	E

Mode and Procedures	Ref.	Broadcaster	Observer	Peripheral	Central
Periodic Advertising Synchronization Establishment procedure	9.5.3	E	O	O	O
Periodic Advertising Synchronization Transfer procedure	9.5.4	E	E	C.2	C.2

C.1: Mandatory if Periodic Advertising Synchronizability mode is supported, otherwise excluded.

C.2: Optional if Periodic Advertising Mode is supported or the Periodic Advertising Synchronization Establishment procedure is supported, otherwise excluded.

Table 9.5: Periodic advertising modes and periodic advertising procedure requirements

9.5.1 Periodic Advertising Synchronizability mode

9.5.1.1 Definition

The periodic advertising synchronizability mode provides a method for a device to send synchronization information about a periodic advertising train (with or without responses) using advertisements.

9.5.1.2 Conditions

A device in the periodic advertising synchronizability mode shall send synchronization information for a periodic advertising train (with or without responses) in non-connectable and non-scannable extended advertising events. The advertising interval used is unrelated to the interval between the periodic advertising events.

A device shall not be in periodic advertising synchronizability mode unless it is also in periodic advertising mode. It may leave, and possibly re-enter, periodic advertising synchronizability mode while remaining in periodic advertising mode.

9.5.2 Periodic Advertising mode

9.5.2.1 Definition

On periodic advertising trains without responses, the periodic advertising mode provides a method for a device to send advertising data at periodic and deterministic intervals. On periodic advertising trains with responses, a device may send advertising data in one or more subevents to synchronized devices who may also send data back to the device.

9.5.2.2 Conditions

A device in the periodic advertising mode shall send periodic advertising events at the interval and using the frequency hopping sequence specified in the periodic advertising

synchronization information. On periodic advertising trains with responses, the interval may be divided into subevents. During a subevent, a synchronized device may send data back to the device in response slots.

A device entering periodic advertising mode shall also enter periodic advertising synchronizability mode for at least long enough to complete one extended advertising event (see [Vol 6] Part B, Section 4.4.2.12).

9.5.3 Periodic Advertising Synchronization Establishment procedure

9.5.3.1 Definition

The periodic advertising synchronization establishment procedure provides a method for a device to receive periodic advertising synchronization information and to synchronize to a periodic advertising train.

9.5.3.2 Conditions

A device performing the periodic advertising synchronization establishment procedure shall scan for non-connectable and non-scannable advertising events containing synchronization information about a periodic advertising train or shall accept periodic advertising synchronization information over an existing connection by taking part in the Link Layer Periodic Advertising Sync Transfer procedure defined in [Vol 6] Part B, Section 5.1.13. When a device receives synchronization information for a periodic advertising train, it may listen for periodic advertising events at the intervals and using the frequency hopping sequence specified in the periodic advertising synchronization information. If a device receives synchronization information about periodic advertising with responses, it may listen to one or more subevents in the interval and may send data to the periodic advertiser.

9.5.4 Periodic Advertising Synchronization Transfer procedure

9.5.4.1 Definition

The periodic advertising synchronization transfer procedure provides a method for a device to send synchronization information about a periodic advertising train over an existing connection.

9.5.4.2 Conditions

A device performing the periodic advertising synchronization transfer procedure shall initiate the Link Layer Periodic Advertising Sync Transfer procedure defined in [Vol 6] Part B, Section 5.1.13.

9.5.5 [This section is no longer used]

The Periodic Advertising Connection procedure is described in Section 9.3.17.

9.6 Isochronous Broadcast modes and procedures

The Isochronous Broadcast modes and procedures allow two or more devices to communicate in a unidirectional, connectionless manner by using extended advertising events, periodic advertising events, and BIG and BIS events. The requirements for a device that operates in a specific GAP role to support these modes and procedures are defined in Table 9.6.

Modes and Procedures	Ref.	Peripheral	Central	Broadcaster	Observer
Broadcast Isochronous Synchronizability mode	9.6.1	E	E	C.1	E
Broadcast Isochronous Broadcasting mode	9.6.2	E	E	O	E
Broadcast Isochronous Synchronization Establishment procedure	9.6.3	E	E	E	O
Broadcast Isochronous Channel Map Update procedure	9.6.4	E	E	C.1	C.2
Broadcast Isochronous Terminate procedure	9.6.5	E	E	C.1	C.2
C.1: Mandatory if Broadcast Isochronous Broadcasting mode is supported, otherwise excluded.					
C.2: Mandatory if Broadcast Isochronous Synchronization Establishment procedure is supported, otherwise excluded.					

Table 9.6: Isochronous Broadcast modes and procedure requirements

9.6.1 Broadcast Isochronous Synchronizability mode

9.6.1.1 Definition

The Broadcast Isochronous Synchronizability mode provides a method for a device to transmit the synchronization information of a BIG.

9.6.1.2 Conditions

A device shall also be in the Broadcast Isochronous Broadcasting mode while it is in the Broadcast Isochronous Synchronizability mode. A device in the Broadcast Isochronous Synchronizability mode shall send the BIGInfo in the ACAD field which is located in the AUX_SYNC_IND PDU of periodic advertisement ([Vol 6] Part B, Section 2.3.4.8).

9.6.2 Broadcast Isochronous Broadcasting mode

9.6.2.1 Definition

The Broadcast Isochronous Broadcasting mode provides a method for a device in the Broadcaster role to send encrypted or unencrypted Broadcast Isochronous PDUs in subevents of BISes of a BIG ([Vol 6] Part B, Section 4.4.6).

9.6.2.2 Conditions

A device in the Broadcast Isochronous Broadcasting mode shall send isochronous PDUs in subevents of BISes of a BIG ([Vol 6] Part B, Section 4.4.6).

9.6.3 Broadcast Isochronous Synchronization Establishment procedure

9.6.3.1 Definition

The Broadcast Isochronous Synchronization Establishment procedure provides a way for a device to synchronize to a BIS.

9.6.3.2 Conditions

A device that performs the Broadcast Isochronous Synchronization Establishment procedure shall first perform the Periodic Advertising Synchronization Establishment procedure (Section 9.5.3) and receive the synchronization information. The synchronization information is used to synchronize to the required BIS in the BIG ([Vol 6] Part B, Section 4.4.6).

9.6.4 Broadcast Isochronous Channel Map Update procedure

9.6.4.1 Definition

The Broadcast Isochronous Channel Map Update procedure allows a Broadcaster to use and transmit a new channel map of a BIG, or an Observer to receive and use a new channel map for a BIG.

9.6.4.2 Conditions

In this procedure, the Broadcaster sends the channel map command in the BIG events ([Vol 6] Part B, Section 4.4.6.4). When an Observer receives a channel map message, it uses the new channel when receiving data from the BIG.

9.6.5 Broadcast Isochronous Terminate procedure

9.6.5.1 Definition

The Broadcast Isochronous Terminate procedure allows a Host of a Broadcaster to terminate a BIG, or the Host of an Observer to terminate synchronization with a BIG.

9.6.5.2 Conditions

The Host initiating the Broadcast Isochronous Stream Terminate procedure shall use the Broadcast Isochronous Stream Termination control procedure defined in [Vol 6] Part B, Section 5.6.2.

9.7 Channel Sounding procedures

The Channel Sounding procedures allow two devices to exchange information that may be used for distance approximation between the two. During this exchange, each device must select the alternate procedure type.

Channel Sounding Procedures	Ref.	Peripheral	Central	Broadcaster	Observer
CS initiator procedure	9.7.1	O	O	E	E
CS reflector procedure	9.7.2	O	O	E	E

Table 9.7: Channel Sounding procedure requirements

9.7.1 Channel Sounding initiator procedure

9.7.1.1 Description

The CS initiator procedure allows a Peripheral or Central to initiate a CS procedure.

9.7.1.2 Conditions

If the CS initiator role is supported by the Controller, then the Host may enable the initiator role by commanding the Controller to set the initiator role flag in the Configuration Exchange procedure as described in [Vol 6] Part B, Section 5.1.25.

If both the Central and Peripheral support the CS procedure, then the Central or Peripheral initiating the CS procedure shall do so in the manner described in [Vol 6] Part B, Section 5.1.26.

9.7.2 Channel Sounding reflector procedure

9.7.2.1 Description

The CS reflector procedure allows a Peripheral or Central to respond to a CS initiator procedure.

9.7.2.2 Conditions

If the CS reflector role is supported by the Controller, then the Host may enable the reflector role by commanding the Controller to set the Responder Role flag in the Configuration Exchange procedure as described in [Vol 6] Part B, Section 5.1.25.

The Central or Peripheral responding to the CS procedure shall do so in the manner described in [Vol 6] Part B, Section 5.1.26.

10 SECURITY ASPECTS – LE PHYSICAL TRANSPORT

This section defines the modes and procedures that relate to the security of either an ACL connection or broadcast. The modes and procedures that relate to the security of a CIS shall be the same as that used in its associated ACL. The following modes and procedures are defined:

- LE security mode 1
- LE security mode 2
- LE security mode 3
- Authentication procedure
- Authorization procedure
- Connection data signing procedure
- Authenticate signed data procedure
- Encrypted Advertising Data procedure

Requirements for a device to support the LE security modes and procedures is shown in Table 10.1.

10.1 Requirements

Security Modes and Procedures	Ref.	Broadcaster	Observer	Peripheral	Central
LE Security mode 1	10.2.1	E	E	O	O
LE Security mode 2	10.2.2	E	E	O	O
LE Security mode 3	10.2.5	O	O	E	E
Authentication procedure	10.3	E	E	O	O
Authorization procedure	10.5	E	E	O	O
Connection data signing procedure	10.4.1	E	E	O	O
Authenticate signed data procedure	10.4.2	E	E	O	O
Encrypted Advertising Data procedure	10.10	O	O	O	O

Table 10.1: Requirements related to security modes and procedures

10.2 LE security modes

The security requirements of a device, a service or a service request are expressed in terms of a security mode and security level. Each service or service request may have its own security requirement. The device may also have a security requirement.

There are three LE security modes, LE security mode 1, LE security mode 2, and LE security mode 3.

10.2.1 LE security mode 1

LE security mode 1 has the following security levels:

1. No security (No authentication and no encryption)
2. Unauthenticated pairing with encryption
3. Authenticated pairing with encryption
4. Authenticated LE Secure Connections pairing with encryption using a 128-bit strength encryption key.

For certain services that require LE security mode 1, levels 2 or 3, a device may enforce the use of LE Secure Connections pairing before those services can be used.

A connection operating in LE security mode 1 level 2 shall also satisfy the security requirements for LE security mode 1 level 1.

A connection operating in LE security mode 1 level 3 shall also satisfy the security requirements for LE security mode 1 level 2 or LE security mode 1 level 1.

A connection operating in LE security mode 1 level 3 shall also satisfy the security requirements for LE security mode 2.

A connection operating in LE security mode 1 level 4 shall also satisfy the security requirements for LE security mode 1 level 3 or LE security mode 1 level 2 or LE security mode 1 level 1.

A connection operating in LE security mode 1 level 4 shall also satisfy the security requirements for LE security mode 2.

10.2.2 LE security mode 2

LE security mode 2 has two security levels:

1. Unauthenticated pairing with data signing
2. Authenticated pairing with data signing

LE security mode 2 shall only be used for connection based data signing.

Data signing as defined in Section 10.4 shall not be used when a connection is operating in LE security mode 1 level 2, LE security mode 1 level 3, or LE security mode 1 level 4.

10.2.3 Mixed security modes requirements

If there are requirements for both LE security mode 1 and LE security mode 2 level 2 for a given physical link then LE security mode 1 level 3 shall be used.

If there are requirements for both LE security mode 1 level 3 and LE security mode 2 for a given physical link then LE security mode 1 level 3 shall be used.

If there are requirements for both LE security mode 1 level 2 and LE security mode 2 level 1 for a given physical link then LE security mode 1 level 2 shall be used.

If there are requirements for both LE security mode 1 level 4 and any other security mode or level for a given physical link then LE security mode 1 level 4 shall be used.

10.2.4 Secure Connections Only mode

A device may be in a Secure Connections Only mode. When in Secure Connections Only mode only security mode 1 level 4 shall be used except for services that only require security mode 1 level 1.

The device shall only accept new outgoing and incoming service level connections for services that require Security Mode 1, Level 4 when the remote device supports LE Secure Connections and authenticated pairing is used.

10.2.5 LE security mode 3

LE security mode 3 has three security levels:

1. No security (no authentication and no encryption)
2. Use of unauthenticated Broadcast_Code
3. Use of authenticated Broadcast_Code

LE security mode 3 shall be used to broadcast a Broadcast Isochronous Group (BIG) in an Isochronous Broadcaster or receive a BIS in a Synchronized Receiver.

A device operating in security mode 3 level 1 shall require that the isochronous data is unencrypted.

A device that operates in LE security mode 3 level 2 shall require a Broadcast_Code to encrypt the data that is transmitted in a BIS.

A device that operates in LE security mode 3 level 3 shall require a Broadcast_Code to encrypt the data that is transmitted in a BIS. If the device has not received a Broadcast_Code using an authenticated method when the service requires Level 3 security and has a user interface capable of doing so, then the device shall indicate an appropriate error to the user (e.g., Insufficient Security for Broadcast_Code).

10.3 Authentication procedure

The authentication procedure describes how the required security is established when a device initiates a service request to a remote device and when a device receives a service request from a remote device. The authentication procedure covers LE security mode 1. The authentication procedure shall only be initiated after a connection has been established.

LE security mode 2 pertains to the use of data signing and is covered in Section 10.4.

Authentication in LE security mode 1 is achieved by enabling encryption as defined in Section 10.6. The security of the encryption is impacted by the type of pairing performed. There are two types of pairing: authenticated pairing or unauthenticated pairing. Authenticated pairing involves performing the pairing procedure defined in [Vol 3] Part H, Section 2.1 with the authentication set to ‘MITM protection’. Unauthenticated pairing involves performing the pairing procedure with authentication set to ‘No MITM protection’.

Note: In this section, the terms “authenticated pairing” and “unauthenticated pairing” refer to the security method used to perform pairing and are not related to the authentication of previously bonded devices during a reconnection.

Section 10.3.1 specifies the authentication procedure when a device responds to a service request. Section 10.3.2 specifies the authentication procedure when a device initiates a service request.

10.3.1 Responding to a service request

In this section the local device is the device responding to a service request made by a remote device. In the L2CAP protocol the local device responds with a connection response to a remote device making a connection request. In GATT, the local device is the GATT Server and the remote device is the GATT Client.

When a local device receives a service request from a remote device, it shall respond with an error code if the service request is denied. The error code is dependent on whether the current connection is encrypted or not and on the type of pairing that was performed to create the LTK or STK to be used.

When a local device receives a service request from a remote device it shall behave according to the following rules:

- The local device's security database specifies the security settings required to accept a service request. If no encryption and no data signing are required, the service request shall be accepted. If encryption is required the local device shall send an error code as defined in Table 10.2. If no encryption is required, but data signing is required, then the local device behavior is as defined in Section 10.4.
- If neither an LTK nor an STK is available, the service request shall be rejected with the error code "Insufficient Authentication".

  Note: When the link is not encrypted, the error code "Insufficient Authentication" does not indicate that MITM protection is required.
- If an LTK or an STK is available and encryption is required (LE security mode 1) but encryption is not enabled, the service request shall be rejected with the error code "Insufficient Encryption". If the encryption is enabled with a key size that is too short then the service request shall be rejected with the error code "Encryption Key Size Too Short."
- If an authenticated pairing is required but only an unauthenticated pairing has occurred and the link is currently encrypted, the service request shall be rejected with the error code "Insufficient Authentication."

  Note: When unauthenticated pairing has occurred and the link is currently encrypted, the error code "Insufficient Authentication" indicates that MITM protection is required.
- If LE Secure Connections pairing is required but LE legacy pairing has occurred and the link is currently encrypted, the service request shall be rejected with the error code "Insufficient Authentication".

The local device will respond with the minimum security level required for access to its services. If the local device has no security requirement it should default to the minimum security level that the local device is capable of as defined in pairing phase 1, (see [Vol 3] Part H, Section 2.1).

A local device shall not require an authenticated pairing (MITM) if the local device does not support the required IO capabilities or OOB data[1].

The local device responds to a service request from a remote device are summarized in Table 10.2.

[1]If an OOB mechanism is used, the level of MITM protection is dependent upon the properties of the OOB communications channel. See [Vol 3] Part H, Section 2.3.5.1 for more information

Link Encryption State	Local Device's Access Requirement for Service	Local Device Pairing Status			
		No LTK **No STK**	**Unauthenticated LTK (with or without LE Secure Connections) or Unauthenticated STK**	**Authenticated LTK without LE Secure Connections or Authenticated STK**	**Authenticated LTK with Secure Connections**
Unencrypted	**None**	Request succeeds	Request succeeds	Request succeeds	Request succeeds
	Encryption, No MITM Protection	Error Resp.: Insufficient Authentication	Error Resp.: Insufficient Encryption	Error Resp.: Insufficient Encryption	Error Resp.: Insufficient Encryption
	Encryption, MITM Protection	Error Resp.: Insufficient Authentication	Error Resp.: Insufficient Encryption	Error Resp.: Insufficient Encryption	Error Resp.: Insufficient Encryption
	Encryption, MITM Protection, Secure Connections	Error Resp.: Insufficient Authentication	Error Resp.: Insufficient Encryption	Error Resp.: Insufficient Encryption	Error Resp.: Insufficient Encryption
Encrypted	**None**	N/A (Not possible to be encrypted without LTK)	Request succeeds	Request succeeds	Request succeeds
	Encryption, No MITM Protection		Request succeeds	Request succeeds	Request succeeds
	Encryption, MITM Protection		Error Resp.: Insufficient Authentication	Request succeeds	Request succeeds
	Encryption, MITM Protection, Secure Connections		Error Resp.: Insufficient Authentication	Error Resp.: Insufficient Authentication	Request succeeds

Table 10.2: Local device responds to a service request

Figure 10.1 shows how a server handles a service request.

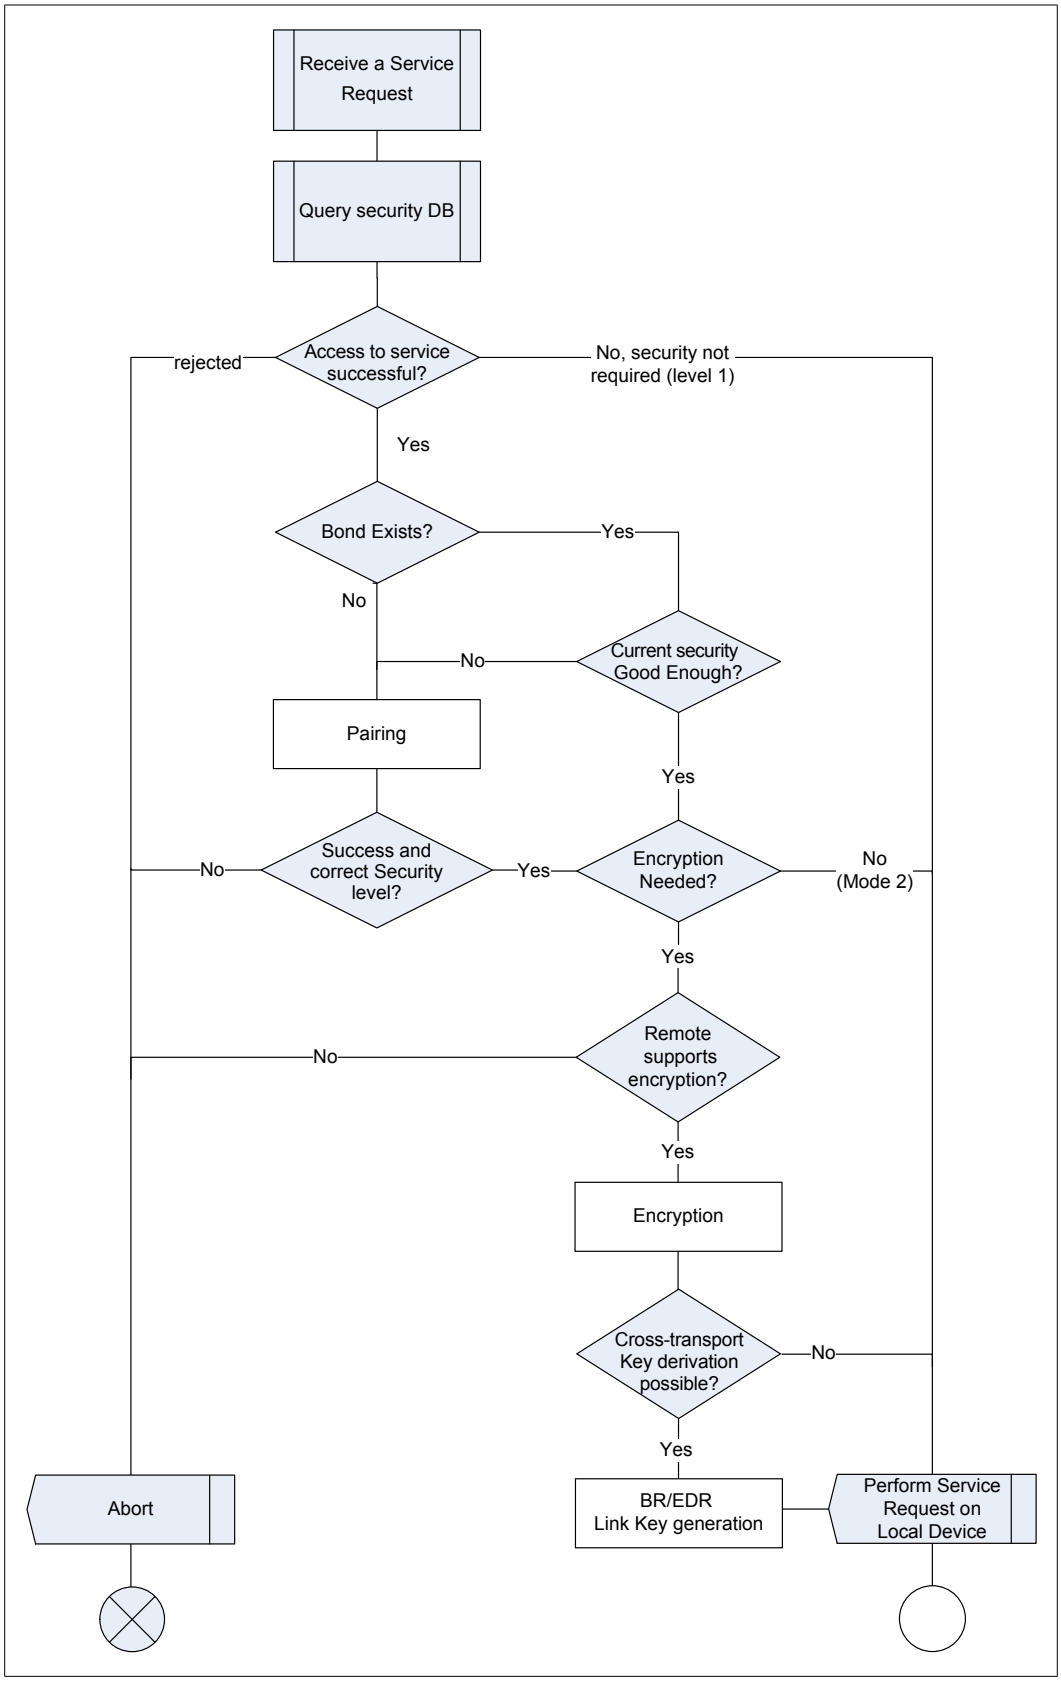

Figure 10.1: Flow chart for a local device handling a service request from a remote device

10.3.1.1 Handling of GATT indications and notifications

A client “requests” a server to send indications and notifications by appropriately configuring the server via a Client Characteristic Configuration Descriptor. Since the configuration is persistent across a disconnection and reconnection, the security requirements for the connection shall be checked against the configuration upon a reconnection before sending indications or notifications. When a server reconnects to a client to send an indication or notification for which a specific level of security for the connection is required, the server shall initiate or request encryption with the client prior to sending an indication or notification. If the client does not have an LTK, indicating that the client has lost the bond, enabling encryption will fail.

10.3.1.2 Cross-transport key generation

After encryption is enabled, the correct security level has been achieved, and both devices support cross-transport key generation, the both devices may perform BR/EDR link key derivation.

Note: If the LTK has an encryption key size that is shorter than 16 octets (128 bits), the BR/EDR link key is derived before the LTK gets masked.

10.3.2 Initiating a service request

In this section the local device is the device initiating a service request to a remote device. In the L2CAP protocol the local device sends the connection request and the remote device sends the connection response. In GATT, the local device is the GATT Client and the remote device is the GATT Server.

When a local device initiates a service request to a remote device it shall behave according to the following rules:

- The local device’s security database specifies the security required to initiate a service request. If no encryption is required by the local device then the service request may proceed without encryption or pairing.
- If an LTK is not available but encryption is required, the pairing procedure shall be initiated with the local device’s required authentication settings. If the pairing procedure fails then the service request shall be aborted.

  Note: When encryption is not enabled, the error code “Insufficient Authentication” does not indicate to the local device that MITM protection is required.

  Note: If the local device is a Peripheral then it may send a Peripheral Initiated Security Request as defined in [Vol 3] Part H, Section 2.4.6.

- If pairing has occurred but the encryption key size is insufficient the pairing procedure shall be executed with the required encryption key size. If the pairing procedure fails then the service request shall be aborted.
- If an LTK is available and encryption is required (LE security mode 1) then encryption shall be enabled before the service request proceeds as defined in Section 10.6. Once encryption is enabled the service request shall proceed. If encryption fails, then either the bond no longer exists on the remote device or the wrong device has been connected. If the local device does not abandon the service request, it shall trigger a user interaction to confirm the remote device and then re-bond, perform service discovery, and reconfigure the remote device (reconfiguring the remote device can involve actions such as re-enabling indications and notifications on the relevant characteristics). If the local device had previously determined that the remote device did not have the «Service Changed» characteristic, or if the local device determines by reading the «Database Hash» characteristic that the database has not changed, then service discovery may be skipped.
- If an authenticated pairing is required but only an unauthenticated pairing has occurred and the link is currently encrypted, the pairing procedure shall be executed with the required authentication settings. If the pairing procedure fails or an authenticated pairing cannot be performed with the IO capabilities of the local device and remote device, then the service request shall be aborted.

  When a bond has been created between two devices, any reconnection should result in the local device enabling or requesting encryption with the remote device before initiating any service request.

  If a local device does not enable encryption before initiating a service request and relies on the error codes to determine the security requirements, the local device shall not request pairing with MITM protection in response to receiving an “Insufficient Authentication” error code from the remote device while the link is unencrypted. The local device shall only set the MITM protection required flag if the local device itself requires MITM protection.
- If encryption is not enabled at the time of the service request, the error code “Insufficient Authentication” is received, and the local device currently has an LTK, then the encryption procedure should be started (see Section 10.6). If this fails (likely indicating that the remote device has lost the bond and no longer has the LTK) or the local device does not have the correct LTK, then it should re-pair. If it re-pairs, it shall trigger a user interaction to confirm the remote device before starting the pairing procedure. IO capabilities are exchanged in pairing phase 1, (see [Vol 3] Part H, Section 2.1) and the security level shall be determined by the devices’ IO capabilities and MITM requirements.
- If encryption is not enabled at the time of the service request, the error code “Insufficient Encryption” is received, and the local device currently has an LTK, then the encryption procedure shall be started (see Section 10.6). If starting encryption

fails (likely indicating that the remote device has lost the bond and no longer has the LTK) or the local device does not have the correct LTK, then it should re-pair. If it re-pairs, it shall trigger a user interaction to confirm the remote device before starting the pairing procedure.

- If LE Secure Connections authenticated pairing is required but the remote device does not support LE Secure Connections, then the service request shall be aborted.

Figure 10.2 shows how a client issues a service request.

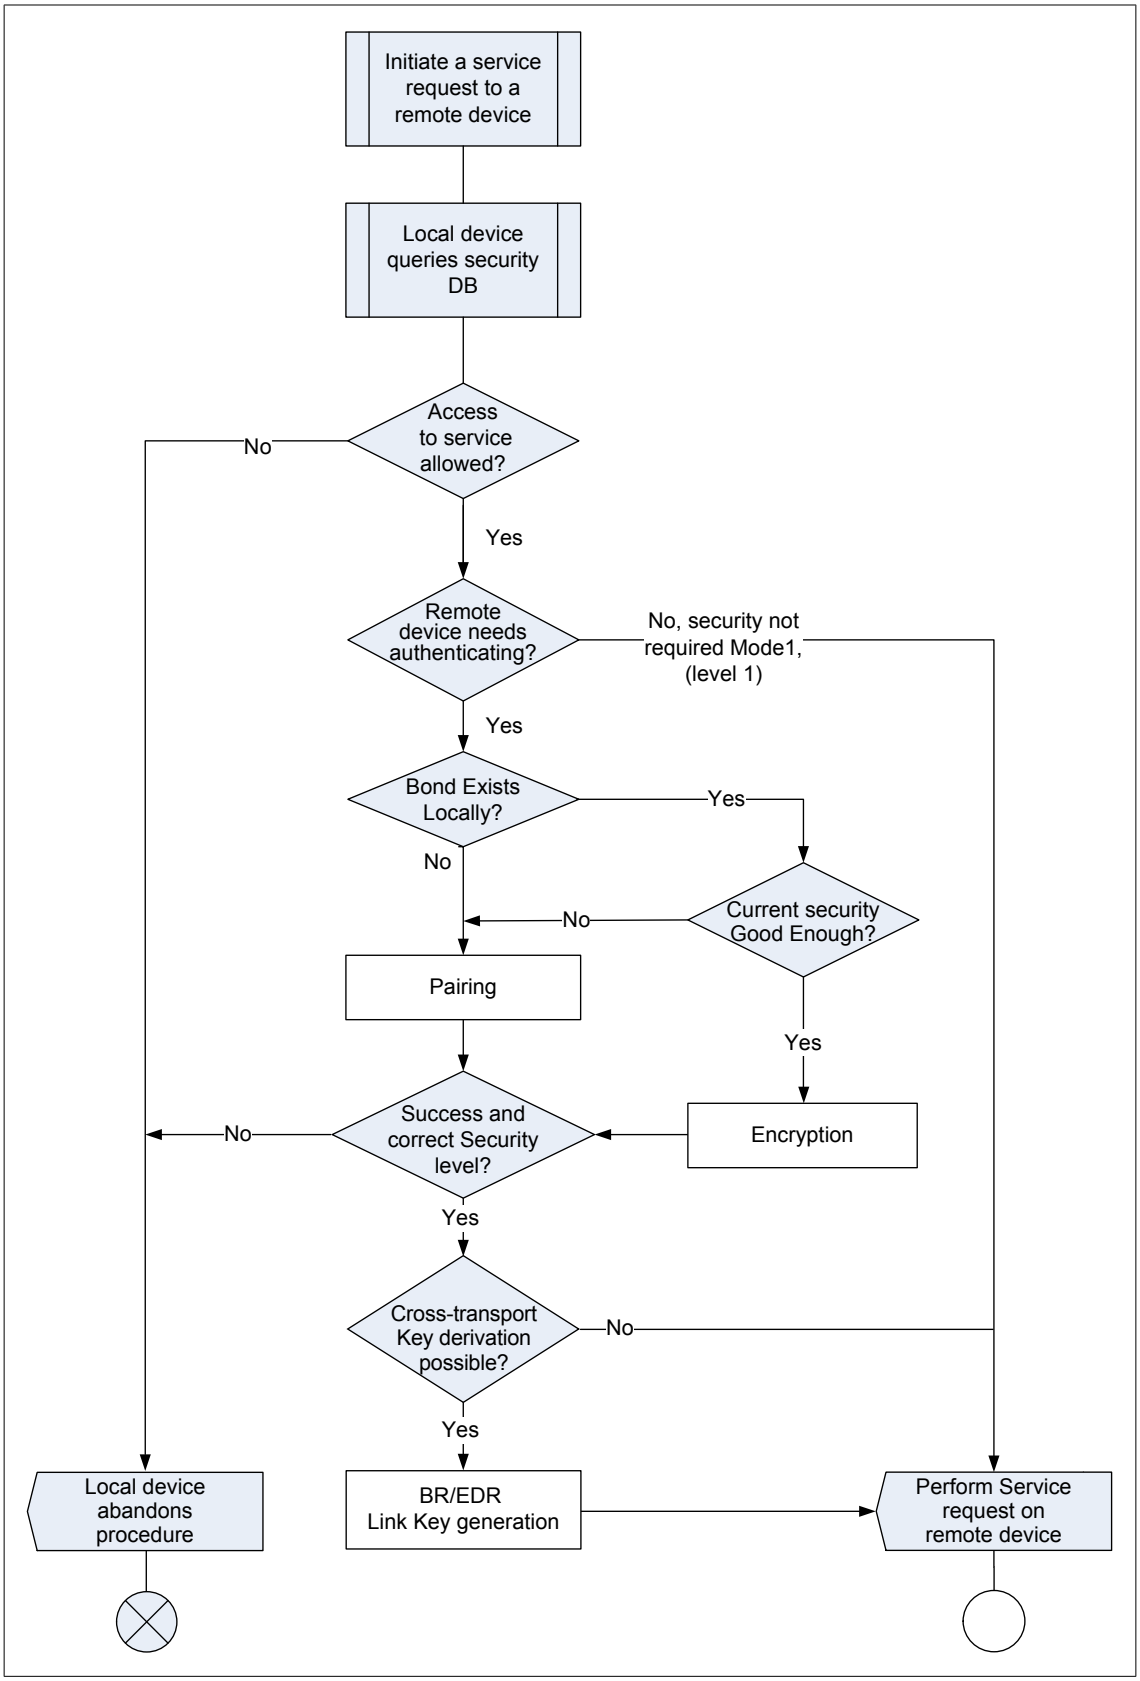

Figure 10.2: Flow chart for a local device issuing a service request to a remote device

10.3.2.1 Cross-transport key generation

After encryption is enabled, the correct security level has been achieved, and both devices support cross-transport key generation, the both devices may perform BR/EDR link key derivation.

Note: If the LTK has an encryption key size that is shorter than 16 octets (128 bits), the BR/EDR link key is derived before the LTK gets masked.

10.3.2.2 Handling of GATT indications and notifications

A client requests a server to send indications and notifications by appropriately configuring the server via a Client Characteristic Configuration Descriptor. Since the configuration is persistent across a disconnection and reconnection, the client shall check the security requirements for the connection against the configuration upon a reconnection before processing any indications or notifications from the server. Any notifications received before the security requirements are met shall be ignored. Any indications received before the security requirements are met shall be confirmed and then discarded. When a client reconnects to a server and expects to receive indications or notifications for which a specific level of security for the connection is required, the client shall enable encryption with the server. If the server does not have an LTK, indicating that the server has lost the bond, enabling encryption will fail.

10.4 Data signing

The data signing is used for transferring authenticated data between two devices in an unencrypted connection. The data signing method is used by services that require fast connection set up and fast data transfer.

If a service request specifies LE security mode 2, the connection data signing procedure shall be used.

10.4.1 Connection Data Signing procedure

A device shall generate a new Connection Signature Resolving Key CSRK for each set of peer device(s) to which it sends signed data in connections. CSRK is defined in [Vol 3] Part H, Section 2.4.2.2.

The data shall be formatted using the Signing Algorithm as defined in [Vol 3] Part H, Section 2.4.5 where m is the Data PDU to be signed, k is the CSRK and the SignCounter is the counter value. A Signature is composed of the counter value and the Message Authentication Code (MAC) generated by the Signing Algorithm. The counter value shall be incremented by one for each new Data PDU sent.

The format of signed data is shown in Figure 10.3.

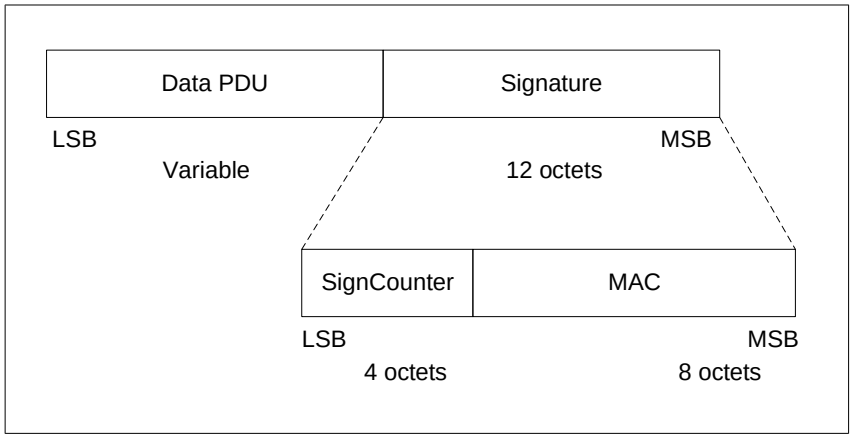

Figure 10.3: Generic format of signed data

10.4.2 Authenticate Signed Data procedure

If encryption is not required and CSRK is available (LE security mode 2) then the data signing procedure shall be used when making a service request involving a write operation.

Note: The existence of the bond on the server can be determined by successfully enabling encryption with the server using the encryption procedure defined in Section 10.6. A higher layer profile may allow a client to not perform the authentication procedure. Alternatively, a higher layer protocol may signal the client that the signature check has failed due to a lost bond, and the client may then take action to notify the user or attempt to pair again to reestablish the bond.

A device receiving signed data shall authenticate it by performing the Signing Algorithm. The signed data shall be authenticated by performing the Signing Algorithm where m is the Data PDU to be authenticated, k is the stored CSRK and the SignCounter is the received counter value. If the MAC computed by the Signing Algorithm does not match the received MAC, the verification fails and the Host shall ignore the received Data PDU.

Since the server does not respond to a Signed Write command, the higher layer application is not necessarily notified of the ignored request. Hence, it is recommended that the server disconnect the link in case the client is a malicious device attempting to mount a security attack.

If the server has no stored CSRK upon receiving a signed write command, it shall ignore the received Data PDU. Since the server does not respond to a Signed Write command, the higher layer application is not necessarily notified of the ignored request. Although the disconnection may be an adequate indication to the user that the devices need to be paired, it is recommended that implementers consider providing an explanatory indication to the user that the devices need to be paired to establish a CSRK.

If the server receives a request from a client for a write operation that requires a response (i.e. other than a Signed Write command or Write command), and encryption is not enabled, then the server shall respond with the error code “Insufficient Authentication”.

If the link is encrypted and the server receives a request from a client for which the server requires data signing but does not require encryption, then the server shall complete the request if it is otherwise valid as the encrypted state of the link is considered to satisfy the signing requirement.

As required by Section 10.2.2, for a given link, signed data is not used at the same time as encryption. Therefore, if the client wishes to test that the server is still bonded, and thus enables encryption, further data transfer must occur without signing, assuming the server does not disconnect the link as recommended above.

If a higher layer determines the bond no longer exists on the server, the client shall trigger a user interaction to confirm the remote device and then re-bond, perform service discovery, and reconfigure the server. If the client had previously determined that the server did not have the «Service Changed» characteristic, or the client determines by reading the «Database Hash» characteristic that the database has not changed, then service discovery may be skipped.

The receiving device shall protect against a replay attack by comparing the received SignCounter with previously received SignCounter from the same peer device. If the SignCounter was previously used then the receiving device shall ignore the Data PDU.

10.5 Authorization procedure

A service may require authorization before allowing access. Authorization is a confirmation by the user to continue with the procedure. Authentication does not necessarily provide authorization. Authorization may be granted by user confirmation after successful authentication.

10.6 Encryption procedure

A Central may encrypt a connection using the Encryption Session Setup as defined in [Vol 3] Part H, Section 2.4.4 to provide integrity and confidentiality.

A Peripheral may encrypt a connection using the Peripheral Initiated Security Request as defined in [Vol 3] Part H, Section 2.4.6 to provide integrity and confidentiality.

If the encryption procedure fails and either the Central or Peripheral used a Resolvable Private Address for the connection establishment, then the current Resolvable Private Address(es) shall be immediately discarded and new Resolvable Private Address(es) shall be generated.

10.7 Privacy feature

The privacy feature provides a level of privacy which makes it more difficult for an attacker to track a device over a period of time. The requirements for a device to support the privacy feature are defined in Table 10.3.

Privacy Requirements	Ref.	Broadcaster	Observer	Peripheral	Central
Privacy feature	10.7	O	O	O	O
Non-resolvable private address generation procedure	10.8.2.1	C.2	C.4	O	O
Resolvable private address generation procedure	10.8.2.2	C.3	C.5	C.1	C.1
Resolvable private address resolution procedure	10.8.2.3	E	O	C.1	C.1
Bondable Mode	9.4.3	E	E	C.1	C.1
Bonding procedure	9.4.4	E	E	C.1	C.1

C.1: Mandatory if privacy feature is supported, otherwise optional

C.2: Mandatory if privacy feature is supported and resolvable private address generation procedure is not supported, otherwise optional

C.3: Mandatory if privacy feature is supported and non-resolvable private address generation procedure is not supported, otherwise optional

C.4: Mandatory if privacy feature and active scanning are supported and resolvable private address generation procedure is not supported, otherwise optional

C.5: Mandatory if privacy feature and active scanning are supported and non-resolvable private address generation procedure is not supported, otherwise optional

Table 10.3: Requirements related to privacy feature

Two modes of privacy exist:

- Device Privacy Mode: When a device is in device privacy mode, it is only concerned about its own privacy. It should accept advertising packets from peer devices that contain their Identity Addresses as well as their private address, even if the peer device has distributed its IRK.
- Network Privacy Mode. When a device is in network privacy mode, it shall not accept advertising packets containing the Identity Address of peer devices that have distributed their IRK.

Note: If the Resolvable Private Address Only characteristic is not present in the GAP Service of the remote device then it may use its Identity Address over the air.

A device may use different modes for different peers.

If a device, i.e. Host and Controller, claims support for the privacy feature, the requirements in this section shall be met.

A device may support either just Host-based privacy or both Host-based and Controller-based privacy. When a device supports Controller-based privacy, the Host configures the Controller to perform some of the privacy functionality.

If a device supports Controller-based privacy, the requirements in the following paragraphs shall be met.

- The Host may maintain a resolving list by adding and removing device identities. A device identity consists of the peer's Identity Address and a local and peer's IRK pair. The local or peer's IRK shall be an all-zero key if not applicable for the particular device identity.
- If a peer device provides an all-zero Identity Address during pairing, the Host shall choose a unique identifier to substitute the peer's device Identity Address. The Host shall ensure that all identities provided to the Controller are unique.
- When address resolution is enabled in the Controller, all references to peer devices that are included in the resolving list from Host to the Controller shall be done using the peer's device Identity Address. Likewise, all incoming events from the Controller to the Host will use the peer's device identity, if the peer's device address has been resolved.
- If the Host wants to be in device privacy mode, it shall so instruct the Controller for each peer in the resolving list.

10.7.1 Privacy feature in a Peripheral

The privacy-enabled Peripheral shall use a resolvable private address as the advertiser's device address when in connectable mode.

A Peripheral shall use non-resolvable or resolvable private addresses when in non-connectable mode as defined in Section 9.3.2.

If a privacy-enabled Peripheral, that has a stored bond, receives a resolvable private address, the Host may resolve the resolvable private address by performing the 'resolvable private address resolution procedure' as defined in Section 10.8.2.3. If the resolution is successful, the Host may accept the connection. If the resolution procedure fails, then the Host shall either accept the connection from the new, unresolved device, disconnect with the error code "Authentication failure", or perform the pairing procedure, or perform the authentication procedure as defined in Section 10.3. Accepting the connection from the new, unresolved device, can result in exposing the device name or unique data to the Central.

The device should not send the device name or unique data in the advertising data that can be used to recognize the device.

10.7.1.1 Privacy feature in a Peripheral with Controller-based privacy

A privacy-enabled Peripheral shall use either the undirected connectable mode as defined in Section 9.3.4 or directed connectable mode as defined in Section 9.3.3. The directed connectable mode shall only be used if the peer device supports Address Resolution in the Controller.

The Host shall enable resolvable private address generation by enabling it in the Controller and populating the resolving list.

By default, network privacy mode is used when private addresses are resolved and generated by the Controller.

If the advertising data or the scan response data change regularly then those changes should be synchronized with any changes in private addresses (both local and remote). For this purpose, the Host should either instruct the Controller to synchronize address changes with those data changes or, if the Controller does not support that feature, generate private addresses as described in Section 10.7.1.2 instead of offloading private address generation to the Controller.

10.7.1.2 Privacy feature in a Peripheral with Host-based privacy

A privacy-enabled Peripheral should use the undirected connectable mode as defined in Section 9.3.2, to create a connection.

The Host shall generate a resolvable private address using the ‘resolvable private address generation procedure’ as defined in Section 10.8.2.2 or non-resolvable private address procedure as defined in Section 10.8.2.1. The Host shall set a timer equal to T_{GAP}(private_addr_int). The Host shall generate a new resolvable private address or non-resolvable private address when the timer T_{GAP}(private_addr_int) expires.

Note: T_{GAP}(private_addr_int) timer need not be run if a Peripheral is not advertising.

10.7.2 Privacy feature in a Central

The privacy-enabled Central shall use a resolvable private address as the initiator's device address.

During active scanning, a privacy enabled Central shall use a non-resolvable or resolvable private address.

If, a privacy-enabled Central, that has a stored bond, receives a resolvable private address, the Host may resolve the resolvable private address by performing the "resolvable private address resolution procedure" as defined in Section 10.8.2.3.

10.7.2.1 Privacy feature in a Central with Controller-based privacy

A privacy-enabled Central with Address Resolution enabled in the Controller can use any of the connection establishment procedures defined in Section 9.3.

By default, network privacy mode is used when private addresses are resolved and generated by the Controller.

10.7.2.2 Privacy feature in a Central with Host-based privacy

A privacy-enabled Central should use the general connection establishment procedure defined in Section 9.3.6 to create a connection.

The Host shall generate a resolvable private address using the ‘resolvable private address generation procedure’ as defined in Section 10.8.2.2 or non-resolvable private address procedure as defined in Section 10.8.2.1. The Host shall set a timer equal to T_{GAP}(private_addr_int). The Host shall generate a new resolvable private address or non-resolvable private address when the timer T_{GAP}(private_addr_int) expires.

Note: T_{GAP}(private_addr_int) timer need not be run if a Central is not scanning or connected.

10.7.3 Privacy feature in a Broadcaster

A privacy-enabled Broadcaster shall use the Broadcast mode defined in Section 9.1.1. The Broadcaster shall use either a resolvable private address or non-resolvable private address.

If Address Resolution is not supported or disabled in the Controller, the following applies to the Host: The Host shall generate a resolvable private address using the ‘resolvable private address generation procedure’ as defined in Section 10.8.2.2 or non-resolvable private address procedure as defined in Section 10.8.2.1. The Host shall set a timer to T_{GAP}(private_addr_int). The Host shall generate a new resolvable private address or non-resolvable private address when the timer T_{GAP}(private_addr_int) expires.

Note: T_{GAP}(private_addr_int) timer need not be run if a Broadcaster is not advertising.

The device should not send the device name or unique data in the advertising data which can be used to recognize the device.

10.7.4 Privacy feature in an Observer

A privacy-enabled Observer shall use the Observation procedure defined in Section 9.1.2. During active scanning, a privacy enabled Observer shall use either a resolvable private address or non-resolvable private address.

If Address Resolution is not supported or disabled in the Controller, the following applies to the Host: The Host shall generate a resolvable private address using the 'resolvable private address generation procedure' as defined in Section 10.8.2.2 or non-resolvable private address procedure as defined in Section 10.8.2.1. The Host shall set a timer equal to T_{GAP}(private_addr_int). The Host shall generate a new resolvable private address or non-resolvable private address when the timer T_{GAP}(private_addr_int) expires. The value of T_{GAP}(private_addr_int) shall not be greater than 1 hour.

Note: T_{GAP}(private_addr_int) timer need not be run if an Observer is not scanning.

10.8 Random Device address

For the purposes of this profile, the random device address may be of either of the following two sub-types:

- Static address
- Private address

The term random device address refers to both static and private address types.

The transmission of a random device address is optional. A device shall accept the reception of a random device address from a remote device.

The private address may be of either of the following two sub-types:

- Non-resolvable private address
- Resolvable private address

A bonded device shall process a resolvable private address as defined in Section 10.8.2.3 or by establishing a connection and then performing the authentication procedure as defined in Section 10.3. A device that generates a resolvable private address for its local address shall always request to distribute its IRK value as defined in [Vol 3] Part H, Section 3.6.4 if both sides are bondable, unless keys have been pre-distributed.

After a device has distributed its IRK, it should use resolvable private addresses when establishing a connection with a peer device to which the IRK has been distributed.

10.8.1 Static address

The Host can generate a static address using the procedure described in [Vol 6] Part B, Section 1.3.2.1.

10.8.2 Private address

The private address may be of either of the following two sub-types:

- Non-resolvable private address
- Resolvable private address

10.8.2.1 Non-Resolvable Private Address Generation procedure

The Host can generate a non resolvable private address using the procedure described in [Vol 6] Part B, Section 1.3.2.2.

10.8.2.2 Resolvable Private Address Generation procedure

The Host can generate a resolvable private address where the Host has its IRK using the procedure described in [Vol 6] Part B, Section 1.3.2.2.

10.8.2.3 Resolvable Private Address Resolution procedure

The Host can resolve a resolvable private address where the Host has the peer device's IRK or the local device's IRK, using the procedure described in [Vol 6] Part B, Section 1.3.2.3.

10.9 Encrypted Broadcast Isochronous Group

A device with a service that requires using an unauthenticated encrypted BIG shall set its security to LE security mode 3 level 2. A device with a service that requires using an authenticated encrypted BIG shall set its security to LE security mode 3 level 3.

When a user initiates a service that includes broadcasting an encrypted BIG, the Host shall provide the Broadcast_Code associated with the encrypted BIG to the Controller.

When a user initiates a service that requires the reception of an encrypted BIS, the device needs to know the Broadcast_Code for that encrypted BIS. If the device does not have the Broadcast_Code or cannot obtain the Broadcast_Code and has a user interface, then it shall indicate an appropriate error (e.g., Code Unavailable) to the user.

10.10 Encrypted Advertising Data procedure

A Broadcaster may encrypt advertising data using an Encrypted Data data type. The data is encrypted using key material that is known by both devices as defined in Section 1.23.3 of [7].

The key material is exposed using the Encrypted Data Key Material characteristic on the Broadcaster.

The scanning device shall read the Encrypted Data Key Material characteristic on an advertising device to obtain the key material for a device if it wants to interpret the encrypted advertising data being sent.

10.11 LE Channel Sounding

A device with a service that requires using the CS procedure described in Section 9.7 must first encrypt the underlying LE connection as described in [Vol 6] Part B, Section 4.5.18.2.

10.11.1 Channel Sounding security

Channel Sounding provides the following levels of channel measurement security for the application layer:

1. Either CS tone or CS RTT
2. 150 ns CS RTT accuracy and CS tones
3. 10 ns CS RTT accuracy and CS tones
4. Level 3 with the addition of CS RTT sounding sequence or random sequence payloads, and support of the Normalized Attack Detector Metric requirements as described in [Vol 6] Part H, Section 3.5.1.

A device that operates in security level 1 shall use CS tone or CS RTT within a CS procedure.

A device that operates in security level 2 shall use 150 ns or better CS RTT accuracy and CS tones within a CS procedure.

A device that operates in security level 3 shall use 10 ns or better CS RTT accuracy and CS tones within a CS procedure.

A device that operates in security level 4 shall meet the requirements of security level 3 and shall also require that the CS procedure uses either CS RTT with sounding sequence or CS RTT with random sequence, and that the device shall also support the Normalized Attack Detector Metric requirements as described in [Vol 6] Part H, Section 3.5.1.

11 ADVERTISING AND SCAN RESPONSE DATA FORMAT

The format of Advertising, Periodic Advertising, and Scan Response data is shown in Figure 11.1. The data consists of a significant part and a non-significant part. The significant part contains a sequence of AD structures. Each AD structure shall have a Length field of one octet, which contains the Length value and shall not be zero, and a Data field of Length octets. The first octet of the Data field shall contain the AD type field. The content of the remaining Length - 1 octets in the Data field depends on the value of the AD type field and is called the AD data. The non-significant part shall only be present when necessary to fill a fixed-length field and shall contain all-zero octets.

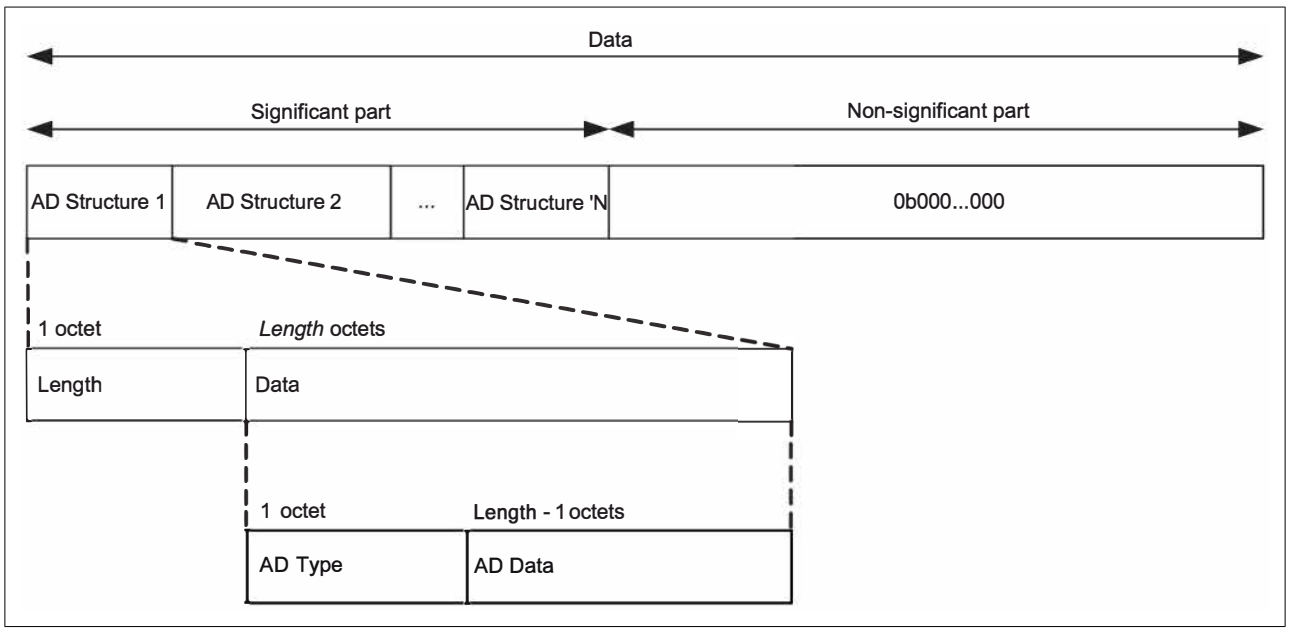

Figure 11.1: Advertising and Scan Response data format

Only the significant part of the data should be sent over the air.

The data is sent in advertising or periodic advertising events. Host Advertising data is placed in the AdvData field of ADV_IND, ADV_NONCONN_IND, ADV_SCAN_IND, AUX_ADV_IND, and AUX_CHAIN_IND PDUs. Additional Controller Advertising Data is placed in the ACAD field of AUX_ADV_IND, AUX_SYNC_IND, and AUX_SCAN_RSP PDUs. Periodic Advertising data is placed in the AdvData field of AUX_SYNC_IND, AUX_SYNC_SUBEVENT_IND, AUX_SYNC_SUBEVENT_RSP, and AUX_CHAIN_IND PDUs. Scan Response data is sent in the ScanRspData field of SCAN_RSP PDUs or the AdvData field of AUX_SCAN_RSP PDUs. If the complete data cannot fit in the AdvData field of an AUX_ADV_IND, AUX_SYNC_IND, or AUX_SCAN_RSP PDU,

AUX_CHAIN_IND PDUs are used to send the remaining fragments of the data. In this case, an AD Structure may be fragmented over two or more PDUs.

The AD type data formats and meanings are defined in Section 1 of [4]. The AD type identifier values are defined in Assigned Numbers.

12 GAP SERVICE AND CHARACTERISTICS FOR GATT SERVER

The GATT Server shall contain the GAP Service as defined in the GAP Service requirements in Table 12.1. A device shall have only one instance of the GAP Service in the GATT Server. The GAP Service shall be a GATT based primary service with the service UUID as «GAP Service» defined in Assigned Numbers.

	BR/EDR GAP Role	LE Broadcaster	LE Observer	LE Peripheral	LE Central
GAP Service	C.1	E	E	M	M
C.1: Mandatory if the GATT Profile is supported on the BR/EDR physical transport, otherwise excluded					

Table 12.1: GAP service requirements

The GAP Service shall contain the characteristics specified in Table 12.2.

Characteristics	Ref.	BR/EDR GAP Role	LE Broadcaster	LE Observer	LE Peripheral	LE Central
Device Name	12.1	C.1	E	E	M	M
Appearance	12.2	C.1	E	E	M	M
Peripheral Preferred Connection Parameters	12.3	O	E	E	O	E
Central Address Resolution	12.4	O	E	E	C.3	C.2
Resolvable Private Address Only	12.5	O	E	E	C.3	C.3
Encrypted Data Key Material	12.6	O	E	E	O	E
LE GATT Security Levels	12.7	E	E	E	O	O
C.1: Mandatory if the GATT Profile is supported on the BR/EDR physical transport, otherwise excluded C.2: Mandatory if Link Layer privacy is supported, otherwise excluded C.3: Optional if Link Layer privacy is supported, otherwise excluded						

Table 12.2: Requirements related to GAP service characteristics

A device that supports multiple GAP roles shall contain all the characteristics required by all the supported roles. The device shall continue to make all the contained characteristics accessible irrespective of the role the device is operating in.

12.1 Device Name characteristic

The Device Name characteristic shall contain the name of the device as an UTF-8 string as defined in Section 3.2.2. When the device is discoverable, the Device Name characteristic value shall be readable without authentication or authorization. When the device is not discoverable, the Device Name Characteristic should not be readable without authentication or authorization. The Device Name characteristic value may be writable. If writable, authentication and authorization may be defined by a higher layer specification or be implementation specific.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xMMMM	0x2A00 – UUID for «Device Name»	Device Name	Readable without authentication or authorization when discoverable. Optionally writable, authentication and authorization may be defined by a higher layer specification or be implementation specific.

Table 12.3: Device Name characteristic

The Device Name characteristic value shall be 0 to 248 octets in length.

A device shall have only one instance of the Device Name characteristic.

12.2 Appearance characteristic

The Appearance characteristic defines the representation of the external appearance of the device. This enables the discovering device to represent the device to the user using an icon, or a string, or similar. The Appearance characteristic value shall be readable without authentication or authorization. The Appearance characteristic value may be writable. If writable, authentication and authorization may be defined by a higher layer specification or be implementation specific.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xMMMM	0x2A01 – UUID for «Appearance»	Appearance	Readable without authentication or authorization. Optionally writable, authentication and authorization may be defined by a higher layer specification or be implementation specific.

Table 12.4: Appearance characteristic

The Appearance characteristic value shall be the enumerated value as defined in Assigned Numbers. The Appearance characteristic value shall be 2 octets in length. A device shall have only one instance of the Appearance characteristic.

12.3 Peripheral Preferred Connection Parameters characteristic

The Peripheral Preferred Connection Parameters (PPCP) characteristic contains the preferred connection parameters of the Peripheral.

The Peripheral Preferred Connection Parameters characteristic value shall be readable. Authentication and authorization may be defined by a higher layer specification or be implementation specific.

The Peripheral Preferred Connection Parameters characteristic value shall not be writable.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xMMMM	0x2A04 – UUID for «Peripheral Preferred Connection Parameters»	Peripheral Preferred Connection Parameters	Readable, authentication and authorization may be defined by a higher layer specification or be implementation specific Not writable

Table 12.5: Peripheral Preferred Connection Parameters characteristic

The Peripheral Preferred Connection Parameters characteristic value shall be 8 octets in length. A device shall have only one instance of the Peripheral Preferred Connection Parameters characteristic. The format of the value is specified in Table 12.6.

Name	Size (Octet)
Interval_Min	2
Interval_Max	2
Latency	2
Timeout	2

Table 12.6: Format of the Peripheral Preferred Connection Parameters data

Each field shall have the same meaning and requirements as the field of the LL_CONNECTION_PARAM_REQ PDU (see [Vol 6] Part B, Section 2.4.2.16) with the same name, or shall contain the value 0xFFFF which indicates that no specific value is requested.

12.4 Central Address Resolution characteristic

The Peripheral should check if the peer device supports address resolution by reading the Central Address Resolution characteristic before using directed advertisement where the target address is set to a Resolvable Private Address (RPA).

The Central Address Resolution characteristic defines whether the device supports privacy with address resolution. See Table 12.7.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xMMMM	0x2AA6 - UUID of «Central Address Resolution»	Central Address Resolution Support	Readable without authentication or authorization. Not writable.

Table 12.7: Central Address Resolution characteristic

The Central Address Resolution characteristic value shall be 1 octet in length:

0 = address resolution is not supported in this device

1 = address resolution is supported in this device

All other values are reserved for future use.

A device shall have only one instance of the Central Address Resolution characteristic. If the Central Address Resolution characteristic is not present, then it shall be assumed that Central Address Resolution is not supported.

12.5 Resolvable Private Address Only characteristic

The device should check if the peer will only use Resolvable Private Addresses (RPAs) after bonding by reading the Resolvable Private Address Only characteristic, in order to determine if it will satisfy its privacy mode as defined in Section 10.7.

The Resolvable Private Address Only characteristic defines whether the device will only use Resolvable Private Addresses (RPAs) as local addresses. See Table 12.8.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xMMMM	0x2AC9 - UUID of «Resolvable Private Address Only»	Resolvable Private Address Only	Readable without authentication or authorization. Not writable.

Table 12.8: Resolvable Private Address Only characteristic

The Resolvable Private Address Only characteristic value shall be 1 octet in length:

0 = only Resolvable Private Addresses will be used as local addresses after bonding

All other values are reserved for future use.

A device shall have only one instance of the Resolvable Private Address Only characteristic. If the Resolvable Private Address Only characteristic is not present, then it cannot be assumed that only Resolvable Private Addresses will be used over the air.

12.6 Encrypted Data Key Material

The Encrypted Data Key Material characteristic allows advertising data associated with the GAP service to be decrypted and authenticated using the key material. The Encrypted Data Key characteristic value shall not be writable. The Encrypted Data Key Material characteristic shall only be readable when authenticated and authorized. When read, the key material is stored on the local device. The key material may be discarded at any time on a local device.

The Encrypted Data Key Material characteristic may support indications. If the characteristic supports indications, the client has configured the characteristic for indications, and the characteristic value changes after being authenticated and authorized, then the characteristic shall be indicated by the server to the client.

The Encrypted Data Key Material characteristic can be used by other services to allow those services to expose separate key material for encrypted advertising data used by those services.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xMMMM	0x2B88 - UUID for «Encrypted Data Key Material»	Key Material	Readable when authenticated and authorized. Indicatable when authenticated and authorized. Not writable.

Table 12.9: Encrypted Data Key Material characteristic

The Key Material is composed of a 128-bit value that is used as the session key and a 64-bit value that is used as the IV for encrypting and authenticating the Encrypted Data as defined in Section 1.23.3 of [4], as shown in Table 12.10. The server should update the Key Material periodically.

Field	Size (octets)	Description
Session Key	16	The shared session key.
IV	8	The initialization vector.

Table 12.10: Key Material format

12.7 LE GATT Security Levels Characteristic

This section specifies the LE GATT Security Levels characteristic.

The LE GATT Security Levels characteristic shall contain the highest security requirements of the GATT server when operating on a LE connection. The value of the LE GATT Security Levels characteristic shall be static during a connection.

The format of the LE GATT Security Levels characteristic is given in Table 12.11.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xMMMM	0x2BF5 - UUID for «LE GATT Security Levels»	Sequence of one or more Security Level Requirements	Read Only, No Encryption required, No Authentication, No Authorization

Table 12.11: LE GATT Security Levels characteristic

The Attribute Value is a sequence of Security Level Requirements, each with the type uint8[2]. Each Security Level Requirement consists of a Security Mode field followed by a Security Level field. The Security Mode and Security Level shall be expressed as the same number as used in their definitions; e.g., mode 1 is represented as 0x01 and level 4 is represented as 0x04.

Meeting any one of the security requirements provided for a given mode shall be sufficient for the GATT server to allow the GATT client to use all the GATT procedures permitted by the characteristic properties for all characteristics on the server operating in that mode. If any one of the security requirements specified in the LE GATT Security Levels characteristic is met, no GATT procedure will fail for a security-related reason (such as insufficient authentication). For example, the attribute value 0x01 0x04 for the LE GATT Security Levels characteristic means that the GATT server requires level 4 when operating in security mode 1 on a LE connection.

Note: The Security Level value is not a minimum; specifying (say) level 2 for a mode does not mean that level 3, level 4, or even level 87 would suffice instead. However, in many cases a given security level satisfies the security requirements of other levels as well. For example, LE security mode 1 levels 3 and 4, by definition, both satisfy the requirements for mode 1 level 2 and so could be used with a GATT server that requires mode 1 level 2.

The security modes and levels for LE are defined in Section 10.

A device shall have at most one instance of a LE GATT Security Levels characteristic.

13 BR/EDR/LE OPERATION

This section describes the requirements for BR/EDR/LE implementations. The implementation may support any LE GAP roles allowed by the Controller over the LE physical channel. The requirements for each role are defined in Section 9.

Feature	Ref.	Broadcaster	Observer	Peripheral	Central
BR/EDR/LE modes and procedures	13.1 and 13.2	O	O	O	O

Table 13.1: Requirements for the modes of BR/EDR/LE implementations

13.1 Modes, procedures, and security aspects

All modes, procedures and security aspects shall follow the requirements as specified for the physical transport over which they operate. Sections 4, 5, 6 and 7 specify the requirements for the modes, procedures and security aspects for operations performed over the BR/EDR physical transport. Sections 9 and 9.6 specify the requirements for the modes, procedures and security aspects performed over the LE physical transport. It is optional to support both physical transports simultaneously to the same remote device.

13.1.1 Discoverable mode requirements

A device shall expose the capabilities of both physical transports for both Limited and General Discoverable Mode using the advertisement Flag AD Type as follows:

a. The ‘BR/EDR Not Supported’ bit in the Flags AD type shall be set to 0 as defined in Section 1.3 of [4].

b. The 'Simultaneous LE and BR/EDR to Same Device Capable (Controller)' bit in the Flags AD type shall be set to 0.

The ‘LE Supported (Controller)’ and ‘LE Supported (Host)’ bits in the LMP features shall be set as defined in [Vol 2] Part C, Section 3.2.

13.2 Bonding for BR/EDR/LE implementations

The requirements for BR/EDR/LE implementations are shown in Table 13.2.

Bonding Requirement	Ref.	Peripheral	Central
Bonding	6.5 / 9.4.4	O	O

Table 13.2: Requirements for the bonding of BR/EDR/LE implementations

If the remote device supports the BR/EDR physical transport, the bonding procedures for the BR/EDR physical transport as defined in Section 6.5 shall be used.

If the remote device supports the LE physical transport, the bonding procedures for the LE physical transport as defined in Section 9.4.4 shall be used.

13.3 Relationship between physical transports

To determine if both the BR/EDR physical transport and the LE physical transport are established to the same peer device, the device shall use either the public address used on the LE advertising physical channel or the public address from the BD_ADDR field contained in the SMP Identity Address Information packet ([Vol 3] Part H, Section 3.6.5) if it has been received.

14 BR/EDR/LE SECURITY ASPECTS

The requirements for BR/EDR/LE implementations are shown in Table 14.1.

Security aspects	Ref.	Peripheral	Central
Security aspects	14	M	M

Table 14.1: Requirements for the security aspects of BR/EDR/LE implementations

If the remote device supports the BR/EDR physical transport the security procedures for the BR/EDR physical transport as defined in Section 5 shall be used.

If the remote device supports the LE physical transport the security procedures for the LE physical transport as defined in Section 9.6 shall be used.

If the LE transport in a BR/EDR/LE device supports Secure Connections, the security procedures in Section 14.1 may also be used.

14.1 Cross-transport key derivation

If both the local and remote devices support Secure Connections over the BR/EDR and LE transports, devices may optionally generate keys of identical strength and the same MITM protection for both transports as part of a single pairing procedure (see [Vol 3] Part H, Section 2.3.5.7).

If both the local and remote devices support Secure Connections over the LE transport but not over the BR/EDR transport, then the devices may optionally generate the BR/EDR keys of identical strength and the same MITM protection as the LE keys as part of the LE pairing procedure (see [Vol 3] Part H, Section 2.3.5.7).

If an LE LTK already exists and the BR/EDR link key is weaker in either strength or MITM protection, then neither device shall generate an LE LTK using cross-transport key derivation from a BR/EDR link key. If either device receives a request to generate an LE LTK using cross-transport key derivation, it shall respond with a Pairing Failed message with reason "Cross-transport Key Derivation/Generation not allowed".

If the BR/EDR link key has been generated by a Controller that does not perform remote public key validation (see [Vol 2] Part H, Section 7.6), then the local device shall not generate an LE LTK using cross-transport key derivation from a BR/EDR link key. If the local device receives a request to generate an LE LTK using cross-transport key derivation, it shall respond with a Pairing Failed message with reason "Cross-transport Key Derivation/Generation not allowed".

If a BR/EDR link key already exists and the LE LTK is weaker in either strength or MITM protection, then the local device shall not generate a BR/EDR link key using

cross-transport key derivation from the LE LTK. If both devices request cross-transport key derivation during pairing, then the local device shall either silently skip deriving the BR/EDR link key or stop the pairing procedure by sending a Pairing Failed message with reason "Cross-transport Key Derivation/Generation not allowed".

Note: The Host can use the HCI_Read_Local_Simple_Pairing_Options command (see [Vol 4] Part E, Section 7.4.9) or vendor-specific methods to determine whether the Controller performs remote public key validation.

If the LE LTK has been generated (e.g., using the HCI_LE_Generate_DHKey command; see [Vol 4] Part E, Section 7.8.37) by a Controller that does not perform remote public key validation (see [Vol 3] Part H, Section 2.3.5.6.1), then the BR/EDR link key shall not be generated from such an LE LTK using cross-transport key derivation.

Note: The Host can use the Remote Public Key Validation feature bit (see [Vol 6] Part B, Section 4.6) or vendor-specific methods to determine whether the HCI_LE_Generate_DHKey command performs the remote public key validation.

14.2 Collision handling

If pairing has been initiated by the local device on the BR/EDR transport, and a pairing request is received from the same remote device on the LE transport, the LE pairing shall be rejected with SMP error code *BR/EDR Pairing in Progress* (0x0D) if both sides support LE Secure Connections.

If a BR/EDR/LE device supports LE Secure Connections, then it shall initiate pairing on only one transport at a time to the same remote device.

14.3 Secure Connections Only Mode

If a BR/EDR/LE device is in Secure Connections Only Mode, then this mode applies to both transports and the requirements in both Section 5.2.2 and Section 10.2.4 shall apply.

15 BLUETOOTH DEVICE REQUIREMENTS

15.1 Bluetooth Device address

All Bluetooth devices shall have a Bluetooth Device Address (BD_ADDR) that uniquely identifies the device to another Bluetooth device. The specific Bluetooth Device Address requirements depend on the type of Bluetooth device.

15.1.1 Bluetooth Device Address types

15.1.1.1 Public Bluetooth address

A Bluetooth public address used as the BD_ADDR for the BR/EDR physical channel is defined in [Vol 2] Part B, Section 1.2. A Bluetooth public address used as the BD_ADDR for the LE physical channel is defined in [Vol 6] Part B, Section 1.3.

15.1.1.2 Random Bluetooth address

A random device address used as the BD_ADDR on the LE physical channel is defined in Section 10.8.

15.2 GATT Profile requirements

The requirements for supporting a GATT Client or GATT Server are specified in Table 15.1.

	BR/EDR GAP Role	LE Broadcaster	LE Observer	LE Peripheral	LE Central
GATT Client	C.1	E	E	O	O
GATT Server	C.2	E	E	M	M

C.1 Optional if the GATT Profile is supported on the BR/EDR physical transport; otherwise excluded

C.2: Mandatory if the GATT Profile is supported on the BR/EDR physical transport; otherwise excluded

Table 15.1: Requirements based on GAP roles supported

15.3 SDP requirements

The requirements for supporting an SDP Client or SDP Server are specified in Table 15.2. There shall be no more than one active SDP Server per device.

	BR/EDR-Only and BR/EDR/LE Implementations	LE-Only Implementations
SDP Client	C.1	E
SDP Server	C.2	E
C.1: Optional if SDP Server is supported, otherwise mandatory. C.2: Mandatory to support if GATT Server is supported, otherwise optional.		

Table 15.2: Requirements based on GAP roles supported

15.4 SDP service record requirement

A BR/EDR or BR/EDR/LE device that supports a GATT Server accessible over the BR/EDR physical transport and that supports only one of ATT or EATT shall publish the SDP record shown below in Table 15.3; if both ATT and EATT are supported, the device shall publish the SDP record shown below in Table 15.4. The GAP Service start handle shall be set to the attribute handle of the GAP Service service declaration. The GAP Service end handle shall be set to the attribute handle of the last attribute within the GAP Service service definition group.

Item	Type	Value	Meaning
Attribute ID	uint16	0x0001	ServiceClassIDList
Attribute Value	Data element sequence (1 item)		
Service Class	UUID	«GAP Service»	
Attribute ID	uint16	0x0004	ProtocolDescriptorList
Attribute Value	Data element sequence (2 items)		
Protocol Descriptor	Data element sequence (2 items)		
Protocol	UUID	«L2CAP»	
Parameter 0	uint16	0x001F *or* 0x0027	PSM = ATT *or* PSM = EATT
Protocol Descriptor	Data element sequence (3 items)		
Protocol	UUID	«ATT»	
Parameter 0	uint16	0xHHHH	GAP Service start handle
Parameter 1	uint16	0xHHHH	GAP Service end handle
Attribute ID	uint16	0x0005	BrowseGroupList
Attribute Value	Data element sequence (1 item)		
Group	UUID	«PublicBrowseRoot»	

Table 15.3: SDP record for the Generic Access Profile, if only one of ATT or EATT is supported

Item	Type	Value	Meaning
Attribute ID	uint16	0x0001	ServiceClassIDList
Attribute Value	Data element sequence (1 item)		
Service class	UUID	«GAP Service»	
Attribute ID	uint16	0x0004	ProtocolDescriptorList
Attribute Value	Data element sequence (2 items)		
Protocol Descriptor	Data element sequence (2 items)		
Protocol	UUID	«L2CAP»	
Parameter 0	uint16	0x001F	PSM = ATT
Protocol Descriptor	Data element sequence (3 items)		
Protocol	UUID	«ATT»	
Parameter 0	uint16	0xHHHH	GAP Service start handle
Parameter 1	uint16	0xHHHH	GAP Service end handle
Attribute ID	uint16	0x000D	AdditionalProtocolDescriptorLists
Attribute Value	Data element sequence (1 item)		
Protocol Descriptor List	Data element sequence (2 items)		
Protocol Descriptor	Data element sequence (2 items)		
Protocol	UUID	«L2CAP»	
Parameter 0	uint16	0x0027	PSM = EATT
Protocol Descriptor	Data element sequence (3 items)		
Protocol	UUID	«ATT»	
Parameter 0	uint16	0xHHHH	GAP Service start handle
Parameter 1	uint16	0xHHHH	GAP Service end handle
Attribute ID	uint16	0x0005	BrowseGroupList
Attribute Value	Data element sequence (1 item)		
Group	UUID	«PublicBrowseRoot»	

Table 15.4: SDP record for the Generic Access Profile, if both ATT and EATT are supported

If a BR/EDR or BR/EDR/LE device supports a GATT-based service on the BR/EDR transport, the service shall exist in the SDP Server and the GATT Server.

16 DEFINITIONS

In the following, terms written with capital letters refer to states.

Most definitions in this section are BR/EDR specific.

16.1 General definitions

Mode: A set of directives that defines how a device will respond to certain events.

Idle: As seen from a remote device, a Bluetooth device is idle, or is in idle mode, when there is no link established between them.

Bond: A relation between two Bluetooth devices defined by creating, exchanging and storing a common link key. The bond is created through the bonding or LMP-pairing procedures.

16.2 Connection-related definitions

Physical channel: See [Vol 2] Part B, Section 2.1.

Piconet: A set of Bluetooth devices sharing the same physical channel defined by the Central's parameters (clock and BD_ADDR).

Physical link: A Baseband-level connection[1] between two devices established using paging. A physical link comprises a sequence of transmission slots on a physical channel alternating between Central and Peripheral transmission slots.

ACL link: An asynchronous (packet-switched) connection[1] between two devices created on LMP level. Traffic on an ACL link uses ACL packets to be transmitted.

SCO link: A synchronous (circuit-switched) connection[1] for reserved bandwidth communications; e.g. voice between two devices, created on the LMP level by reserving slots periodically on a physical channel. Traffic on a SCO link uses SCO packets to be transmitted. SCO links can be established only after an ACL link has first been established.

Link: Shorthand for an ACL link.

PAGE: A Baseband state where a device transmits page trains, and processes any eventual responses to the page trains.

[1]The term 'connection' used here is not identical to the definition below. It is used in the absence of a more concise term.

PAGE_SCAN: A Baseband state where a device listens for page trains.

Page: The transmission by a device of page trains containing the Device Access Code of the device to which the physical link is requested.

Page scan: The listening by a device for page trains containing its own Device Access Code.

Channel: A logical connection on L2CAP level between two devices serving a single application or higher layer protocol.

Connection: A connection between two peer applications or higher layer protocols mapped onto a channel.

Connecting: A phase in the communication between devices when a connection between them is being established. (Connecting phase follows after the link establishment phase is completed.)

Connect (to service): The establishment of a connection to a service. If not already done, this includes establishment of a physical link, link and channel as well.

16.3 Device-related definitions

Discoverable device: A Bluetooth device in range that will respond to an inquiry (normally in addition to responding to page).

Silent device: A Bluetooth device appears as silent to a remote device if it does not respond to inquiries made by the remote device. A device may be silent due to being non-discoverable or due to baseband congestion while being discoverable.

Connectable device: Bluetooth device in range that will respond to a page.

Trusted device: A paired device that is explicitly marked as trusted.

Paired device: A Bluetooth device with which a link key has been exchanged (either before connection establishment was requested or during connecting phase).

Pre-paired device: A Bluetooth device with which a link key was exchanged, and the link key is stored, before link establishment.

Un-paired device: A Bluetooth device for which there was no exchanged link key available before connection establishment was requested.

Known device: A Bluetooth device for which at least the BD_ADDR is stored.

Un-known device: Bluetooth device for which no information (BD_ADDR, link key or other) is stored.

Authenticated device: A Bluetooth device whose identity has been verified during the lifetime of the current link, based on the authentication procedure.

16.4 Procedure-related definitions

Paging: A procedure for establishing a physical link of ACL type on Baseband level, consisting of a page action of the initiator and a page scan action of the responding device.

Link establishment: A procedure for establishing a link on LMP level. A link is established when both devices have agreed that LMP setup is completed.

Channel establishment: A procedure for establishing a channel on L2CAP level.

Connection establishment: A procedure for creating a connection mapped onto a channel.

Creation of a trusted relationship: A procedure where the remote device is marked as a trusted device. This includes storing a common link key for future authentication and pairing (if the link key is not available).

Creation of a secure connection: A procedure of establishing a connection, including authentication and encryption.

Device discovery: A procedure for retrieving the Bluetooth Device Address, clock, and Class of Device from discoverable devices.

Name discovery: A procedure for retrieving the user-friendly name (the Bluetooth Device Name) of a connectable device.

Service discovery: Procedures for querying and browsing for services offered by or through another Bluetooth device.

16.5 Security-related definitions

Authentication: A generic procedure based on LMP-authentication if a link key exists or on LMP-pairing if no link key exists.

LMP-authentication: An LMP level procedure for verifying the identity of a remote device. The procedure is based on a challenge-response mechanism using a random number, a secret key and the BD_ADDR of the non-initiating device. The secret key used can be a previously exchanged link key.

Authorization: A procedure where a user of a Bluetooth device grants a specific (remote) Bluetooth device access to a specific service. Authorization implies that the identity of the remote device can be verified through authentication.

Authorize: The act of granting a specific Bluetooth device access to a specific service. It may be based upon user confirmation, or given the existence of a trusted relationship.

LMP-pairing: A procedure that authenticates two devices, based on a PIN, and subsequently creates a common link key that can be used as a basis for a trusted relationship or a (single) secure connection. The procedure consists of the steps: creation of an initialization key (based on a random number and a PIN), creation and exchange of a common link key and LMP-authentication based on the common link key.

Bonding: A dedicated procedure for performing the first authentication, where a common link key is created and stored for future use.

Trusting: The marking of a paired device as trusted. Trust marking can be done by the user, or automatically by the device (e.g. when in bondable mode) after a successful pairing.

Appendix A Timers and Constants

The following timers are required by this profile.

Timer name	Value	Description	Requirement or Recommendation
$T_{GAP}(100)$	10.24 s	Time span that a Bluetooth device performs device discovery	Recommended value
$T_{GAP}(101)$	10.625 ms	A discoverable Bluetooth device enters INQUIRY_SCAN for at least TGAP(101) every TGAP(102)	Required value
$T_{GAP}(102)$	2.56 s	Maximum time between repeated INQUIRY_SCAN enterings when power consumption or bandwidth is more important than discovery speed	Recommended value
$T_{GAP}(103)$	30.72 s	Minimum time span that a device is in discoverable mode	Required value
$T_{GAP}(104)$	1 min	Maximum time span that a device is in limited discoverable mode	Recommended value
$T_{GAP}(105)$	100 ms	Maximum time between INQUIRY_SCAN enterings when discovery speed is more important than power consumption or bandwidth	Recommended value
$T_{GAP}(106)$	100 ms	Maximum time between PAGE_SCAN enterings when connection speed is more important than power consumption or bandwidth	Recommended value
$T_{GAP}(107)$	1.28 s	Maximum time between PAGE_SCAN enterings (R1 page scan) when power consumption or bandwidth is more important than connection speed	Recommended value
$T_{GAP}(108)$	2.56 s	Maximum time between PAGE_SCAN enterings (R2 page scan) when power consumption or bandwidth is more important than connection speed	Recommended value

Timer name	Value	Description	Requirement or Recommendation
T_{GAP}(adv_fast_-interval1_coded)	90 ms to 180 ms	Minimum to maximum advertising interval in the following GAP Modes on the LE Coded PHY when user initiated: 1. Undirected Connectable Mode 2. Limited Discoverable Mode and sending connectable undirected advertising events 3. General Discoverable Mode and sending connectable undirected advertising events 4. Directed Connectable Mode and sending low duty cycle connectable directed advertising events	Recommended value
T_{GAP}(adv_fast_-interval1)	30 ms to 60 ms	Minimum to maximum advertising interval in the following GAP Modes on the LE 1M PHY when user initiated: 1. Undirected Connectable Mode 2. Limited Discoverable Mode and sending connectable undirected advertising events 3. General Discoverable Mode and sending connectable undirected advertising events 4. Directed Connectable Mode and sending low duty cycle directed advertising events	Recommended value
T_{GAP}(adv_fast_-interval2_coded)	300 ms to 450 ms	Minimum to maximum advertising interval in the following GAP Modes on the LE Coded PHY when user initiated and sending non-connectable advertising events: 1. Non-Discoverable Mode 2. Non-Connectable Mode 3. Limited Discoverable Mode 4. General Discoverable Mode	Recommended value

Timer name	Value	Description	Requirement or Recommendation
T_{GAP}(adv_fast_-interval2)	100 ms to 150 ms	Minimum to maximum advertising interval in the following GAP Modes on the LE 1M PHY when user initiated and sending non-connectable advertising events: 1. Non-Discoverable Mode 2. Non-Connectable Mode 3. Limited Discoverable Mode 4. General Discoverable Mode	Recommended value
T_{GAP}(adv_fast_period)	30 s	Minimum time to perform advertising when user initiated	Recommended value
T_{GAP}(adv_slow_-interval_coded)	3 s to 3.6 s	Minimum to maximum advertisement interval in any discoverable or connectable mode when background advertising on the LE Coded PHY	Recommended value
T_{GAP}(adv_slow_-interval)	1 s to 1.2 s	Minimum to maximum advertisement interval in any discoverable or connectable mode when background advertising on the LE 1M PHY	Recommended value
T_{GAP}(conn_param_-timeout)	30 s	Connection parameter update notification timer when performing the connection parameter update procedure	Recommended value
T_{GAP}(conn_pause_-central)	1 s	Central idle timer	Recommended value
T_{GAP}(conn_pause_-peripheral)	5 s	Minimum time upon connection establishment before the Peripheral starts a connection update procedure	Recommended value
T_{GAP}(gen_disc_scan_-min_coded)	30.72 s	Minimum time to perform scanning when performing the general discovery procedure on the LE Coded PHY	Recommended value
T_{GAP}(gen_disc_-scan_min)	10.24 s	Minimum time to perform scanning when performing the general discovery procedure on the LE 1M PHY	Recommended value
T_{GAP}(initial_conn_-interval_coded)	90 ms to 150 ms	Minimum to maximum connection interval upon any connection establishment on the LE Coded PHY	Recommended value
T_{GAP}(initial_conn_-interval)	30 ms to 50 ms	Minimum to maximum connection interval upon any connection establishment on the LE 1M PHY	Recommended value
T_{GAP}(lim_adv_timeout)	180 s	Maximum time to remain advertising when in the limited discoverable mode	Required value

Timer name	Value	Description	Requirement or Recommendation
T_{GAP}(lim_disc_scan_int_coded)	33.75 ms	Scan interval used in the limited discovery procedure on the LE Coded PHY	Recommended value
T_{GAP}(lim_disc_scan_int)	11.25 ms	Scan interval used in the limited discovery procedure on the LE 1M PHY	Recommended value
T_{GAP}(lim_disc_scan_min_coded)	30.72 s	Minimum time to perform scanning when performing the limited discovery procedure on the LE Coded PHY	Recommended value
T_{GAP}(lim_disc_scan_min)	10.24 s	Minimum time to perform scanning when performing the limited discovery procedure on the LE 1M PHY	Recommended value
T_{GAP}(private_addr_int)	15 min	Maximum time interval between private address change	Recommended value
T_{GAP} (scan_fast_interval_coded	90 ms to 180 ms	Scan interval in any discovery or connection establishment procedure when user initiated on the LE Coded PHY	Recommended value
T_{GAP}(scan_fast_interval)	30 ms to 60 ms	Scan interval in any discovery or connection establishment procedure when user initiated on the LE 1M PHY	Recommended value
T_{GAP}(scan_fast_period)	30.72 s	Minimum time to perform scanning when user initiated	Recommended value
T_{GAP}(scan_fast_window_coded)	90 ms	Scan window in any discovery or connection establishment procedure when user initiated on the LE Coded PHY	Recommended value
T_{GAP}(scan_fast_window)	30 ms	Scan window in any discovery or connection establishment procedure when user initiated on the LE 1M PHY	Recommended value
T_{GAP}(scan_slow_interval1_coded)	3.84 s	Scan interval in any discovery or connection establishment procedure when background scanning on the LE Coded PHY	Recommended value
T_{GAP}(scan_slow_interval1)	1.28 s	Scan interval in any discovery or connection establishment procedure when background scanning on the LE 1M PHY	Recommended value
T_{GAP}(scan_slow_interval2_coded)	7.68 s	Scan interval in any discovery or connection establishment procedure when background scanning on the LE Coded PHY	Recommended value

Timer name	Value	Description	Requirement or Recommendation
T_{GAP}(scan_slow_interval2)	2.56 s	Scan interval in any discovery or connection establishment procedure when background scanning on the LE 1M PHY	Recommended value
T_{GAP}(scan_slow_window1_coded)	33.75 ms	Scan window in any discovery or connection establishment procedure when background scanning on the LE Coded PHY	Recommended value
T_{GAP}(scan_slow_window1)	11.25 ms	Scan window in any discovery or connection establishment procedure when background scanning on the LE 1M PHY	Recommended value
T_{GAP}(scan_slow_window2_coded)	67.5 ms	Scan window in any discovery or connection establishment procedure when background scanning on the LE Coded PHY	Recommended value
T_{GAP}(scan_slow_window2)	22.5 ms	Scan window in any discovery or connection establishment procedure when background scanning on the LE 1M PHY	Recommended value
T_{GAP}(Sync_Scan_Interval)	320 ms	Interval between the start of adjacent synchronization scan windows	Recommended value
T_{GAP}(Sync_Scan_Window)	91.25 ms	Duration of Synchronization scan window	Recommended value
T_{GAP}(Sync_Train_Duration)	30.72 s	Duration of synchronizability mode	Required value
T_{GAP}(Sync_Train_Interval)	80 ms	Interval between Synchronization Train events	Recommended value

Table A.1: Defined GAP timers

Appendix B Information Flows of Related Procedures

B.1 LMP – authentication

Authentication at the link level is specified in [Vol 2] Part C, Section 4.2.1.

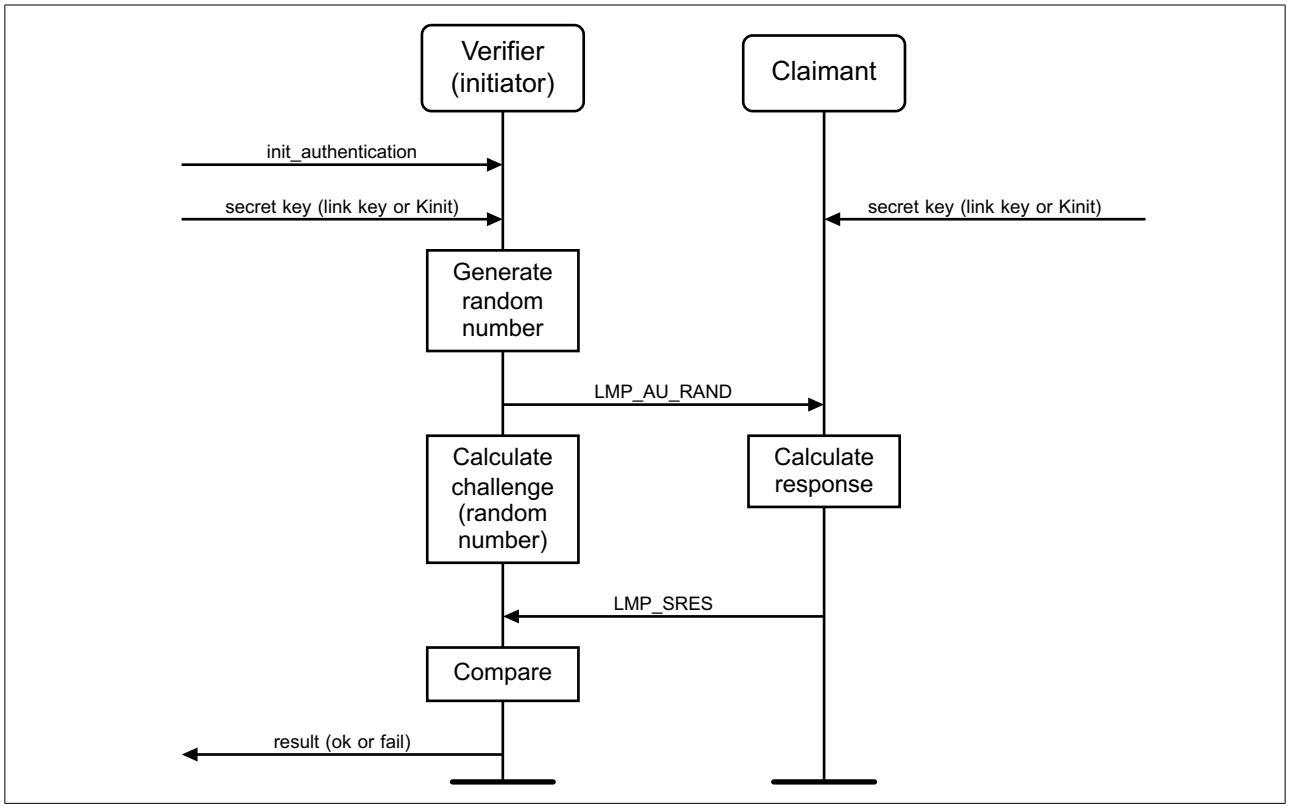

Figure B.1: LMP authentication

The secret key used here is an already exchanged link key.

B.2 LMP – pairing

Pairing at the link level is specified in [Vol 2] Part C, Section 4.2.2.

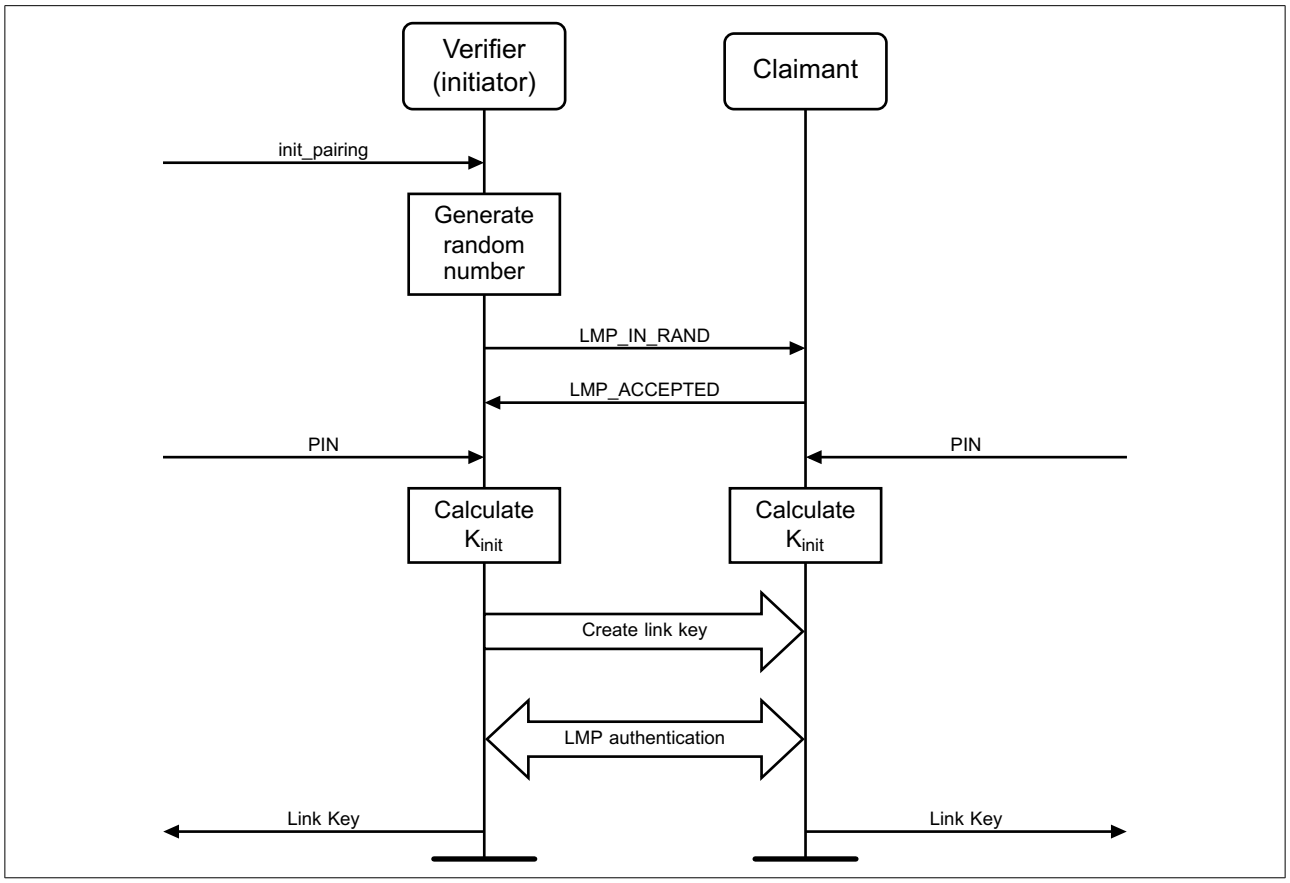

Figure B.2: LMP pairing

The PIN used here is PINBB.

The create link key procedure is described in [Vol 2] Part C, Section 4.2.2.4 and [Vol 2] Part H, Section 3.2. A mutual authentication takes place irrespective of the current security mode.

B.3 Service Discovery

The Service Discovery Protocol specifies what PDUs are used over-the-air to inquire about services and service attributes. The procedures for discovery of supported

services and capabilities using the Service Discovery Protocol are described in higher layer specifications. This is just an example.

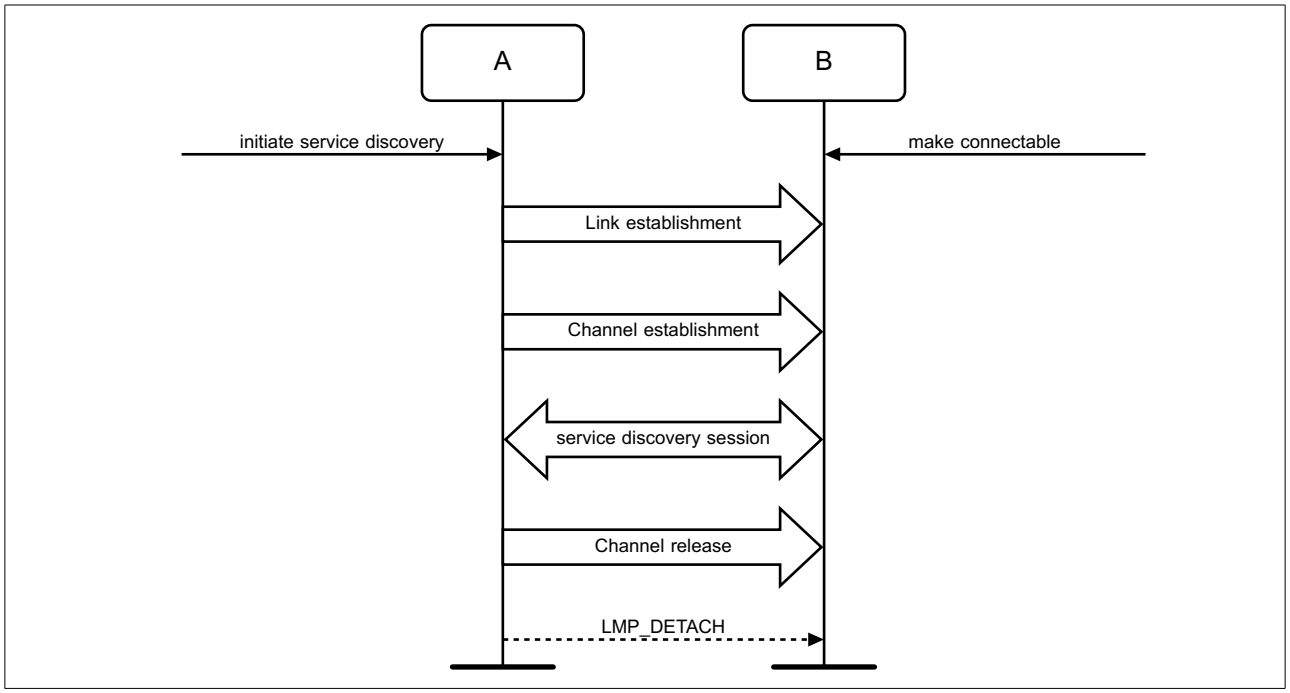

Figure B.3: Service Discovery procedure

B.4 Generating a resolvable private address

Generating a resolvable private address is described in Section 10.8.2.2.

B.5 Resolving a resolvable private address

Resolving a resolvable private address is described in Section 10.8.2.3.

Part D

TEST SUPPORT

CONTENTS

1 TEST METHODOLOGY

This section describes the test modes for hardware and low-level functionality tests of Bluetooth devices.

The BR/EDR Test mode supports testing of the Bluetooth transmitter and receiver including transmitter tests (packets with constant bit patterns) and loopback tests. It is intended mainly for testing of the radio and Baseband and may also be used for in-production and after-sales testing.

1.1 BR/EDR test scenarios

A device in BR/EDR Test mode shall not support normal operation. For security reasons the BR/EDR Test mode is designed such that it offers no benefit to the user. Therefore, no data output or acceptance on a HW or SW interface shall be allowed.

1.1.1 Test setup

The setup consists of an implementation under test (IUT) and a tester. Optionally, additional measurement equipment may be used.

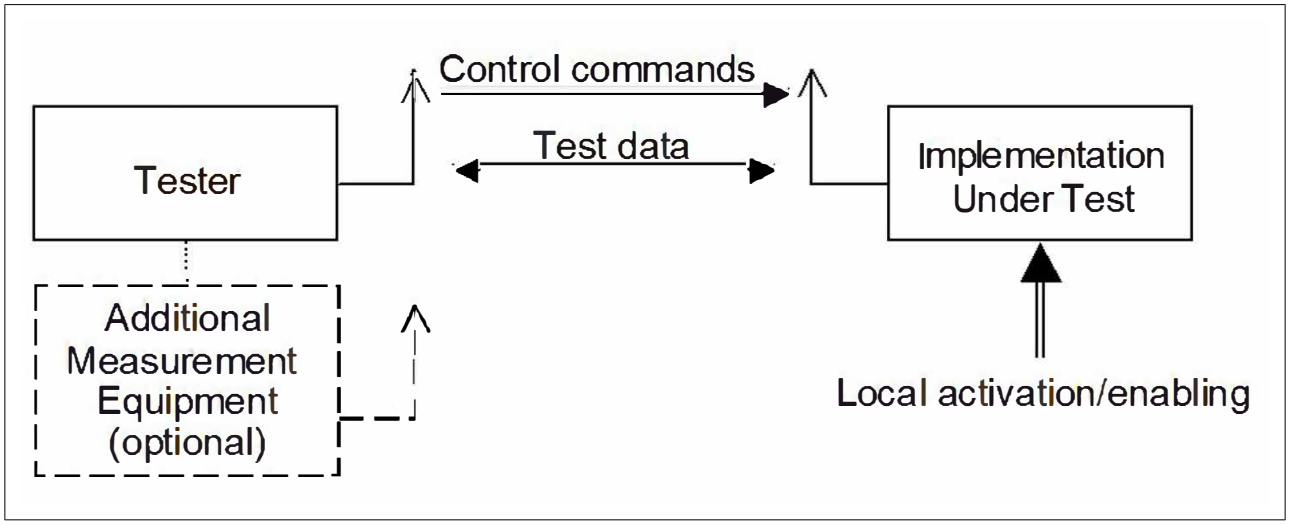

Figure 1.1: Setup for Test mode

Tester and IUT form a piconet where the tester acts as Central and has full control over the test procedure. The IUT acts as Peripheral.

The control is done via the air interface using LMP commands (see [Vol 2] Part C, Section 4.7.3). Hardware interfaces to the IUT may exist, but are not subject to standardization.

The test mode is a special state of the Bluetooth model. For security and type approval reasons, a Bluetooth device in test mode shall not support normal operation. When the IUT leaves the test mode it enters the standby state. After power-off the Bluetooth device shall return to the standby state.

1.1.2 Transmitter test

The Bluetooth device transmits a constant bit pattern. This pattern is transmitted periodically with packets aligned to the Peripheral TX timing of the piconet formed by tester and IUT. The same test packet is repeated for each transmission.

The transmitter test is started when the Central sends the first POLL packet. In non-hopping mode the agreed frequency is used for this POLL packet.

The tester (Central) transmits control or POLL packets in the Central-to-Peripheral transmission slots. The IUT (Peripheral) shall transmit packets in the following Peripheral-to-Central transmission slot. The tester's polling interval is fixed and defined by the LMP_TEST_CONTROL PDU. The implementation under test may transmit its burst according to the normal timing even if no packet from the tester was received. In this case, the ARQN bit is shall be set to NAK.

The burst length may exceed the length of a one slot packet. In this case the tester may take the next free Central TX slot for polling. The timing is illustrated in Figure 1.2.

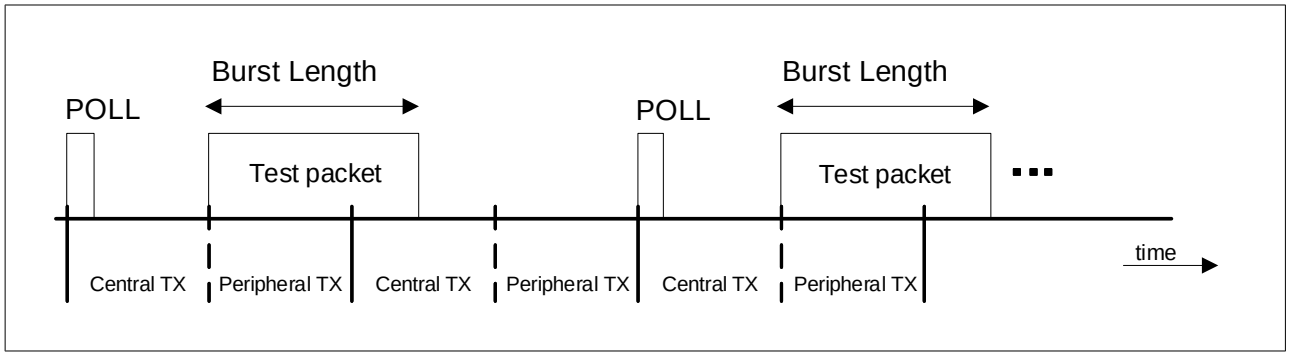

Figure 1.2: Timing for transmitter test

1.1.2.1 Packet format

The test packet is a normal Bluetooth packet, see Figure 1.3. For the payload itself see below.

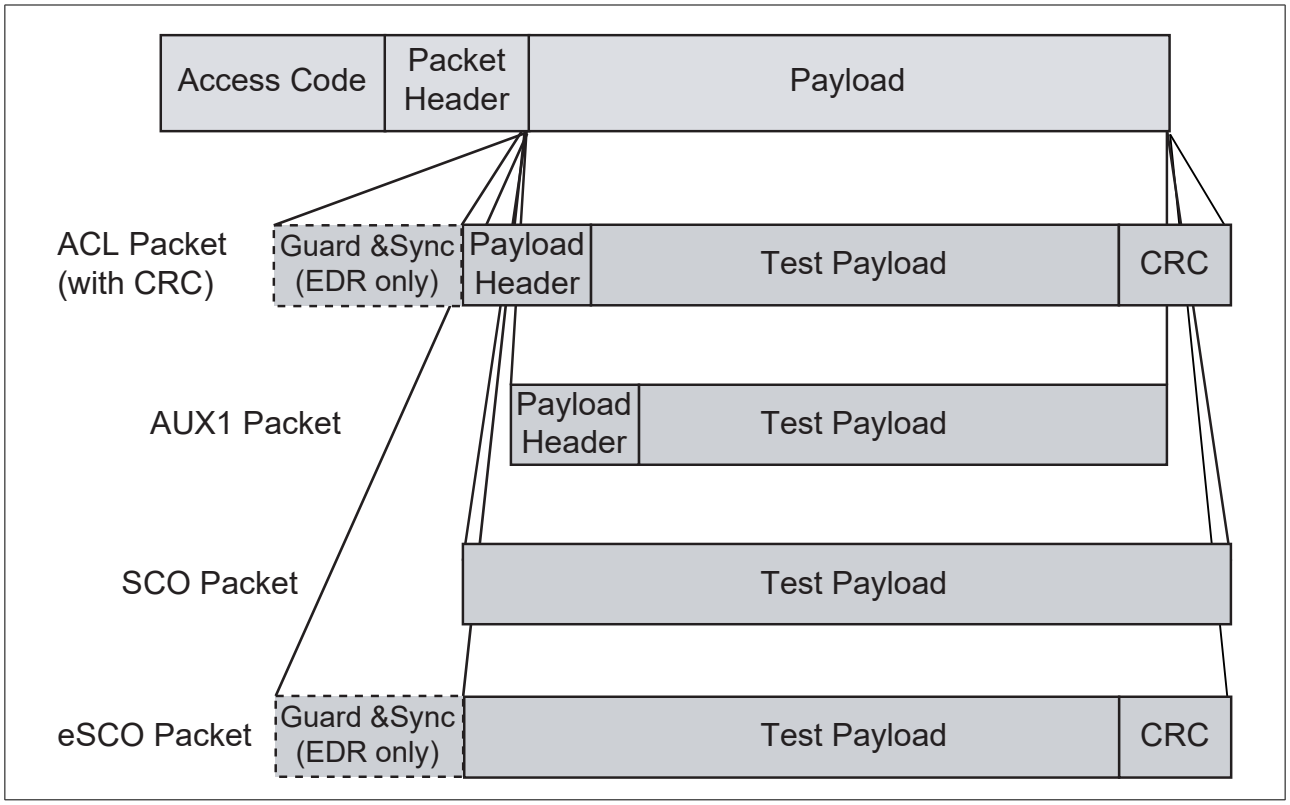

Figure 1.3: General format of TX packet

During configuration the tester defines:

- the packet type to be used
- payload length

For the payload length, the restrictions from the Baseband specification shall apply (see [Vol 2] Part B, Section 6.5). In case of ACL, SCO and eSCO packets the payload structure defined in the Baseband specification is preserved as well, see Figure 1.3.

For the transmitter test mode, only packets without FEC should be used; i.e. HV3, EV3, EV5, DH1, DH3, DH5, 2-EV3, 2-EV5, 3-EV3, 3-EV5, 2-DH1, 2-DH3, 2-DH5, 3-DH1, 3-DH3, 3-DH5 and AUX1 packets.

In transmitter test mode, the packets exchanged between the tester and the IUT shall not be scrambled with the whitening sequence. Whitening shall be turned off when the IUT has accepted to enter the transmitter test mode, and shall be turned on when the IUT has accepted to exit the transmitter test mode, see Figure 1.4. Implementations shall ensure that retransmissions of the LMP_ACCEPTED messages use the same whitening status as used in the original LMP_ACCEPTED.

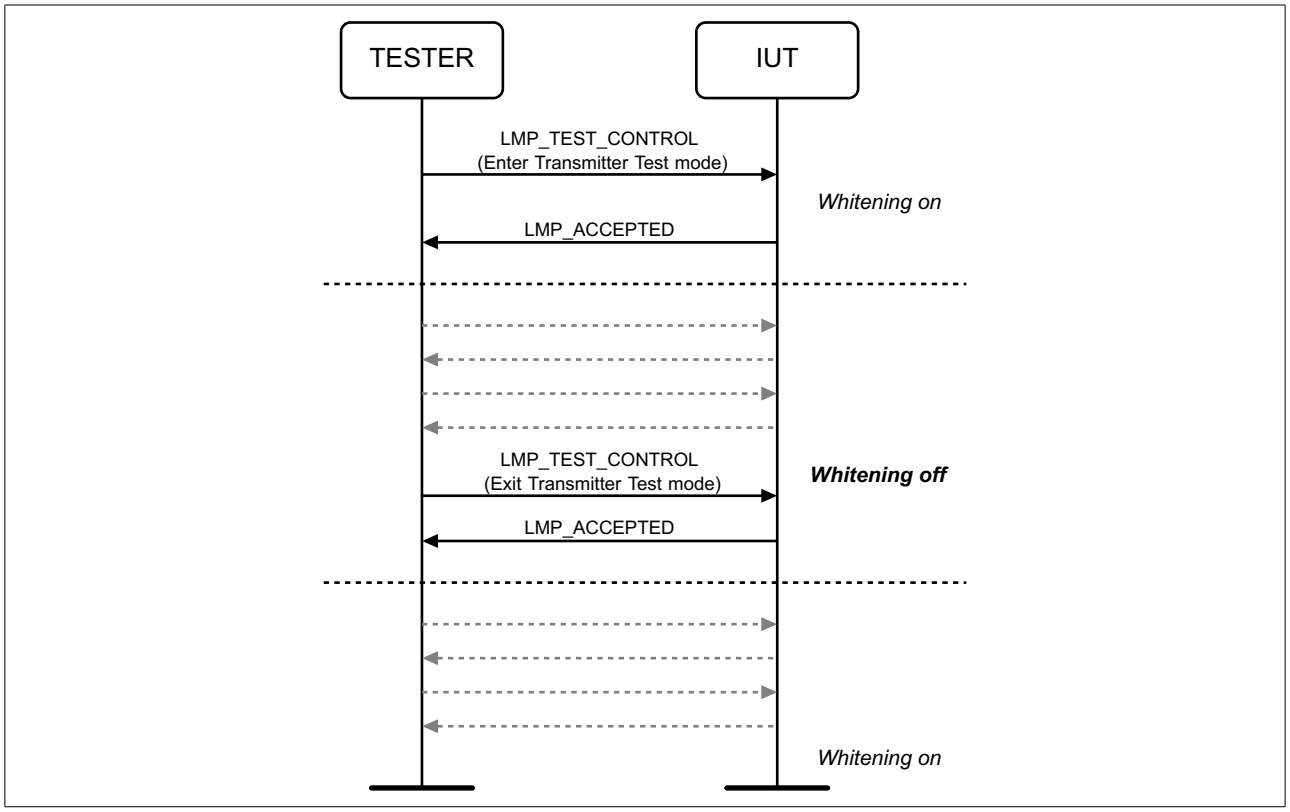

Figure 1.4: Use of whitening in Transmitter mode

1.1.2.2 Pseudorandom sequence

The same pseudorandom sequence of bits shall be used for each transmission (i.e. the packet is repeated). A PRBS9 sequence is used, see [1] and [2].

The properties of this sequence are as follows (see [2]). The sequence may be generated in a nine-stage shift register whose 5th and 9th stage outputs are XORed (see Figure 1.5), and the result is fed back to the input of the first stage. The sequence begins with the first ONE of 9 consecutive ONEs; i.e. the shift register is initialized with nine ones.

- Number of shift register stages: 9
- Length of pseudo-random sequence: 2^9-1 = 511 bits
- Longest sequence of zeros: 8 (non-inverted signal)

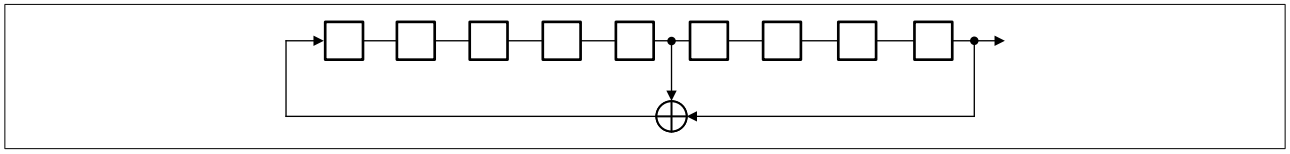

Figure 1.5: Linear feedback shift register for generation of the PRBS sequence

1.1.2.3 Control of transmit parameters

The following parameters can be set to configure the transmitter test:

1. Bit pattern:
   - Constant zero
   - Constant one
   - Alternating 1010...[1]
   - Alternating 1111 0000 1111 0000...[1]
   - Pseudorandom bit pattern
   - Transmission off
2. Frequency selection:
   - Single frequency
   - Normal hopping
3. TX frequency
   - (2402 + k) MHz for channel k
4. Default poll period in TDD frames (n × 1.25 ms)
5. Packet Type
6. Length of test payload

1.1.2.4 Power control

When the legacy power control mechanism is tested the IUT shall start transmitting at the maximum power and shall reduce/increase its power by one step on every LMP_INCR_POWER_REQ or LMP_DECR_POWER_REQ PDU received. When the enhanced power control mechanism is tested the IUT shall start transmitting at the maximum power and shall reduce/increase its power by one step or go to the maximum power level when a LMP_POWER_CONTROL_REQ PDU is received.

1.1.2.5 Switch between different frequency settings

A change in the frequency selection becomes effective when the LMP procedure is completed:

When the tester receives the LMP_ACCEPTED it shall then transmit POLL packets containing the ACK for at least 8 slots (4 transmissions). When these transmissions

[1]It is recommended that the sequence starts with a one; but, as this is irrelevant for measurements, it is also allowed to start with a zero.

have been completed the tester shall change to the new frequency hop and whitening settings.

After sending LMP_ACCEPTED the IUT shall wait for the LC level ACK for the LMP_ACCEPTED. When this is received it shall change to the new frequency hop and whitening settings.

There will be an implementation defined delay after sending the LMP_ACCEPTED before the TX or loopback test starts. Testers shall be able to cope with this.

Note: Loss of the LMP_ACCEPTED PDU will eventually lead to a loss of frequency synchronization that cannot be recovered. Similar problems occur in normal operation, when the hopping pattern changes.

1.1.2.6 Adaptive Frequency Hopping

Adaptive Frequency Hopping (AFH) shall only be used when the Hopping Mode is set to 79 channels (e.g., Hopping Mode = 1) in the LMP_TEST_CONTROL PDU. If AFH is used, the normal LMP commands and procedures shall be used. When AFH is enabled prior to entering test mode it shall continue to be used with the same parameters if Hopping Mode = 1 until the AFH parameters are changed by the LMP_SET_AFH PDU.

The channel classification reporting state shall be retained upon entering or exiting Test Mode. The IUT shall change the channel classification reporting state in Test Mode based on control messages from the tester (e.g., LMP_CHANNEL_CLASSIFICATION_REQ) and from the Host (HCI_Write_AFH_Channel_Assessment_Mode).

1.1.3 LoopBack test

In loopback, the implementation under test receives normal Baseband packets containing payload *Accepted* from the tester. The received packets shall be decoded in the IUT, and the payload shall be sent back using the same packet type. The return packet shall be sent back in either the Peripheral-to-Central transmission slot directly following the transmission of the tester, or it is delayed and sent back in the Peripheral-to-Central transmission slot after the next transmission of the tester (see Figure 1.7 to Figure 1.9).

There is no signaling to determine or control the mode. The device behavior shall be fixed or adjusted by other means, and shall not change randomly.

The tester can select whether whitening is on or off. This setting holds for both uplink and downlink. For switching the whitening status, the same rules as in Section 1.1.2 (Figure 1.4) shall apply.

The following rules apply (for illustration see Figure 1.6):

- If the synch word was not detected, the IUT shall not reply.
- If the header error check (HEC) fails, the IUT shall either reply with a NULL packet with the ARQN bit set to NAK or send nothing.
- If the packet contains an LMP message relating to the control of the test mode this command shall be executed and the packet shall not be returned, though ACK or NAK shall be returned as per the usual procedure. Other LMP commands shall be ignored and no packet returned.
- The payload FEC is decoded and the payload shall be encoded again for transmission. This allows testing of the FEC handling. If the pure bit error rate shall be determined the tester chooses a packet type without FEC.
- The CRC shall be evaluated. In the case of a failure, ARQN=NAK shall be returned. The payload shall be returned as received.

  A new CRC for the return packet shall be calculated for the returned payload regardless of whether the CRC was valid or not.
- If the CRC fails for a packet with a CRC and a payload header, the number of bytes as indicated in the (possibly erroneous) payload header shall be looped back.

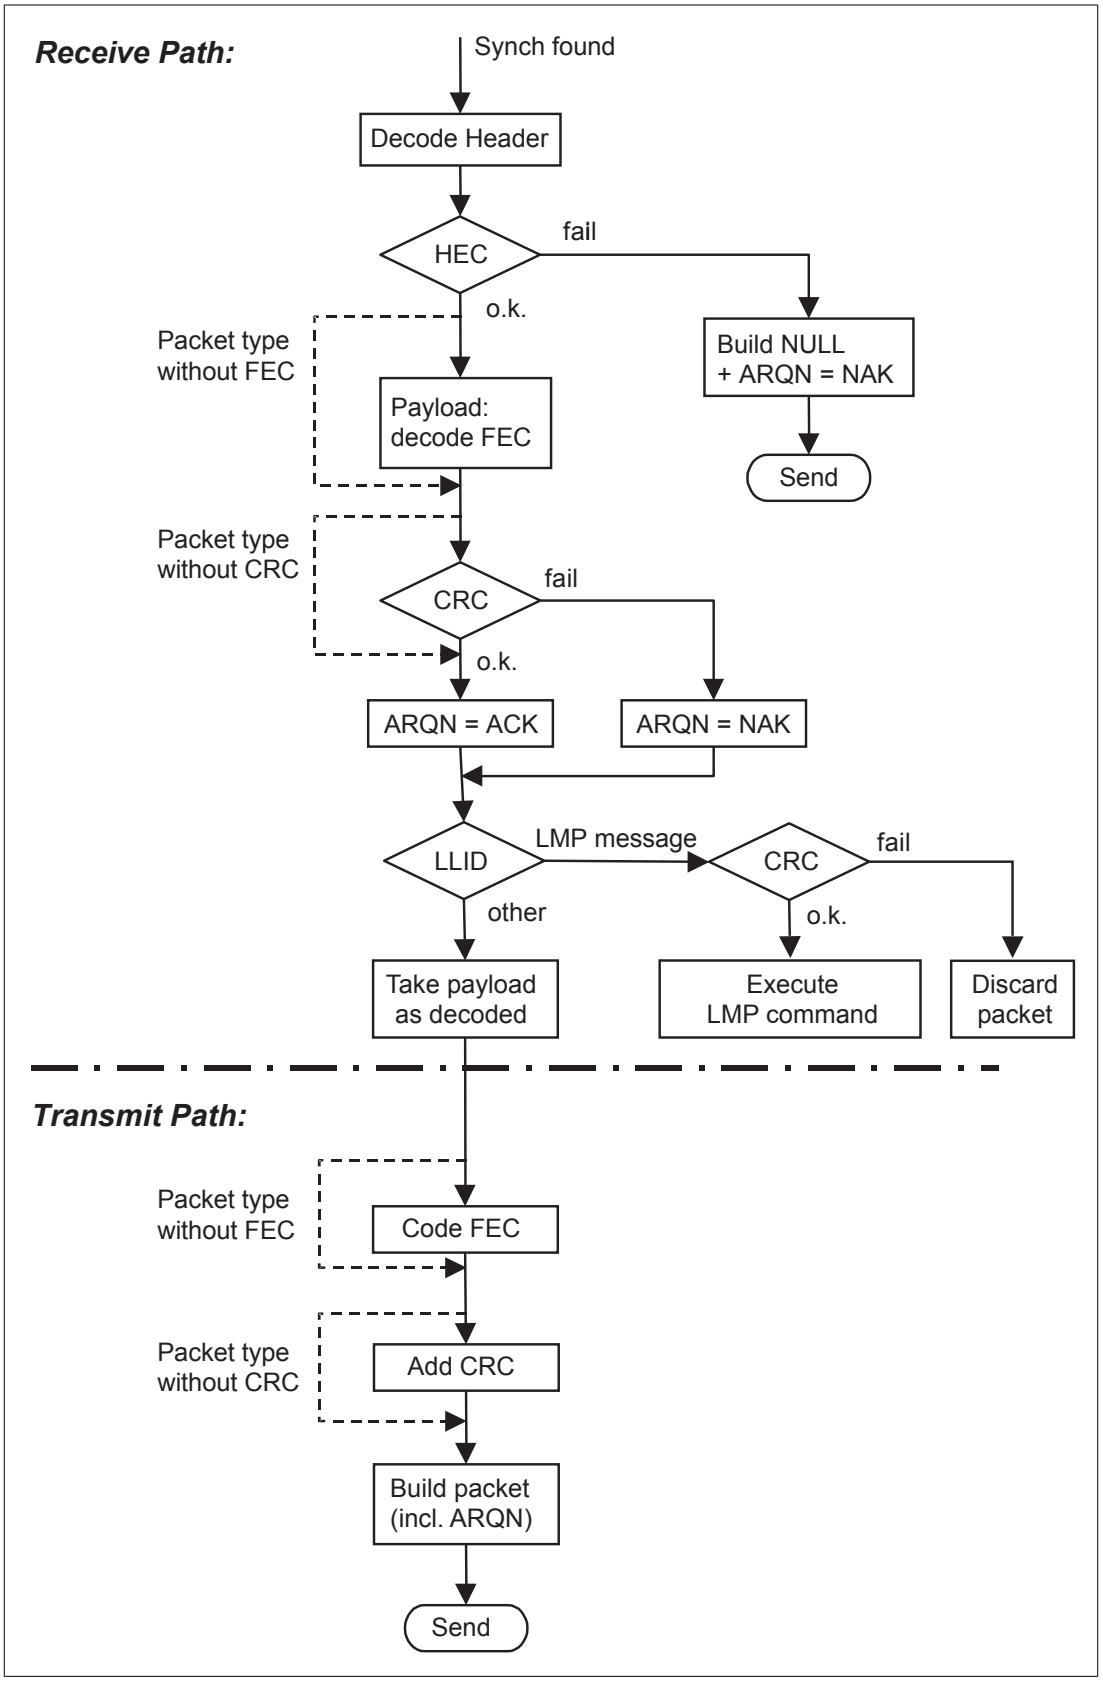

Figure 1.6: IUT packet handling in loopback test

The timing for normal and delayed loopback is illustrated in Figure 1.7 to Figure 1.9:

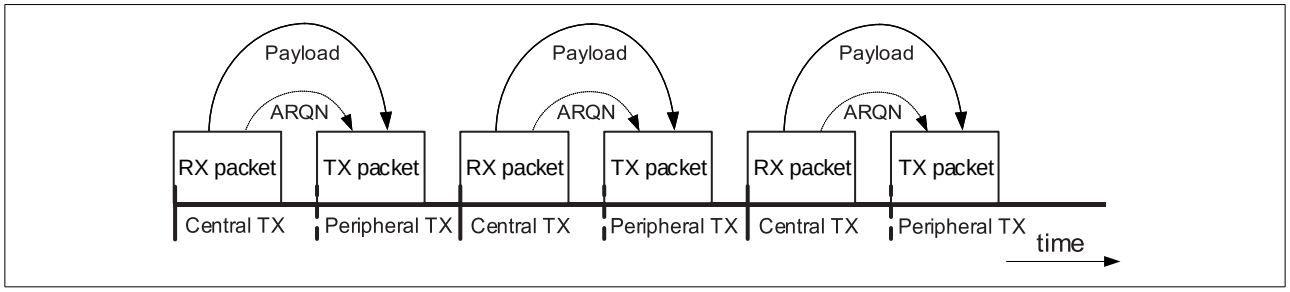

Figure 1.7: Payload and ARQN handling in normal loopback

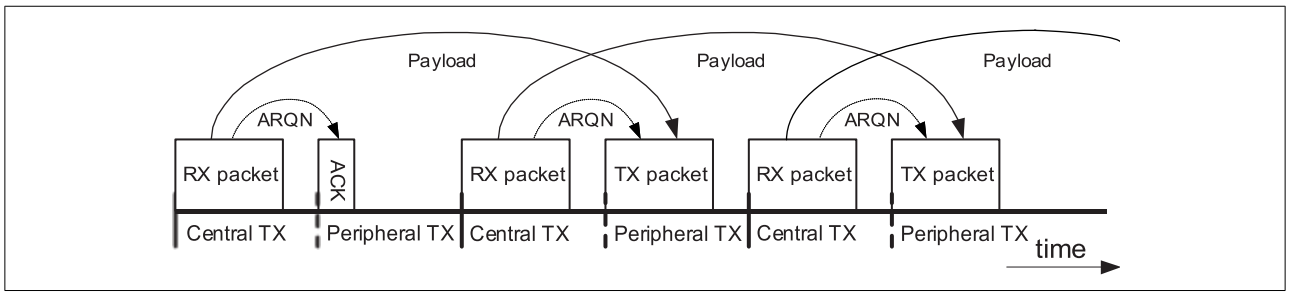

Figure 1.8: Payload and ARQN handling in delayed loopback – start

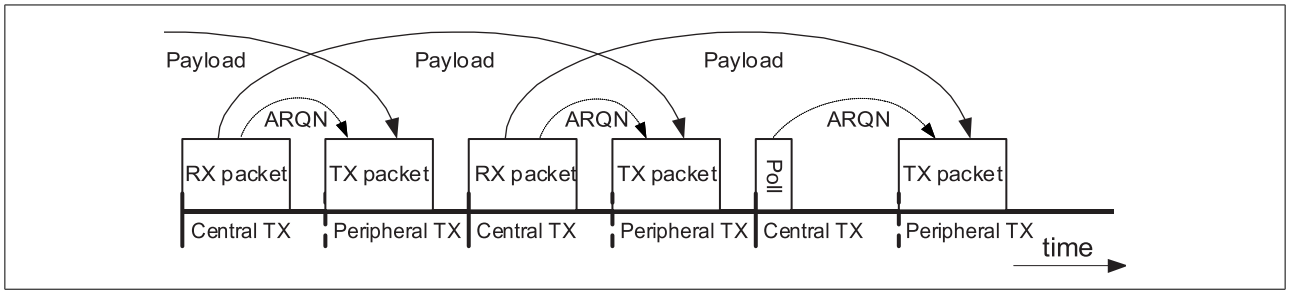

Figure 1.9: Payload and ARQN handling in delayed loopback – end

The whitening is performed in the same way as it is used in normal Active mode.

The following parameters can be set to configure the loop back test:

1. Packet Class[1] ACL packets
   SCO packets
   eSCO packets
   ACL packets without whitening
   SCO packets without whitening
   eSCO packets without whitening

[1]This is included because the packet type numbering is ambiguous.

2. Frequency Selection

   Single frequency (independent for RX and TX)

   Normal hopping

3. Power level: (To be used according radio specification requirements)

   power control or fixed TX power

The switch of the frequency setting is done exactly as for the transmitter test (see Section 1.1.2.5).

1.1.4 Pause test

Pause test is used by testers to put the implementation under test into Pause Test mode from either the loopback or transmitter test modes.

When an LMP_TEST_CONTROL PDU that specifies Pause Test is received the IUT shall stop the current test and enter Pause Test mode. In the case of a transmitter test this means that no more packets shall be transmitted. While in Pause Test mode the IUT shall respond normally to POLL packets (i.e. responds with a NULL packet). The IUT shall also respond normally to all the LMP packets that are allowed in test mode.

When the test scenario is set to Pause Test all the other fields in the LMP_TEST_CONTROL PDU shall be ignored. There shall be no change in hopping scheme or whitening as a result of a request to pause test.

ATTRIBUTE PROTOCOL (ATT)

This Part defines the Attribute Protocol; a protocol for discovering, reading, and writing attributes on a peer device

CONTENTS

1 INTRODUCTION

1.1 Scope

The Attribute Protocol allows a device referred to as the server to expose a set of attributes and their associated values to a peer device referred to as the client. These attributes exposed by the server can be discovered, read, and written by a client, and can be indicated and notified by the server.

1.2 [This section is no longer used]

1.3 Conventions

In this Part PDU names appear in italics. Error codes defined in Table 3.4 (see Section 3.4.1.1) appear in italics followed by the numeric code (e.g. *Attribute Not Found* (0x0A)). Other names such as parameters appear in Roman text.

2 PROTOCOL OVERVIEW

The Attribute Protocol defines two roles; a server role and a client role. It allows a server to expose a set of attributes to a client that are accessible using the Attribute Protocol.

An attribute is a discrete value that has the following three properties associated with it:

a. attribute type, defined by a UUID

b. attribute handle

c. a set of permissions that are defined by each higher layer specification that utilizes the attribute; these permissions cannot be accessed using the Attribute Protocol.

The attribute type specifies what the attribute represents. Bluetooth SIG defined attribute types are defined in Assigned Numbers and used by an associated higher layer specification. Non-Bluetooth SIG attribute types may also be defined.

The attribute handle uniquely identifies an attribute on a server, allowing a client to reference the attribute in read or write requests; see Section 3.4.4, Section 3.4.5, and Section 3.4.6. It allows a client to uniquely identify the attribute being notified or indicated, see Section 3.4.7. Clients are able to discover the handles of the server's attributes; see Section 3.4.3. Permissions may be applied to an attribute to prevent applications from obtaining or altering an attribute's value. An attribute may be defined by a higher layer specification to be readable or writable or both, and may have additional security requirements. For more information, see Section 3.2.5.

A client may send Attribute Protocol requests to a server, and the server shall respond to all requests that it receives. A device can implement both client and server roles, and both roles can function concurrently in the same device and between the same devices. There shall be only one instance of a server on each Bluetooth device; this implies that the attribute handles shall be identical for all supported bearers. For a given client, the server shall have one set of attributes, which shall have the same value and properties irrespective of which bearer is used. The server can support multiple clients. The attribute values can be the same or different for each client as defined by GATT or a higher layer specification.

Note: Multiple services may be exposed on a single server by allocating separate ranges of handles for each service. The discovery of these handle ranges is defined by a higher layer specification.

The Attribute Protocol has notification and indication capabilities that provide an efficient way of sending attribute values to a client without the need for them to be read; see Section 3.3.

All Attribute Protocol requests are sent over an ATT bearer. There can be multiple ATT bearers established between two devices. Each ATT bearer uses a separate L2CAP channel and can have a different configuration.

In LE, there is a single ATT bearer that uses a fixed channel that is available as soon as the ACL connection is established. Additional ATT bearers can be established using L2CAP (see Section 3.2.11).

In BR/EDR, one or more ATT bearers can be established using L2CAP (see Section 3.2.11).

3 PROTOCOL REQUIREMENTS

3.1 Introduction

Each attribute has an attribute type that identifies, by means of a UUID (Universally Unique IDentifier), what the attribute represents so that a client can understand the attributes exposed by a server. Each attribute has an attribute handle that is used for accessing the attribute on a server, as well as an attribute value.

An attribute value is accessed using its attribute handle. The attribute handles are discovered by a client using Attribute Protocol PDUs (Protocol Data Unit). Attributes that have the same attribute type may exist more than once in a server. Attributes also have a set of permissions that controls whether they can be read or written, or whether the attribute value shall be sent over an encrypted link. Security aspects of the Attribute Protocol are defined in Section 4.

3.2 Basic concepts

3.2.1 Attribute type

A universally unique identifier (UUID) is used to identify every attribute type. A UUID is considered unique over all space and time. A UUID can be independently created by anybody and distributed or published as required. There is no central registry for UUIDs, as they are based off a unique identifier that is not duplicated. The Attribute Protocol allows devices to identify attribute types using UUIDs regardless of the local handle used to identify them in a read or write request.

Universal unique identifiers are defined in SDP [Vol 3] Part B, Section 2.5.1.

All 32-bit Attribute UUIDs shall be converted to 128-bit UUIDs when the Attribute UUID is contained in an ATT PDU.

3.2.2 Attribute handle

An attribute handle is a 16-bit value that is assigned by each server to its own attributes to allow a client to reference those attributes. An attribute handle shall not be reused while an ATT bearer exists between a client and its server.

Attribute handles on any given server shall have unique, non-zero values. Attributes are ordered by attribute handle.

An attribute handle of value 0x0000 is reserved for future use. An attribute handle of value 0xFFFF is known as the maximum attribute handle.

Note: Attributes can be added or removed while an ATT bearer is established; however, an attribute that has been removed cannot be replaced by another attribute with the same handle while any ATT bearer is established.

3.2.3 Attribute handle grouping

Grouping is defined by a specific attribute placed at the beginning of a range of other attributes that are grouped with that attribute, as defined by a higher layer specification. Clients can request the first and last handles associated with a group of attributes.

3.2.4 Attribute value

An attribute value is an octet array that may be either fixed or variable length. For example, it can be a one octet value, or a four octet integer, or a variable length string. An attribute may contain a value that is too large to transmit in a single PDU and can be sent using multiple PDUs. The values that are transmitted are opaque to the Attribute Protocol. The encoding of these octet arrays is defined by the attribute type.

When transmitting attribute values in a request, a response, a notification or an indication, the attribute value length is not sent in any field of the majority of PDUs. The length of a variable length field in those PDUs is implicitly given by the length of the packet that carries this PDU. This implies that:

- Only one attribute value can be placed in a single request, response, notification or indication unless the attribute values have lengths known by both the server and client, as defined by the attribute type.
- This attribute value will always be the only variable length field of a request, response, notification or indication.
- The bearer protocol (e.g. L2CAP) preserves datagram boundaries.

Note: Some responses include multiple attribute values, for example when client requests multiple attribute reads. For the client to determine the attribute value boundaries, the attribute values must have a fixed size defined by the attribute type.

There are some PDUs where the length of attribute values is included as a field within the PDU and therefore the above implications do not apply to these PDUs.

3.2.5 Attribute permissions

An attribute has a set of permission values associated with it. The permissions associated with an attribute specifies that it may be read and/or written. The permissions associated with the attribute specifies the security level required for read and/or write access, as well as notification and/or indication. The permissions of a given attribute are defined by a higher layer specification, and are not discoverable using the Attribute Protocol.

If access to a secure attribute requires an authenticated link, and the client is not already authenticated with the server with sufficient security, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authentication* (0x05). When a client receives this error code it may try to authenticate the link, and if the authentication is successful, it can then access the secure attribute.

If access to a secure attribute requires an encrypted link, and the link is not encrypted, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Encryption* (0x0F). When a client receives this error code it may try to encrypt the link and if the encryption is successful, it can then access the secure attribute.

If access to a secure attribute requires an encrypted link, and the link is encrypted but with an encryption key size that is too short for the level of security required, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Encryption Key Size Too Short* (0x0C). When a client receives this error code it may try to encrypt the link with a longer key size, and if the encryption is successful, it can then access the secure attribute.

Attribute permissions are a combination of access permissions, encryption permissions, authentication permissions and authorization permissions.

The following access permissions are possible:

- Readable
- Writeable
- Readable and writable

The following encryption permissions are possible:

- Encryption required
- No encryption required

The following authentication permissions are possible:

- Authentication Required
- No Authentication Required

The following authorization permissions are possible:

- Authorization Required
- No Authorization Required

Encryption, authentication, and authorization permissions can have different possibilities; for example, a specific attribute could require a particular kind of

authentication or a certain minimum encryption key length. An attribute can have several combinations of permissions that apply; for example, a specific attribute could allow any of the following:

- Read if encrypted (authentication not required)
- Write if authenticated and encrypted
- Read or write if authenticated and authorized (irrespective of encryption)

Access permissions are used by a server to determine if a client can read and/or write an attribute value.

Authentication permissions are used by a server to determine if an authenticated physical link is required when a client attempts to access an attribute. Authentication permissions are also used by a server to determine if an authenticated physical link is required before sending a notification or indication to a client.

Authorization permissions determine if a client needs to be authorized before accessing an attribute value.

Different bearers for the same client may be on links with different security properties. Therefore, the server must not assume that when a client has been authenticated on the link carrying one bearer, it has been authenticated on all bearers. The different security properties might have other implications that an implementation needs to take into account.

3.2.6 Control-point attributes

Attributes that cannot be read, but can only be written, notified or indicated are called control-point attributes. These control-point attributes can be used by higher layers to enable device specific procedures, for example the writing of a command or the indication when a given procedure on a device has completed.

3.2.7 Protocol methods

The Attribute Protocol uses methods defined in Section 3.4 to find, read, write, notify, and indicate attributes. A method is categorized as either a command, a request, a response, a notification, an indication, or a confirmation; see Section 3.3. Some Attribute Protocol PDUs can also include an Authentication Signature, to allow authentication of the originator of this PDU without requiring encryption. The method and signed bit are known as the opcode.

3.2.8 Exchanging MTU size

ATT_MTU is defined as the maximum size of any packet sent between a client and a server. A higher layer specification defines the default ATT_MTU value.

When using an L2CAP channel with a fixed CID, the client and server may optionally exchange the maximum size of a packet that can be received using the ATT_EXCHANGE_MTU_REQ and ATT_EXCHANGE_MTU_RSP PDUs. Both devices then use the minimum of these exchanged values for all further communication (see Section 3.4.2). A device that is acting as a server and client at the same time shall use the same value for Client Rx MTU and Server Rx MTU.

When using an L2CAP channel with a dynamically allocated CID, the ATT_MTU shall be set to the L2CAP MTU size.

The ATT_MTU value is a per ATT bearer value. A device with multiple ATT bearers may have a different ATT_MTU value for each ATT bearer.

3.2.9 Long attribute values

The longest attribute that can be sent in a single packet is (ATT_MTU-1) octets in size. At a minimum, the Attribute Opcode is included in an Attribute PDU.

An attribute value may be defined to be larger than (ATT_MTU-1) octets in size. These attributes are called long attributes.

To read the entire value of an attributes larger than (ATT_MTU-1) octets, the ATT_READ_BLOB_REQ PDU is used. It is possible to read the first (ATT_MTU-1) octets of a long attribute value using the ATT_READ_REQ PDU.

To write the entire value of an attribute larger than (ATT_MTU-3) octets, the ATT_PREPARE_WRITE_REQ and ATT_EXECUTE_WRITE_REQ PDUs are used. It is possible to write the first (ATT_MTU-3) octets of a long attribute value using the ATT_WRITE_CMD PDU.

It is not possible to determine if an attribute value is longer than (ATT_MTU-3) octets using this protocol. A higher layer specification will state that a given attribute can have a maximum length larger than (ATT_MTU-3) octets.

The maximum length of an attribute value shall be 512 octets.

Note: The protection of an attribute value changing when reading the value using multiple Attribute Protocol PDUs is the responsibility of the higher layer.

3.2.10 Atomic operations

The server shall treat each request or command as an atomic operation that cannot be affected by another ATT bearer sending a request or command at the same time. If an ATT bearer is terminated for any reason (user action or loss of the radio link), the value of any modified attribute is the responsibility of the higher layer specification.

Long attributes cannot be read or written in a single atomic operation.

3.2.11 ATT bearers

An ATT bearer is a channel used to send Attribute Protocol PDUs. Each ATT bearer uses an L2CAP channel which shall be either a dynamically allocated channel or the LE Attribute Protocol fixed channel (see [Vol 3] Part A, Section 2.1). A device may have any number of dynamically allocated channels and at most one fixed channel as ATT bearers to a peer device.

An ATT bearer connects an ATT Client on one device to an ATT Server on the peer device and may also connect an ATT Server on the first device to an ATT Client on the peer device. Whether a received Attribute PDU is intended for the ATT Client or for the ATT Server is determined by the PDU type (see Section 3.3).

The L2CAP channel mode determines the behavior of Attribute Protocol on that ATT bearer. If the L2CAP channel is using Enhanced Credit Based Flow Control mode or (on BR/EDR) Enhanced Retransmission mode, then the ATT bearer is known as an Enhanced ATT bearer. Any ATT bearer that is not an Enhanced ATT bearer, using any other L2CAP channel mode, is known as an Unenhanced ATT bearer. Except where explicitly stated, the behavior of an Enhanced ATT bearer shall be identical to the behavior of an Unenhanced ATT bearer.

An ATT bearer is terminated when either the L2CAP channel (if dynamically allocated) or the underlying physical link is disconnected.

An LE fixed channel can only be terminated by disconnecting the physical link.

A higher-layer specification may require an Enhanced ATT bearer.

A device that supports L2CAP over multiple logical transports may, subject to any other requirements in this specification, support ATT bearers on some or all of those transports.

3.3 Attribute PDU

Attribute PDUs have one of six types, which are indicated by the suffix to the PDU name as shown in Table 3.1:

Type	Purpose	Suffix
Commands	PDUs sent to a server by a client that do not invoke a response.	CMD
Requests	PDUs sent to a server by a client that invoke a response.	REQ
Responses	PDUs sent to a client by a server in response to a request.	RSP

Type	Purpose	Suffix
Notifications	Unsolicited PDUs sent to a client by a server that do not invoke a confirmation.	NTF
Indications	Unsolicited PDUs sent to a client by a server that invoke a confirmation.	IND
Confirmations	PDUs sent to a server by a client to confirm receipt of an indication.	CFM

Table 3.1: Attribute PDUs

A server shall be able to receive and properly respond to the following request PDUs:

- ATT_FIND_INFORMATION_REQ
- ATT_READ_REQ

Support for all other PDU types in a server can be specified in a higher layer specification, see Section 3.4.8.

If a client sends a request, then the client shall support all possible response PDUs for that request.

If a server receives a request that it does not support, then the server shall respond with the ATT_ERROR_RSP PDU with the Error Code parameter set to *Request Not Supported* (0x06), with the Attribute Handle In Error set to 0x0000.

If a server receives a command that it does not support, indicated by the Command Flag of the PDU set to one, then the server shall ignore the command.

If the server receives an invalid request – for example, the PDU is the wrong length – then the server shall respond with the ATT_ERROR_RSP PDU with the Error Code parameter set to *Invalid PDU* (0x04), with the Attribute Handle In Error set to 0x0000.

If a server does not have sufficient resources to process a request, then the server shall respond with the ATT_ERROR_RSP PDU with the Error Code parameter set to *Insufficient Resources* (0x11), with the Attribute Handle In Error set to 0x0000.

If a server cannot process a request because an error was encountered during the processing of this request, then the server shall respond with the ATT_ERROR_RSP PDU with the Error Code parameter set to *Unlikely Error* (0x0E), with the Attribute Handle In Error set to 0x0000.

3.3.1 Attribute PDU format

Attribute PDUs have the following format:

Name	Size (octets)	Description
Attribute Op-code	1	The attribute PDU operation code bit 7: Authentication Signature Flag bit 6: Command Flag bits 5-0: Method
Attribute Parameters	0 to (ATT_MTU - X)	The attribute PDU parameters X = 1 if Authentication Signature Flag of the Attribute Opcode is 0 X = 13 if Authentication Signature Flag of the Attribute Opcode is 1
Authentication Signature	0 or 12	Optional authentication signature for the Attribute Opcode and Attribute Parameters

Table 3.2: Format of attribute PDU

Multi-octet fields within the Attribute Protocol shall be sent least significant octet first (little-endian) with the exception of the Attribute Value field. The endian-ness of the Attribute Value field is defined by a higher layer specification.

The Attribute Opcode is composed of three fields, the Authentication Signature Flag, the Command Flag, and the Method. The Method is a 6-bit value that determines the format and meaning of the Attribute Parameters.

If the Authentication Signature Flag of the Attribute Opcode is set to one, the Authentication Signature value shall be appended to the end of the attribute PDU, and X is 13. If the Authentication Signature Flag of the Attribute Opcode is set to zero, the Authentication Signature value shall not be appended, and X is 1.

The Authentication Signature field is calculated as defined in Security Manager (see [Vol 3] Part H, Section 2.4.5). This value provides an Authentication Signature for the variable length message (m) consisting of the following values in this order: Attribute Opcode, Attribute Parameters.

An Attribute PDU that includes an Authentication Signature should not be sent on an encrypted link.

Note: An encrypted link already includes authentication data on every packet and therefore adding more authentication data is not required.

If the Command Flag of the Attribute Opcode is set to one, the PDU shall be considered to be a command.

Only the ATT_WRITE_CMD PDU may include an Authentication Signature (and therefore becomes an ATT_SIGNED_WRITE_CMD PDU).

3.3.2 Sequential protocol

Many Attribute Protocol PDUs use a sequential request-response protocol.

Once a client sends a request to a server, that client shall send no other request to the same server on the same ATT bearer until a response PDU has been received.

Indications sent from a server also use a sequential indication-confirmation protocol. No other indications shall be sent to the same client from this server on the same ATT bearer until a confirmation PDU has been received. The client, however, is free to send commands and requests prior to sending a confirmation.

For notifications, which do not have a response PDU, there is no flow control and a notification can be sent at any time.

For commands, which do not have a response PDU, there is no flow control and a command can be sent at any time.

Note: A server can be flooded with commands, and a higher layer specification can define how to prevent this from occurring.

Commands that are received but cannot be processed, due to buffer overflows or a change-unaware client (see [Vol 3] Part G, Section 2.5.2.1), shall be discarded. Therefore, those PDUs must be considered to be unreliable.

On an Unenhanced ATT bearer, notifications that are received but cannot be processed due to buffer overflows shall be discarded. Therefore, those PDUs must be considered to be unreliable.

On an Enhanced ATT bearer, notifications shall always be processed when received.

Note: Flow control for each client and a server is independent.

Note: It is possible for a server to receive a request, send one or more notifications, and then the response to the original request. The flow control of requests is not affected by the transmission of the notifications.

Note: It is possible for a server to receive a request and then a command before responding to the original request. The flow control of requests is not affected by the transmission of commands.

Note: It is possible for a notification from a server to be sent after an indication has been sent but the confirmation has not been received. The flow control of indications is not affected by the transmission of notifications.

Note: It is possible for a client to receive an indication from a server and then send a request or command to that server before sending the confirmation of the original indication.

3.3.3 Transaction

An Attribute Protocol request and response or indication-confirmation pair is considered a single transaction. A transaction shall always be performed on one ATT bearer, and shall not be split over multiple ATT bearers.

On the client, a transaction shall start when the request is sent by the client. A transaction shall complete when the response is received by the client.

On a server, a transaction shall start when a request is received by the server. A transaction shall complete when the response is sent by the server.

On a server, a transaction shall start when an indication is sent by the server. A transaction shall complete when the confirmation is received by the server.

On a client, a transaction shall start when an indication is received by the client. A transaction shall complete when the confirmation is sent by the client.

A transaction not completed within 30 seconds shall time out. Such a transaction shall be considered to have failed and the local higher layers shall be informed of this failure. No more Attribute Protocol requests, commands, indications or notifications shall be sent to the target device on this ATT bearer.

To send another Attribute Protocol PDU, a new ATT bearer must be established between these devices. The existing ATT bearer may need to be terminated before the new ATT bearer is established.

If the ATT bearer is terminated during a transaction, then the transaction shall be considered to be closed, and any values that were being modified on the server will be in an undetermined state.

Note: Each ATT_PREPARE_WRITE_REQ and each ATT_READ_BLOB_REQ PDU starts a separate request and therefore a separate transaction.

3.4 Attribute Protocol PDUs

3.4.1 Error handling

3.4.1.1 ATT_ERROR_RSP

The ATT_ERROR_RSP PDU is used to state that a given request cannot be performed, and to provide the reason.

Note: Commands (i.e. the ATT_WRITE_CMD and ATT_SIGNED_WRITE_CMD PDUs) do not generate this response.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x01 = ATT_ERROR_RSP PDU
Request Opcode In Error	1	The request that generated this ATT_ERROR_RSP PDU
Attribute Handle In Error	2	The attribute handle that generated this ATT_ERROR_RSP PDU
Error Code	1	The reason why the request has generated an ATT_ERROR_RSP PDU

Table 3.3: Format of the ATT_ERROR_RSP PDU

The Request Opcode In Error parameter shall be set to the Attribute Opcode of the request that generated this error.

The Attribute Handle In Error parameter shall be set to the attribute handle in the original request that generated this error. If there was no attribute handle in the original request or if the request is not supported, then the value 0x0000 shall be used for this field.

The Error Code parameter shall be set to one of the following values:

Name	Error Code	Description
Invalid Handle	0x01	The attribute handle given was not valid on this server.
Read Not Permitted	0x02	The attribute cannot be read.
Write Not Permitted	0x03	The attribute cannot be written.
Invalid PDU	0x04	The attribute PDU was invalid.
Insufficient Authentication	0x05	The attribute requires authentication before it can be read or written.
Request Not Supported	0x06	ATT Server does not support the request received from the client.
Invalid Offset	0x07	Offset specified was past the end of the attribute.
Insufficient Authorization	0x08	The attribute requires authorization before it can be read or written.
Prepare Queue Full	0x09	Too many prepare writes have been queued.
Attribute Not Found	0x0A	No attribute found within the given attribute handle range.
Attribute Not Long	0x0B	The attribute cannot be read using the ATT_READ_BLOB_REQ PDU.

Name	Error Code	Description
Encryption Key Size Too Short[1]	0x0C	The Encryption Key Size used for encrypting this link is too short.
Invalid Attribute Value Length	0x0D	The attribute value length is invalid for the operation.
Unlikely Error	0x0E	The attribute request that was requested has encountered an error that was unlikely, and therefore could not be completed as requested.
Insufficient Encryption	0x0F	The attribute requires encryption before it can be read or written.
Unsupported Group Type	0x10	The attribute type is not a supported grouping attribute as defined by a higher layer specification.
Insufficient Resources	0x11	Insufficient Resources to complete the request.
Database Out Of Sync	0x12	The server requests the client to rediscover the database.
Value Not Allowed	0x13	The attribute parameter value was not allowed.
Application Error	0x80 – 0x9F	Application error code defined by a higher layer specification.
Common Profile and Service Error Codes	0xE0 – 0xFF	Common profile and service error codes defined in [1]
Reserved for future use	All other values	Reserved for future use.

Table 3.4: Error codes

[1]This was previously "Insufficient Encryption Key Size".

The Error Code values listed in Section 3.4.2 to Section 3.4.8 are not necessarily the only ones permitted in response to those PDUs. See Section 3.4.9 for the definitive list of which Error Code values are permitted.

If more than one error code applies, then it is vendor-specific which error code is transmitted in the ATT_ERROR_RSP PDU.

If an error code is received in the ATT_ERROR_RSP PDU that is not understood by the client, for example an error code that was reserved for future use that is now being used in a future version of the specification, then the ATT_ERROR_RSP PDU shall still be considered to state that the given request cannot be performed for an unknown reason.

Note: Sending an ATT_ERROR_RSP PDU should not cause the ATT Server to disconnect from the client. The client may upgrade the security and retry the request, so the server should give the client sufficient time to perform such an upgrade.

3.4.2 MTU exchange

3.4.2.1 ATT_EXCHANGE_MTU_REQ

The ATT_EXCHANGE_MTU_REQ PDU is used by the client to inform the server of the client's maximum receive MTU size and request the server to respond with its maximum receive MTU size.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x02 = ATT_EXCHANGE_MTU_REQ
Client Rx MTU	2	Client receive MTU size

Table 3.5: Format of ATT_EXCHANGE_MTU_REQ PDU

The Client Rx MTU shall be greater than or equal to the default ATT_MTU.

This request shall only be sent once during a connection by the client. The Client Rx MTU parameter shall be set to the maximum size of the Attribute Protocol PDU that the client can receive.

3.4.2.2 ATT_EXCHANGE_MTU_RSP

The ATT_EXCHANGE_MTU_RSP PDU is sent in reply to a received ATT_EXCHANGE_MTU_REQ PDU.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x03 = ATT_EXCHANGE_MTU_RSP
Server Rx MTU	2	ATT Server receive MTU size

Table 3.6: Format of ATT_EXCHANGE_MTU_RSP PDU

The Server Rx MTU shall be greater than or equal to the default ATT_MTU.

The Server Rx MTU parameter shall be set to the maximum size of the Attribute Protocol PDU that the server can receive.

The server and client shall set ATT_MTU to the minimum of the Client Rx MTU and the Server Rx MTU. The size is the same to ensure that a client can correctly detect the final packet of a long attribute read.

This ATT_MTU value shall be applied in the server after this response has been sent and before any other Attribute Protocol PDU is sent.

This ATT_MTU value shall be applied in the client after this response has been received and before any other Attribute Protocol PDU is sent.

If either Client Rx MTU or Service Rx MTU are incorrectly less than the default ATT_MTU, then the ATT_MTU shall not be changed and the ATT_MTU shall be the default ATT_MTU.

If a device is both a client and a server, the following rules shall apply:

1. A device's ATT_EXCHANGE_MTU_REQ PDU shall contain the same MTU as the device's ATT_EXCHANGE_MTU_RSP PDU (i.e. the MTU shall be symmetric).
2. If MTU is exchanged in one direction, that is sufficient for both directions.
3. It is permitted, (but not necessary - see 2.) to exchange MTU in both directions, but the MTUs shall be the same in each direction (see 1.)
4. If an Attribute Protocol Request is received after the MTU Exchange Request is sent and before the MTU Exchange Response is received, the associated Attribute Protocol Response shall use the default MTU. Figure 3.1 shows an example that is covered by this rule. In this case device A and device B both use the default MTU for the Attribute Protocol Response.
5. Once the MTU Exchange Request has been sent, the initiating device shall not send an Attribute Protocol Indication or Notification until after the MTU Exchange Response has been received.

   Note: This stops the risk of a cross-over condition where the MTU size is unknown for the Indication or Notification.

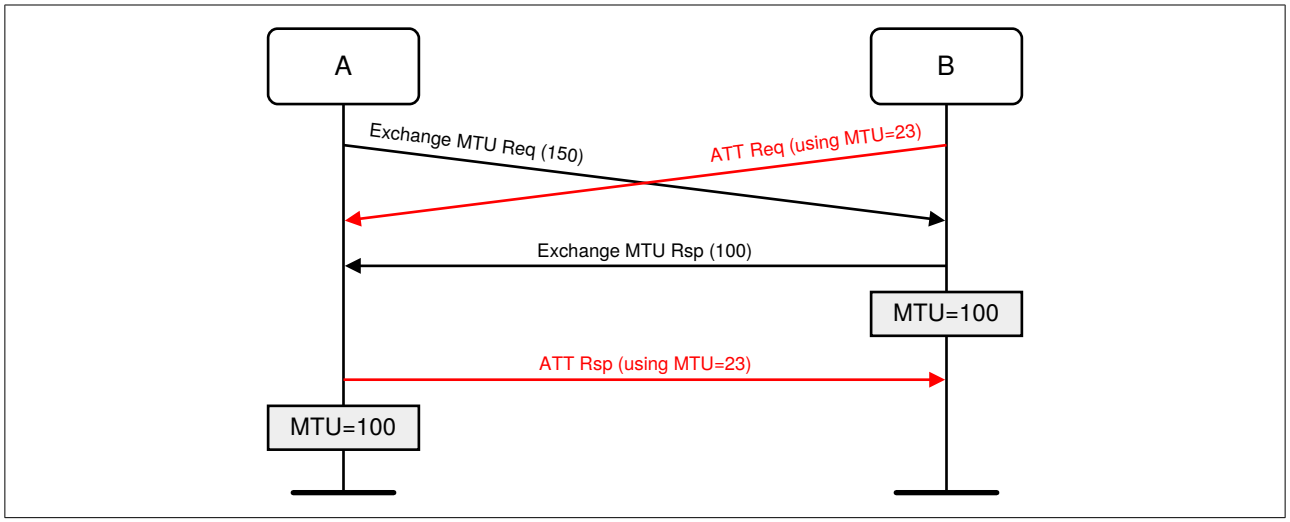

Figure 3.1: MTU Request and Response exchange

3.4.3 Find information

3.4.3.1 ATT_FIND_INFORMATION_REQ

The ATT_FIND_INFORMATION_REQ PDU is used to obtain the mapping of attribute handles with their associated types. This allows a client to discover the list of attributes and their types on a server.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x04 = ATT_FIND_INFORMATION_REQ
Starting Handle	2	First requested handle number
Ending Handle	2	Last requested handle number

Table 3.7: Format of ATT_FIND_INFORMATION_REQ PDU

Only attributes with attribute handles between the Starting Handle parameter and the Ending Handle parameter will be returned. To read all attributes, the Starting Handle parameter shall be set to 0x0001, and the Ending Handle parameter shall be set to 0xFFFF. The Starting Handle parameter shall be less than or equal to the Ending Handle parameter.

If one or more attributes will be returned, an ATT_FIND_INFORMATION_RSP PDU shall be sent.

If a server receives an ATT_FIND_INFORMATION_REQ PDU with the Starting Handle parameter greater than the Ending Handle parameter or the Starting Handle parameter is 0x0000, an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01); the Attribute Handle In Error parameter shall be set to the Starting Handle parameter.

If no attributes will be returned (e.g., because there are no attributes in the range), an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Attribute Not Found* (0x0A); the Attribute Handle In Error parameter shall be set to the Starting Handle parameter.

The server shall not respond to the ATT_FIND_INFORMATION_REQ PDU with an ATT_ERROR_RSP PDU with the Error Code parameter set to *Insufficient Authentication* (0x05), *Insufficient Authorization* (0x08), *Encryption Key Size Too Short* (0x0C), *Database Out of Sync* (0x12), *Application Error* (0x80 to 0x9F), or *Common Profile and Service Error Codes* (0xE0 to 0xFF).

3.4.3.2 ATT_FIND_INFORMATION_RSP

The ATT_FIND_INFORMATION_RSP PDU is sent in reply to a received ATT_FIND_INFORMATION_REQ PDU and contains information about attributes on this server.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x05 = ATT_FIND_INFORMATION_RSP
Format	1	The format of the information data.
Information Data	4 to (ATT_MTU-2)	The information data whose format is determined by the Format field

Table 3.8: Format of ATT_FIND_INFORMATION_RSP PDU

The *Find Information Response* shall have complete handle-UUID pairs. Such pairs shall not be split across response packets; this also implies that a handle-UUID pair shall fit into a single response packet. The handle-UUID pairs shall be returned in ascending order of attribute handles without omissions.

The Format parameter can contain one of two possible values.

Name	Format	Description
Handle(s) and 16-bit Bluetooth UUID(s)	0x01	A list of 1 or more handles with their 16-bit Bluetooth UUIDs
Handle(s) and 128-bit UUID(s)	0x02	A list of 1 or more handles with their 128-bit UUIDs

Table 3.9: Format field values

The information data field is comprised of a list of data defined in Table 3.10 and Table 3.11 depending on the value chosen for the format.

Handle	16-bit Bluetooth UUID
2 octets	2 octets

Table 3.10: Format 0x01 – handle and 16-bit Bluetooth UUIDs

Handle	128-bit UUID
2 octets	16 octets

Table 3.11: Format 0x02 – handle and 128-bit UUIDs

If sequential attributes have differing UUID sizes, the ATT_FIND_INFORMATION_RSP PDU shall end with the first attribute of the pair even though this may mean that it is not filled with the maximum possible amount of (handle, UUID) pairs. This is because it is not possible to include attributes with differing UUID sizes into a single response packet. In this situation, the client must use another ATT_FIND_INFORMATION_REQ PDU with its starting handle updated to fetch the second attribute of the pair and any further ones in its original request. However, the server may convert a 16-bit UUID to the corresponding 128-bit UUID to allow it to be included in the response packet.

3.4.3.3 ATT_FIND_BY_TYPE_VALUE_REQ

The ATT_FIND_BY_TYPE_VALUE_REQ PDU is used to obtain the handles of attributes that have a 16-bit UUID attribute type and attribute value.This allows the range of handles associated with a given attribute to be discovered when the attribute type determines the grouping of a set of attributes.

Note: GATT defines grouping of attributes by attribute type.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x06 = ATT_FIND_BY_TYPE_VALUE_REQ PDU
Starting Handle	2	First requested handle number
Ending Handle	2	Last requested handle number
Attribute Type	2	2 octet UUID to find
Attribute Value	0 to (ATT_MTU-7)	Attribute value to find

Table 3.12: Format of ATT_FIND_BY_TYPE_VALUE_REQ PDU

Only attributes with attribute handles between the Starting Handle parameter and the Ending Handle parameter that match the requested attribute type and the attribute value that have sufficient permissions to allow reading will be returned. To read all attributes, the Starting Handle parameter shall be set to 0x0001, and the Ending Handle parameter shall be set to 0xFFFF.

If one or more handles will be returned, an ATT_FIND_BY_TYPE_VALUE_RSP PDU shall be sent.

Note: Attribute values will be compared in terms of length and binary representation.

Note: It is not possible to use this request on an attribute that has a value longer than (ATT_MTU-7).

If a server receives an ATT_FIND_BY_TYPE_VALUE_REQ PDU with the Starting Handle parameter greater than the Ending Handle parameter or the Starting Handle parameter is 0x0000, an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01). The Attribute Handle In Error parameter shall be set to the Starting Handle parameter.

If no attributes will be returned, an ATT_ERROR_RSP PDU shall be sent by the server with the Error Code parameter set to *Attribute Not Found* (0x0A). The Attribute Handle In Error parameter shall be set to the starting handle.

The server shall not respond to the ATT_FIND_BY_TYPE_VALUE_REQ PDU with an ATT_ERROR_RSP PDU with the Error Code parameter set to *Insufficient Authentication* (0x05), *Insufficient Authorization* (0x08), *Encryption Key Size Too Short*

(0x0C), *Insufficient Encryption* (0x0F), *Database Out of Sync* (0x12), *Application Error* (0x80 to 0x9F), or *Common Profile and Service Error Codes* (0xE0 to 0xFF).

3.4.3.4 ATT_FIND_BY_TYPE_VALUE_RSP

The ATT_FIND_BY_TYPE_VALUE_RSP PDU is sent in reply to a received ATT_FIND_BY_TYPE_VALUE_REQ PDU and contains information about this server.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x07 = ATT_FIND_BY_TYPE_VALUE_RSP PDU
Handles Information List	4 to (ATT_MTU-1)	A list of 1 or more Handle Informations

Table 3.13: Format of ATT_FIND_BY_TYPE_VALUE_RSP PDU

The Handles Information List field is a list of one or more Handle Informations. The Handles Information field is an attribute handle range as defined in Table 3.14.

Found Attribute Handle	Group End Handle
2 octets	2 octets

Table 3.14: Format of the Handles Information

The ATT_FIND_BY_TYPE_VALUE_RSP PDU shall contain one or more complete Handles Information. Such Handles Information shall not be split across response packets. The Handles Information List is ordered sequentially based on the found attribute handles.

For each handle that matches the attribute type and attribute value in the ATT_FIND_BY_TYPE_VALUE_REQ PDU a Handles Information shall be returned. The Found Attribute Handle shall be set to the handle of the attribute that has the exact attribute type and attribute value from the ATT_FIND_BY_TYPE_VALUE_REQ PDU. If the attribute type in the ATT_FIND_BY_TYPE_VALUE_REQ PDU is a grouping attribute as defined by a higher layer specification, the Group End Handle shall be defined by that higher layer specification. If the attribute type in the ATT_FIND_BY_TYPE_VALUE_REQ PDU is not a grouping attribute as defined by a higher layer specification, the Group End Handle shall be equal to the Found Attribute Handle.

Note: The Group End Handle may be greater than the Ending Handle in the ATT_FIND_BY_TYPE_VALUE_REQ PDU.

If a server receives an ATT_FIND_BY_TYPE_VALUE_REQ PDU, the server shall respond with the ATT_FIND_BY_TYPE_VALUE_RSP PDU containing as many handles for attributes that match the requested attribute type and attribute value that exist in the server that will fit into the maximum PDU size of (ATT_MTU-1).

3.4.4 Reading attributes

3.4.4.1 ATT_READ_BY_TYPE_REQ

The ATT_READ_BY_TYPE_REQ PDU is used to obtain the values of attributes where the attribute type is known but the handle is not known.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x08 = ATT_READ_BY_TYPE_REQ PDU
Starting Handle	2	First requested handle number
Ending Handle	2	Last requested handle number
Attribute Type	2 or 16	2 or 16 octet UUID

Table 3.15: Format of ATT_READ_BY_TYPE_REQ PDU

Only the attributes with attribute handles between the Starting Handle and the Ending Handle with the attribute type that is the same as the Attribute Type given will be returned. To search through all attributes, the starting handle shall be set to 0x0001 and the ending handle shall be set to 0xFFFF.

Note: All attribute types are effectively compared as 128-bit UUIDs, even if a 16-bit UUID is provided in this request or defined for an attribute. See [Vol 3] Part B, Section 2.5.1.

The starting handle shall be less than or equal to the ending handle. If a server receives an ATT_READ_BY_TYPE_REQ PDU with the Starting Handle parameter greater than the Ending Handle parameter or the Starting Handle parameter is 0x0000, an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01). The Attribute Handle In Error parameter shall be set to the Starting Handle parameter.

If no attribute with the given type exists within the handle range, then no attribute handle and value will be returned, and an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Attribute Not Found* (0x0A). The Attribute Handle In Error parameter shall be set to the starting handle.

The attributes returned shall be the attributes with the lowest handles within the handle range. These are known as the requested attributes.

If the attributes with the requested type within the handle range have attribute values that have the same length, then these attributes can all be read in a single request. However, if those attributes have different lengths, then multiple ATT_READ_BY_TYPE_REQ PDUs must be issued.

The ATT Server shall include as many attributes as possible in the response in order to minimize the number of PDUs required to read attributes of the same type.

When multiple attributes match, then the rules below shall be applied to each in turn.

- Only attributes that can be read shall be returned in an ATT_READ_BY_TYPE_RSP PDU.
- If an attribute in the set of requested attributes would cause an ATT_ERROR_RSP PDU then this attribute cannot be included in an ATT_READ_BY_TYPE_RSP PDU and the attributes before this attribute shall be returned.
- If the first attribute in the set of requested attributes would cause an ATT_ERROR_RSP PDU then no other attributes in the requested attributes can be considered.

The server shall respond with an ATT_READ_BY_TYPE_RSP PDU if the requested attributes have sufficient permissions to allow reading.

If the client has insufficient authorization to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authorization* (0x08). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

If the client has insufficient security to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authentication* (0x05). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

If the client has an encryption key size that is too short to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Encryption Key Size Too Short* (0x0C). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

If the client has not enabled encryption, and encryption is required to read the requested attribute, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Encryption* (0x0F). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

If the requested attribute’s value cannot be read due to permissions then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Read Not Permitted* (0x02). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

Note: If there are multiple attributes with the requested type within the handle range, and the client would like to get the next attribute with the requested type, it would have to issue another ATT_READ_BY_TYPE_REQ PDU with its starting handle updated. The client can be sure there are no more such attributes remaining once it gets an ATT_ERROR_RSP PDU with the Error Code parameter set to *Attribute Not Found* (0x0A).

3.4.4.2 ATT_READ_BY_TYPE_RSP

The ATT_READ_BY_TYPE_RSP PDU is sent in reply to a received ATT_READ_BY_TYPE_REQ PDU and contains the handles and values of the attributes that have been read.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x09 = ATT_READ_BY_TYPE_RSP PDU
Length	1	The size of each attribute handle-value pair
Attribute Data List	2 to (ATT_MTU-2)	A list of Attribute Data

Table 3.16: Format of ATT_READ_BY_TYPE_RSP PDU

The ATT_READ_BY_TYPE_RSP PDU shall contain complete handle-value pairs. Such pairs shall not be split across response packets. The handle-value pairs shall be returned sequentially based on the attribute handle.

The Length parameter shall be set to the size of one attribute handle-value pair.

The maximum length of an attribute handle-value pair is 255 octets, bounded by the Length parameter that is one octet. Therefore, the maximum length of an attribute value returned in this response is (Length – 2) = 253 octets.

The attribute handle-value pairs shall be set to the value of the attributes identified by the attribute type within the handle range within the request. If the attribute value is longer than (ATT_MTU - 4) or 253 octets, whichever is smaller, then the first (ATT_MTU - 4) or 253 octets shall be included in this response.

Note: The ATT_READ_BLOB_REQ PDU (see Section 3.4.4.5) can be used to read the remaining octets of a long attribute value.

The Attribute Data field is comprised of a list of attribute handle and value pairs as defined in Table 3.17.

Attribute Handle	Attribute Value
2 octets	(Length – 2) octets

Table 3.17: Format of the Attribute Data

3.4.4.3 ATT_READ_REQ

The ATT_READ_REQ PDU is used to request the server to read the value of an attribute and return its value in an ATT_READ_RSP PDU.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x0A = ATT_READ_REQ PDU
Attribute Handle	2	The handle of the attribute to be read

Table 3.18: Format of ATT_READ_REQ PDU

The attribute handle parameter shall be set to a valid handle.

The server shall respond with an ATT_READ_RSP PDU if the handle is valid and the attribute has sufficient permissions to allow reading.

If the client has insufficient authorization to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authorization* (0x08).

If the client has insufficient security to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authentication* (0x05).

If the client has an encryption key size that is too short to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Encryption Key Size Too Short* (0x0C).

If the client has not enabled encryption, and encryption is required to read the requested attribute, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Encryption* (0x0F).

If the handle is invalid, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01).

If the attribute value cannot be read due to permissions then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Read Not Permitted* (0x02).

3.4.4.4 ATT_READ_RSP

The ATT_READ_RSP PDU is sent in reply to a received *Read Request* and contains the value of the attribute that has been read.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x0B = ATT_READ_RSP PDU
Attribute Value	0 to (ATT_MTU-1)	The value of the attribute with the handle given

Table 3.19: Format of ATT_READ_RSP PDU

The attribute value shall be set to the value of the attribute identified by the attribute handle in the request. If the attribute value is longer than

(ATT_MTU-1) then the first (ATT_MTU-1) octets shall be included in this response.

Note: The ATT_READ_BLOB_REQ PDU (see Section 3.4.4.5) can be used to read the remaining octets of a long attribute value.

3.4.4.5 ATT_READ_BLOB_REQ

The ATT_READ_BLOB_REQ PDU is used to request the server to read part of the value of an attribute at a given offset and return a specific part of the value in an ATT_READ_BLOB_RSP PDU.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x0C = ATT_READ_BLOB_REQ PDU
Attribute Handle	2	The handle of the attribute to be read
Value Offset	2	The offset of the first octet to be read

Table 3.20: Format of ATT_READ_BLOB_REQ PDU

The attribute handle parameter shall be set to a valid handle.

The value offset parameter is based from zero; the first value octet has an offset of zero, the second octet has a value offset of one, etc.

The server shall respond with an ATT_READ_BLOB_RSP PDU if the handle is valid and the attribute and value offset is not greater than the length of the attribute value and has sufficient permissions to allow reading.

If the client has insufficient authorization to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authorization* (0x08).

If the client has insufficient security to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authentication* (0x05).

If the client has an encryption key size that is too short to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Encryption Key Size Too Short* (0x0C).

If the client has not enabled encryption, and encryption is required to read the requested attribute, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Encryption* (0x0F).

If the handle is invalid, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01).

If the attribute value cannot be read due to permissions then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Read Not Permitted* (0x02).

If the value offset of the *Read Blob Request* is greater than the length of the attribute value, an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Offset* (0x07).

If the attribute value has a fixed length that is less than or equal to (ATT_MTU - 1) octets in length, then an ATT_ERROR_RSP PDU may be sent with the Error Code parameter set to *Attribute Not Long* (0x0B).

If the value offset of the ATT_READ_BLOB_REQ PDU is equal to the length of the attribute value, then the length of the part attribute value in the response shall be zero.

Note: If the attribute is longer than (ATT_MTU-1) octets, the ATT_READ_BLOB_REQ PDU is the only way to read the additional octets of a long attribute. The first (ATT_MTU-1) octets may be read using an ATT_READ_RSP PDU; the first (ATT_MTU-3) octets can be received in an ATT_HANDLE_VALUE_NTF or an ATT_HANDLE_VALUE_IND PDU.

Note: Some, but not all, long attributes have their length specified by a higher layer specification. If the long attribute has a variable length, the only way to get to the end of it is to read it part by part until the value in the ATT_READ_BLOB_RSP PDU has a length shorter than (ATT_MTU-1) or an ATT_ERROR_RSP PDU is sent with the Error Code parameter set to *Invalid Offset* (0x07).

Note: The value of a Long Attribute may change between the server receiving one ATT_READ_BLOB_REQ PDU and the next ATT_READ_BLOB_REQ PDU. A higher layer specification should be aware of this and define appropriate behavior.

3.4.4.6 ATT_READ_BLOB_RSP

The ATT_READ_BLOB_RSP PDU is sent in reply to a received ATT_READ_BLOB_REQ PDU and contains part of the value of the attribute that has been read.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x0D = ATT_READ_BLOB_RSP
Part Attribute Value	0 to (ATT_MTU-1)	Part of the value of the attribute with the handle given

Table 3.21: Format of ATT_READ_BLOB_RSP PDU

The part attribute value shall be set to part of the value of the attribute identified by the attribute handle and the value offset in the request. If the value offset is equal to the length of the attribute value, then the length of the part attribute value shall be zero. If the attribute value is longer than (Value Offset + ATT_MTU-1) then (ATT_MTU-1) octets from Value Offset shall be included in this response.

3.4.4.7 ATT_READ_MULTIPLE_REQ

The ATT_READ_MULTIPLE_REQ PDU is used to request the server to read two or more values of a set of attributes and return their values in an ATT_READ_MULTIPLE_RSP PDU. Only values that have a known fixed size can be read, with the exception of the last value that can have a variable length. The knowledge of whether attributes have a known fixed size is defined in a higher layer specification.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x0E = ATT_READ_MULTIPLE_REQ PDU
Set Of Handles	4 to (ATT_MTU-1)	A set of two or more attribute handles.

Table 3.22: Format of ATT_READ_MULTIPLE_REQ PDU

The attribute handles in the Set Of Handles parameter shall be valid handles.

The server shall respond with an ATT_READ_MULTIPLE_RSP PDU if all the handles are valid and all attributes have sufficient permissions to allow reading.

Note: The attribute values for the attributes in the Set Of Handles parameters do not have to all be the same size.

Note: The attribute handles in the Set Of Handles parameter do not have to be in attribute handle order; they are in the order that the values are required in the response.

If the client has insufficient authorization to read any of the attributes then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authorization* (0x08).

If the client has insufficient security to read any of the attributes then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authentication* (0x05).

If the client has an encryption key size that is too short to read any of the attributes then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Encryption Key Size Too Short* (0x0C).

If the client has not enabled encryption, and encryption is required to read the requested attribute, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Encryption* (0x0F).

If any of the handles are invalid, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01).

If any of the attribute values cannot be read due to permissions then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Read Not Permitted* (0x02).

If an ATT_ERROR_RSP PDU is sent, the Attribute Handle In Error parameter shall be set to the handle of the first attribute causing the error.

3.4.4.8 ATT_READ_MULTIPLE_RSP

The ATT_READ_MULTIPLE_RSP PDU is sent in reply to a received ATT_READ_MULTIPLE_REQ PDU and contains the values of the attributes that have been read.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x0F = ATT_READ_MULTIPLE_RSP PDU
Set Of Values	0 to (ATT_MTU-1)	A set of two or more values

Table 3.23: Format of ATT_READ_MULTIPLE_RSP PDU

The Set Of Values parameter shall be a concatenation of attribute values for each of the attribute handles in the request in the order that they were requested. If the Set Of Values parameter is longer than (ATT_MTU-1) then only the first (ATT_MTU-1) octets shall be included in this response.

Note: A client should not use this request for attributes when the Set Of Values parameter could be (ATT_MTU-1) as it will not be possible to determine if the last attribute value is complete, or if it overflowed.

3.4.4.9 ATT_READ_BY_GROUP_TYPE_REQ

The ATT_READ_BY_GROUP_TYPE_REQ PDU is used to obtain the values of attributes where the attribute type is known, the type of a grouping attribute as defined by a higher layer specification, but the handle is not known.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x10 = ATT_READ_BY_GROUP_TYPE_REQ PDU
Starting Handle	2	First requested handle number
Ending Handle	2	Last requested handle number
Attribute Group Type	2 or 16	2 or 16 octet UUID

Table 3.24: Format of ATT_READ_BY_GROUP_TYPE_REQ PDU

Only the attributes with attribute handles between the Starting Handle and the Ending Handle with the attribute type that is the same as the Attribute Group Type given will be returned. To search through all attributes, the starting handle shall be set to 0x0001 and the ending handle shall be set to 0xFFFF.

Note: All attribute types are effectively compared as 128-bit UUIDs, even if a 16-bit UUID is provided in this request or defined for an attribute. See [Vol 3] Part B, Section 2.5.1.

The starting handle shall be less than or equal to the ending handle. If a server receives an ATT_READ_BY_GROUP_TYPE_REQ PDU with the Starting Handle parameter greater than the Ending Handle parameter or the Starting Handle parameter is 0x0000, an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01). The Attribute Handle In Error parameter shall be set to the Starting Handle parameter.

If the Attribute Group Type is not a supported grouping attribute as defined by a higher layer specification then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Unsupported Group Type* (0x10). The Attribute Handle In Error parameter shall be set to the Starting Handle.

If no attribute with the given type exists within the handle range, then no attribute handle and value will be returned, and an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Attribute Not Found* (0x0A). The Attribute Handle In Error parameter shall be set to the starting handle.

The attributes returned shall be the attributes with the lowest handles within the handle range. These are known as the requested attributes.

If the attributes with the requested type within the handle range have attribute values that have the same length, then these attributes can all be read in a single request. However, if those attributes have different lengths, then multiple ATT_READ_BY_GROUP_TYPE_REQ PDUs must be issued.

The ATT Server shall include as many attributes as possible in the response in order to minimize the number of PDUs required to read attributes of the same type.

When multiple attributes match, then the rules below shall be applied to each in turn.

- Only attributes that can be read shall be returned in an ATT_READ_BY_GROUP_TYPE_RSP PDU.
- If an attribute in the set of requested attributes would cause an ATT_ERROR_RSP PDU then this attribute cannot be included in an ATT_READ_BY_GROUP_TYPE_RSP PDU and the attributes before this attribute shall be returned.
- If the first attribute in the set of requested attributes would cause an ATT_ERROR_RSP PDU then no other attributes in the requested attributes can be considered.

The server shall respond with an ATT_READ_BY_GROUP_TYPE_RSP PDU if the requested attributes have sufficient permissions to allow reading.

If the client has insufficient authorization to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authorization* (0x08). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

If the client has insufficient security to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authentication* (0x05). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

If the client has an encryption key size that is too short to read the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Encryption Key Size Too Short* (0x0C). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

If the client has not enabled encryption, and encryption is required to read the requested attribute, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Encryption* (0x0F). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

If the requested attribute's value cannot be read due to permissions then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Read Not Permitted* (0x02). The Attribute Handle In Error parameter shall be set to the handle of the attribute causing the error.

Note: If there are multiple attributes with the requested type within the handle range, and the client would like to get the next attribute with the requested type, it would have to issue another ATT_READ_BY_GROUP_TYPE_REQ PDU with its starting handle updated. The client can be sure there are no more such attributes remaining once it gets an ATT_ERROR_RSP PDU with the Error Code parameter set to *Attribute Not Found* (0x0A).

The server shall not respond to the ATT_READ_BY_GROUP_TYPE_REQ PDU with an ATT_ERROR_RSP PDU with the error code *Database Out of Sync* (0x12).

3.4.4.10 ATT_READ_BY_GROUP_TYPE_RSP

The ATT_READ_BY_GROUP_TYPE_RSP PDU is sent in reply to a received ATT_READ_BY_GROUP_TYPE_REQ PDU and contains the handles and values of the attributes that have been read.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x11 = ATT_READ_BY_GROUP_TYPE_RSP PDU
Length	1	The size of each Attribute Data
Attribute Data List	4 to (ATT_MTU-2)	A list of Attribute Data

Table 3.25: Format of ATT_READ_BY_GROUP_TYPE_RSP PDU

The ATT_READ_BY_GROUP_TYPE_RSP PDU shall contain complete Attribute Data. An Attribute Data shall not be split across response packets. The Attribute Data List is ordered sequentially based on the attribute handles.

The Length parameter shall be set to the size of the one Attribute Data.

The maximum length of an Attribute Data is 255 octets, bounded by the Length parameter that is one octet. Therefore, the maximum length of an attribute value returned in this response is (Length – 4) = 251 octets.

The Attribute Data List shall be set to the value of the attributes identified by the attribute type within the handle range within the request. If the attribute value is longer than (ATT_MTU - 6) or 251 octets, whichever is smaller, then the first (ATT_MTU - 6) or 251 octets shall be included in this response.

Note: The ATT_READ_BLOB_REQ PDU (see Section 3.4.4.5) can be used to read the remaining octets of a long attribute value.

The Attribute Data List is comprised of a list of Attribute Data as defined in Table 3.26.

Attribute Handle	End Group Handle	Attribute Value
2 octets	2 octets	(Length - 4) octets

Table 3.26: Format of the Attribute Data

3.4.4.11 ATT_READ_MULTIPLE_VARIABLE_REQ

The ATT_READ_MULTIPLE_VARIABLE_REQ PDU is used to request that the server read two or more values of a set of attributes that have a variable or unknown value length and return their values in an ATT_READ_MULTIPLE_VARIABLE_RSP PDU.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x20 = ATT_READ_MULTIPLE_VARIABLE_REQ PDU
Set Of Handles	4 to (ATT_MTU-1)	A set of two or more attribute handles

Table 3.27: Format of ATT_READ_MULTIPLE_VARIABLE_REQ PDU

The attribute handles in the Set Of Handles parameter shall all be valid handles.

The server shall respond with an ATT_READ_MULTIPLE_VARIABLE_RSP PDU if all attributes have sufficient permissions to allow reading.

Note: The attribute values for the attributes in the Set Of Handles parameters do not have to all be the same size.

Note: The attribute handles in the Set Of Handles parameter do not have to be in attribute handle order; they are in the order that the values are required in the response.

If the client has insufficient authorization to read any of the attributes, then an ATT_ERROR_RSP PDU shall be sent with the error code *Insufficient Authorization*.

If the client has insufficient security to read any of the attributes, then an ATT_ERROR_RSP PDU shall be sent with the error code *Insufficient Authentication*.

If the client has an encryption key size that is too short to read any of the attributes, then an ATT_ERROR_RSP PDU shall be sent with the error code *Encryption Key Size Too Short*.

If the client has not enabled encryption, and encryption is required to read any of the attributes, then an ATT_ERROR_RSP PDU shall be sent with the error code *Insufficient Encryption*.

If any of the handles are invalid, then an ATT_ERROR_RSP PDU shall be sent with the error code *Invalid Handle*.

If any of the attribute values cannot be read due to permissions, then an ATT_ERROR_RSP PDU shall be sent with the error code *Read Not Permitted*.

If an ATT_ERROR_RSP PDU is sent, the Attribute Handle In Error parameter in the ATT_ERROR_RSP PDU (see Section 3.4.1.1) shall be set to the handle of the first attribute causing the error.

3.4.4.12 ATT_READ_MULTIPLE_VARIABLE_RSP

The ATT_READ_MULTIPLE_VARIABLE_RSP PDU is sent in reply to a received ATT_READ_MULTIPLE_VARIABLE_REQ PDU and contains the lengths and values of the attributes that have been read.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x21 = ATT_READ_MULTIPLE_VARIABLE_RSP
Length Value Tuple List	4 to (ATT_MTU-1)	A list of Length Value Tuples

Table 3.28: Format of ATT_READ_MULTIPLE_VARIABLE_RSP PDU

The Length Value Tuple List shall be a concatenation of Length Value Tuples for each of the attribute handles in the request in the order that they were requested. If the Length Value Tuple List is longer than (ATT_MTU-1) octets, then it shall be truncated after (ATT_MTU-1) or, if that would be within the Value Length field of a Length Value Tuple, at the start of the Length Value Tuple.

Note: The ATT_READ_BLOB_REQ PDU (see Section 3.4.4.5) can be used to read the remaining octets of a long attribute value.

The Value Length field in a Length Value Tuple shall be set to the length of the Attribute Value field. The Attribute Value field in a Length Value Tuple shall be set to the value of the attribute being read.

Value Length	Attribute Value
2 octets	(Value Length) octets

Table 3.29: Format of the Length Value Tuple

Note: If a Length Value Tuple is truncated, then the amount of Attribute Value will be less than the value of the Value Length field. The client must therefore not use the Value Length to determine the amount of the Attribute Value actually included in the PDU.

3.4.5 Writing attributes

3.4.5.1 ATT_WRITE_REQ

The ATT_WRITE_REQ PDU is used to request the server to write the value of an attribute and acknowledge that this has been achieved in an ATT_WRITE_RSP PDU.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x12 = ATT_WRITE_REQ PDU
Attribute Handle	2	The handle of the attribute to be written
Attribute Value	0 to (ATT_MTU-3)	The value to be written to the attribute

Table 3.30: Format of ATT_WRITE_REQ PDU

The Attribute Handle shall be set to a valid handle.

The Attribute Value shall be set to the new value of the attribute.

If the attribute value has a variable length, then the attribute value shall be truncated or lengthened to match the length of the Attribute Value parameter.

Note: If an attribute value has a variable length and if the Attribute Value parameter is of zero length, the attribute value will be fully truncated.

If the attribute value has a fixed length and the Attribute Value parameter length is less than or equal to the length of the attribute value, the octets of the attribute value parameter length shall be written; all other octets in this attribute value shall be unchanged.

The server shall respond with an ATT_WRITE_RSP PDU if the handle is valid, the attribute has sufficient permissions to allow writing, and the attribute value has a valid size and format, and it is successful in writing the attribute.

If the attribute value has a variable length and the Attribute Value parameter length exceeds the maximum valid length of the attribute value then the server shall respond with an ATT_ERROR_RSP PDU with the Error Code parameter set to *Invalid Attribute Value Length* (0x0D).

If the attribute value has a fixed length and the requested attribute value parameter length is greater than the length of the attribute value then the server shall respond with an ATT_ERROR_RSP PDU with the Error Code parameter set to *Invalid Attribute Value Length* (0x0D).

If the client has insufficient authorization to write the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authorization* (0x08).

If the client has insufficient security to write the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authentication* (0x05).

If the client has an encryption key size that is too short to write the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Encryption Key Size Too Short* (0x0C).

If the client has not enabled encryption, and encryption is required to write the requested attribute, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Encryption* (0x0F).

If the handle is invalid, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01).

If the attribute value cannot be written due to permissions then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Write Not Permitted* (0x03).

If the attribute value cannot be written due to an application error then an ATT_ERROR_RSP PDU shall be sent with an error code defined by a higher layer specification.

3.4.5.2 ATT_WRITE_RSP

The ATT_WRITE_RSP PDU is sent in reply to a valid ATT_WRITE_REQ PDU and acknowledges that the attribute has been successfully written.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x13 = ATT_WRITE_RSP PDU

Table 3.31: Format of ATT_WRITE_RSP

The ATT_WRITE_RSP PDU shall be sent after the attribute value is written.

3.4.5.3 ATT_WRITE_CMD

The ATT_WRITE_CMD PDU is used to request the server to write the value of an attribute, typically into a control-point attribute.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x52 = ATT_WRITE_CMD PDU
Attribute Handle	2	The handle of the attribute to be set
Attribute Value	0 to (ATT_MTU-3)	The value of be written to the attribute

Table 3.32: Format of ATT_WRITE_CMD PDU

The attribute handle parameter shall be set to a valid handle.

The attribute value parameter shall be set to the new value of the attribute.

If the attribute value has a variable length, then the attribute value shall be truncated or lengthened to match the length of the attribute value parameter.

Note: If an attribute value has a variable length and if the attribute value parameter is of zero length, the attribute value will be fully truncated.

If the attribute value has a fixed length and the attribute value parameter length is less than or equal to the length of the attribute value, the octets up to the attribute value parameter length shall be written; all other octets in this attribute value shall be unchanged.

If the attribute value has a variable length and the attribute value parameter length exceeds the maximum valid length of the attribute value then the server shall ignore the command.

If the attribute value has a fixed length and the requested attribute value parameter length is greater than the length of the attribute value then the server shall ignore the command.

No ATT_ERROR_RSP or ATT_WRITE_RSP PDUs shall be sent in response to this command. If the server cannot write this attribute for any reason the command shall be ignored.

3.4.5.4 ATT_SIGNED_WRITE_CMD

This command shall not be used on an Enhanced ATT bearer.

The ATT_SIGNED_WRITE_CMD PDU is used to request the server to write the value of an attribute with an authentication signature, typically into a control-point attribute.

Parameter	Size (Octets)	Description
Attribute Opcode	1	0xD2 = ATT_SIGNED_WRITE_CMD PDU
Attribute Handle	2	The handle of the attribute to be set
Attribute Value	0 to (ATT_MTU-15)	The value to be written to the attribute
Authentication Signature	12	Authentication signature for the Attribute Opcode, Attribute Handle and Attribute Value parameters

Table 3.33: Format of ATT_SIGNED_WRITE_CMD

The attribute handle parameter shall be set to a valid handle.

The attribute value parameter shall be set to the new value of the attribute.

The attribute signature shall be calculated as defined in Section 3.3.1.

For example, if the variable length message m to be signed is ‘D212001337’, SignCounter is 0x00000001 and key is 0x611B64EBFBCD1FD372EC9196DF425E50,

then message to be signed (M) by the CMAC function is the octet sequence ‘D21200133701000000’.

The padding(M) is 0x0000000137130012D280000000000000, resultant CMAC is 0xF20F903C931E87F159B64F012574B4D0 and Authentication Signature is the octet sequence ‘01000000F1871E933C900FF2’.

The final signed message is ‘D21200133701000000F1871E933C900FF2’.

If the attribute value has a variable length, then the attribute value shall be truncated or lengthened to match the length of the attribute value parameter.

Note: If an attribute value has a variable length and if the attribute value parameter is of zero length, the attribute value will be fully truncated.

If the attribute value has a fixed length and the attribute value parameter length is less than or equal to the length of the attribute value, the octets up to the attribute value parameter length shall be written; all other octets in this attribute value shall be unchanged.

If the attribute value has a variable length and the attribute value parameter length exceeds the maximum valid length of the attribute value then the server shall ignore the command.

If the attribute value has a fixed length and the requested attribute value parameter length is greater than the length of the attribute value then the server shall ignore the command.

If the authentication signature verification fails, then the server shall ignore the command.

No ATT_ERROR_RSP PDU or ATT_WRITE_RSP PDU shall be sent in response to this command. If the server cannot write this attribute for any reason the command shall be ignored.

3.4.6 Queued writes

The purpose of queued writes is to queue up writes of values of multiple attributes in a first-in first-out queue and then execute the write on all of them in a single atomic operation.

Each client's queued values are separate; the execution of one queue shall not affect the preparation or execution of any other client's queued values. Each client has a single queue regardless of how many ATT bearers are currently established.

3.4.6.1 ATT_PREPARE_WRITE_REQ

The ATT_PREPARE_WRITE_REQ PDU is used to request the server to prepare to write the value of an attribute. The server will respond to this request with an ATT_PREPARE_WRITE_RSP PDU, so that the client can verify that the value was received correctly.

A client may send more than one ATT_PREPARE_WRITE_REQ PDU to a server, which will queue and send a response for each handle value pair.

A server may limit the number of prepared writes that it can queue. A higher layer specification should define this limit.

After an ATT_PREPARE_WRITE_REQ PDU has been issued, and the response received, any other attribute command or request can be issued from the same client to the same server.

Any actions on attributes that exist in the prepare queue shall proceed as if the prepare queue did not exist, and the prepare queue shall be unaffected by these actions. A subsequent execute write will write the values in the prepare queue even if the value of the attribute has changed since the prepared writes were started.

The Attribute Protocol makes no determination on the validity of the Part Attribute Value or the Value Offset. A higher layer specification determines the meaning of the data.

Each ATT_PREPARE_WRITE_REQ PDU will be queued even if the attribute handle is the same as a previous ATT_PREPARE_WRITE_REQ PDU. These will then be executed in the order received, causing multiple writes for this attribute to occur.

If all ATT bearers belonging to the same client are lost while a number of pending prepared write values have been queued, the queue will be cleared and no writes will be executed.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x16 = ATT_PREPARE_WRITE_REQ PDU
Attribute Handle	2	The handle of the attribute to be written
Value Offset	2	The offset of the first octet to be written
Part Attribute Value	0 to (ATT_MTU-5)	The value of the attribute to be written

Table 3.34: Format of ATT_PREPARE_WRITE_REQ PDU

The Attribute Handle parameter shall be set to a valid handle.

The Value Offset parameter shall be set to the offset of the first octet where the Part Attribute Value parameter is to be written within the attribute value. The Value Offset

parameter is based from zero; the first octet has an offset of zero, the second octet has an offset of one, etc.

The server shall respond with an ATT_PREPARE_WRITE_RSP PDU if the handle is valid, the attribute has sufficient permissions to allow writing at this time, and the prepare queue has sufficient space.

Note: The Attribute Value validation is done when an ATT_EXECUTE_WRITE_REQ PDU is received. Hence, any *Invalid Offset* (0x07) or *Invalid Attribute Value Length* (0x0D) errors are generated when an ATT_EXECUTE_WRITE_REQ PDU is received.

If the client has insufficient authorization to write the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authorization* (0x08).

If the client has insufficient security to write the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Authentication* (0x05).

If the client has an encryption key size that is too short to write the requested attribute then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Encryption Key Size Too Short* (0x0C).

If the client has not enabled encryption, and encryption is required to write the requested attribute, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Insufficient Encryption* (0x0F).

If the server does not have sufficient space to queue this request then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Prepare Queue Full* (0x09).

If the handle is invalid, then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Handle* (0x01).

If the attribute value cannot be written then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Write Not Permitted* (0x03).

The server shall not change the value of the attribute until an ATT_EXECUTE_WRITE_REQ PDU is received.

If an ATT_PREPARE_WRITE_REQ PDU was invalid, and therefore an ATT_ERROR_RSP PDU has been issued, then this prepared write will be considered to have not been received. All existing prepared writes in the prepare queue shall not be affected by this invalid request.

3.4.6.2 ATT_PREPARE_WRITE_RSP

The ATT_PREPARE_WRITE_RSP PDU is sent in response to a received ATT_PREPARE_WRITE_REQ PDU and acknowledges that the value has been successfully received and placed in the prepare write queue.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x17 = ATT_PREPARE_WRITE_RSP PDU
Attribute Handle	2	The handle of the attribute to be written
Value Offset	2	The offset of the first octet to be written
Part Attribute Value	0 to (ATT_MTU-5)	The value of the attribute to be written

Table 3.35: Format of ATT_PREPARE_WRITE_RSP PDU

The attribute handle shall be set to the same value as in the corresponding ATT_PREPARE_WRITE_REQ PDU.

The value offset and part attribute value shall be set to the same values as in the corresponding ATT_PREPARE_WRITE_REQ PDU.

3.4.6.3 ATT_EXECUTE_WRITE_REQ

The ATT_EXECUTE_WRITE_REQ PDU is used to request the server to write or cancel the write of all the prepared values currently held in the prepare queue from this client. This request shall be handled by the server as an atomic operation.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x18 = ATT_EXECUTE_WRITE_REQ PDU
Flags	1	0x00 – Cancel all prepared writes 0x01 – Immediately write all pending prepared values

Table 3.36: Format of ATT_EXECUTE_WRITE_REQ PDU

When the flags parameter is set to 0x01, all pending prepared write values that are currently queued shall be written in the order they were received in the corresponding ATT_PREPARE_WRITE_REQ PDUs. The queue shall then be cleared and an ATT_EXECUTE_WRITE_RSP PDU shall be sent.

When the flags parameter is set to 0x00 all pending prepared write values shall be discarded for this client. The queue shall then be cleared, and an ATT_EXECUTE_WRITE_RSP PDU shall be sent.

Note: If multiple ATT bearers were used to send the prepared write requests, then the order that writes sent on different ATT bearers are executed is not specified and is not reported to the client. In addition, if the ATT_EXECUTE_WRITE_REQ PDU is sent before the client has received responses to all the prepared write requests, the requests for which the client has not yet received a response might form part of a subsequent write rather than this one; this is also not reported to the client.

If there are no pending prepared write values, then no values are written and an ATT_EXECUTE_WRITE_RSP PDU shall be sent.

If the prepared Attribute Value exceeds the maximum valid length of the attribute value, then all pending prepared write values shall be discarded for this client, the queue shall then be cleared, and then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Attribute Value Length* (0x0D).

If the prepared Value Offset is greater than the current length of the attribute value, then all pending prepared write values shall be discarded for this client, the queue shall be cleared, and then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Invalid Offset* (0x07).

If the pending prepared write values cannot be written due to an application error, then the queue shall be cleared and then an ATT_ERROR_RSP PDU shall be sent with a higher layer specification defined error code. The Attribute Handle In Error parameter shall be set to the attribute handle of the attribute from the prepare queue that caused this application error. The state of the attributes that were to be written from the prepare queue is not defined in this case.

If the pending prepared write values cannot be written due to a database change, then the queue shall be cleared and then an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Database Out Of Sync* (0x12). The Attribute Handle In Error parameter shall be set to the attribute handle of the attribute from the prepare queue that caused this error. The state of the attributes that were to be written from the prepare queue is not defined in this case.

3.4.6.4 ATT_EXECUTE_WRITE_RSP

The ATT_EXECUTE_WRITE_RSP PDU is sent in response to a received ATT_EXECUTE_WRITE_REQ PDU.

Parameter	Size	Description
Attribute Opcode	1	0x19 - ATT_EXECUTE_WRITE_RSP PDU

Table 3.37: Format of ATT_EXECUTE_WRITE_RSP PDU

The ATT_EXECUTE_WRITE_RSP PDU shall be sent after the attributes are written. In case an action is taken in response to the write, an indication may be used once the action is complete.

3.4.7 Server initiated

3.4.7.1 ATT_HANDLE_VALUE_NTF

A server can send a notification of an attribute's value at any time.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x1B = ATT_HANDLE_VALUE_NTF PDU
Attribute Handle	2	The handle of the attribute
Attribute Value	0 to (ATT_MTU-3)	The current value of the attribute

Table 3.38: Format of ATT_HANDLE_VALUE_NTF PDU

The attribute handle shall be set to a valid handle.

The attribute value shall be set to the current value of the attribute identified by the attribute handle.

If the attribute value is longer than (ATT_MTU-3) octets, then only the first (ATT_MTU-3) octets of this attributes value can be sent in a notification.

Note: For a client to get a long attribute, it must use the ATT_READ_BLOB_REQ PDU (see Section 3.4.4.5) following the receipt of this notification.

If the attribute handle or the attribute value is invalid, then this notification shall be ignored upon reception.

3.4.7.2 ATT_HANDLE_VALUE_IND

A server can send an indication of an attribute's value.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x1D = ATT_HANDLE_VALUE_IND PDU
Attribute Handle	2	The handle of the attribute
Attribute Value	0 to (ATT_MTU-3)	The current value of the attribute

Table 3.39: Format of ATT_HANDLE_VALUE_IND PDU

The attribute handle shall be set to a valid handle.

The attribute value shall be set to the current value of the attribute identified by the attribute handle.

If the attribute value is longer than (ATT_MTU-3) octets, then only the first (ATT_MTU - 3) octets of this attributes value can be sent in an indication.

Note: For a client to get a long attribute, it must use the ATT_READ_BLOB_REQ PDU (see Section 3.4.4.5) following the receipt of this indication.

The client shall send an ATT_HANDLE_VALUE_CFM PDU in response to an ATT_HANDLE_VALUE_IND PDU. No further indications to this client shall occur until the confirmation has been received by the server.

If the attribute handle or the attribute value is invalid, the client shall send an ATT_HANDLE_VALUE_CFM PDU in response and shall discard the handle and value from the received indication.

3.4.7.3 ATT_HANDLE_VALUE_CFM

The ATT_HANDLE_VALUE_CFM PDU is sent in response to a received ATT_HANDLE_VALUE_IND PDU and confirms that the client has received an indication of the given attribute.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x1E = ATT_HANDLE_VALUE_CFM PDU

Table 3.40: Format of ATT_HANDLE_VALUE_CFM PDU

3.4.7.4 ATT_MULTIPLE_HANDLE_VALUE_NTF

A server can send a notification of two or more attributes' values at any time.

Parameter	Size (octets)	Description
Attribute Opcode	1	0x23 = ATT_MULTIPLE_- HANDLE_VALUE_NTF
Handle Length Value Tuple List	8 to (ATT_MTU-1)	A list of Handle Length Value Tuples

Table 3.41: Format of ATT_MULTIPLE_HANDLE_VALUE_NTF PDU

The Handle Length Value Tuple List shall be a concatenation of Handle Length Value Tuples for each of the attributes being notified.

The server shall not truncate a Handle Length Value Tuple.

The Attribute Handle field in a Handle Length Value Tuple shall be set to the handle of the attribute being notified. The Value Length field in a Handle Length Value Tuple shall be set to the length of the Attribute Value field. The Attribute Value field in a Handle Length Value Tuple shall be set to the value of the attribute being notified.

Attribute Handle	Value Length	Attribute Value
2 octets	2 octets	(Value Length) octets

Table 3.42: Format of the Handle Length Value Tuple

If an attribute handle or an attribute value is invalid, then the client shall ignore that attribute when receiving this notification.

3.4.8 Attribute Opcode summary

Table 3.43 gives a summary of the Attribute Protocol PDUs.

Attribute PDU Name	Attribute Opcode	Parameters
ATT_ERROR_RSP	0x01	Request Opcode in Error, Attribute Handle In Error, Error Code
ATT_EXCHANGE_MTU_REQ	0x02	Client Rx MTU
ATT_EXCHANGE_MTU_RSP	0x03	Server Rx MTU
ATT_FIND_INFORMATION_REQ	0x04	Starting Handle, Ending Handle
ATT_FIND_INFORMATION_RSP	0x05	Format, Information Data
ATT_FIND_BY_TYPE_VALUE_REQ	0x06	Starting Handle, Ending Handle, Attribute Type, Attribute Value
ATT_FIND_BY_TYPE_VALUE_RSP	0x07	Handles Information List
ATT_READ_BY_TYPE_REQ	0x08	Starting Handle, Ending Handle, UUID
ATT_READ_BY_TYPE_RSP	0x09	Length, Attribute Data List
ATT_READ_REQ	0x0A	Attribute Handle
ATT_READ_RSP	0x0B	Attribute Value
ATT_READ_BLOB_REQ	0x0C	Attribute Handle, Value Offset
ATT_READ_BLOB_RSP	0x0D	Part Attribute Value
ATT_READ_MULTIPLE_REQ	0x0E	Handle Set

Attribute PDU Name	Attribute Opcode	Parameters
ATT_READ_MULTIPLE_RSP	0x0F	Value Set
ATT_READ_BY_GROUP_TYPE_REQ	0x10	Start Handle, Ending Handle, UUID
ATT_READ_BY_GROUP_TYPE_RSP	0x11	Length, Attribute Data List
ATT_WRITE_REQ	0x12	Attribute Handle, Attribute Value
ATT_WRITE_RSP	0x13	*none*
ATT_WRITE_CMD	0x52	Attribute Handle, Attribute Value
ATT_PREPARE_WRITE_REQ	0x16	Attribute Handle, Value Offset, Part Attribute Value
ATT_PREPARE_WRITE_RSP	0x17	Attribute Handle, Value Offset, Part Attribute Value
ATT_EXECUTE_WRITE_REQ	0x18	Flags
ATT_EXECUTE_WRITE_RSP	0x19	*none*
ATT_READ_MULTIPLE_VARIABLE_REQ	0x20	Set Of Handles
ATT_READ_MULTIPLE_VARIABLE_RSP	0x21	Length Value Tuple List
ATT_MULTIPLE_HANDLE_VALUE_NTF	0x23	Handle Length Value Tuple List
ATT_HANDLE_VALUE_NTF	0x1B	Attribute Handle, Attribute Value
ATT_HANDLE_VALUE_IND	0x1D	Attribute Handle, Attribute Value
ATT_HANDLE_VALUE_CFM	0x1E	*none*
ATT_SIGNED_WRITE_CMD	0xD2	Attribute Handle, Attribute Value, Authentication Signature

Table 3.43: Attribute Protocol summary

3.4.9 Attribute PDU response summary

Table 3.44 gives a summary of the Attribute PDU Method responses that are allowed. Each method indicates the method that should be sent as a successful response,

and whether an ATT_ERROR_RSP PDU can be sent in response instead. If an ATT_ERROR_RSP PDU can be sent, then Table 3.44 also indicates the error codes that are valid within this ATT_ERROR_RSP PDU for the given method.

Attribute PDU Method	Successful Response PDU	ATT_ERROR_-RSP Allowed	Valid Error Codes
ATT_EXCHANGE_-MTU_REQ	ATT_EXCHANGE_-MTU_RSP	Yes	*Request Not Supported* (0x06)
ATT_FIND_-INFORMATION_REQ	ATT_FIND_-INFORMATION_RSP	Yes	*Invalid Handle* (0x01), *Attribute Not Found* (0x0A)
ATT_FIND_BY_-TYPE_VALUE_REQ	ATT_FIND_BY_-TYPE_VALUE_RSP	Yes	*Invalid Handle* (0x01), *Request Not Supported* (0x06), *Attribute Not Found* (0x0A)
ATT_READ_BY_-TYPE_REQ	ATT_READ_BY_-TYPE_RSP	Yes	*Invalid Handle* (0x01), *Database Out of Sync* (0x12), *Request Not Supported* (0x06), *Attribute Not Found* (0x0A), *Insufficient Authorization* (0x08), *Insufficient Authentication* (0x05), *Insufficient Encryption* (0x0F), *Encryption Key Size Too Short* (0x0C), *Read Not Permitted* (0x02), *Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF)

Attribute PDU Method	Successful Response PDU	ATT_ERROR_-RSP Allowed	Valid Error Codes
ATT_READ_REQ	ATT_READ_RSP	Yes	*Invalid Handle* (0x01), *Database Out Of Sync* (0x12), *Insufficient Authorization* (0x08), *Insufficient Authentication* (0x05), *Insufficient Encryption* (0x0F), *Encryption Key Size Too Short* (0x0C), *Read Not Permitted* (0x02), *Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF)
ATT_READ_BLOB_-REQ	ATT_READ_BLOB_-RSP	Yes	*Invalid Handle* (0x01), *Database Out Of Sync* (0x12), *Request Not Supported* (0x06), *Insufficient Authorization* (0x08), *Insufficient Authentication* (0x05), *Insufficient Encryption* (0x0F), *Encryption Key Size Too Short* (0x0C), *Read Not Permitted* (0x02), *Invalid Offset* (0x07), *Attribute Not Long* (0x0B), *Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF)

Attribute PDU Method	Successful Response PDU	ATT_ERROR_-RSP Allowed	Valid Error Codes
ATT_READ_-MULTIPLE_REQ	ATT_READ_-MULTIPLE_RSP	Yes	*Invalid Handle* (0x01), *Database Out Of Sync* (0x12), *Request Not Supported* (0x06), *Insufficient Authorization* (0x08), *Insufficient Authentication* (0x05), *Insufficient Encryption* (0x0F), *Encryption Key Size Too Short* (0x0C), *Read Not Permitted* (0x02), *Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF)
ATT_READ_BY_-GROUP_TYPE_REQ	ATT_READ_BY_-GROUP_TYPE_RSP	Yes	*Invalid Handle* (0x01), *Request Not Supported* (0x06), *Attribute Not Found* (0x0A), *Insufficient Authorization* (0x08), *Insufficient Authentication* (0x05), *Insufficient Encryption* (0x0F), *Encryption Key Size Too Short* (0x0C), *Read Not Permitted* (0x02), *Unsupported Group Type* (0x10), *Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF)

Attribute PDU Method	Successful Response PDU	ATT_ERROR_-RSP Allowed	Valid Error Codes
ATT_READ_-MULTIPLE_-VARIABLE_REQ	ATT_READ_-MULTIPLE_-VARIABLE_RSP	Yes	*Invalid Handle* (0x01), *Database Out Of Sync* (0x12), *Request Not Supported* (0x06), *Insufficient Authorization* (0x08), *Insufficient Authentication* (0x05), *Insufficient Encryption* (0x0F), *Encryption Key Size Too Short* (0x0C), *Read Not Permitted* (0x02), *Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF)
ATT_WRITE_REQ	ATT_WRITE_RSP	Yes	*Invalid Handle* (0x01), *Database Out Of Sync* (0x12), *Request Not Supported* (0x06), *Insufficient Authorization* (0x08), *Insufficient Authentication* (0x05), *Insufficient Encryption* (0x0F), *Encryption Key Size Too Short* (0x0C), *Write Not Permitted* (0x03), *Invalid Attribute Value Length* (0x0D), *Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF)
ATT_WRITE_CMD	*none*	No	*none*
ATT_SIGNED_-WRITE_CMD	*none*	No	*none*

Attribute PDU Method	Successful Response PDU	ATT_ERROR_-RSP Allowed	Valid Error Codes
ATT_PREPARE_-WRITE_REQ	ATT_PREPARE_-WRITE_RSP	Yes	*Invalid Handle* (0x01), *Database Out Of Sync* (0x12), *Request Not Supported* (0x06), *Insufficient Authorization* (0x08), *Insufficient Authentication* (0x05), *Write Not Permitted* (0x03), *Prepare Queue Full* (0x09), *Insufficient Encryption* (0x0F), *Encryption Key Size Too Short* (0x0C), *Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF)
ATT_EXECUTE_-WRITE_REQ	ATT_EXECUTE_-WRITE_RSP	Yes	*Application Error* (0x80 to 0x9F), *Common Profile and Service Error Codes* (0xE0 to 0xFF), *Invalid Offset* (0x07), *Invalid Attribute Value Length* (0x0D), *Database Out Of Sync* (0x12)
ATT_HANDLE_-VALUE_NTF	*none*	No	*none*
ATT_HANDLE_-VALUE_IND	ATT_HANDLE_-VALUE_CFM	No	*none*
ATT_MULTIPLE_-HANDLE_VALUE_-NTF	*none*	No	*none*

Table 3.44: Attribute request and response summary

4 SECURITY CONSIDERATIONS

The Attribute Protocol can be used to access information that may require both authorization and an authenticated and encrypted physical link before an attribute can be read or written.

If such a request is issued when the client has not been authorized to access this information, the server shall send an ATT_ERROR_RSP PDU with the Error Code parameter set to *Insufficient Authorization* (0x08). The authorization requirements for access to a given attribute are not defined in this Part. Each device implementation will determine how authorization occurs. Authorization procedures are defined in GAP, and may be further refined in a higher layer specification.

If such a request is issued when the physical link is unauthenticated, the server shall send an ATT_ERROR_RSP PDU with the Error Code parameter set to *Insufficient Authentication* (0x05). A client wanting to read or write this attribute can then request that the physical link be authenticated, and once this has been completed, send the request again.

The Attribute Protocol can be used to notify or indicate the value of an attribute that may require an authenticated and encrypted physical link before an attribute notification or indication is performed. A server wanting to notify or indicate this attribute can then request that the physical link be authenticated, and once this has been completed, send the notification or indication.

The list of attributes that a device supports is not considered private or confidential information, and therefore the ATT_FIND_INFORMATION_REQ PDU shall always be permitted. This implies that the error code *Insufficient Authorization* (0x08) or *Insufficient Authentication* (0x05) shall not be used in an ATT_ERROR_RSP PDU for an ATT_FIND_INFORMATION_REQ PDU.

For example, an attribute value may be allowed to be read by any device, but only written by an authenticated device. An implementation should take this into account, and not assume that just because it can read an attribute’s value, it will also be able to write the value. Similarly, just because an attribute value can be written, does not mean that an attribute value can also be read. Each individual attribute could have different security requirements.

When a client accesses an attribute, the order of checks that are performed on the server will have security implications. A server shall check authentication and authorization requirements before any other check is performed.

Note: For example, if the authentication and authorization requirement checks are not performed first then the size of an attribute could be determined by sending repeated ATT_READ_BLOB_REQ PDUs for an attribute that a client does not have access to, because either the error code *Invalid Offset* (0x07) or *Insufficient Authentication* (0x05) would be returned.

Appendix A Changes to PDU names

Previous versions of this specification used different names for the PDUs defined in Section 3.4. Table A.1 shows the previous and current names of these PDUs.

Previous name	Current name
Error Response	ATT_ERROR_RSP
Exchange MTU Request	ATT_EXCHANGE_MTU_REQ
Exchange MTU Response	ATT_EXCHANGE_MTU_RSP
Execute Write Request	ATT_EXECUTE_WRITE_REQ
Execute Write Response	ATT_EXECUTE_WRITE_RSP
Find By Type Value Request	ATT_FIND_BY_TYPE_VALUE_REQ
Find By Type Value Response	ATT_FIND_BY_TYPE_VALUE_RSP
Find Information Request	ATT_FIND_INFORMATION_REQ
Find Information Response	ATT_FIND_INFORMATION_RSP
Handle Value Confirmation	ATT_HANDLE_VALUE_CFM
Handle Value Indication	ATT_HANDLE_VALUE_IND
Handle Value Notification	ATT_HANDLE_VALUE_NTF
Prepare Write Request	ATT_PREPARE_WRITE_REQ
Prepare Write Response	ATT_PREPARE_WRITE_RSP
Read Blob Request	ATT_READ_BLOB_REQ
Read Blob Response	ATT_READ_BLOB_RSP
Read by Group Type Request	ATT_READ_BY_GROUP_TYPE_REQ
Read by Group Type Response	ATT_READ_BY_GROUP_TYPE_RSP
Read By Type Request	ATT_READ_BY_TYPE_REQ
Read By Type Response	ATT_READ_BY_TYPE_RSP
Read Multiple Request	ATT_READ_MULTIPLE_REQ
Read Multiple Response	ATT_READ_MULTIPLE_RSP
Read Request	ATT_READ_REQ
Read Response	ATT_READ_RSP
Signed Write Command	ATT_SIGNED_WRITE_CMD
Write Command	ATT_WRITE_CMD

Previous name	Current name
Write Request	ATT_WRITE_REQ
Write Response	ATT_WRITE_RSP

Host
Part G

GENERIC ATTRIBUTE PROFILE (GATT)

This Part defines the Generic Attribute Profile that describes a service framework using the Attribute Protocol for discovering services, and for reading and writing characteristic values on a peer device.

CONTENTS

1 INTRODUCTION

1.1 Scope

The Generic Attribute profile (GATT) defines a service framework using the Attribute Protocol. This framework defines procedures and formats of services and their characteristics. The procedures defined include discovering, reading, writing, notifying and indicating characteristics, as well as configuring the broadcast of characteristics.

1.2 Profile dependency

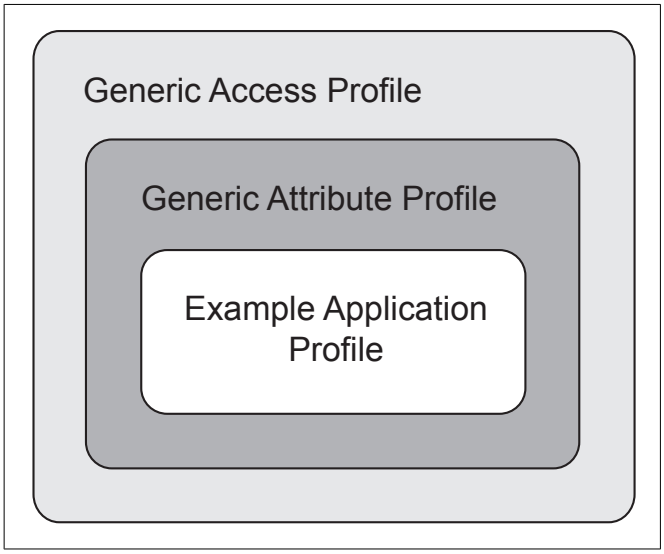

Figure 1.1: Profile dependencies

Figure 1.1 depicts the structure and the dependencies of the profiles. A profile is dependent upon another profile if it re-uses parts of that profile by implicitly or explicitly referencing it.

1.3 [This section is no longer used]

1.4 [This section is no longer used]

1.5 Conventions

In this Part the use of literal terms such as procedure, PDUs, opcodes, or function names appear in italics. Specific names of fields in structures, packets, etc. also appear in italics. The use of « » (e.g. «Primary Service») indicates a UUID. Attribute Protocol error codes (see [Vol 3] Part F, Table 3.4) appear in italics followed by the numeric error code.

2 PROFILE OVERVIEW

The GATT profile is designed to be used by an application or another profile, so that a client can communicate with a server. The server contains a number of attributes, and the GATT Profile defines how to use the Attribute Protocol to discover, read, write and obtain indications of these attributes, as well as configuring broadcast of attributes.

2.1 Protocol stack

Figure 2.1 shows the peer protocols used by this profile.

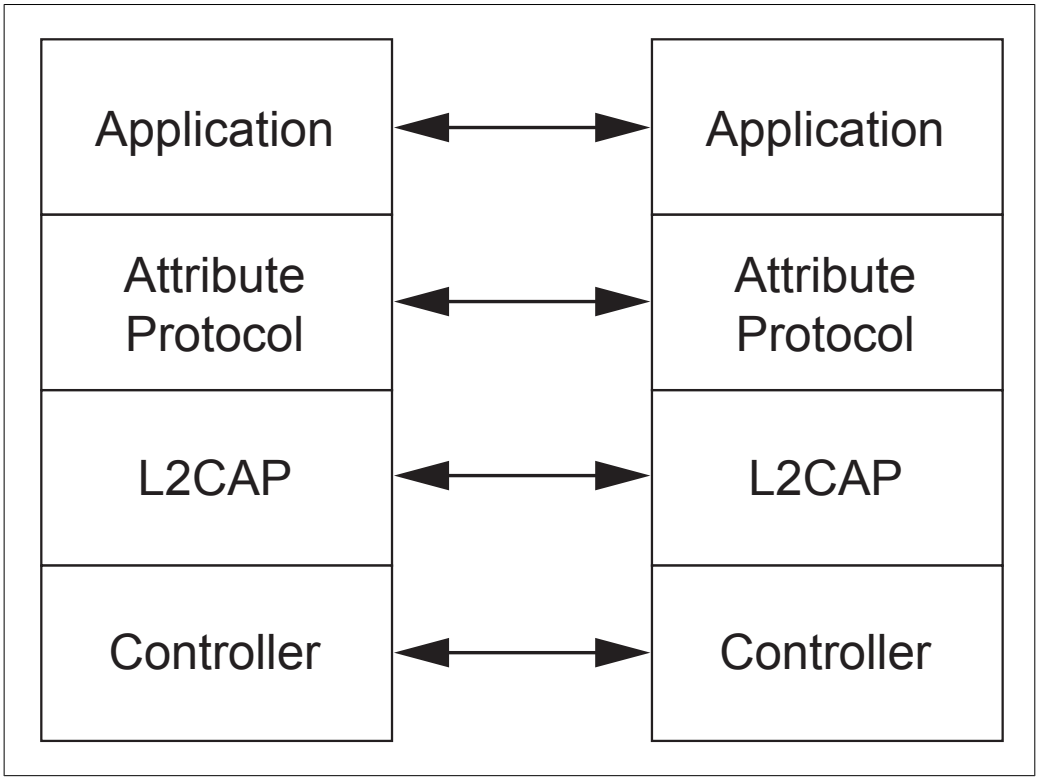

Figure 2.1: Protocol model

2.2 Configurations and roles

The following roles are defined for devices that implement this profile:

Client—This is the device that initiates commands and requests towards the server and can receive responses, indications and notifications sent by the server.

Server—This is the device that accepts incoming commands and requests from the client and sends responses, indications and notifications to a client.

Note: The roles are not fixed to the device. The roles are determined when a device initiates a defined procedure, and they are released when the procedure ends.

A device can act in both roles at the same time.

An example of configurations illustrating the roles for this profile is depicted in Figure 2.2.

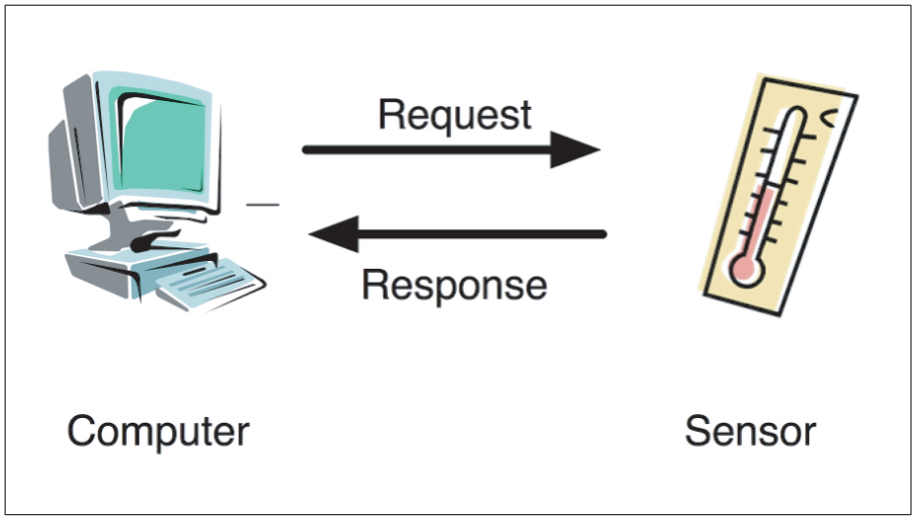

Figure 2.2: Examples of configuration

In Figure 2.2, the computer is the temperature service client and the sensor is the temperature service server. The computer initiates procedures to configure the sensor or to read the sensor values. In this example the sensor provides information about the characteristics the sensor device exposes as part of the temperature service and may permit some characteristics to be written. Also, the sensor responds to read requests with the appropriate values.

2.3 User requirements and scenarios

The following scenarios are covered by this profile:

- Exchanging configuration
- Discovery of services and characteristics on a device
- Reading a characteristic value
- Writing a characteristic value
- Notification of a characteristic value
- Indication of a characteristic value

2.4 Profile fundamentals

This profile can be used over any physical link, using the Attribute Protocol L2CAP channel, known as the ATT Bearer. Here is a brief summary of lower layer requirements communication between the client and the server.

- An ATT bearer is established using “Channel Establishment” as defined in Section 6.
- The profile roles are not tied to the Controller roles (i.e. Central or Peripheral).
- On an LE Physical link, use of security features such as authorization, authentication and encryption are optional. On a BR/EDR physical link encryption is mandatory.
- Multi-octet fields within the GATT profile shall be sent least significant octet first (little-endian) with the exception of the Characteristic Value field. The Characteristic Value and any fields within it shall be little-endian unless otherwise defined in the specification which defines the characteristic.
- Multiple ATT bearers may be established between a client and a server. The server can determine if ATT bearers are from the same client, and vice versa, by using connection information such as the Bluetooth Device Address of the peer device.

2.5 Attribute Protocol

The GATT profile requires the implementation of the Attribute Protocol (See [Vol 3] Part F) and those Attribute Protocol PDUs required by Section 4.2 and Section 4.13.

2.5.1 Overview

The GATT Profile uses the Attribute Protocol to transport data in the form of commands, requests, responses, indications, notifications and confirmations between devices. This data is contained in Attribute Protocol PDUs as specified in Figure 2.3.

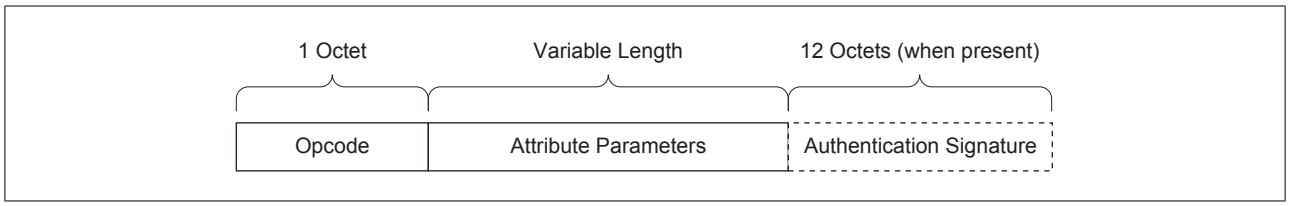

Figure 2.3: Attribute Protocol PDU

The *Opcode* contains the specific command, request, response, indication, notification or confirmation opcode and a flag for authentication. The *Attribute Parameters* contain data for the specific command or request or the data returned in a response, indication, or notification. The *Authentication Signature* is optional and is described in [Vol 3] Part H, Section 2.4.5.

Attribute Protocol commands and requests act on values stored in Attributes on the server device. An Attribute is composed of four parts: *Attribute Handle*, *Attribute Type*,

Attribute Value, and *Attribute Permissions*. Figure 2.4 shows a logical representation of an Attribute. The actual representation for a given implementation is specific to that implementation.

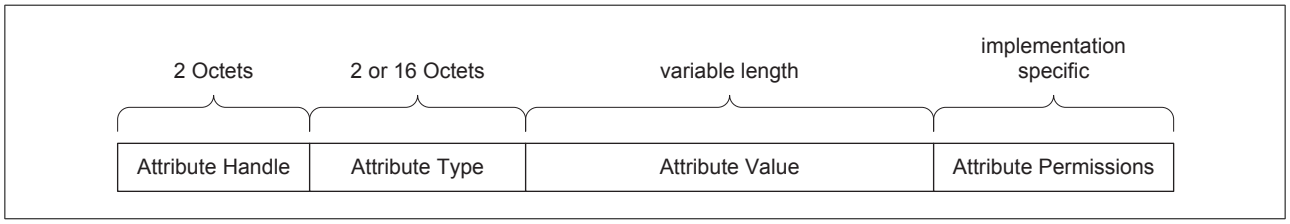

Figure 2.4: Logical attribute representation

The *Attribute Handle* is an index corresponding to a specific Attribute. The *Attribute Type* is a UUID that describes the *Attribute Value*. The *Attribute Value* is the data described by the *Attribute Type* and indexed by the *Attribute Handle*. The Attributes are ordered by increasing *Attribute Handle* values. *Attribute Handle* values may begin at any value between 0x0001 and 0xFFFF. Although the *Attribute Handle* values are in increasing order, following *Attribute Handle* values may differ by more than one. That is to say there may be gaps between successive *Attribute Handles*. When the specification requires two attribute handles to be adjacent or for one to immediately follow one the other, such gaps are still permitted and shall be ignored.

Attribute Permissions is part of the Attribute that cannot be read from or written to using the Attribute Protocol. It is used by the server to determine whether read or write access is permitted for a given attribute. *Attribute Permissions* are established by the GATT profile, a higher layer profile or are implementation specific if not specified.

2.5.2 Attribute caching

Attribute caching is an optimization that allows the client to discover the Attribute information such as *Attribute Handles* used by the server once and use the same Attribute information across reconnections without rediscovery. If the client does not cache the Attribute information, then it must rediscover the *Attribute* information at each reconnection. With caching, time is saved and a significant number of packets need not be exchanged between the client and server. The Attribute information that shall be cached by a client is the *Attribute Handles* of all server attributes and the GATT service characteristics values.

Attribute Handles used by the server should not change over time. This means that once an *Attribute Handle* is discovered by a client the *Attribute Handle* for that Attribute should not be changed.

Some circumstances may cause servers to change the *Attribute Handles* used for services, perhaps due to a factory reset or a firmware upgrade procedure being performed. The following is only required on the server if the services on the server

can be added, modified or removed. If GATT based services on the server cannot be changed during the usable lifetime of the device, the *Service Changed* characteristic shall not exist on the server and the client does not need to ever perform service discovery after the initial service discovery for that server.

To support caching when a server supports changes in GATT based services, an indication is sent by the server to clients when a service is added, removed, or modified on the server. A client may also detect a service change by reading the *Database Hash* characteristic if that characteristic exists on the server. A GATT based service is considered modified if the binding of the *Attribute Handles* to the associated Attributes grouped within a service definition are changed. Any change to the GATT service definition characteristic values other than the *Service Changed* characteristic value and the *Client Supported Features* characteristic value themselves shall also be considered a modification.

For clients that have a trusted relationship (i.e. bond) with the server, the attribute cache is valid across connections. For clients with a trusted relationship and not in a connection when a service change occurs, the server shall send an indication when the client reconnects to the server (see Section 7.1). For clients that do not have a trusted relationship with the server and that do not support reading the *Database Hash* characteristic, the attribute cache is valid only during the connection. Clients without a trusted relationship that do support reading the *Database Hash* characteristic may validate the attribute cache on connection setup. Clients without a trusted relationship shall receive an indication when the service change occurs only during the current connection.

Note: Clients without a trusted relationship that support caching must either perform service discovery or detect service changes by reading the *Database Hash* characteristic on each connection if the server supports the *Service Changed* characteristic.

The server shall send an ATT_HANDLE_VALUE_IND PDU containing the range of affected *Attribute Handles* that shall be considered invalid in the client's attribute cache. The start *Attribute Handle* shall be the start *Attribute Handle* of the service definition containing the change and the end *Attribute Handle* shall be the last *Attribute Handle* of the service definition containing the change. The value in the indication is composed of two 16-bit *Attribute Handles* concatenated to indicate the affected *Attribute Handle* range.

Note: A server may set the affected *Attribute Handle* range to 0x0001 to 0xFFFF to indicate to the client to rediscover the entire set of *Attribute Handles* on the server.

If the *Database Hash* characteristic exists on the server then, each time a service change occurs, the server shall update the *Database Hash* characteristic value with the new Database Hash (see Section 7.3).

If the *Database Hash* characteristic value has changed since the last time it was read, the client shall consider its attribute cache invalid and shall not make use of the cached information until it has performed service discovery or obtained the changed database definitions using an out-of-band mechanism.

The client, upon receiving an ATT_HANDLE_VALUE_IND PDU containing the range of affected Attribute Handles, shall consider the attribute cache invalid over the affected Attribute Handle range. Any outstanding request transaction shall be considered invalid if the Attribute Handle is contained within the affected Attribute Handle range. The client must perform service discovery before the client uses any service that has an attribute within the affected Attribute Handle range. Alternatively, the client may read the *Database Hash* characteristic and obtain the changed database definitions using an out-of-band mechanism. If the client receives an ATT_HANDLE_VALUE_IND PDU during service discovery and the client has read the *Database Hash* characteristic prior to the service discovery, the client may read the *Database Hash* characteristic again to determine if the current service discovery can be continued or if a new service discovery is required.

Once the server has received the ATT_HANDLE_VALUE_CFM PDU, the server can consider the client to be aware of the updated Attribute Handles.

The client shall consider the affected *Attribute Handle* range to be invalid in its attribute cache and perform the discovery procedures to restore the attribute cache. The server shall store service changed information for all bonded devices.

2.5.2.1 Robust Caching

Robust Caching is a feature where the server sends an ATT_ERROR_RSP PDU to the client if the server does not consider the client to be aware of a service change.

If the *Database Hash* and *Service Changed* characteristics are both present on the server, then the server shall support the Robust Caching feature.

From the perspective of a server, each connected client is either "change-aware" or "change-unaware" regarding changes in the database definitions. After connecting to a server, the initial state of a client without a trusted relationship is change-aware. The initial state of a client with a trusted relationship is unchanged from the previous connection unless the database has been updated since the last connection, in which case the initial state is change-unaware.

Whenever the server updates the database definitions, all connected clients become change-unaware. A change-unaware connected client becomes change-aware when it reads the *Database Hash* characteristic and then the server receives another ATT request from the client. A change-unaware client using multiple ATT bearers shall wait

until the server has responded to all pending requests before reading the *Database Hash* characteristic (see Figure 2.5).

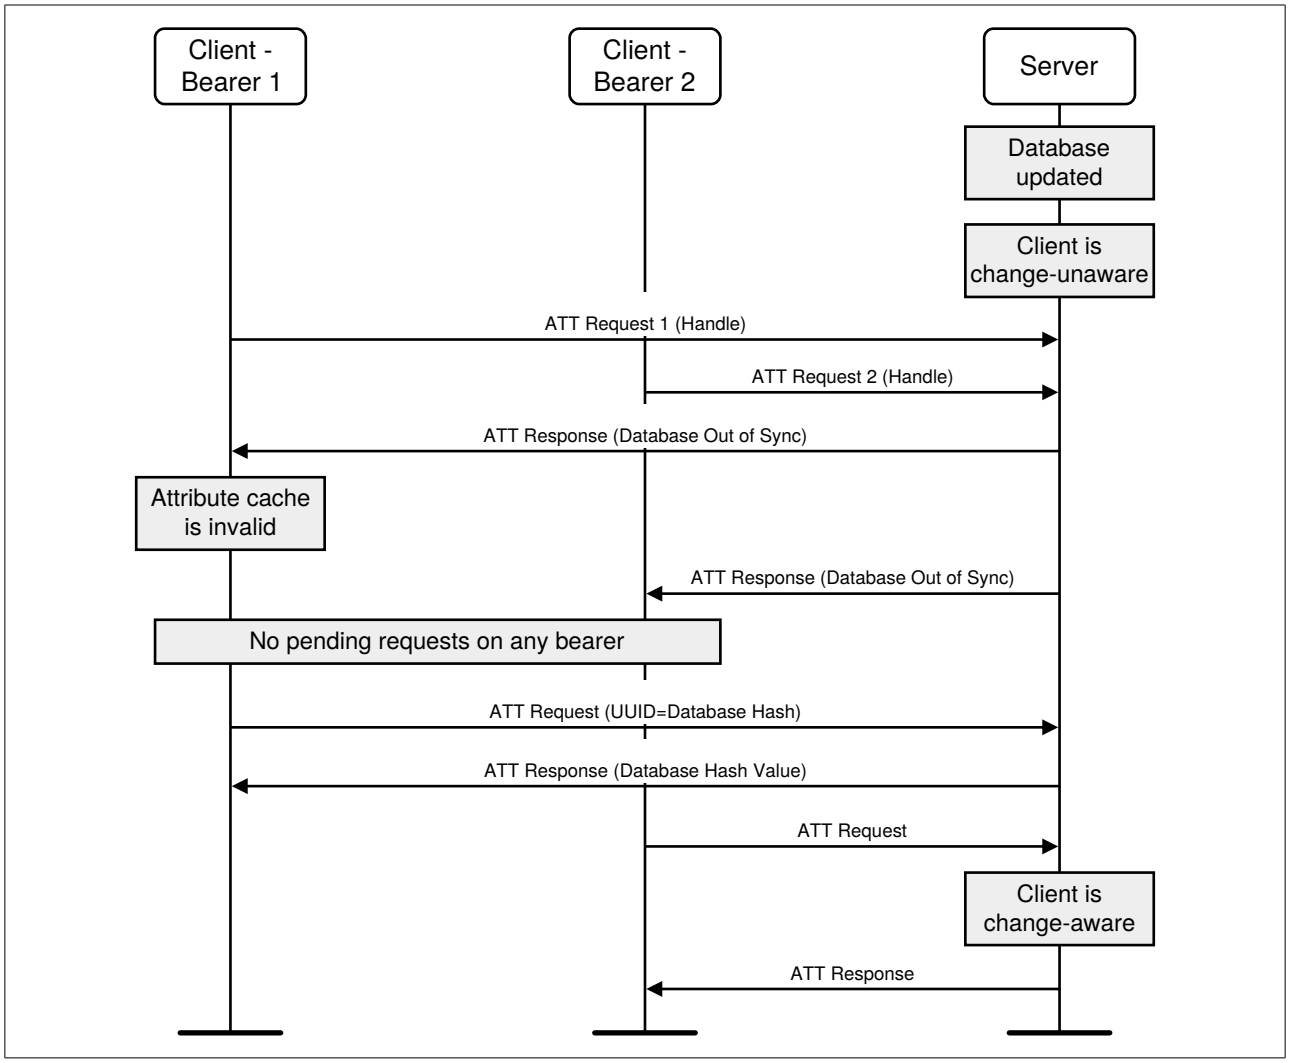

Figure 2.5: Transition to change-aware state for a client using multiple ATT bearers

In addition, a change-unaware connected client using exactly one ATT bearer becomes change-aware when either of the following happen:

- The client receives and confirms a *Handle Value Indication* for the *Service Changed* characteristic (see Figure 2.6).
- The server sends the client a response with the Error Code parameter set to *Database Out Of Sync* (0x12) and then the server receives another ATT request from the client (see Figure 2.7).

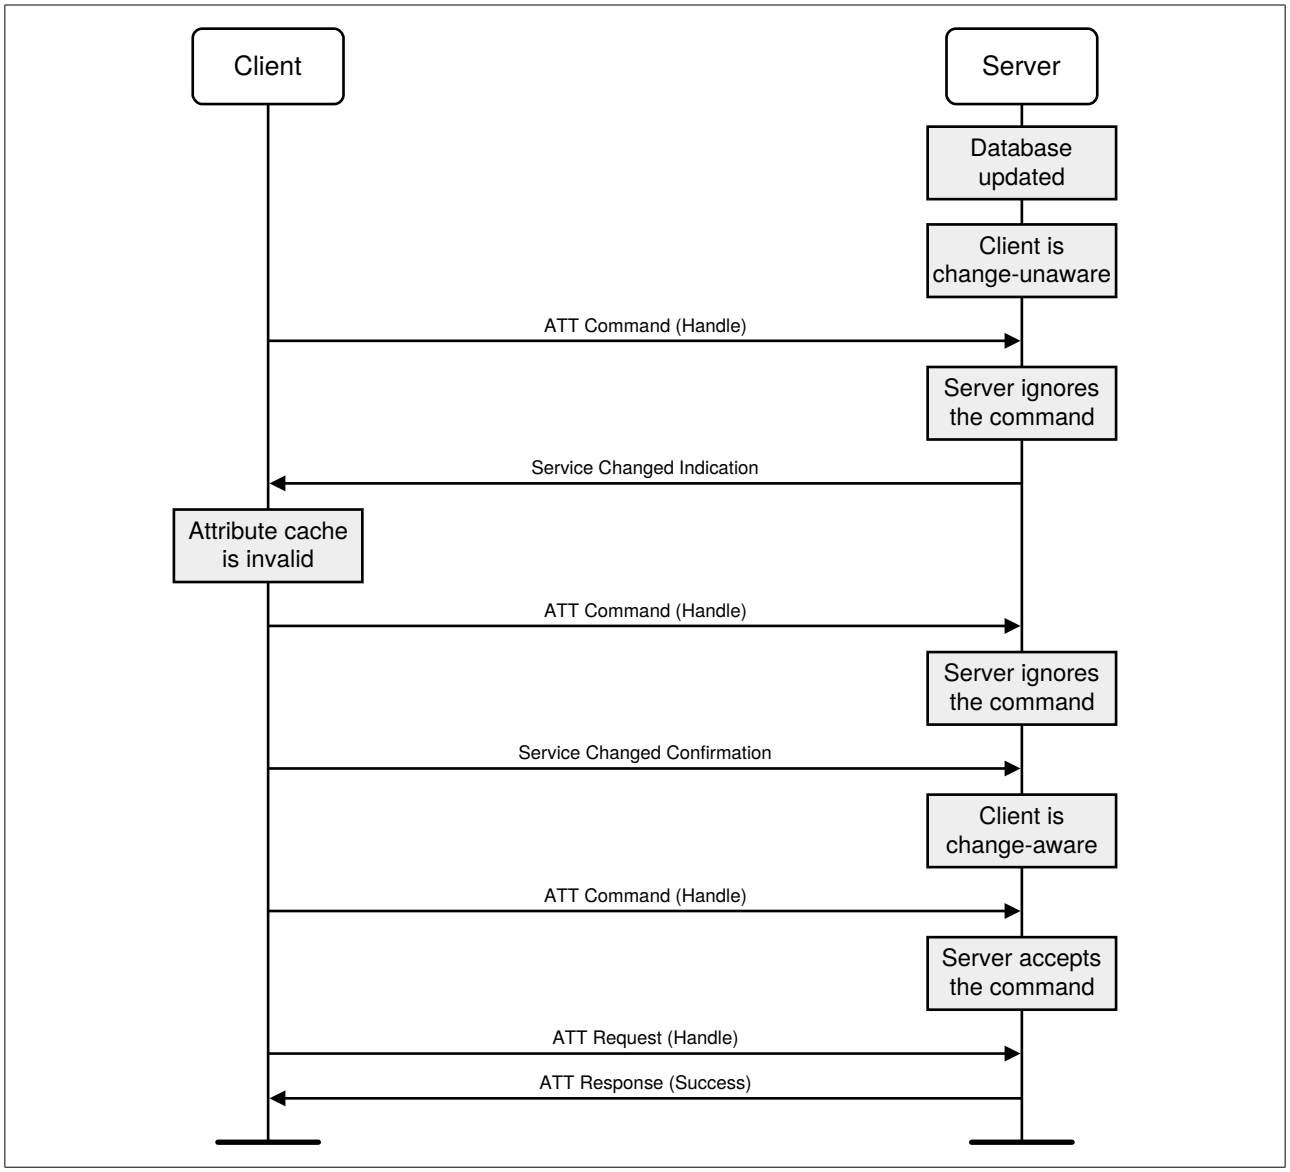

Figure 2.6: Transition to change-aware state for a client using exactly one ATT bearer, triggered by a Service Changed confirmation

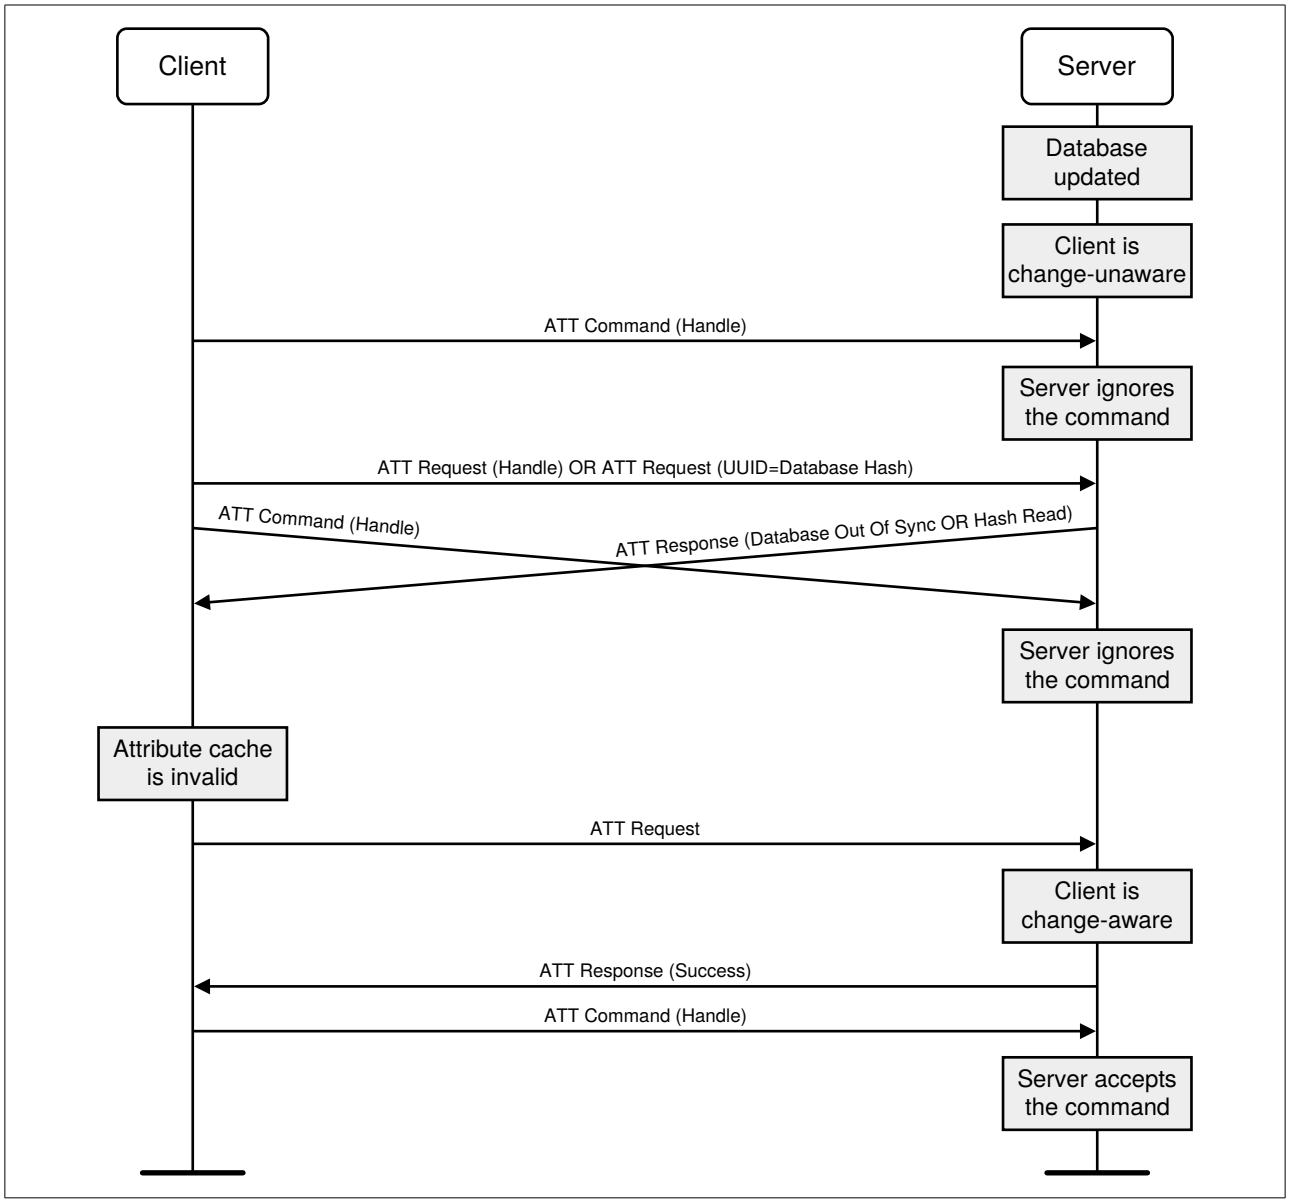

Figure 2.7: Transition to change-aware state for a client using exactly one ATT bearer, triggered by the ATT response "Database Out Of Sync" or "Hash Read"

If a client that has indicated support for robust caching (by setting the *Robust Caching* bit in the *Client Supported Features* characteristic) is change-unaware then the server shall send an ATT_ERROR_RSP PDU with the Error Code parameter set to *Database Out Of Sync* (0x12) when either of the following happen:

- That client requests an operation at any *Attribute Handle* or list of *Attribute Handles* by sending an ATT request.
- That client sends an ATT_READ_BY_TYPE_REQ PDU with Attribute Type other than «Include» or «Characteristic» and an *Attribute Handle* range other than 0x0001 to 0xFFFF.

The ATT_ERROR_RSP PDU is sent only once per bearer after the client becomes change-unaware, unless the client disconnects or the database changes again before the client becomes change-aware in which case the ATT_ERROR_RSP PDU shall be sent again. If a change-unaware client sends an ATT command, the server shall ignore it. Except for a *Handle Value Indication* for the *Service Changed* characteristic, the server shall not send notifications and indications to such a client until it becomes change-aware. If a client is change-aware, then the server shall perform the operation normally.

Note: To reduce the probability of blocked notifications and indications, servers should send this indication as soon as possible after a service change.

If a client receives an ATT_ERROR_RSP PDU with the Error Code parameter set to *Database Out Of Sync* (0x12), it shall consider its attribute cache invalid and shall not make use of the cached information until it has performed service discovery or obtained the changed database definitions using an out-of-band mechanism.

2.5.3 Attribute grouping

GATT defines the grouping of attributes for three attribute types: «Primary Service», «Secondary Service» and «Characteristic». A group begins with a declaration, and ends as defined in Section 3.1 for services and Section 3.3 for characteristics. Not all of the grouping attributes can be used in the ATT_READ_BY_GROUP_TYPE_REQ PDU. The «Primary Service» and «Secondary Service» grouping types may be used in the ATT_READ_BY_GROUP_TYPE_REQ PDU. The «Characteristic» grouping type shall not be used in the ATT_READ_BY_GROUP_TYPE_REQ PDU.

2.5.4 UUIDs

All 16-bit UUIDs shall be contained in exactly 2 octets. All 128-bit UUIDs shall be contained in exactly 16 octets.

All 32-bit UUIDs shall be converted to 128-bit UUIDs when the UUID is contained in an ATT PDU. See [Vol 3] Part B, Section 2.5.1 for the method of conversion.

2.6 GATT Profile hierarchy

2.6.1 Overview

The GATT Profile specifies the structure in which profile data is exchanged. This structure defines basic elements such as services and characteristics, used in a profile. All of the elements are contained by Attributes. Attributes used in the Attribute Protocol are containers that carry this profile data.

The top level of the hierarchy is a profile. A profile is composed of one or more services necessary to fulfill a use case. A service is composed of characteristics or inclusions

of other services. Each characteristic contains a value and may contain optional information about the value. The service and characteristic and the components of the characteristic (i.e. value and descriptors) contain the profile data and are all stored in Attributes on the server.

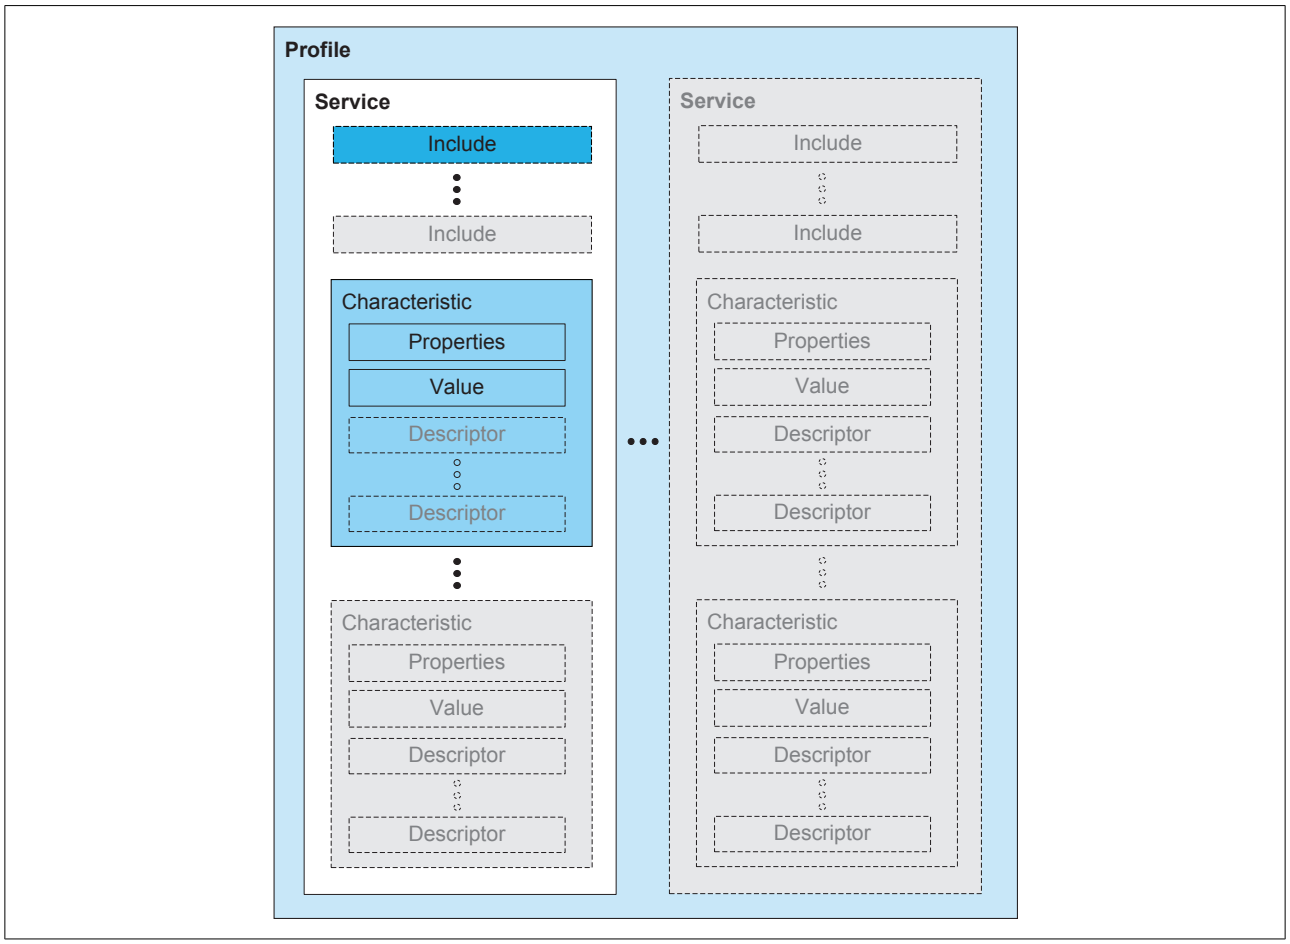

Figure 2.8: GATT Profile hierarchy

2.6.2 Service

A service is a collection of data and associated behaviors to accomplish a particular function or feature. In GATT, a service is defined by its service definition. A service definition may contain included services, mandatory characteristics, and optional characteristics.

To maintain backward compatibility with earlier clients, later versions of a service definition can only add new included services or optional characteristics. Later versions of a service definition are forbidden from changing behaviors from previous versions of the service definition.

There are two types of services: primary service and secondary service. A primary service is a service that exposes functionality of this device. A primary service can be

included by another service. Primary services can be discovered using Primary Service Discovery procedures. A secondary service is a service that should only be included from a primary service or another secondary service or other higher layer specification. A secondary service is only relevant in the context of the entity that includes it.

The determination of whether a service is either a primary or secondary service can be mandated by a higher layer specification.

Note: There is no procedure for discovering secondary services.

Services may be used in one or more higher layer specifications to fulfill a particular use case.

The service definition is described in Section 3.1.

2.6.3 Included services

An included service is a method to reference another service definition existing on the server into the service being defined. To include another service, an include definition is used at the beginning of the service definition. When a service definition uses an include definition to include a service, the entire included service definition becomes part of the new service definition. This includes all the included services and characteristics of the included service. The included service still exists as an independent service. A service that is included by another service shall not be changed by the act of inclusion or by the including service. There are no limits to the number of include definitions or the depth of nested includes in a service definition.

The include definition is described in Section 3.2.

2.6.4 Characteristic

A characteristic is a value used in a service along with properties and configuration information about how the value is accessed and information about how the value is displayed or represented. In GATT, a characteristic is defined by its characteristic definition. A characteristic definition contains a characteristic declaration, characteristic properties, and a value and may contain descriptors that describe the value or permit configuration of the server with respect to the characteristic.

The characteristic definition is described in Section 3.3.

2.7 Configured Broadcast

For LE physical links, Configured Broadcast is a method for a client to indicate to a server which *Characteristic Value* shall be broadcast in the advertising data when the server is executing the Broadcast mode procedure. For BR/EDR physical links, Configured Broadcast is not supported.

To configure a *Characteristic Value* to be broadcast by the server when in Broadcast mode, the client sets the broadcast configuration bit described in Section 3.3.3.4. The frequency of the broadcast is part of the service behavior definition. The data shall be broadcast as part of the Service Data Advertising Data type as defined in Section 1.11 of [3]. If multiple characteristics can simultaneously be enabled for broadcast, the service specification defines how the characteristics are to be formatted in the service data which follows the service UUID in the Service Data Advertising Data type payload.

3 SERVICE INTEROPERABILITY REQUIREMENTS

3.1 Service definition

A service definition shall contain a service declaration and may contain include definitions and characteristic definitions. The service definition ends before the next service declaration or after the maximum *Attribute Handle* is reached. Service definitions appear on the server in an order based on *Attribute Handle*.

All include definitions and characteristic definitions contained within the service definition are considered to be part of the service. All include definitions shall immediately follow the service declaration and precede any characteristic definitions. A service definition may have zero or more include definitions. All characteristic definitions shall be immediately following the last include definition or, in the event of no include definitions, immediately following the service declaration. A service definition may have zero or more characteristic definitions. There is no upper limit for include or characteristic definitions.

A service declaration is an Attribute with the *Attribute Type* set to the UUID for «Primary Service» or «Secondary Service». The *Attribute Value* shall be the 16-bit Bluetooth UUID or 128-bit UUID for the service, known as the service UUID. A client shall support the use of both 16-bit and 128-bit UUIDs. A client may ignore any service definition with an unknown service UUID. An unknown service UUID is a UUID for an unsupported service. The *Attribute Permissions* shall be read-only and shall not require authentication or authorization.

When multiple services exist, services definitions with service declarations using 16-bit Bluetooth UUID should be grouped together (i.e. listed sequentially) and services definitions with service declarations using 128-bit UUID should be grouped together.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permission
0xNNNN	0x2800 – UUID for «Primary Service» OR 0x2801 for «Secondary Service»	16-bit Bluetooth UUID or 128-bit UUID for Service	Read Only, No Authentication, No Authorization

Table 3.1: Service declaration

A device or higher level specification may have multiple service definitions and may have multiple service definitions with the same service UUID.

All Attributes on a server shall either contain a service declaration or exist within a service definition.

Service definitions contained in a server may appear in any order; a client shall not assume the order of service definitions on a server.

3.2 Include definition

An include definition shall contain only one include declaration.

The include declaration is an Attribute with the *Attribute Type* set to the UUID for «Include». The *Attribute Value* shall be set to the included service *Attribute Handle*, the End Group Handle, and the *service UUID*. The Service UUID shall only be present when the UUID is a 16-bit Bluetooth UUID.The *Attribute Permissions* shall be read only and not require authentication or authorization.

Attribute Handle	Attribute Type	Attribute Value			Attribute Permission
0xNNNN	0x2802 – UUID for «Include»	Included Service Attribute Handle	End Group Handle	Service UUID	Read Only, No Authentication, No Authorization

Table 3.2: Include declaration

A server shall not contain a service definition with an include definition to another service that includes the original service. This applies to each of the services the included definition references. This is referred to as a circular reference.

If the client detects a circular reference or detects nested include declarations to a greater level than it expects, it should terminate or stop using the ATT bearer.

3.3 Characteristic definition

A characteristic definition shall contain a characteristic declaration, a Characteristic Value declaration and may contain characteristic descriptor declarations. A characteristic definition ends at the start of the next characteristic declaration or service declaration or after the maximum *Attribute Handle*. Characteristic definitions appear on the server within a service definition in an order based on *Attribute Handle*.

Each declaration above is contained in a separate Attribute. The two required declarations are the characteristic declaration and the Characteristic Value declaration. The Characteristic Value declaration shall exist immediately following the characteristic declaration. Any optional characteristic descriptor declarations are placed after the Characteristic Value declaration. The order of the optional characteristic descriptor declarations is not significant.

A characteristic definition may be defined to concatenate several Characteristic Values into a single aggregated Characteristic Value. This may be used to optimize read

and writes of multiple Characteristic Values through the reading and writing of a single aggregated Characteristic Value. This type of characteristic definition is the same as a normal characteristic definition. The characteristic declaration shall use a characteristic UUID that is unique to the aggregated characteristic definition. The aggregated characteristic definition may also contain a characteristic aggregate format descriptor that describes the display format of the aggregated Characteristic Value.

3.3.1 Characteristic declaration

A characteristic declaration is an Attribute with the Attribute Type set to the UUID for «Characteristic» and *Attribute Value* set to the Characteristic Properties, Characteristic Value *Attribute Handle* and Characteristic UUID. The Attribute Permissions shall be readable and not require authentication or authorization.

If the server changes any characteristic declaration *Attribute Value* while the server has a trusted relationship with any client, then it shall send each client a Service Changed Indication indicating a change in the service holding the Characteristic Declaration (see Section 7.1).

Attribute Handle	Attribute Types	Attribute Value			Attribute Permissions
0xNNNN	0x2803–UUID for «Characteristic»	Characteristic Properties	Characteristic Value Attribute Handle	Characteristic UUID	Read Only, No Authentication, No Authorization

Table 3.3: Characteristic declaration

The *Attribute Value* of a characteristic declaration is read only.

Attribute Value	Size	Description
Characteristic Properties	1 octets	Bit field of characteristic properties
Characteristic Value Handle	2 octets	Handle of the Attribute containing the value of this characteristic
Characteristic UUID	2 or 16 octets	16-bit Bluetooth UUID or 128-bit UUID for Characteristic Value

Table 3.4: Attribute Value field in characteristic declaration

A service may have multiple characteristic definitions with the same Characteristic UUID.

Within a service definition, some characteristics may be mandatory and those characteristics shall be located after the include declarations and before any optional characteristics within the service definition. A client shall not assume any order of those characteristics that are mandatory or any order of those characteristics

that are optional within a service definition. Whenever possible and within the requirements stated earlier, characteristics definitions with characteristic declarations using 16-bit Bluetooth UUIDs should be grouped together (i.e. listed sequentially) and characteristics definitions with characteristic declarations using 128-bit UUIDs should be grouped together.

3.3.1.1 Characteristic Properties

The Characteristic Properties bit field determines how the Characteristic Value can be used, or how the characteristic descriptors (see Section 3.3.3) can be accessed. If the bits defined in Table 3.5 are set, the action described is permitted. Multiple characteristic properties can be set.

These bits shall be set according to the procedures allowed for this characteristic, as defined by higher layer specifications, without regard to security requirements.

Properties	Value	Description
Broadcast	0x01	If set, permits broadcasts of the Characteristic Value using Server Characteristic Configuration Descriptor. If set, the Server Characteristic Configuration Descriptor shall exist.
Read	0x02	If set, permits reads of the Characteristic Value using procedures defined in Section 4.8
Write Without Response	0x04	If set, permit writes of the Characteristic Value without response using procedures defined in Section 4.9.1.
Write	0x08	If set, permits writes of the Characteristic Value with response using procedures defined in Section 4.9.3 or Section 4.9.4.
Notify	0x10	If set, permits notifications of a Characteristic Value without acknowledgment using the procedure defined in Section 4.10. If set, the Client Characteristic Configuration Descriptor shall exist.
Indicate	0x20	If set, permits indications of a Characteristic Value with acknowledgment using the procedure defined in Section 4.11. If set, the Client Characteristic Configuration Descriptor shall exist.
Authenticated Signed Writes	0x40	If set, permits signed writes to the Characteristic Value using the procedure defined in Section 4.9.2.
Extended Properties	0x80	If set, additional characteristic properties are defined in the Characteristic Extended Properties Descriptor defined in Section 3.3.3.1. If set, the Characteristic Extended Properties Descriptor shall exist.

Table 3.5: Characteristic Properties bit field

3.3.1.2 Characteristic Value Attribute Handle

The Characteristic Value *Attribute Handle* field is the *Attribute Handle* of the Attribute that contains the *Characteristic Value*.

3.3.1.3 Characteristic UUID

The *Characteristic UUID* field is a 16-bit Bluetooth UUID or 128-bit UUID that describes the type of *Characteristic Value*. A client shall support the use of both 16-bit and 128-bit *Characteristic UUIDs*. A client may ignore any characteristic definition with an unknown *Characteristic UUID*. An unknown characteristic UUID is a UUID for an unsupported characteristic.

3.3.2 Characteristic Value declaration

The *Characteristic Value* declaration contains the value of the characteristic. It is the first Attribute after the characteristic declaration. All characteristic definitions shall have a *Characteristic Value* declaration.

A Characteristic Value declaration is an Attribute with the Attribute Type set to the 16-bit Bluetooth or 128-bit UUID for the Characteristic Value used in the characteristic declaration. The *Attribute Value* is set to the *Characteristic Value*. The *Attribute Permissions* are specified by the service or may be implementation specific if not specified otherwise.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xNNNN	0xUUUU – 16-bit Bluetooth UUID or 128-bit UUID for Characteristic UUID	Characteristic Value	Higher layer profile or implementation specific

Table 3.6: Characteristic Value declaration

3.3.3 Characteristic descriptor declarations

Characteristic descriptors are used to contain related information about the *Characteristic Value*. The GATT profile defines a standard set of characteristic descriptors that can be used by higher layer profiles. Higher layer profiles may define additional characteristic descriptors that are profile specific. Each characteristic descriptor is identified by the characteristic descriptor UUID. A client shall support the use of both 16-bit and 128-bit characteristic descriptor UUIDs. A client may ignore any characteristic descriptor declaration with an unknown characteristic descriptor UUID. An unknown characteristic descriptor UUID is a UUID for an unsupported characteristic descriptor.

Characteristic descriptors if present within a characteristic definition shall follow the *Characteristic Value* declaration. The characteristic descriptor declaration may appear in any order within the characteristic definition. The client shall not assume the order in which a characteristic descriptor declaration appears in a characteristic definition following the *Characteristic Value* declaration.

Characteristic descriptor declaration permissions are defined by a higher layer profile or are implementation specific. A client shall not assume all characteristic descriptor declarations are readable.

3.3.3.1 Characteristic Extended Properties

The *Characteristic Extended Properties* declaration is a descriptor that defines additional *Characteristic Properties*. If the *Extended Properties* bit of the *Characteristic Properties* is set then this characteristic descriptor shall exist. The characteristic descriptor may occur in any position within the characteristic definition after the Characteristic Value. Only one *Characteristic Extended Properties* declaration shall exist in a characteristic definition.

The characteristic descriptor is contained in an Attribute and the *Attribute Type* shall be set to the UUID for «Characteristic Extended Properties» and the *Attribute Value* shall be two octets in length and shall contain the *Characteristic Extended Properties Bit Field*. The *Attribute Permissions* shall be readable without authentication and authorization being required.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xNNNN	0x2900 – UUID for «Characteristic Extended Properties»	Characteristic Extended Properties Bit Field	Read Only, No Authentication, No Authorization

Table 3.7: Characteristic Extended Properties declaration

The *Characteristic Extended Properties* bit field describes additional properties on how the Characteristic Value can be used, or how the characteristic descriptors (see Section 3.3.3.3) can be accessed. If the bits defined in Table 3.8 are set, the action described is permitted. Multiple additional properties can be set.

Bit Number	Property	Description
0	Reliable Write	If set, permits reliable writes of the Characteristic Value using the procedure defined in Section 4.9.5
1	Writable Auxiliaries	If set, permits writes to the characteristic descriptor defined in Section 3.3.3.2
All other bits		Reserved for future use

Table 3.8: Characteristic Extended Properties bit field

3.3.3.2 Characteristic User Description

The *Characteristic User Description* declaration is an optional characteristic descriptor that defines a UTF-8 string of variable size that is a user textual description of

the *Characteristic Value*. If the *Writable Auxiliaries* bit of the *Characteristic Extended Properties* is set then this characteristic descriptor can be written. The characteristic descriptor may occur in any position within the characteristic definition after the *Characteristic Value*. Only one *Characteristic User Description* declaration shall exist in a characteristic definition.

The characteristic descriptor is contained in an Attribute and the *Attribute Type* shall be set to the UUID for «Characteristic User Description» and the *Attribute Value* shall be set to the characteristic user description UTF-8 string. The *Attribute Permissions* are specified by the profile or may be implementation specific if not specified otherwise.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xNNNN	0x2901 – UUID for «Characteristic User Description»	Characteristic User Description UTF-8 String	Higher layer profile or implementation specific

Table 3.9: Characteristic User Description declaration

3.3.3.3 Client Characteristic Configuration

The *Client Characteristic Configuration* declaration is an optional characteristic descriptor that defines how the characteristic may be configured by a specific client. The Client Characteristic Configuration descriptor value shall be persistent across connections for bonded devices. The Client Characteristic Configuration descriptor value shall be set to the default value at each connection with non-bonded devices.The characteristic descriptor value is a bit field. When a bit is set, that action shall be enabled, otherwise it will not be used. The *Client Characteristic Configuration* descriptor may occur in any position within the characteristic definition after the Characteristic Value. Only one *Client Characteristic Configuration* declaration shall exist in a characteristic definition.

A client may write this configuration descriptor to control the configuration of this characteristic on the server for the client. Each client has its own instantiation of the *Client Characteristic Configuration*. Reads of the *Client Characteristic Configuration* only shows the configuration for that client and writes only affect the configuration of that client. Authentication and authorization may be required by the server to write the configuration descriptor. The *Client Characteristic Configuration* declaration shall be readable and writable.

The characteristic descriptor is contained in an Attribute. The *Attribute Type* shall be set to the UUID for «Client Characteristic Configuration». The *Attribute Value* shall be two octets in length and shall be set to the characteristic descriptor value. The *Attribute Permissions* are specified by the profile or may be implementation specific if not specified otherwise.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xNNNN	0x2902 – UUID for «Client Characteristic Configuration»	Characteristic Configuration Bits	Readable with no authentication or authorization. Writable with authentication and authorization defined by a higher layer specification or is implementation specific.

Table 3.10: Client Characteristic Configuration declaration

The following Client Characteristic Configuration bits are defined:

Bit Number	Configuration	Description
0	Notification	The Characteristic Value shall be notified. This value shall only be set if the characteristic's properties have the notify bit set.
1	Indication	The Characteristic Value shall be indicated. This value shall only be set if the characteristic's properties have the indicate bit set.
All other bits		Reserved for future use.

Table 3.11: Client Characteristic Configuration bit field definition

If both the Notification and Indication bits are set, then the server shall use the notification procedure (see Section 4.10) when an acknowledgment is not required by a higher-layer specification or shall use the indication procedure (see Section 4.11) when an acknowledgment is required. The server should not use both procedures to send the same characteristic value.

The server may reject a request to set both the Notification and Indication bits for the same characteristic.

The default value for the *Client Characteristic Configuration* descriptor value shall be 0x0000.

Between a client and a server there shall be a single Client Characteristic Configuration Descriptor irrespective of the number of ATT bearers between them.

3.3.3.4 Server Characteristic Configuration

The *Server Characteristic Configuration* declaration is an optional characteristic descriptor that defines how the characteristic may be configured for the server. The characteristic descriptor value is a bit field. When a bit is set, that action shall be enabled, otherwise it will not be used. The *Server Characteristic Configuration* descriptor may occur in any position within the characteristic definition after the *Characteristic Value*. Only one *Server Characteristic Configuration* declaration shall exist in a characteristic definition. The *Server Characteristic Configuration* declaration shall be readable and writable.

A client may write this configuration descriptor to control the configuration of this characteristic on the server for all clients. There is a single instantiation of the *Server Characteristic Configuration* for all clients. Reads of the *Server Characteristic Configuration* shows the configuration all clients and writes affect the configuration for all clients. Authentication and authorization may be required by the server to write the configuration descriptor.

The characteristic descriptor is contained in an Attribute. The *Attribute Type* shall be set to the UUID for «Server Characteristic Configuration». The *Attribute Value* shall be two octets in length and shall be set to the characteristic descriptor value. The *Attribute Permissions* are specified by the profile or may be implementation specific if not specified otherwise.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xNNNN	0x2903 – UUID for «Server Characteristic Configuration»	Characteristic Configuration Bits	Readable with no authentication or authorization. Writable with authentication and authorization defined by a higher layer specification or is implementation specific.

Table 3.12: Server Characteristic Configuration declaration

The following *Server Characteristic Configuration* bits are defined:

Bit Number	Configuration	Description
0	Broadcast	The Characteristic Value shall be broadcast when the server is in the broadcast procedure if advertising data resources are available. This value can only be set if the characteristic's properties have the broadcast bit set.
All other bits		Reserved for future use.

Table 3.13: Server Characteristic Configuration bit field definition

3.3.3.5 Characteristic Presentation Format

The *Characteristic Presentation Format* declaration is an optional characteristic descriptor that defines the format of the *Characteristic Value*. The characteristic descriptor may occur in any position within the characteristic definition after the *Characteristic Value*. If more than one *Characteristic Presentation Format* declaration exists in a characteristic definition, then a *Characteristic Aggregate Format* declaration shall exist as part of the characteristic definition.

The characteristic presentation format value is composed of five parts: format, exponent, unit, name space, and description.

The characteristic descriptor is contained in an Attribute. The *Attribute Type* shall be set to the UUID for «Characteristic Presentation Format». The *Attribute Value* shall be set to the characteristic descriptor value. The *Attribute Permissions* shall be read only and not require authentication or authorization.

Attribute Handle	Attribute Type	Attribute Value					Attribute Permissions
0xNNNN	0x2904 – UUID for «Characteristic Presentation Format»	Format	Exponent	Unit	Name Space	Description	Read only No Authentication, No Authorization

Table 3.14: Characteristic Presentation Format declaration

The definition of the Characteristic Presentation Format descriptor Attribute Value field is the following.

Field Name	Value Size	Description
Format	1 octet	Format of the value of this characteristic as defined in [1].
Exponent	1 octet	Exponent field to determine how the value of this characteristic is further formatted.
Unit	2 octets	The unit of this characteristic as defined in [1]
Name Space	1 octet	The name space of the description as defined in [1]
Description	2 octets	The description of this characteristic as defined in a higher layer profile.

Table 3.15: Characteristic Presentation Format value definition

3.3.3.5.1 Bit ordering

The bit ordering used for the Characteristic Presentation Format descriptor shall be little-endian.

3.3.3.5.2 Format

The format field determines how a single value contained in the *Characteristic Value* is formatted. The values of this field are defined in Assigned Numbers [1].

3.3.3.5.3 Exponent

The exponent field is used with integer data types to indicate that the actual value being represented differs from the value stored in the characteristic by a power of 10. The exponent field is only used on integer format types; this field is RFU for all other format types. The exponent field has type sint8.

$$\text{actual value} = \textit{Characteristic Value} \times 10^{\text{Exponent}}$$

As can be seen in the above equation, the actual value is a combination of the Characteristic Value and the value 10 to the power Exponent. This is sometimes known as a fixed point number.

For example, if the Exponent is 2 and the *Characteristic Value* is 23, the actual value would be 2300.

For example, if the Exponent is -3 and the *Characteristic Value* is 3892, the actual value would be 3.892.

3.3.3.5.4 Unit

The Unit is a UUID as defined in Assigned Numbers [1].

3.3.3.5.5 Name Space

The Name Space field is used to identify the organization, as defined in Assigned Numbers [1], that is responsible for defining the enumerations for the description field.

3.3.3.5.6 Description

The Description is an enumerated value as defined in Assigned Numbers [1] from the organization identified by the Name Space field. The Description is used to distinguish between different instances of the same characteristic; for example, if a sound system has several speakers each with a "volume" characteristic, the Description would identify which speaker a given characteristic refers to.

3.3.3.6 Characteristic Aggregate Format

The *Characteristic Aggregate Format* declaration is an optional characteristic descriptor that defines the format of an aggregated *Characteristic Value*.

The characteristic descriptor may occur in any position within the characteristic definition after the *Characteristic Value*. Only one *Characteristic Aggregate Format* declaration shall exist in a characteristic definition.

The Characteristic Aggregate Format value is composed of a list of Attribute Handles of *Characteristic Presentation Format* declarations, where each *Attribute Handle* points to a *Characteristic Presentation Format* declaration.

The *Attribute Permissions* shall be read only and not require authentication or authorization.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permissions
0xNNNN	0x2905 – UUID for «Characteristic Aggregate Format»	List of *Attribute Handles* for the Characteristic Presentation Format Declarations	Read only No authentication No authorization

Table 3.16: Characteristic Aggregate Format declaration

The *List of Attribute Handles* is the concatenation of multiple 16-bit *Attribute Handle* values into a single *Attribute Value*. The list shall contain at least two *Attribute Handle for Characteristic Presentation Format declarations*. The Characteristic Value shall be decomposed by each of the *Characteristic Presentation Format* declarations pointed to by the *Attribute Handles*. The order of the *Attribute Handles* in the list is significant.

If more than one *Characteristic Presentation Format* declarations exist in a characteristic definition, there shall also be one Characteristic Aggregate Format declaration. The *Characteristic Aggregate Format* declaration shall include each *Characteristic Presentation Format* declaration in the characteristic definition in the list of *Attribute Handles*. Characteristic Presentation Format declarations from other characteristic definitions may also be used.

A *Characteristic Aggregate Format* declaration may exist without a *Characteristic Presentation Format* declaration existing in the characteristic definition. The *Characteristic Aggregate Format* declaration may use *Characteristic Presentation Format* declarations from other characteristic definitions.

3.4 Summary of GATT Profile attribute types

Table 3.17 summarizes the attribute types defined by the GATT Profile.

Attribute Type	UUID	Description
«Primary Service»	0x2800	Primary Service Declaration
«Secondary Service»	0x2801	Secondary Service Declaration
«Include»	0x2802	Include Declaration
«Characteristic»	0x2803	Characteristic Declaration
«Characteristic Extended Properties»	0x2900	Characteristic Extended Properties
«Characteristic User Description»	0x2901	Characteristic User Description Descriptor
«Client Characteristic Configuration»	0x2902	Client Characteristic Configuration Descriptor
«Server Characteristic Configuration»	0x2903	Server Characteristic Configuration Descriptor
«Characteristic Presentation Format»	0x2904	Characteristic Presentation Format Descriptor
«Characteristic Aggregate Format»	0x2905	Characteristic Aggregate Format Descriptor

Table 3.17: Summary of GATT Profile attribute types

4 GATT FEATURE REQUIREMENTS

4.1 Overview

There are 11 features defined in the GATT Profile:

1. Server Configuration
2. Primary Service Discovery
3. Relationship Discovery
4. Characteristic Discovery
5. Characteristic Descriptor Discovery
6. Reading a Characteristic Value
7. Writing a Characteristic Value
8. Notification of a Characteristic Value
9. Indication of a Characteristic Value
10. Reading a Characteristic Descriptor
11. Writing a Characteristic Descriptor

Each of the features is mapped to procedures and sub-procedures. These procedures and sub-procedures describe how the Attribute Protocol is used to accomplish the corresponding feature.

4.2 Feature support and procedure mapping

Table 4.1 maps each feature to the procedures used for that feature, and indicates whether the procedure is optional or mandatory for that feature. The procedures are described in the referenced section.

If an ATT PDU is supported on any ATT bearer, then it shall be supported on all supported ATT bearers with the following exceptions:

- The Exchange MTU sub-procedure shall only be supported on the LE Fixed Channel Unenhanced ATT bearer.
- The Signed Write Without Response sub-procedure shall only be supported on the LE Fixed Channel Unenhanced ATT bearer.

Feature	Sub-Procedure	Ref.	Support in Client	Support in Server
Server Configuration	Exchange MTU	4.3.1	O	O
Primary Service Discovery	Discover All Primary Services	4.4.1	O	M
	Discover Primary Service By Service UUID	4.4.2	O	M
Relationship Discovery	Find Included Services	4.5.1	O	M
Characteristic Discovery	Discover All Characteristics of a Service	4.6.1	O	M
	Discover Characteristics by UUID	4.6.2	O	M
Characteristic Descriptor Discovery	Discover All Characteristic Descriptors	4.7.1	O	M
Characteristic Value Read	Read Characteristic Value	4.8.1	O	M
	Read Using Characteristic UUID	4.8.2	O	M
	Read Long Characteristic Value	4.8.3	O	C.4
	Read Multiple Characteristic Values	4.8.4	O	O
	Read Multiple Variable Length Characteristic Values	4.8.5	O	C.4
Characteristic Value Write	Write Without Response	4.9.1	O	C.1
	Signed Write Without Response	4.9.2	O	O
	Write Characteristic Value	4.9.3	O	C.2
	Write Long Characteristic Value	4.9.4	O	C.4
	Characteristic Value Reliable Writes	4.9.5	O	O
Characteristic Value Notification	Single Notification	4.10.1	C.4	C.4
	Multiple Variable Length Notifications	4.10.2	C.4	C.4
Characteristic Value Indication	Indication	4.11.1	M	C.3

Feature	Sub-Procedure	Ref.	Support in Client	Support in Server
Characteristic Descriptor Value Read	Read Characteristic Descriptor	4.12.1	O	C.4
	Read Long Characteristic Descriptor	4.12.2	O	C.4
Characteristic Descriptor Value Write	Write Characteristic Descriptor	4.12.3	O	C.4
	Write Long Characteristic Descriptor	4.12.4	O	O

C.1: Write Without Response is mandatory if Signed Write Without Response or Enhanced ATT Bearers are supported otherwise optional

C.2: Write Characteristic Value is mandatory if Write Long Characteristic Value or Enhanced ATT Bearers are supported otherwise optional

C.3: If *Service Changed Characteristic* is present, this feature is mandatory, otherwise optional.

C.4: If Enhanced ATT Bearers are supported then this feature is mandatory, otherwise optional.

Table 4.1: GATT feature mapping to procedures

4.3 Server configuration

This procedure is used by the client to configure the Attribute Protocol. This procedure has only one sub-procedure used to set the MTU sizes.

4.3.1 Exchange MTU

This sub-procedure is used by the client to set the ATT_MTU to the maximum possible value that can be supported by both devices when the client supports a value greater than the default ATT_MTU for the Attribute Protocol. This sub-procedure shall only be initiated once during a connection.

This sub-procedure shall not be used on a BR/EDR physical link since the MTU size is negotiated using L2CAP channel configuration procedures.

The ATT_EXCHANGE_MTU_REQ PDU is used by this sub-procedure. The Client Rx MTU parameter shall be set to the maximum MTU that this client can receive.

Two possible responses can be sent from the server for the ATT_EXCHANGE_MTU_REQ PDU: ATT_EXCHANGE_MTU_RSP and ATT_ERROR_RSP PDUs.

An ATT_ERROR_RSP PDU is returned if an error occurred on the server.

The server shall respond to this message with an ATT_EXCHANGE_MTU_RSP PDU with the Server Rx MTU parameter set to the maximum MTU that this server can receive.

If the ATT_ERROR_RSP PDU is sent by the server with the Error Code parameter set to *Request Not Supported* (0x06), the *Attribute Opcode* is not supported and the default MTU shall be used.

Once the messages have been exchanged, the ATT_MTU shall be set to the minimum of the Client Rx MTU and Server Rx MTU values.

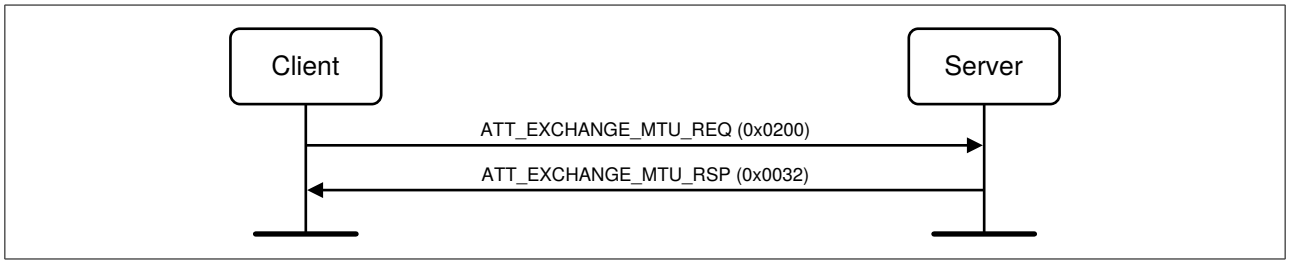

Figure 4.1: Exchange MTU

For example, in Figure 4.1, based on the exchanged ATT_MTU values, the ATT_MTU would be 0x0032.

4.4 Primary Service Discovery

This procedure is used by a client to discover primary services on a server. Once the primary services are discovered, additional information about the primary services can be accessed using other procedures, including characteristic discovery and relationship discovery to find other related primary and secondary services.

There are two sub-procedures that can be used for primary service discovery: Discover All Primary Services and Discover Primary Service by Service UUID.

4.4.1 Discover All Primary Services

This sub-procedure is used by a client to discover all the primary services on a server.

The ATT_READ_BY_GROUP_TYPE_REQ PDU shall be used with the Attribute Type parameter set to the UUID for «Primary Service». The *Starting Handle* shall be set to 0x0001 and the *Ending Handle* shall be set to 0xFFFF.

Two possible responses can be sent from the server for the ATT_READ_BY_GROUP_TYPE_REQ PDU: ATT_READ_BY_GROUP_TYPE_RSP and ATT_ERROR_RSP PDUs.

An ATT_ERROR_RSP PDU is returned if an error occurred on the server.

The ATT_READ_BY_GROUP_TYPE_RSP PDU returns a list of *Attribute Handle*, *End Group Handle*, and *Attribute Value* tuples corresponding to the services supported by the server. Each *Attribute Value* contained in the response is the Service UUID of a service supported by the server. The *Attribute Handle* is the handle for the service declaration. The *End Group Handle* is the handle of the last attribute within the service definition. The *End Group Handle* of the last service in a device can be 0xFFFF. The ATT_READ_BY_GROUP_TYPE_REQ PDU shall be issued again with the *Starting Handle* set to one greater than the last *End Group Handle* in the ATT_READ_BY_GROUP_TYPE_RSP PDU.

This sub-procedure is complete when the ATT_ERROR_RSP PDU is received and the Error Code parameter is set to *Attribute Not Found* (0x0A) or when the *End Group Handle* in the *Read by Type Group Response* is 0xFFFF.

The sub-procedure may end early if a desired primary service is found prior to discovering all the primary services on the server.

The service declaration described in Section 3.1 specifies that the service declaration is readable and requires no authentication or authorization, therefore insufficient authentication or read not permitted errors shall not occur.

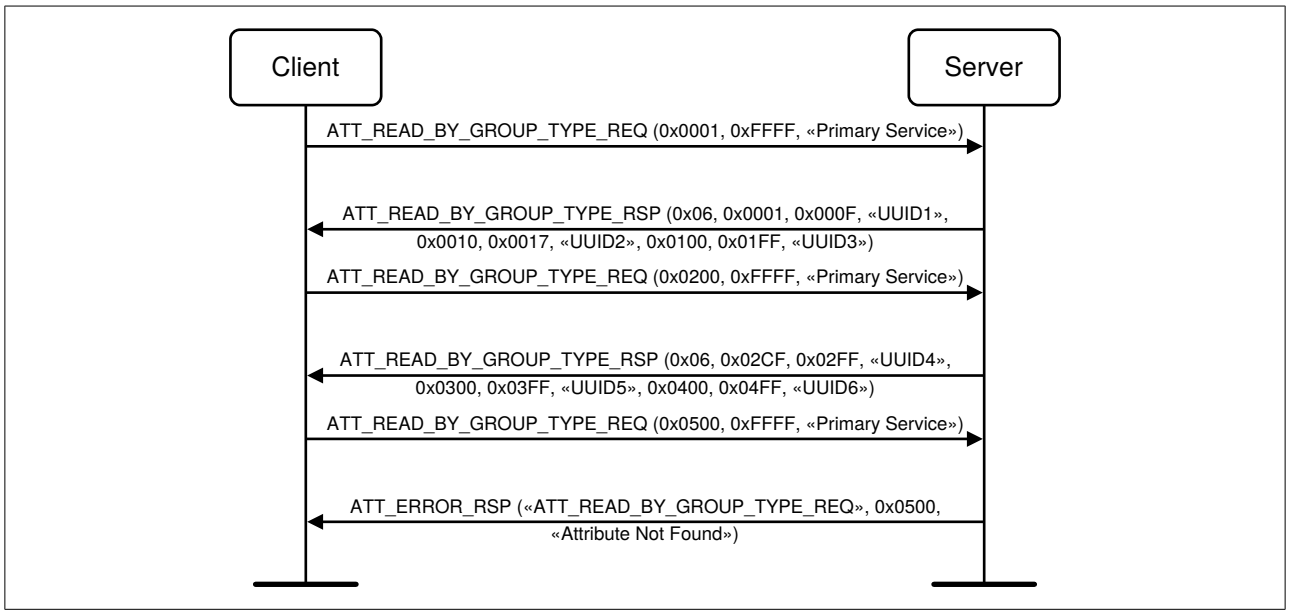

Figure 4.2: Discover All Primary Services example

4.4.2 Discover Primary Service by Service UUID

This sub-procedure is used by a client to discover a specific primary service on a server when only the Service UUID is known. The specific primary service may exist multiple times on a server. The primary service being discovered is identified by the service UUID.

The ATT_FIND_BY_TYPE_VALUE_REQ PDU shall be used with the Attribute Type parameter set to the UUID for «Primary Service» and the *Attribute Value* set to the 16-bit Bluetooth UUID or 128-bit UUID for the specific primary service. The *Starting Handle* shall be set to 0x0001 and the *Ending Handle* shall be set to 0xFFFF.

Two possible responses can be sent from the server for the ATT_FIND_BY_TYPE_VALUE_REQ PDU: ATT_FIND_BY_TYPE_VALUE_RSP and ATT_ERROR_RSP PDUs.

An ATT_ERROR_RSP PDU is returned if an error occurred on the server.

The ATT_FIND_BY_TYPE_VALUE_RSP PDU returns a list of *Attribute Handle* ranges. The *Attribute Handle* range is the starting handle and the ending handle of the service definition. The *End Group Handle* of the last service in a device can be 0xFFFF. If the *Attribute Handle* range for the Service UUID being searched is returned and the End Found Handle is not 0xFFFF, the ATT_FIND_BY_TYPE_VALUE_REQ PDU may be issued again with the *Starting Handle* set to one greater than the last *Attribute Handle* range in the ATT_FIND_BY_TYPE_VALUE_RSP PDU.

This sub-procedure is complete when the ATT_ERROR_RSP PDU is received and the Error Code parameter is set to *Attribute Not Found* (0x0A) or when the *End Group Handle* in the ATT_FIND_BY_TYPE_VALUE_RSP PDU is 0xFFFF.

The sub-procedure may end early if a desired primary service is found prior to discovering all the primary services of the specified service UUID supported on the server.

The service declaration described in Section 3.1 specifies that the service declaration is readable and requires no authentication or authorization, therefore insufficient authentication or read not permitted errors shall not occur.

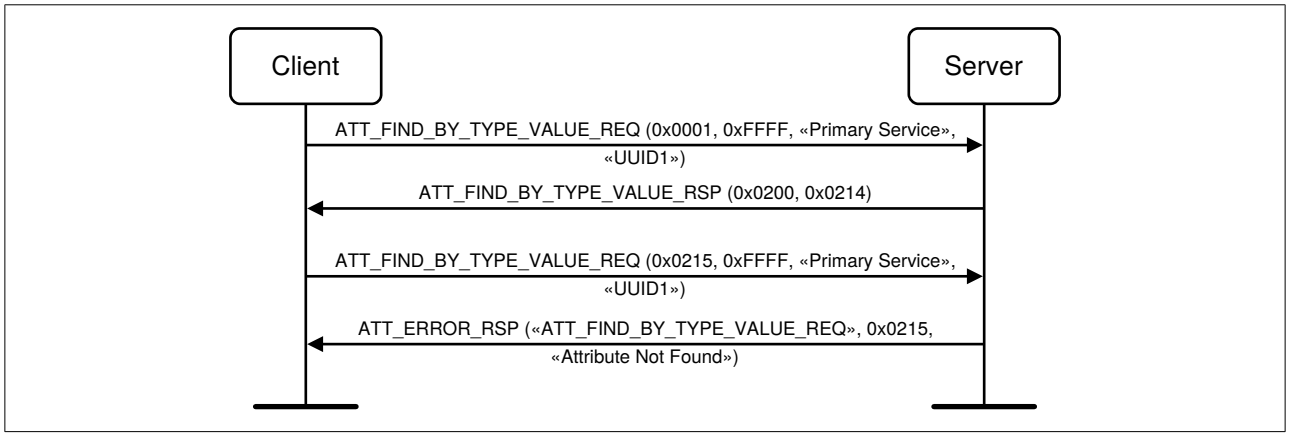

Figure 4.3: Discover Primary Service by Service UUID example

4.5 Relationship Discovery

This procedure is used by a client to discover service relationships to other services.

There is one sub-procedure that can be used for relationship discovery: Find Included Services.

4.5.1 Find Included Services

This sub-procedure is used by a client to find include service declarations within a service definition on a server. The service specified is identified by the service handle range.

The ATT_READ_BY_TYPE_REQ PDU shall be used with the *Attribute Type* parameter set to the UUID for «Include» The *Starting Handle* shall be set to the starting handle of the specified service and the *Ending Handle* shall be set to the ending handle of the specified service. The sub-procedure may end early if a desired included service is found prior to discovering all the included services of the specified service supported on the server.

Two possible responses can be sent from the server for the ATT_READ_BY_TYPE_REQ PDU: ATT_READ_BY_TYPE_RSP and ATT_ERROR_RSP PDUs.

An ATT_ERROR_RSP PDU is returned if an error occurred on the server.

The ATT_READ_BY_TYPE_RSP PDU returns a set of *Attribute Handle* and *Attribute Value* pairs corresponding to the included services in the service definition. Each *Attribute Value* contained in the response is composed of the *Attribute Handle* of the included service declaration and the *End Group Handle*. If the service UUID is a 16-bit Bluetooth UUID it is also returned in the response. The ATT_READ_BY_TYPE_REQ PDU shall be issued again with the *Starting Handle* set to one greater than the last *Attribute Handle* in the ATT_READ_BY_TYPE_RSP PDU.

The sub-procedure is complete when either the ATT_ERROR_RSP PDU is received with the Error Code parameter set to *Attribute Not Found* (0x0A) or the ATT_READ_BY_TYPE_RSP PDU has an *Attribute Handle* of the included service declaration that is equal to the *Ending Handle* of the request.

To get the included service UUID when the included service uses a 128-bit UUID, the ATT_READ_REQ PDU is used. The *Attribute Handle* for the ATT_READ_REQ PDU is the *Attribute Handle* of the included service.

The include declaration described in Section 3.2 specifies that the include declaration is readable and requires no authentication or authorization, therefore insufficient authentication or read not permitted errors shall not occur.

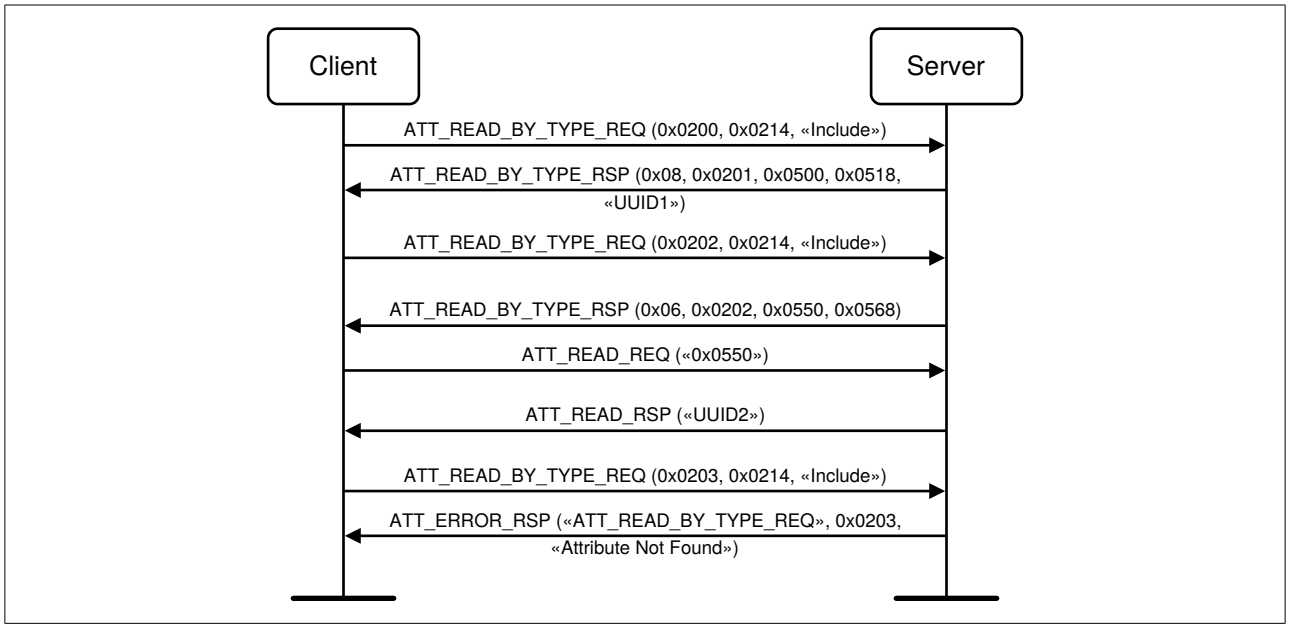

Figure 4.4: Find Included Services example

4.6 Characteristic discovery

This procedure is used by a client to discover service characteristics on a server. Once the characteristics are discovered additional information about the characteristics can be discovered or accessed using other procedures.

There are two sub-procedures that can be used for characteristic discovery: Discover All Characteristics of a Service and Discover Characteristics by UUID.

4.6.1 Discover All Characteristics of a Service

This sub-procedure is used by a client to find all the characteristic declarations within a service definition on a server when only the service handle range is known. The service specified is identified by the service handle range.

The ATT_READ_BY_TYPE_REQ PDU shall be used with the *Attribute Type* parameter set to the UUID for «Characteristic» The *Starting Handle* shall be set to starting handle of the specified service and the *Ending Handle* shall be set to the ending handle of the specified service.

Two possible responses can be sent from the server for the ATT_READ_BY_TYPE_REQ PDU: ATT_READ_BY_TYPE_RSP and ATT_ERROR_RSP PDUs.

An ATT_ERROR_RSP PDU is returned if an error occurred on the server.

The ATT_READ_BY_TYPE_RSP PDU returns a list of *Attribute Handle* and *Attribute Value* pairs corresponding to the characteristics in the service definition. The *Attribute*

Handle is the handle for the characteristic declaration. The *Attribute Value* is the Characteristic Properties, Characteristic Value Handle and Characteristic UUID. The ATT_READ_BY_TYPE_REQ PDU shall be issued again with the *Starting Handle* set to one greater than the last *Attribute Handle* in the ATT_READ_BY_TYPE_RSP PDU.

The sub-procedure is complete when the ATT_ERROR_RSP PDU is received and the Error Code parameter is set to *Attribute Not Found* (0x0A) or the ATT_READ_BY_TYPE_RSP PDU has an *Attribute Handle* that is equal to the *Ending Handle* of the request.

The sub-procedure may end early if a desired characteristic is found prior to discovering all the characteristics of the specified service supported on the server.

Note: The characteristic declaration described in Section 3.3 specifies that the characteristic declaration is readable and requires no authentication or authorization, therefore insufficient authentication or read not permitted errors should not occur.

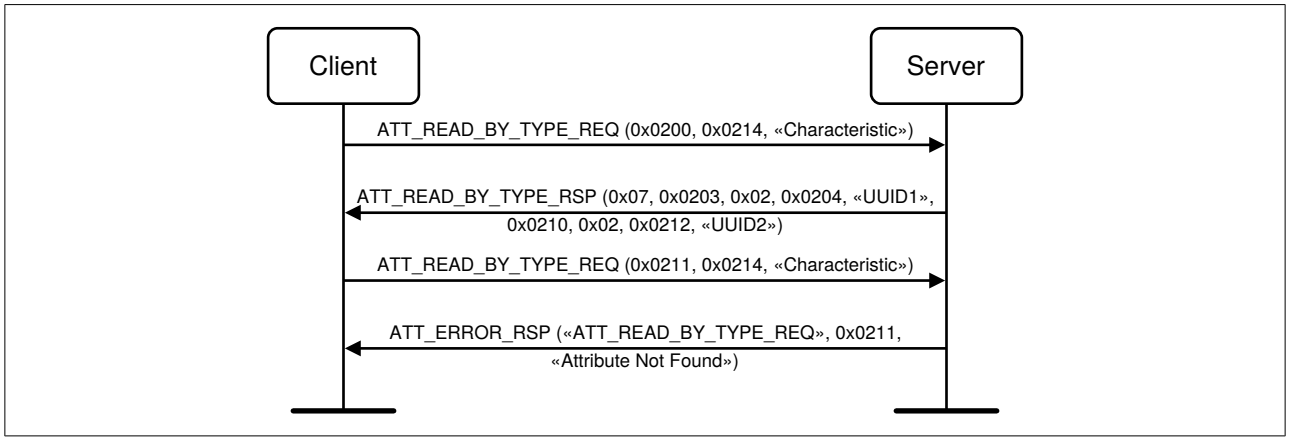

Figure 4.5: Discover All Characteristics of a Service example

Note: In this example «UUID1» and «UUID2» are 16 bits (2 octets).

If they were 128 bits (16 octets) then the ATT_READ_BY_TYPE_RSP PDU data would instead be:

0x15, 0x0203, 0x02, 0x0204, «UUID1», 0x0210, 0x02, 0x0212, «UUID2»

4.6.2 Discover Characteristics by UUID

This sub-procedure is used by a client to discover service characteristics on a server when only the service handle ranges are known and the characteristic UUID is known. The specific service may exist multiple times on a server. The characteristics being discovered are identified by the characteristic UUID.

The ATT_READ_BY_TYPE_REQ PDU is used to perform the beginning of the sub-procedure. The *Attribute Type* is set to the UUID for «Characteristic» and the *Starting Handle* and *Ending Handle* parameters shall be set to the service handle range.

Two possible responses can be sent from the server for the ATT_READ_BY_TYPE_REQ PDU: ATT_READ_BY_TYPE_RSP and ATT_ERROR_RSP PDUs.

An ATT_ERROR_RSP PDU is returned if an error occurred on the server.

The ATT_READ_BY_TYPE_RSP PDU returns a list of *Attribute Handle* and *Attribute Value* pairs corresponding to the characteristics contained in the handle range provided. Each *Attribute Value* in the list is the *Attribute Value* for the characteristic declaration. The *Attribute Value* contains the characteristic properties, Characteristic *Value Handle* and characteristic UUID. The *Attribute Value* for each *Attribute Handle* and *Attribute Value* pairs are checked for a matching characteristic UUID. Once found, the sub-procedure continues until the end of the service handle range is exhausted. The ATT_READ_BY_TYPE_REQ PDU is issued again with the *Starting Handle* set to one greater than the last *Attribute Handle* in the ATT_READ_BY_TYPE_RSP PDU.

If the ATT_ERROR_RSP PDU is sent by the server with the Error Code parameter set to *Attribute Not Found* (0x0A), the characteristic does not exist on the server within the handle range provided.

The sub-procedure may end early if a desired characteristic is found prior to discovering all the characteristics for the specified service supported on the server.

The characteristic declaration described in Section 3.3 specifies that the characteristic declaration is readable and requires no authentication or authorization, therefore insufficient authentication or read not permitted errors shall not occur.

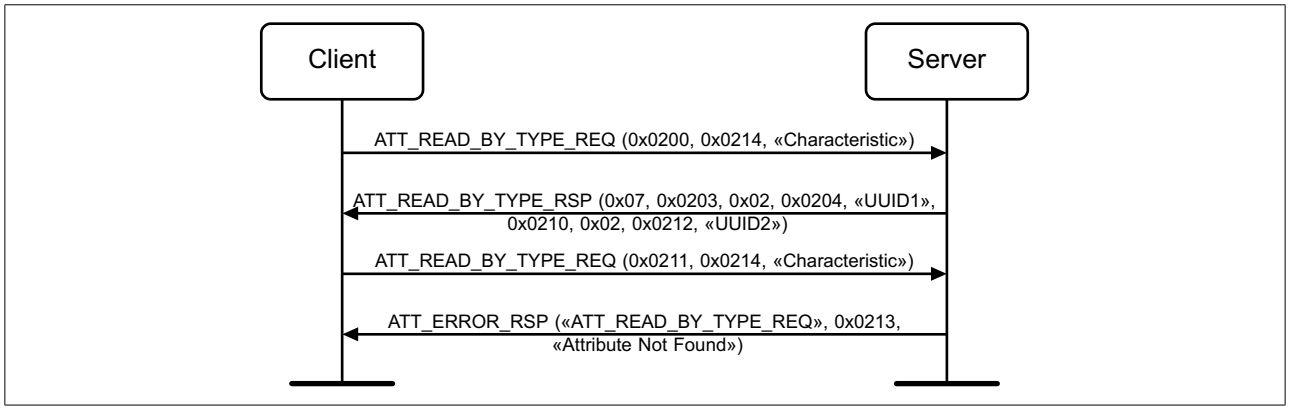

Figure 4.6: Discover Characteristics by UUID example

4.7 Characteristic Descriptor Discovery

This procedure is used by a client to discover characteristic descriptors of a characteristic. Once the characteristic descriptors are discovered additional information about the characteristic descriptors can be accessed using other procedures.

There is one sub-procedure that can be used for characteristic descriptor discovery: Discover All Characteristic Descriptors.

4.7.1 Discover All Characteristic Descriptors

This sub-procedure is used by a client to find all the characteristic descriptor's Attribute Handles and Attribute Types within a characteristic definition when only the characteristic handle range is known. The characteristic specified is identified by the characteristic handle range.

The ATT_FIND_INFORMATION_REQ PDU shall be used with the Starting Handle set to the handle of the specified characteristic value + 1 and the *Ending Handle* set to the ending handle of the specified characteristic.

Two possible responses can be sent from the server for the ATT_FIND_INFORMATION_REQ PDU: ATT_FIND_INFORMATION_RSP and ATT_ERROR_RSP PDUs.

An ATT_ERROR_RSP PDU is returned if an error occurred on the server.

The ATT_FIND_INFORMATION_RSP PDU returns a list of *Attribute Handle* and *Attribute Type* pairs corresponding to the characteristic descriptors in the characteristic definition. The *Attribute Handle* is the handle for the characteristic descriptor declaration. The *Attribute Type* is the characteristic descriptor UUID. The ATT_FIND_INFORMATION_REQ PDU shall be issued again with the *Starting Handle* set to one greater than the last *Attribute Handle* in the ATT_FIND_INFORMATION_RSP PDU.

The sub-procedure is complete when the ATT_ERROR_RSP PDU is received and the Error Code parameter is set to *Attribute Not Found* (0x0A) or the ATT_FIND_INFORMATION_RSP PDU has an *Attribute Handle* that is equal to the *Ending Handle* of the request.

The sub-procedure may end early if a desired Characteristic Descriptor is found prior to discovering all the characteristic descriptors of the specified characteristic.

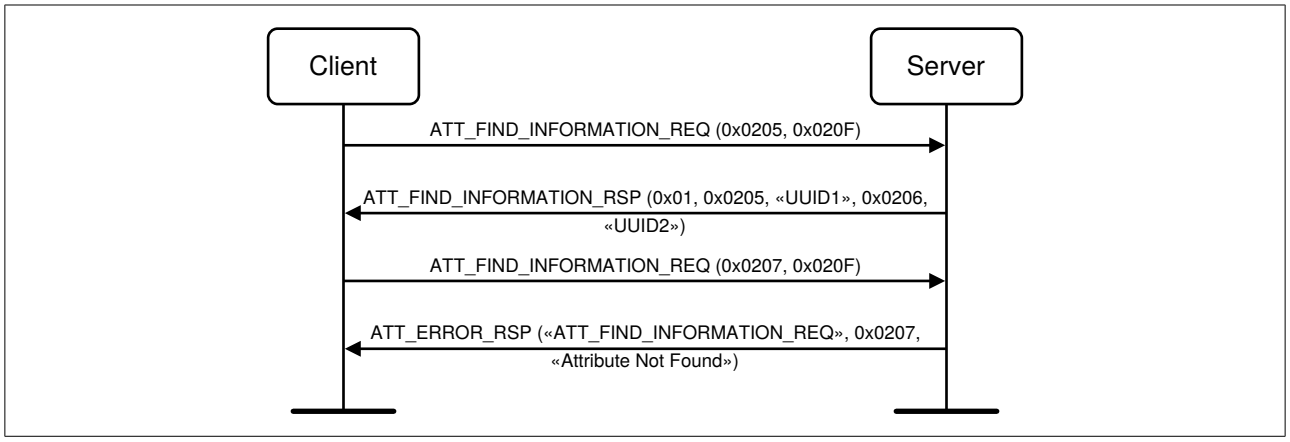

Figure 4.7: Discover All Characteristic Descriptors example

4.8 Characteristic Value Read

This procedure is used to read a *Characteristic Value* from a server. There are four sub-procedures that can be used to read a *Characteristic Value*: Read Characteristic Value, Read Using Characteristic UUID, Read Long Characteristic Value, and Read Multiple Characteristic Values.

4.8.1 Read Characteristic Value

This sub-procedure is used to read a *Characteristic Value* from a server when the client knows the *Characteristic Value Handle*. The ATT_READ_REQ PDU is used with the *Attribute Handle* parameter set to the *Characteristic Value Handle*. The ATT_READ_RSP PDU returns the *Characteristic Value* in the *Attribute Value* parameter.

The ATT_READ_RSP PDU only contains the complete *Characteristic Value* if that is less than or equal to (ATT_MTU – 1) octets in length. If the *Characteristic Value* is greater than (ATT_MTU – 1) octets in length, the ATT_READ_RSP PDU only contains the first portion of the *Characteristic Value* and the *Read Long Characteristic Value* procedure may be used if the rest is required.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_READ_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the client, or if a read operation is not permitted on the *Characteristic Value*. The *Error Code* parameter is set as specified in the Attribute Protocol.

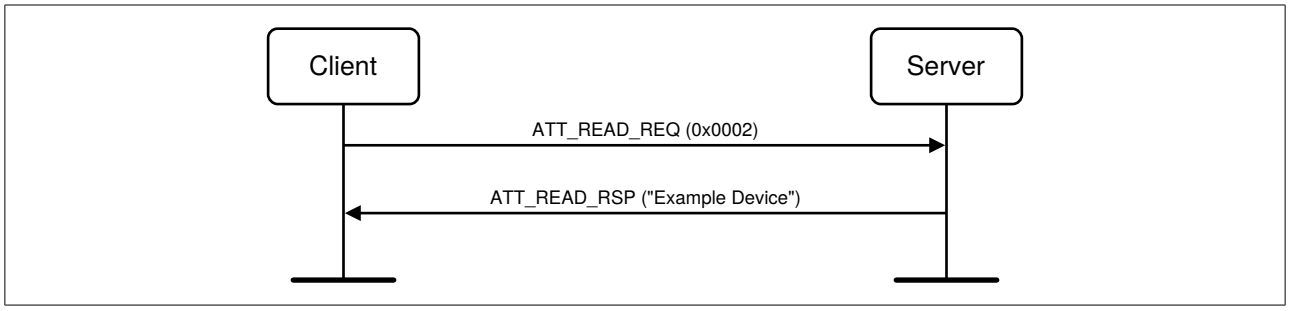

Figure 4.8: Read Characteristic Value example

4.8.2 Read Using Characteristic UUID

This sub-procedure is used to read a *Characteristic Value* from a server when the client only knows the characteristic UUID and does not know the handle of the characteristic.

The ATT_READ_BY_TYPE_REQ PDU is used to perform the sub-procedure. The Attribute Type is set to the known characteristic UUID and the Starting Handle and Ending Handle parameters shall be set to the range over which this read is to be performed. This is typically the handle range for the service in which the characteristic belongs.

Two possible responses can be sent from the server for the ATT_READ_BY_TYPE_REQ PDU: ATT_READ_BY_TYPE_RSP and ATT_ERROR_RSP PDUs.

An ATT_ERROR_RSP PDU is returned if an error occurred on the server.

The ATT_READ_BY_TYPE_RSP PDU returns a list of *Attribute Handle* and *Attribute Value* pairs corresponding to the first characteristics contained in the handle range that will fit into the ATT_READ_BY_TYPE_RSP PDU. This procedure does not return the complete list of all characteristics with the given characteristic UUID within the range of values. If such an operation is required, then the *Discover Characteristics by UUID* sub procedure shall be used.

If the ATT_ERROR_RSP PDU is sent by the server with the Error Code parameter set to *Attribute Not Found* (0x0A), the characteristic does not exist on the server within the handle range provided.

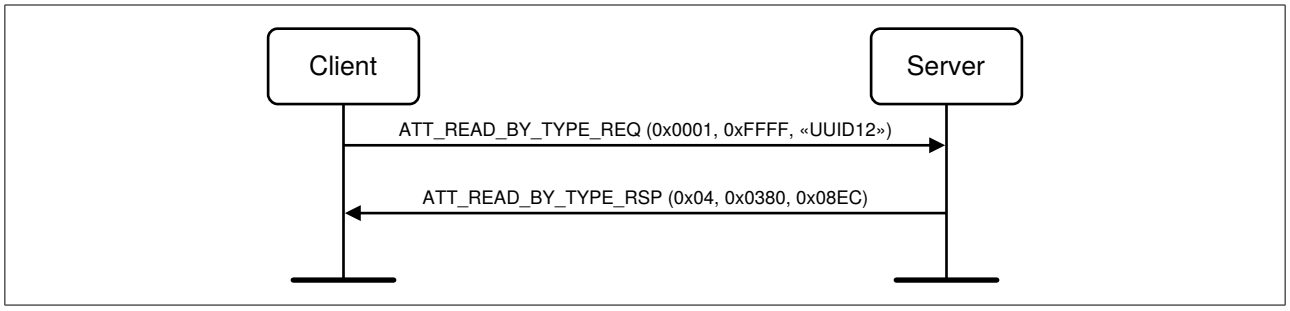

Figure 4.9: Read Using Characteristic UUID example

4.8.3 Read Long Characteristic Value

This sub-procedure is used to read a *Characteristic Value* from a server when the client knows the *Characteristic Value Handle* and the length of the *Characteristic Value* is longer than can be sent in a single ATT_READ_RSP PDU.

The ATT_READ_REQ and ATT_READ_BLOB_REQ PDUs are used to perform this sub-procedure. The *Attribute Handle* shall be set to the *Characteristic Value Handle* of the *Characteristic Value* to be read. To read the complete *Characteristic Value* an ATT_READ_REQ PDU should be used for the first part of the value and ATT_READ_BLOB_REQ PDUs shall used for the rest. The Value Offset parameter of each ATT_READ_BLOB_REQ PDU shall be set to the offset of the next octet within the *Characteristic Value* that has yet to be read. The ATT_READ_BLOB_REQ PDU is repeated until the ATT_READ_BLOB_RSP PDU's *Part Attribute Value* parameter is shorter than (ATT_MTU – 1).

For each ATT_READ_BLOB_REQ PDU a ATT_READ_BLOB_RSP PDU is received with a portion of the Characteristic Value contained in the *Part Attribute Value* parameter.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_READ_BLOB_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the client, or if a read operation is not permitted on the *Characteristic Value*. The Error Code parameter is set as specified in the Attribute Protocol. If the *Characteristic Value* has a fixed length that is not longer than (ATT_MTU – 1), then the server may respond to the first ATT_READ_BLOB_REQ_PDU with an ATT_ERROR_RSP PDU with the Error Code parameter set to *Attribute Not Long* (0x0B).

Note: The ATT_READ_BLOB_REQ PDU with zero offset may be used to read the first part of the value of the Attribute.

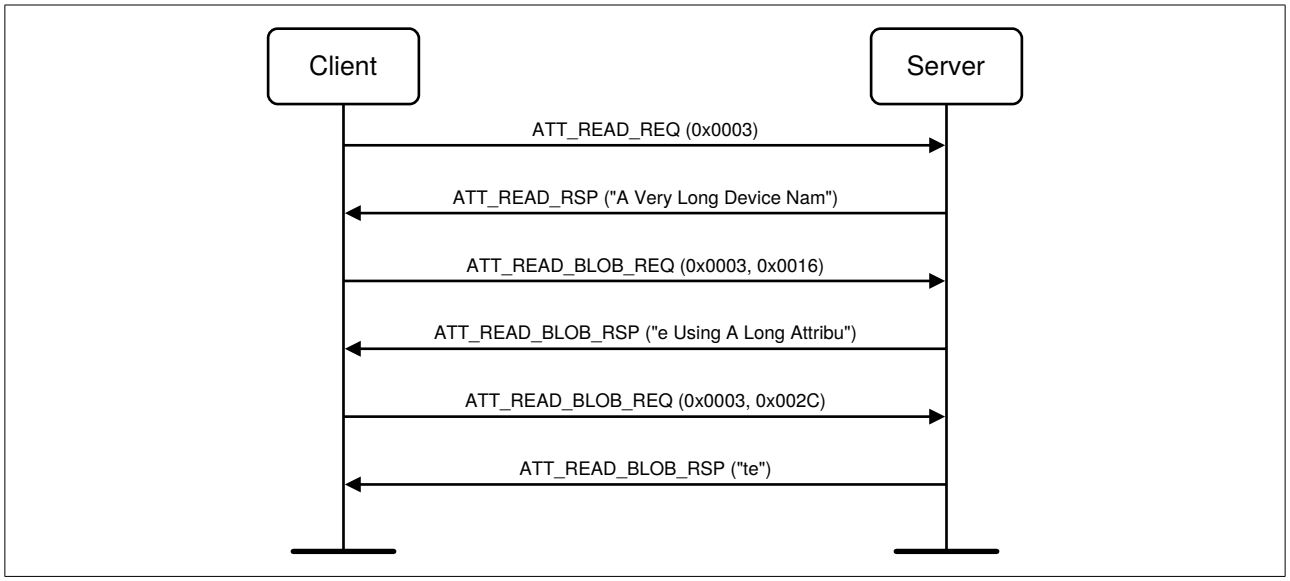

Figure 4.10: Read Long Characteristic Value example

4.8.4 Read Multiple Characteristic Values

This sub-procedure is used to read multiple *Characteristic Values* from a server when the client knows the *Characteristic Value Handles*. The ATT_READ_MULTIPLE_REQ PDU is used with the *Set Of Handles* parameter set to the *Characteristic Value Handles*. The ATT_READ_MULTIPLE_RSP PDU returns the *Characteristic Values* in the *Set Of Values* parameter.

The ATT_READ_MULTIPLE_RSP PDU only contains a set of *Characteristic Values* that is less than or equal to (ATT_MTU – 1) octets in length. If the *Set Of Values* is greater than (ATT_MTU – 1) octets in length, only the first (ATT_MTU – 1) octets are included in the response.

Note: A client should not request multiple *Characteristic Values* when the response's *Set Of Values* parameter is equal to (ATT_MTU – 1) octets in length since it is not possible to determine if the last *Characteristic Value* was read or additional *Characteristic Values* exist but were truncated.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_READ_MULTIPLE_RSP PDU if insufficient authentication, insufficient authorization, a too-short encryption key size, or insufficient encryption is used by the client, or if a read operation is not permitted on any of the *Characteristic Values*. The *Error Code* parameter is set as specified in the Attribute Protocol.

Refer to the Attribute Protocol specification for the format of the *Set Of Handles* and *Set Of Values* parameter.

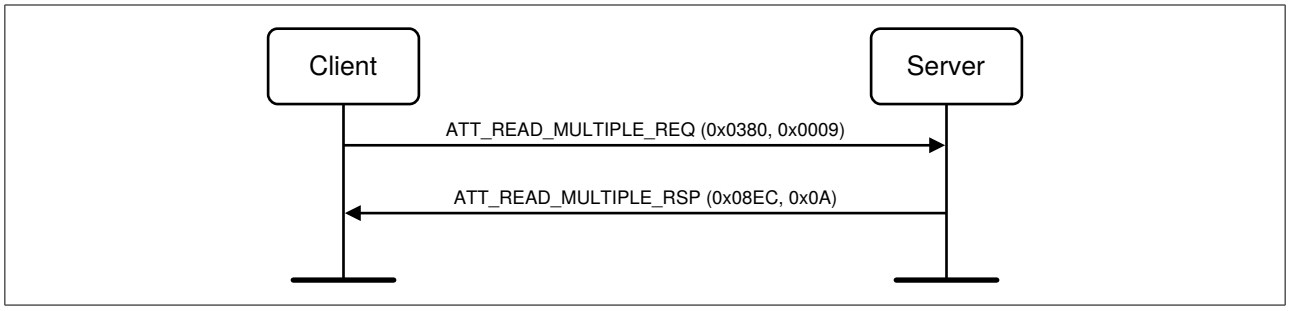

Figure 4.11: Read Multiple Characteristic Values example

4.8.5 Read Multiple Variable Length Characteristic Values

This sub-procedure is used to read multiple variable length Characteristic Values from a server when the client knows the Characteristic Value Handles. The Attribute Protocol ATT_READ_MULTIPLE_VARIABLE_REQ PDU is used with the Set Of Handles parameter set to the Characteristic Value Handles. The ATT_READ_MULTIPLE_VARIABLE_RSP PDU returns the Characteristic Values in the Length Value Tuple List parameter.

The ATT_READ_MULTIPLE_VARIABLE_RSP PDU can only contain a Length Value Tuple List that is less than or equal to (ATT_MTU – 1) octets in length. If the Length Value Tuple List is greater than (ATT_MTU – 1) octets in length, only the first (ATT_MTU – 1) octets are included in the response.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_READ_MULTIPLE_VARIABLE_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size, or insufficient encryption is used by the client, or if a read operation is not permitted on any of the Characteristic Values. The Error Code parameter is set as specified in the Attribute Protocol.

Refer to the Attribute Protocol specification for the format of the Set Of Handles and Length Value Tuple List parameter.

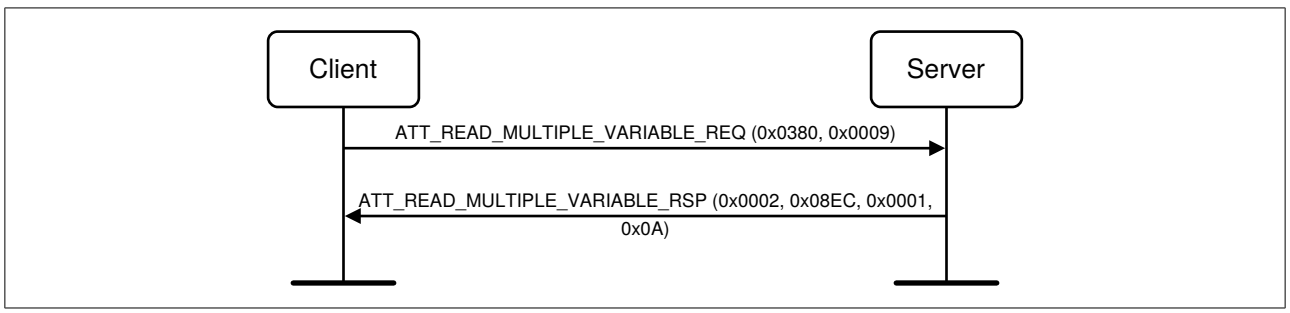

Figure 4.12: Read Multiple Variable Length Characteristic Values example

4.9 Characteristic Value Write

This procedure is used to write a *Characteristic Value* to a server.

There are five sub-procedures that can be used to write a *Characteristic Value*: Write Without Response, Signed Write Without Response, Write Characteristic Value, Write Long Characteristic Value and Characteristic Value Reliable Writes.

4.9.1 Write Without Response

This sub-procedure is used to write a *Characteristic Value* to a server when the client knows the *Characteristic Value Handle* and the client does not need an acknowledgment that the write was successfully performed. This sub-procedure only writes the first (ATT_MTU – 3) octets of a *Characteristic Value*. This sub-procedure cannot be used to write a long characteristic; instead the *Write Long Characteristic Value* sub-procedure should be used.

The ATT_WRITE_CMD PDU is used for this sub-procedure. The *Attribute Handle* parameter shall be set to the *Characteristic Value Handle*. The *Attribute Value* parameter shall be set to the new *Characteristic Value*.

If the *Characteristic Value* write request is too long (see [Vol 3] Part F, Section 3.4.5.1) or has an invalid value as defined by the profile, then the write shall not succeed and no error shall be generated by the server.

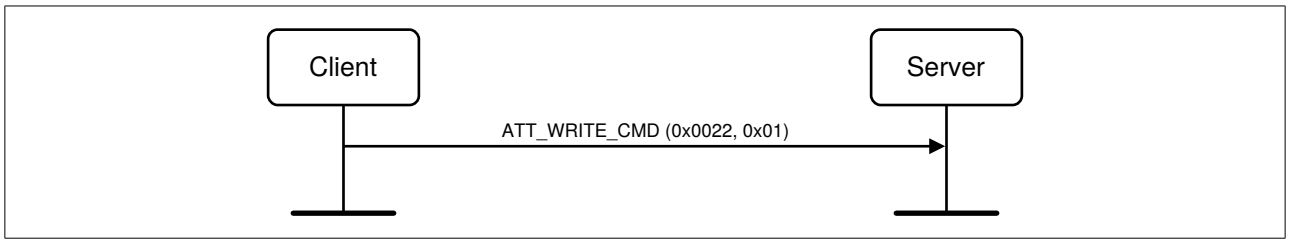

Figure 4.13: Write Without Response example

4.9.2 Signed Write Without Response

This sub-procedure is used to write a *Characteristic Value* to a server when the client knows the *Characteristic Value Handle* and the ATT bearer is not encrypted. This sub-procedure shall only be used if the *Characteristic Properties* authenticated bit is enabled and the client and server device share a bond as defined in [Vol 3] Part C, Generic Access Profile.

This sub-procedure only writes the first (ATT_MTU – 15) octets of an *Attribute Value.* This sub-procedure cannot be used to write a long Attribute.

The ATT_SIGNED_WRITE_CMD PDU is used for this sub-procedure. The *Attribute Handle* parameter shall be set to the *Characteristic Value Handle*. The *Attribute Value*

parameter shall be set to the new *Characteristic Value* authenticated by signing the value, as defined in the Security Manager [Vol 3] Part H, Section 2.4.5.

If the authenticated *Characteristic Value* that is written is too long (see [Vol 3] Part F, Section 3.4.5.4), has an invalid value as defined by the profile, or the signed value does not authenticate the client, then the write shall not succeed and no error shall be generated by the server.

If a connection is already encrypted with LE security mode 1, level 2 or level 3 as defined in [Vol 3] Part C, Section 10.2 then, a Write Without Response as defined in Section 4.9.1 shall be used instead of a Signed Write Without Response.

On BR/EDR, the ATT bearer is always encrypted, due to the use of Security Mode 4, therefore this sub-procedure shall not be used.

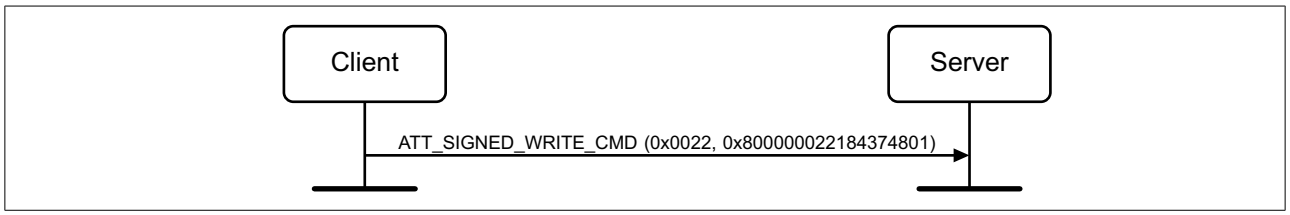

Figure 4.14: Signed Write Without Response example

4.9.3 Write Characteristic Value

This sub-procedure is used to write a *Characteristic Value* to a server when the client knows the *Characteristic Value Handle*. This sub-procedure only writes the first (ATT_MTU – 3) octets of a *Characteristic Value*. This sub-procedure cannot be used to write a long Attribute; instead the *Write Long Characteristic Value* sub-procedure should be used.

The ATT_WRITE_REQ PDU is used to for this sub-procedure. The *Attribute Handle* parameter shall be set to the *Characteristic Value Handle*. The *Attribute Value* parameter shall be set to the new characteristic.

An ATT_WRITE_RSP PDU shall be sent by the server if the write of the *Characteristic Value* succeeded.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_WRITE_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the client, the *Attribute Value* to be written is too long (see [Vol 3] Part F, Section 3.4.5.1), or if a write operation is not permitted on the *Characteristic Value*. The Error Code parameter is set as specified in the Attribute Protocol. If the *Characteristic Value* has an invalid value as defined by the profile, then the value shall not be written and an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Application Error* (0x80 – 0x9F) by the server.

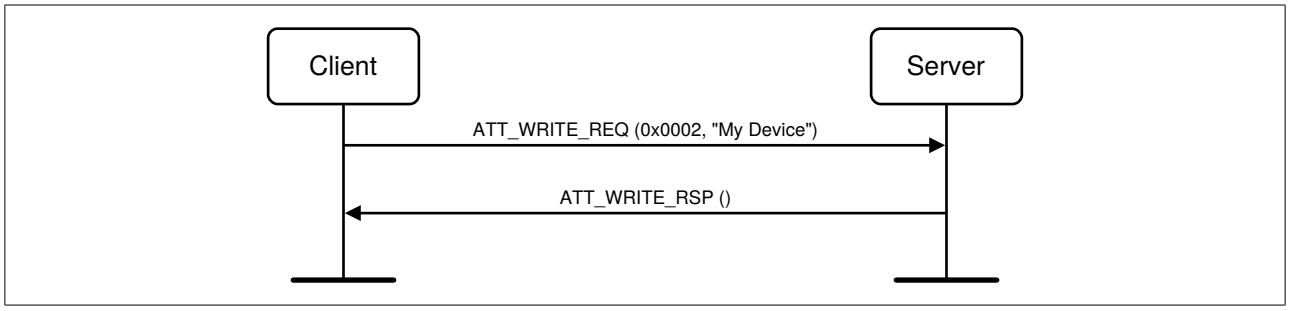

Figure 4.15: Write Characteristic Value example

4.9.4 Write Long Characteristic Value

This sub-procedure is used to write a *Characteristic Value* to a server when the client knows the *Characteristic Value Handle* but the length of the *Characteristic Value* is longer than can be sent in a single ATT_WRITE_REQ PDU.

The ATT_PREPARE_WRITE_REQ and ATT_EXECUTE_WRITE_REQ PDUs are used to perform this sub-procedure. The *Attribute Handle* parameter shall be set to the *Characteristic Value Handle* of the *Characteristic Value* to be written. The *Part Attribute Value* parameter shall be set to the part of the *Attribute Value* that is being written. The *Value Offset* parameter shall be the offset within the *Characteristic Value* to be written. To write the complete *Characteristic Value* the offset should be set to 0x0000 for the first ATT_PREPARE_WRITE_REQ PDU. The offset for subsequent ATT_PREPARE_WRITE_REQ PDUs is the next octet that has yet to be written. The ATT_PREPARE_WRITE_REQ PDU is repeated until the complete *Characteristic Value* has been transferred, after which an ATT_EXECUTE_WRITE_REQ PDU is used to write the complete value.

Note: The values in the ATT_PREPARE_WRITE_RSP PDU do not need to be verified in this sub-procedure.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_PREPARE_WRITE_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the client, the prepared attribute value is too long (see [Vol 3] Part F, Section 3.4.6.3), or if a write operation is not permitted on the *Characteristic Value*. The Error Code parameter is set as specified in the Attribute Protocol. If the *Attribute Value* has an invalid value as defined by the profile, then the write shall not succeed and an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Application Error* (0x80 – 0x9F) by the server.

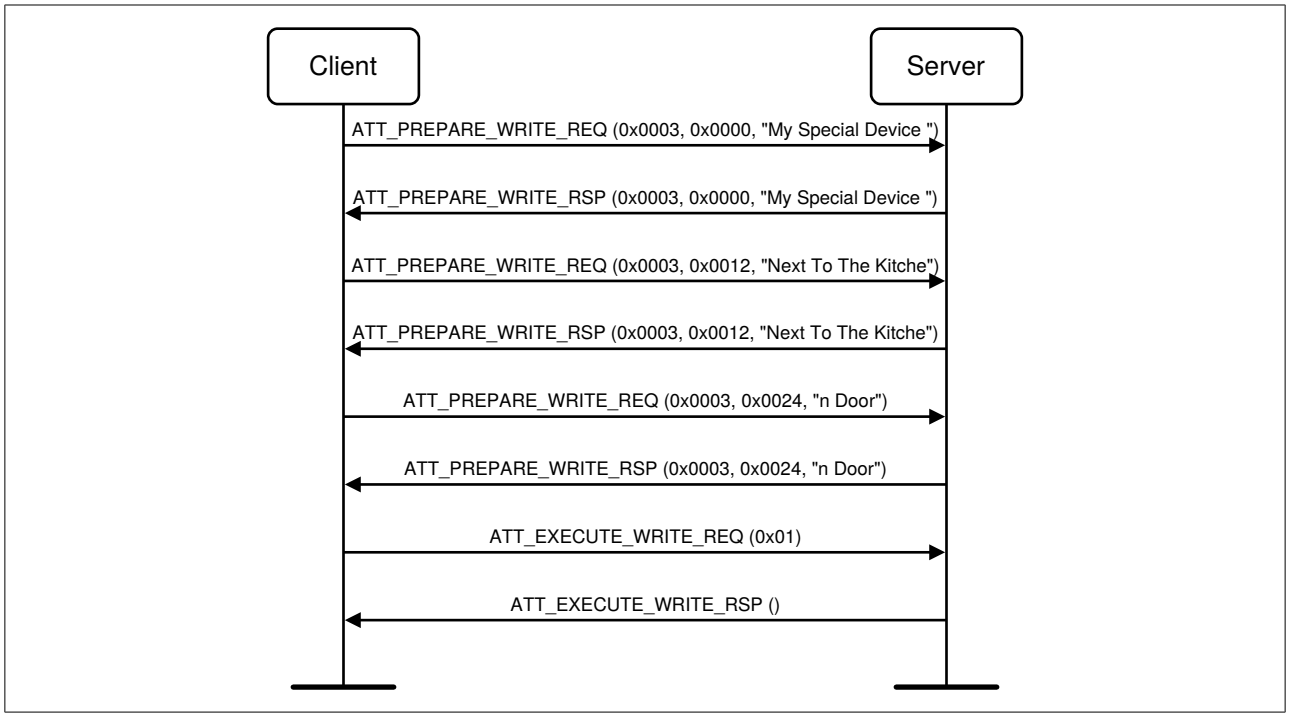

Figure 4.16: Write Long Characteristic Value example

4.9.5 Characteristic Value Reliable Writes

This sub-procedure is used to write a *Characteristic Value* to a server when the client knows the *Characteristic Value Handle*, and assurance is required that the correct *Characteristic Value* is going to be written by transferring the *Characteristic Value* to be written in both directions before the write is performed. A higher-layer protocol can also use this sub-procedure to write multiple values in order in a single operation.

The sub-procedure has two phases; the first phase prepares the *Characteristic Values* to be written. To do this, the client transfers the *Characteristic Values* to the server. The server checks the validity of the *Characteristic Values*. The client also checks each *Characteristic Value* to verify it was correctly received by the server using the server responses. Once this is complete, the second phase performs the execution of all of the prepared Characteristic Value writes on the server from this client.

In the first phase, the ATT_PREPARE_WRITE_REQ PDU is used. The *Attribute Handle* shall be set to the *Characteristic Value Handle* that is to be prepared to write. The *Value Offset* and *Part Attribute Value* parameter shall be set to the new *Characteristic Value*.

Two possible responses can be sent from the server for the ATT_PREPARE_WRITE_-REQ PDU: ATT_PREPARE_WRITE_RSP and ATT_ERROR_RSP PDUs.

If the number of prepared write requests exceeds the number of prepared writes supported, then an ATT_ERROR_RSP PDU with the Error Code parameter set to *Prepare Queue Full* (0x09) shall be sent by the server.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_PREPARE_WRITE_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the client, the prepared attribute value is too long (see [Vol 3] Part F, Section 3.4.6.3), or if a write operation is not permitted on the *Characteristic Value*. The *Error Code* parameter is set as specified in the Attribute Protocol.

If a *Characteristic Value* is prepared two or more times during this sub-procedure, then all prepared values are written to the same *Characteristic Value* in the order that they were prepared.

If an ATT_PREPARE_WRITE_RSP PDU is returned, then the *Value Offset* and *Part Attribute Value* parameter in the response shall be checked with the *Value Offset* and *Part Attribute Value* parameter that was sent in the ATT_PREPARE_WRITE_REQ PDU; if they are different, then the value has been corrupted during transmission, and the sub-procedure shall be aborted by sending an ATT_EXECUTE_WRITE_REQ PDU with the Flags parameter set to 0x00 to cancel all prepared writes. The complete sub-procedure may be restarted.

Multiple ATT_PREPARE_WRITE_REQ PDUs can be sent by a client, each of which will be queued by the server.

In the second phase, the ATT_EXECUTE_WRITE_REQ PDU is used. The Attribute Flags parameter shall be set to 0x01 to immediately write all pending prepared values in the order that they were prepared. The server shall write the prepared writes once it receives this request and shall only send the ATT_EXECUTE_WRITE_RSP PDU once all the prepared values have been successfully written. If the *Characteristic Value* has an invalid value as defined by the profile, then the write shall not succeed, and an ATT_ERROR_RSP PDU with the Error Code parameter set to *Application Error* (0x80 – 0x9F) shall be sent by the server. The state of the Characteristic Values that were prepared is undefined.

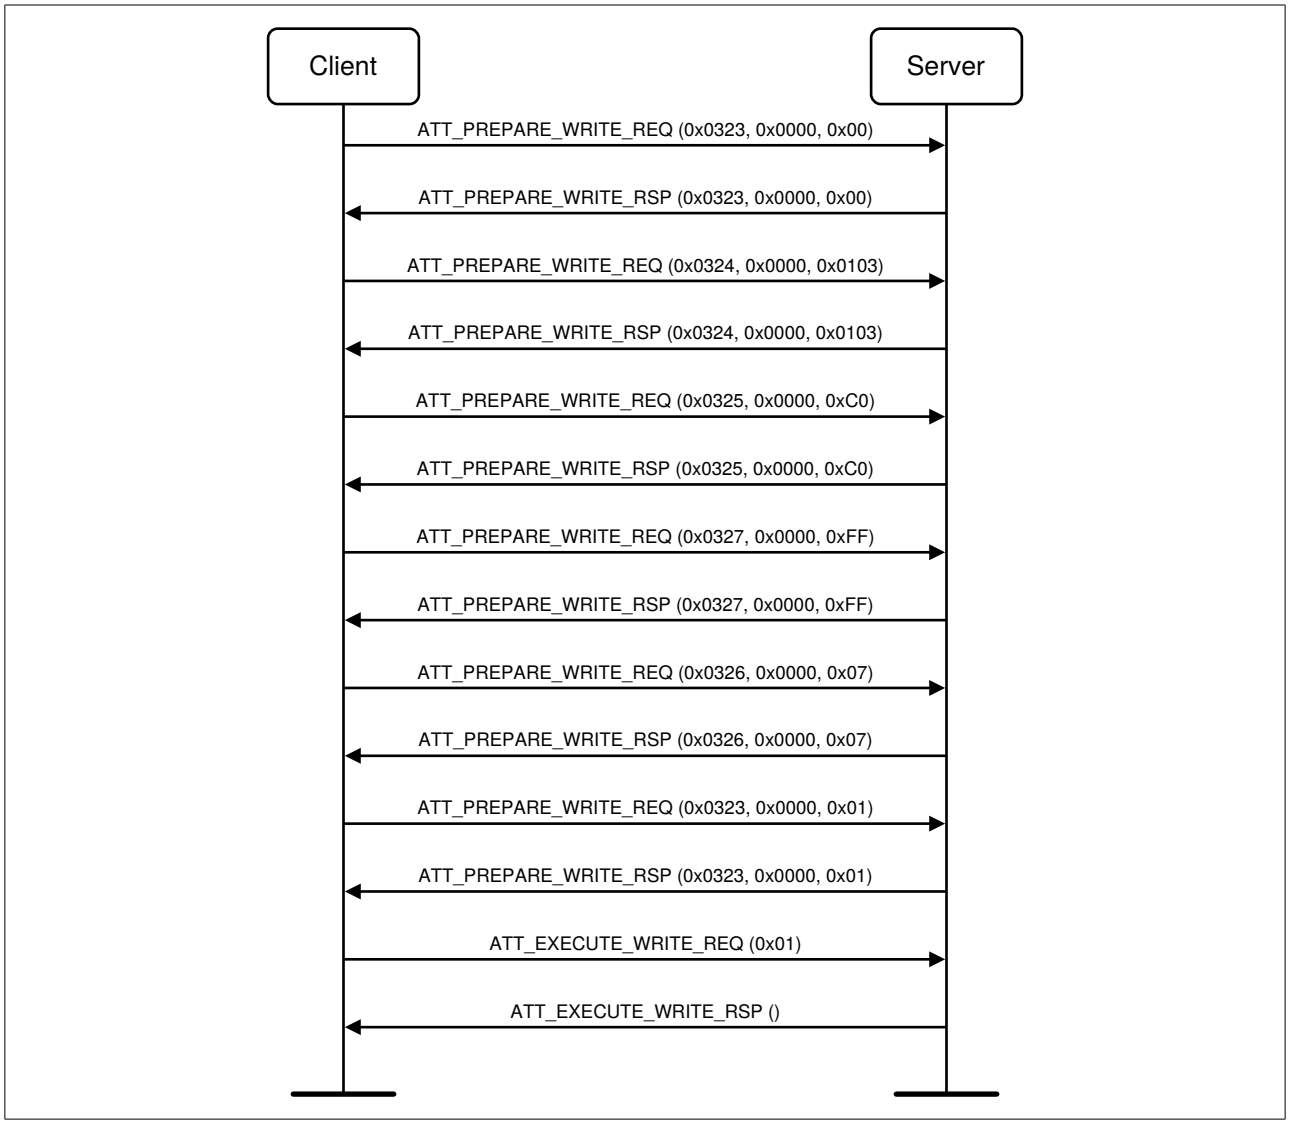

Figure 4.17: Characteristic Value Reliable Writes example

4.10 Characteristic Value Notification

This procedure is used to notify a client of the value of a *Characteristic Value* from a server without expecting any Attribute Protocol layer acknowledgment that the notification was successfully received. There are two sub-procedures that can be used to notify a value: Single Notification[1] and Multiple Variable Length Notifications. Notifications can be configured using the Client Characteristic Configuration descriptor (See Section 3.3.3.3).

A profile defines when to use notifications.

[1]This was previously just "Notifications".

4.10.1 Single Notification

This sub-procedure is used when a server is configured to notify a *Characteristic Value* to a client.

The ATT_HANDLE_VALUE_NTF PDU is used to perform this sub-procedure. The *Attribute Handle* parameter shall be set to the *Characteristic Value Handle* being notified, and the *Attribute Value* parameter shall be set to the *Characteristic Value*.

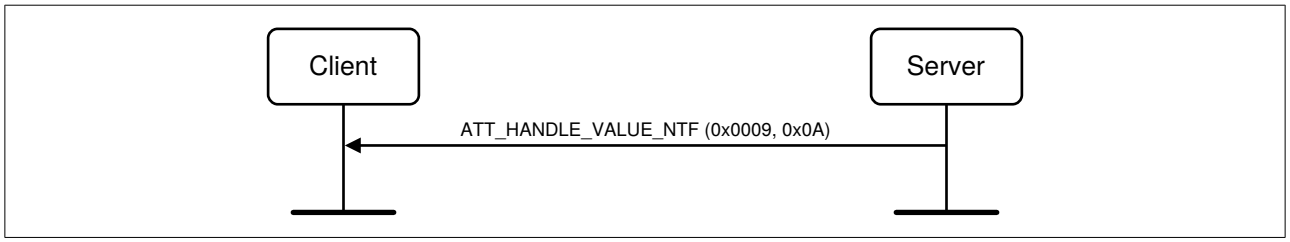

Figure 4.18: Notifications example

4.10.2 Multiple Variable Length Notifications

This sub-procedure is used when a server is configured to notify multiple Characteristic Values to a client.

The Attribute Protocol ATT_MULTIPLE_HANDLE_VALUE_NTF PDU is used to perform this sub-procedure. The Handle Length Value Tuple List parameter shall include the set of Characteristic Value Handles and associated Attribute Values.

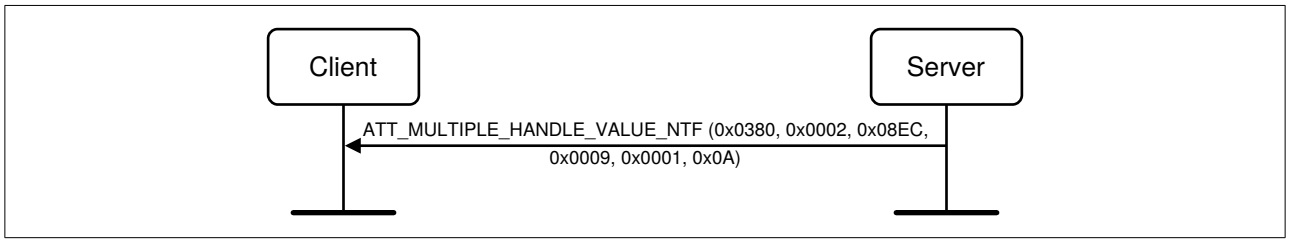

Figure 4.19: Multiple Variable Length Notifications example

4.11 Characteristic Value Indication

This procedure is used to indicate the *Characteristic Value* from a server to a client. There is one sub-procedure that can be used to indicate a value: Indication. Indications can be configured using the Client Characteristic Configuration descriptor (See Section 3.3.3.3).

A profile defines when to use indications.

4.11.1 Indication

This sub-procedure is used when a server is configured to indicate a *Characteristic Value* to a client and expects an Attribute Protocol layer acknowledgment that the indication was successfully received.

The ATT_HANDLE_VALUE_IND PDU is used to perform this sub-procedure. The *Attribute Handle* parameter shall be set to the *Characteristic Value Handle* being indicated, and the *Attribute Value* parameter shall be set to the *Characteristic Value*. Once the ATT_HANDLE_VALUE_IND PDU is received by the client, the client shall respond with an ATT_HANDLE_VALUE_CFM PDU.

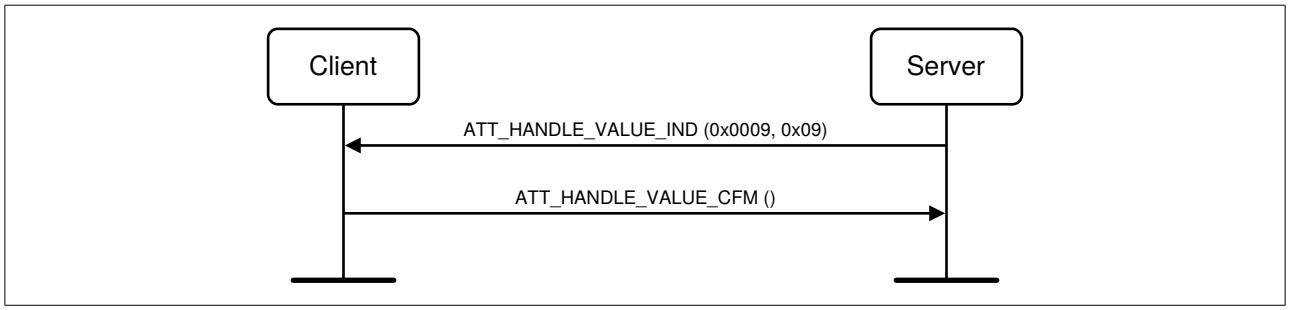

Figure 4.20: Indication example

4.12 Characteristic Descriptors

This procedure is used to read and write characteristic descriptors on a server. There are four sub-procedures that can be used to read and write characteristic descriptors: Read Characteristic Descriptor, Read Long Characteristic Descriptor, Write Characteristic Descriptor, and Write Long Characteristic Descriptor.

4.12.1 Read Characteristic Descriptor

This sub-procedure is used to read a characteristic descriptor from a server when the client knows the characteristic descriptor declaration's Attribute handle.

The ATT_READ_REQ PDU is used for this sub-procedure. The ATT_READ_REQ PDU is used with the *Attribute Handle* parameter set to the characteristic descriptor handle. The ATT_READ_RSP PDU returns the characteristic descriptor value in the *Attribute Value* parameter.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_READ_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the client, or if a read operation is not permitted on the *Characteristic Value*. The *Error Code* parameter is set accordingly.

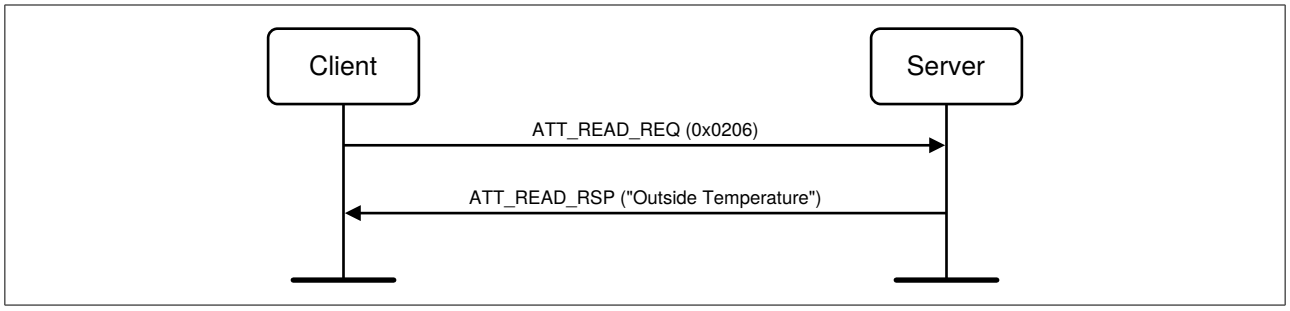

Figure 4.21: Read Characteristic Descriptor example

4.12.2 Read Long Characteristic Descriptor

This sub-procedure is used to read a characteristic descriptor from a server when the client knows the characteristic descriptor declaration's Attribute handle and the length of the characteristic descriptor declaration is longer than can be sent in a single ATT_READ_RSP PDU.

The ATT_READ_BLOB_REQ PDU is used to perform this sub-procedure. The Attribute Handle parameter shall be set to the characteristic descriptor handle. The Value Offset parameter shall be the offset within the characteristic descriptor to be read. To read the complete characteristic descriptor the offset should be set to 0x00 for the first ATT_READ_BLOB_REQ PDU. The offset for subsequent ATT_READ_BLOB_REQ PDUs is the next octet that has yet to be read. The ATT_READ_BLOB_REQ PDU is repeated until the ATT_READ_BLOB_RSP PDU's Part Attribute Value parameter is zero or an ATT_ERROR_RSP PDU is sent by the server with the Error Code parameter set to *Invalid Offset* (0x07).

For each ATT_READ_BLOB_REQ PDU an ATT_READ_BLOB_RSP PDU is received with a portion of the characteristic descriptor value contained in the Part Attribute Value parameter.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_READ_BLOB_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the client, or if a read operation is not permitted on the characteristic descriptor. The Error Code parameter is set accordingly.

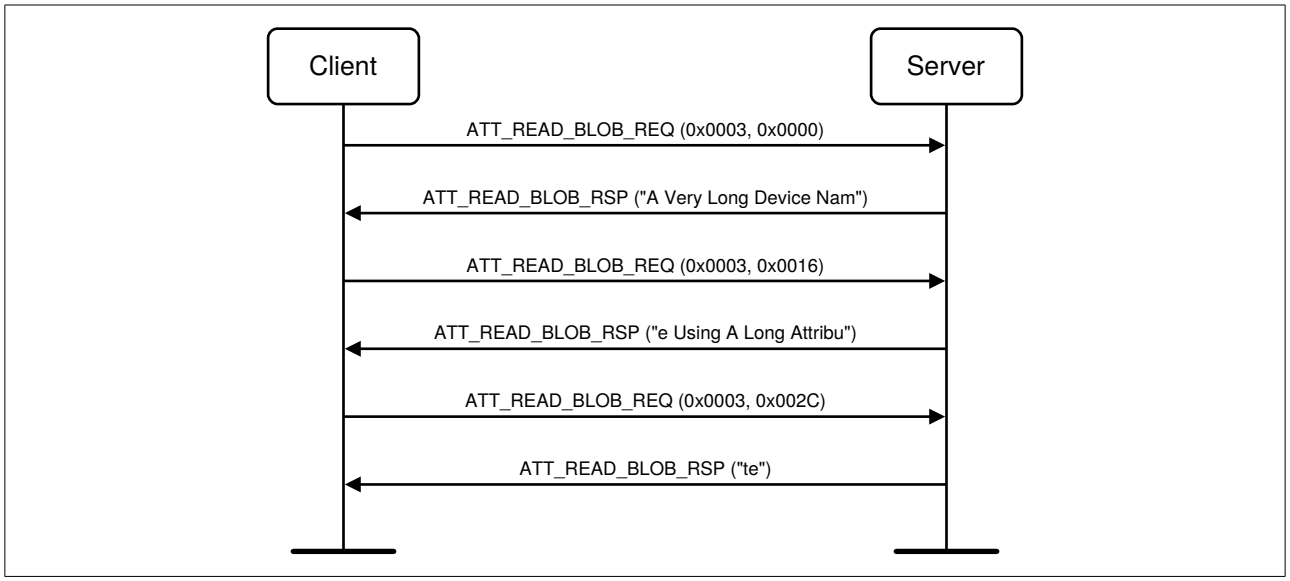

Figure 4.22: Read Long Characteristic Descriptor example

Note: The ATT_READ_BLOB_REQ PDU may be used to read the remainder of an characteristic descriptor value where the first part was read using a simple ATT_READ_REQ PDU.

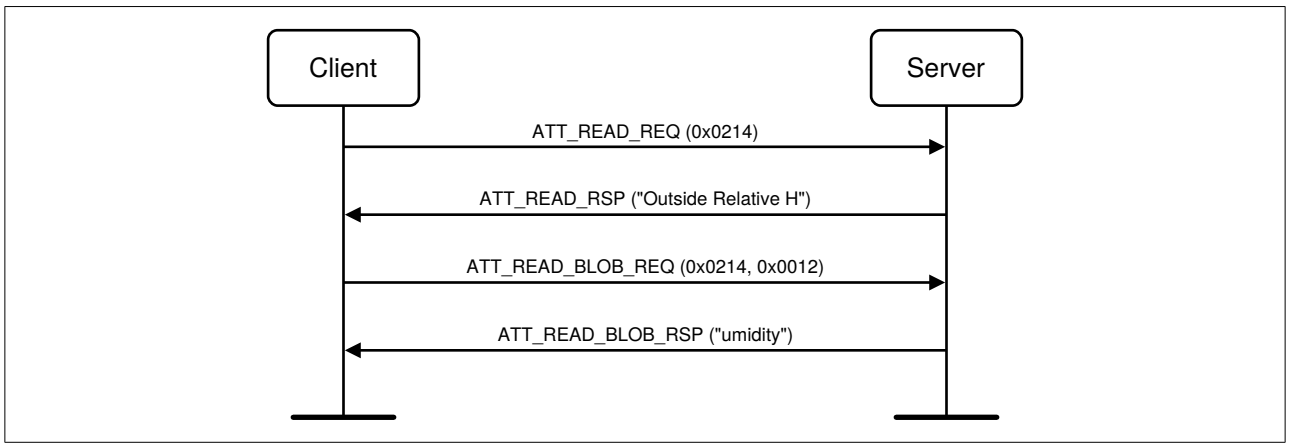

Figure 4.23: Read Long Characteristic Descriptor (following simple read) example

4.12.3 Write Characteristic Descriptor

This sub-procedure is used to write a characteristic descriptor value to a server when the client knows the characteristic descriptor handle.

The ATT_WRITE_REQ PDU is used for this sub-procedure. The *Attribute Handle* parameter shall be set to the characteristic descriptor handle. The *Attribute Value* parameter shall be set to the new characteristic descriptor value.

An ATT_WRITE_RSP PDU shall be sent by the server if the write of the characteristic descriptor value succeeded.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_WRITE_REQ PDU if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the client, the *Attribute Value* to be written is too long (see [Vol 3] Part F, Section 3.4.5.1), or if a write operation is not permitted on the *Characteristic Value*. The Error Code parameter shall be set as specified in the Attribute Protocol. If the characteristic descriptor value has an invalid value as defined by the profile or the operation is not permitted at this time, then the value shall not be written and an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Application Error* (0x80 – 0x9F) by the server.

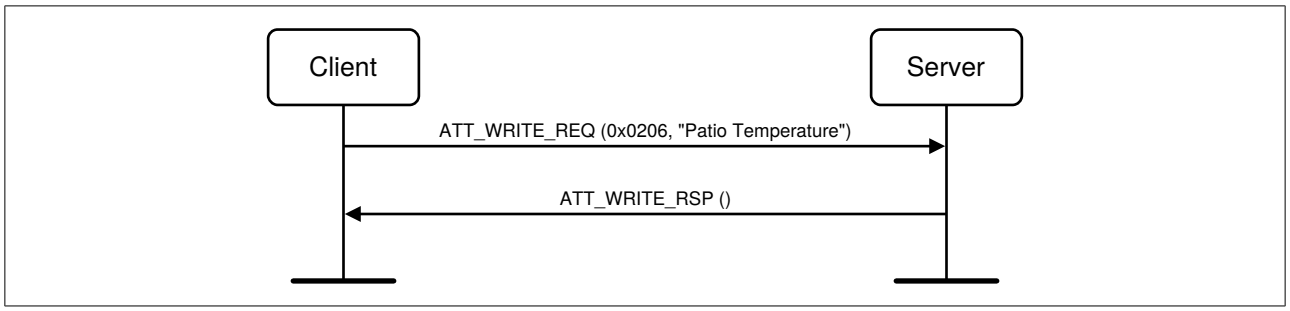

Figure 4.24: Write Characteristic Descriptor example

4.12.4 Write Long Characteristic Descriptor

This sub-procedure is used to write a characteristic descriptor value to a server when the client knows the characteristic descriptor handle but the length of the characteristic descriptor value is longer than can be sent in a single ATT_WRITE_REQ PDU.

The ATT_PREPARE_WRITE_REQ and ATT_EXECUTE_WRITE_REQ PDUs are used to perform this sub-procedure. The *Attribute Handle* parameter shall be set to the *Characteristic Descriptor Handle* of the *Characteristic Value* to be written. The *Part Attribute Value* parameter shall be set to the part of the *Attribute Value* that is being written. The *Value Offset* parameter shall be the offset within the *Characteristic Value* to be written. To write the complete *Characteristic Value* the offset should be set to 0x0000 for the first ATT_PREPARE_WRITE_REQ PDU. The offset for subsequent ATT_PREPARE_WRITE_REQ PDUs is the next octet that has yet to be written. The ATT_PREPARE_WRITE_REQ PDU is repeated until the complete *Characteristic Value* has been transferred, after which an ATT_EXECUTE_WRITE_REQ PDU is used to write the complete value.

Note: The values in the ATT_PREPARE_WRITE_RSP PDU do not need to be verified in this sub-procedure.

An ATT_ERROR_RSP PDU shall be sent by the server in response to the ATT_PREPARE_WRITE_REQ or ATT_EXECUTE_WRITE_REQ PDUs if insufficient authentication, insufficient authorization, a too-short encryption key size is used by the

client, or if a write operation is not permitted on the *Characteristic Value*. The Error Code parameter is set as specified in the Attribute Protocol. If the *Attribute Value* that is written is the wrong size, or has an invalid value as defined by the profile, then the write shall not succeed and an ATT_ERROR_RSP PDU shall be sent with the Error Code parameter set to *Application Error* (0x80 – 0x9F) by the server.

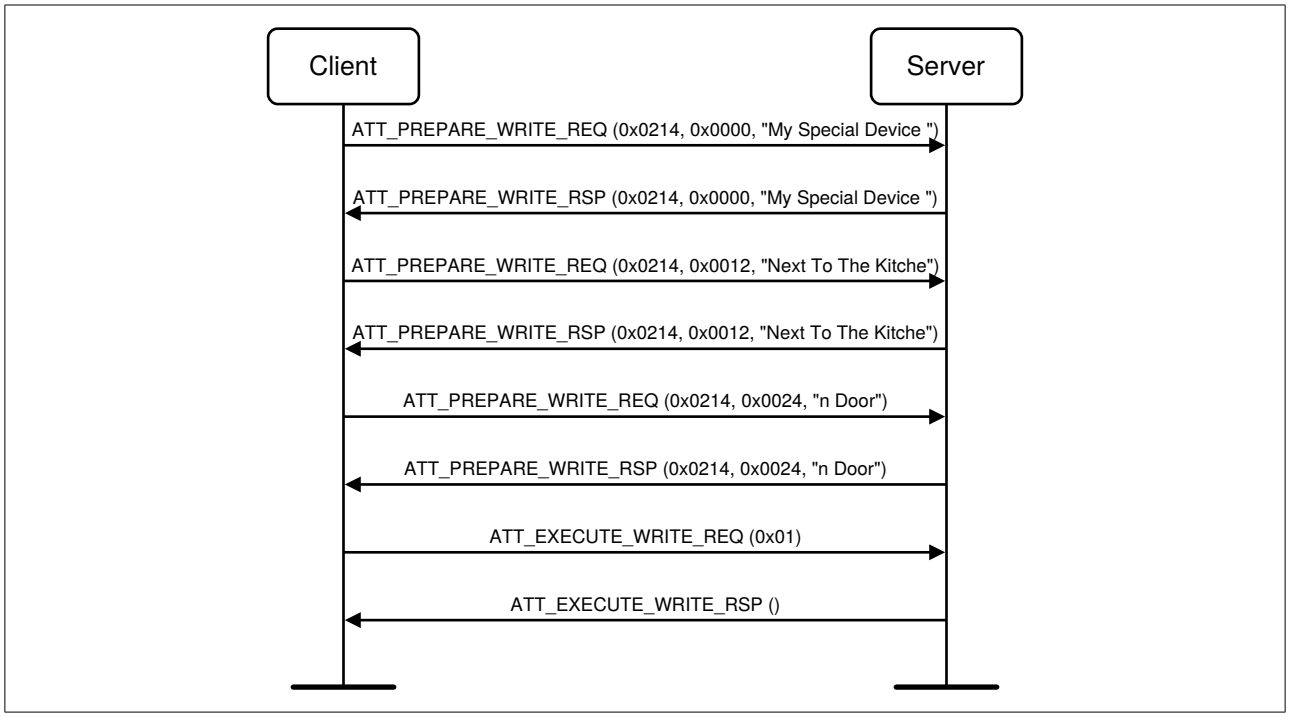

Figure 4.25: Write Long Characteristic Descriptor example

4.13 GATT procedure mapping to ATT protocol opcodes

Table 4.2 describes the mapping of the ATT protocol opcodes to the GATT procedures and sub-procedures. Only those portions of the ATT protocol requests, responses, notifications or indications necessary to implement the mandatory or supported optional sub-procedures is required.

Feature	Sub-Procedure	ATT Protocol Opcodes
Server Configuration	Exchange MTU	ATT_EXCHANGE_MTU_REQ ATT_EXCHANGE_MTU_RSP ATT_ERROR_RSP
Primary Service Discovery	Discover All Primary Services	ATT_READ_BY_GROUP_TYPE_REQ ATT_READ_BY_GROUP_TYPE_RSP ATT_ERROR_RSP

Feature	Sub-Procedure	ATT Protocol Opcodes
	Discover Primary Service By Service UUID	ATT_FIND_BY_TYPE_VALUE_REQ ATT_FIND_BY_TYPE_VALUE_RSP ATT_ERROR_RSP
Relationship Discovery	Find Included Services	ATT_READ_BY_TYPE_REQ ATT_READ_BY_TYPE_RSP ATT_ERROR_RSP
Characteristic Discovery	Discover All Characteristics of a Service	ATT_READ_BY_TYPE_REQ ATT_READ_BY_TYPE_RSP ATT_ERROR_RSP
	Discover Characteristics by UUID	ATT_READ_BY_TYPE_REQ ATT_READ_BY_TYPE_RSP ATT_ERROR_RSP
Characteristic Descriptor Discovery	Discover All Characteristic Descriptors	ATT_FIND_INFORMATION_REQ ATT_FIND_INFORMATION_RSP ATT_ERROR_RSP
Characteristic Value Read	Read Characteristic Value	ATT_READ_REQ ATT_READ_RSP ATT_ERROR_RSP
	Read Using Characteristic UUID	ATT_READ_BY_TYPE_REQ ATT_READ_BY_TYPE_RSP ATT_ERROR_RSP
	Read Long Characteristic Value	ATT_READ_BLOB_REQ ATT_READ_BLOB_RSP ATT_ERROR_RSP
	Read Multiple Characteristic Values	ATT_READ_MULTIPLE_REQ ATT_READ_MULTIPLE_RSP ATT_ERROR_RSP
	Read Multiple Variable Length Characteristic Values	ATT_READ_MULTIPLE_VARIABLE_REQ ATT_READ_MULTIPLE_VARIABLE_RSP ATT_ERROR_RSP
Characteristic Value Write	Write Without Response	ATT_WRITE_CMD
	Signed Write Without Response	ATT_SIGNED_WRITE_CMD

Feature	Sub-Procedure	ATT Protocol Opcodes
	Write Characteristic Value	ATT_WRITE_REQ ATT_WRITE_RSP ATT_ERROR_RSP
	Write Long Characteristic Value	ATT_PREPARE_WRITE_REQ ATT_PREPARE_WRITE_RSP ATT_EXECUTE_WRITE_REQ ATT_EXECUTE_WRITE_RSP ATT_ERROR_RSP
	Characteristic Value Reliable Writes	ATT_PREPARE_WRITE_REQ ATT_PREPARE_WRITE_RSP ATT_EXECUTE_WRITE_REQ ATT_EXECUTE_WRITE_RSP ATT_ERROR_RSP
Characteristic Value Notification	Single Notification	ATT_HANDLE_VALUE_NTF
	Multiple Variable Length Notifications	ATT_MULTIPLE_HANDLE_VALUE_NTF
Characteristic Value Indication	Indication	ATT_HANDLE_VALUE_IND ATT_HANDLE_VALUE_CFM
Characteristic Descriptor Value Read	Read Characteristic Descriptor	ATT_READ_REQ ATT_READ_RSP ATT_ERROR_RSP
	Read Long Characteristic Descriptor	ATT_READ_BLOB_REQ ATT_READ_BLOB_RSP ATT_ERROR_RSP
Characteristic Descriptor Value Write	Write Characteristic Descriptor	ATT_WRITE_REQ ATT_WRITE_RSP ATT_ERROR_RSP
	Write Long Characteristic Descriptor	ATT_PREPARE_WRITE_REQ ATT_PREPARE_WRITE_RSP ATT_PREPARE_WRITE_REQ ATT_PREPARE_WRITE_RSP ATT_ERROR_RSP

Table 4.2: GATT procedure mapping to ATT protocol opcodes

4.14 Procedure timeouts

GATT procedures are protected from failure with an Attribute Protocol transaction timeout.

If the Attribute Protocol transaction times out, the procedure shall be considered to have failed, and the local higher layer shall be notified. No further GATT procedures shall be performed on that ATT bearer. A new GATT procedure shall only be performed on another ATT bearer.

5 L2CAP INTEROPERABILITY REQUIREMENTS

The following default values shall be used by an implementation of this profile. The default values used may be different depending on the physical channel that the Attribute Protocol is being sent over.

5.1 BR/EDR L2CAP interoperability requirements

When using an Unenhanced ATT bearer, L2CAP connection-oriented channels over BR/EDR not in Enhanced Flow Control mode can be used to transmit Attribute Protocol PDUs. These channels use the channel establishment procedure from L2CAP using the ATT fixed PSM (see [1]) including the configuration procedure to determine the ATT_MTU (see [Vol 3] Part A, Section 5.1). Therefore, the ATT bearer (or the logical link as referred to in the Attribute Protocol) is, in this case, an established L2CAP connection-oriented channel.

5.1.1 ATT_MTU

At the end of the L2CAP configuration phase, upon transition to the OPEN state, the ATT_MTU for this ATT bearer shall be set to the minimum of the negotiated Maximum Transmission Unit configuration options.

Note: The minimum ATT_MTU for BR/EDR is 48 octets, as defined by L2CAP in [Vol 3] Part A, Section 5.1.

5.1.2 BR/EDR channel requirements

All Attribute Protocol messages sent by GATT over an L2CAP channel are sent using a dynamic channel ID derived by connecting using a fixed PSM. The use of a fixed PSM allows rapid reconnection of the L2CAP channel for Attribute Protocol as a preliminary SDP query is not required.

All packets sent on this L2CAP channel shall be Attribute PDUs.

PDUs shall be reliably sent.

The flow specification for the Attribute Protocol shall be best effort.

If operating in Basic L2CAP mode, the information payload of the L2CAP B-frame shall be a single Attribute PDU.

The channel shall be encrypted. The Key_Type shall be either an Unauthenticated Combination Key or an Authenticated Combination Key.

The L2CAP connection may be initiated by the client or by the server.

5.1.3 [This section is no longer used]

5.2 LE L2CAP interoperability requirements

When using an Unenhanced ATT bearer, the channel used to carry Attribute Protocol PDUs over LE is the Attribute L2CAP fixed channel.

To terminate the ATT bearer, the physical channel has to be disconnected.

5.2.1 ATT_MTU

Both GATT Client and GATT Server implementations shall support an ATT_MTU not less than the default value.

Default Value	Value for LE
ATT_MTU	23

Table 5.1: LE L2CAP ATT_MTU

5.2.2 LE channel requirements

L2CAP fixed CID 0x0004 shall be used for the Attribute Protocol. All packets sent on this fixed channel shall be Attribute Protocol PDUs.

The flow specification for the Attribute Protocol shall be best effort.

PDUs shall be reliably sent, and not flushed.

The retransmission and flow control mode for this channel shall be Basic L2CAP mode

The default parameters for the payload of the L2CAP B-frame shall be a single Attribute PDU.

Parameter	Value
MTU	23
Flush Timeout	0xFFFF (Infinite)
QoS	Best Effort
Mode	Basic Mode

Table 5.2: Attribute Protocol fixed channel configuration parameters

5.3 Enhanced ATT bearer L2CAP interoperability requirements

When using an Enhanced ATT bearer over BR/EDR, L2CAP connection-oriented channels in Enhanced Retransmission mode can be used to transmit Attribute Protocol PDUs. Such channels are established using L2CAP_CONNECTION_REQ packets.

When using an Enhanced ATT bearer over either BR/EDR or LE, L2CAP connection-oriented channels in Enhanced Credit Based Flow Control mode can be used to transmit Attribute Protocol PDUs. Such channels are established using L2CAP_CREDIT_BASED_CONNECTION_REQ packets.

In both cases, the EATT fixed PSM [1] is used and the ATT bearer is the established L2CAP connection-oriented channel.

Multiple L2CAP channels can be established between a client and a server.

5.3.1 ATT_MTU

The ATT_MTU for the Enhanced ATT bearer shall be set to the minimum of the MTU field values of the two devices; these values come from the L2CAP_CREDIT_BASED_CONNECTION_REQ and L2CAP_CREDIT_BASED_CONNECTION_RSP signaling packets or the latest L2CAP_CREDIT_BASED_RECONFIGURE_REQ packets.

Note: The minimum ATT_MTU for an Enhanced ATT bearer is 64 octets.

5.3.2 Channel Requirements

All Attribute Protocol messages sent by GATT over an L2CAP Enhanced Credit Based Flow Control mode channel are sent using one of the dynamic channel IDs derived by connecting using a fixed PSM.

All packets sent on this L2CAP channel shall be Attribute PDUs.

The flow specification for the Attribute Protocol shall be best effort.

The information payload of the L2CAP K-frame shall be a single Attribute PDU.

The channel shall be encrypted.

5.4 L2CAP collision mitigation

If both devices request L2CAP connections simultaneously and both devices have limited resources, a device may reject the incoming request and find its own request is also rejected. In this situation, the Central may retry immediately but the Peripheral shall wait a minimum of 100 ms before retrying; on LE connections, the Peripheral shall wait at least 2 × (*connPeripheralLatency* + 1) × *connInterval* if that is longer.

5.5 Bearer support

A GATT implementation supporting bearers over BR/EDR shall support at least one of Unenhanced and Enhanced ATT bearers over BR/EDR and may support both.

A GATT implementation supporting bearers over LE shall support Unenhanced ATT bearers over LE and may support Enhanced ATT bearers over LE.

Note: A GATT implementation supporting bearers over both BR/EDR and LE therefore may support any combination of bearers provided that it supports Unenhanced ATT bearers over LE and at least one type of ATT bearer over BR/EDR.

6 GAP INTEROPERABILITY REQUIREMENTS

6.1 BR/EDR GAP interoperability requirements

6.1.1 Connection Establishment

To establish an Unenhanced ATT bearer, the Channel Establishment procedure (as defined in [Vol 3] Part C, Section 7.2) shall be used with the PSM set to ATT.

Either device may establish an ATT bearer at any time.

To establish an Enhanced ATT bearer, the Section 5.3 procedure shall be used with the fixed PSM set to EATT. A device shall not attempt to establish an Enhanced ATT bearer with a peer unless it is aware that the peer supports Enhanced ATT bearers, for example by using an out of band method, via a higher layer protocol, or because the device has checked the peer's Server Supported Features characteristic (see Section 7.4) or its SDP record.

Either device may terminate an ATT bearer at any time.

No idle mode procedures or modes are defined by this profile.

6.2 LE GAP interoperability requirements

6.2.1 Connection Establishment

To establish an Unenhanced ATT bearer, the Connection Establishment procedure (as defined in [Vol 3] Part C, Section 9.3.5 to Section 9.3.8) shall be used.

To establish an Enhanced ATT bearer, the Section 5.3 procedure shall be used with the fixed PSM set to EATT.

Either device may terminate an ATT bearer at any time.

No idle mode procedures or modes are defined by this profile.

Note: Unlike BR/EDR, it is not necessary to check the Server Supported Features characteristic before attempting to establish an Enhanced ATT bearer.

6.2.2 Profile roles

This profile can be used in the following profile roles (as defined in [Vol 3] Part C, Section 2.2.2):

- Central
- Peripheral

6.3 Disconnected events

6.3.1 Notifications and indications while disconnected

If a client has configured the server to send a notification or indication to the client, it shall be configured to allow re-establishment of the connection when it is disconnected.

If the client is disconnected, but intends to become a Central in the connection it shall perform a GAP connection establishment procedure. If the client is disconnected, but intends to become a Peripheral in the connection it shall go into a GAP connectable mode.

A server shall re-establish a connection with a client when an event or trigger operation causes a notification or indication to a client.

If the server is disconnected, but intends to become a Peripheral in the connection it shall go into a GAP connectable mode. If the server is disconnected, but intends to become a Central in the connection it shall perform a GAP connection establishment procedure.

If the server cannot re-establish a connection, then the notification or indication for this event shall be discarded and no further connection re-establishment shall occur, until another event occurs.

7 DEFINED GATT SERVICE

All characteristics defined within this section shall be contained in a primary service with the service UUID set to «GATT Service» as defined in Section 3.1. Only one instance of the GATT service shall be exposed on a GATT Server.

Table 7.1 lists characteristics that may be present in the server and the characteristics that may be supported by the client.

Characteristic	Ref.	Support in Client	Support in Server
Service Changed	7.1	M	C.1
Client Supported Features	7.2	O	C.2
Database Hash	7.3	O	O
Server Supported Features	7.4	O	C.3
C.1: Mandatory if service definitions on the server can be added, changed, or removed; otherwise excluded			
C.2: Mandatory if the *Database Hash* and *Service Changed* characteristics are supported or if Enhanced ATT Bearer or Multiple Variable Length Notifications are supported; otherwise excluded			
C.3: Mandatory if any of the features in Table 7.11 are supported, otherwise optional			

Table 7.1: GATT service characteristic support

The assigned UUIDs for these characteristics are defined in Assigned Numbers [1].

7.1 Service Changed

The «Service Changed» characteristic is a control-point attribute (as defined in [Vol 3] Part F, Section 3.2.6) that shall be used to indicate to connected devices that services have changed (i.e., added, removed or modified). The characteristic shall be used to indicate to clients that have a trusted relationship (i.e. bond) with the server when GATT based services have changed when they re-connect to the server. See Section 2.5.2.

This *Characteristic Value* shall be configured to be indicated using the Client Characteristic Configuration descriptor by a client. Indications caused by changes to the Service Changed Characteristic Value shall be considered lost if the client has erroneously not enabled indications in the Client Characteristic Configuration descriptor (see [Vol 3] Part F, Section 3.3.3).

Attribute Handle	Attribute Type	Attribute Value			Attribute Permission
0xNNNN	0x2803 – UUID for «Characteristic»	Characteristic Properties = 0x20	0xMMMM = Handle of Characteristic Value	0x2A05 – UUID for «Service Changed»	No Authentication, No Authorization

Table 7.2: Service Changed Characteristic declaration

The *Service Changed Characteristic Value* is two 16-bit *Attribute Handles* concatenated together indicating the beginning and ending *Attribute Handles* affected by an addition, removal, or modification to a GATT-based service on the server. A change to a characteristic value is not considered a modification of the service. If a change has been made to any of the GATT service definition characteristic values other than the *Service Changed* characteristic value and the *Client Supported Features* characteristic value, the range shall also include the beginning and ending *Attribute Handle* for the GATT service definition.

Attribute Handle	Attribute Type	Attribute Value		Attribute Permission
0xMMMM	0x2A05 – UUID for «Service Changed»	0xSSSS – Start of Affected Attribute Handle Range	0xTTTT – End of Affected Attribute Handle Range	No Authentication, No Authorization, Not Readable, Not Writable

Table 7.3: Service Changed Characteristic Value declaration

There shall be only one instance of the *Service Changed* characteristic within the GATT service definition. A *Service Changed* characteristic value shall exist for each client with a trusted relationship.

If the list of GATT based services and the service definitions cannot change for the lifetime of the device then this characteristic shall not exist, otherwise this characteristic shall exist.

If the *Service Changed* characteristic exists on the server, the *Characteristic Value Indication* support on the server is mandatory.

The client shall support *Characteristic Value Indication* of the *Service Changed* characteristic.

The *Service Changed* characteristic *Attribute Handle* on the server shall not change if the server has a trusted relationship with any client.

7.2 Client Supported Features

The *Client Supported Features* characteristic is used by the client to inform the server which features are supported by the client. If the characteristic exists on the server, the

client may update the *Client Supported Features* bit field. If a client feature bit is set by a client and the server supports that feature, the server shall fulfill all requirements associated with this feature when communicating with this client. If a client feature bit is not set by a client, then the server shall not use any of the features associated with that bit when communicating with this client.

Attribute Handle	Attribute Type	Attribute Value			Attribute Permission
0xNNNN	0x2803 – UUID for «Characteristic»	Characteristic Properties = 0x0A	0xMMMM = Handle of Characteristic Value	0x2B29 – UUID for «Client Supported Features»	Read only, No Authentication, No Authorization

Table 7.4: Client Supported Features characteristic declaration

The format of the *Client Supported Features* characteristic is defined in Table 7.5.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permission
0xMMMM	0x2B29 - UUID for «Client Supported Features»	0xXX...XX (variable length) - Client Features	Readable, Writable, No Authentication, No Authorization

Table 7.5: Client Supported Features value declaration

The *Client Supported Features* characteristic value is an array of octets, each of which is a bit field. The allocation of these bits is specified in Table 7.6. All bits not listed are reserved for future use. The array should not have any trailing all-zero octets.

If any octet number in Table 7.6 does not appear in the attribute value because it is too short, the server shall behave as if that octet were present with a value of zero.

Client Features	Octet	Bit	Ref.	Description
Robust Caching	0	0	2.5.2.1	The client supports robust caching
Enhanced ATT bearer	0	1	5.3	The client supports Enhanced ATT bearer
Multiple Handle Value Notifications	0	2	4.10.2	The client supports receiving ATT_MULTIPLE_HANDLE_VALUE_NTF PDUs

Table 7.6: Client Supported Features bit assignments

The default value for the *Client Supported Features* characteristic value shall be all bits set to zero.

There shall be only one instance of the *Client Supported Features* characteristic within the GATT service definition.

A *Client Supported Features* characteristic value shall exist for each connected client. For clients with a trusted relationship, the characteristic value shall be persistent across connections. For clients without a trusted relationship the characteristic value shall be set to the default value at each connection.

The Attribute Handle of the *Client Supported Features* characteristic on the server shall not change during a connection or if the server has a trusted relationship with any client.

A client shall not clear any bits it has set. The server shall respond to any such request with the Error Code parameter set to *Value Not Allowed* (0x13).

7.3 Database Hash

The *Database Hash* characteristic contains the result of a hash function applied to the service definitions in the GATT database. The client may read the characteristic at any time to determine if services have been added, removed, or modified. If any of the input fields to the hash function (as listed in Section 7.3.1) have changed, the server shall calculate a new Database Hash and update the characteristic value.

The *Database Hash* characteristic is a read-only attribute.

Attribute Handle	Attribute Type	Attribute Value			Attribute Permission
0xNNNN	0x2803 – UUID for «Characteristic»	Characteristic Properties = 0x02	0xMMMM = Handle of Characteristic Value	0x2B2A – UUID for «Database Hash»	Read only, No Authentication, No Authorization

Table 7.7: Database Hash characteristic declaration

The characteristic value is a 128-bit unsigned integer number. The calculation of the Database Hash is specified in Section 7.3.1.

Attribute Handle	Attribute Type	Attribute Value	Attribute Permission
0xMMMM	0x2B2A - UUID for «Database Hash»	uint128 - Database Hash	Read only, No Authentication, No Authorization

Table 7.8: Database Hash characteristic value declaration

There is only one instance of the *Database Hash* characteristic within the GATT service definition. The same *Database Hash* value is used for all clients, whether a trusted relationship exists or not.

In order to read the value of this characteristic the client shall always use the *GATT Read Using Characteristic UUID* sub-procedure. The *Starting Handle* should be set to 0x0001 and the *Ending Handle* should be set to 0xFFFF.

If a client reads the value of this characteristic while the server is re-calculating the hash following a change to the database, the server shall return the new hash, delaying its response until it is available.

7.3.1 Database Hash calculation

The Database Hash shall be calculated according to RFC-4493[2]. This RFC defines the Cipher-based Message Authentication Code (CMAC) using AES-128 as the block cipher function, also known as AES-CMAC.

The inputs to AES-CMAC are:

m is the variable length data to be hashed
k is the 128-bit key, which shall be all zero
(0x00000000_00000000_00000000_00000000)

The 128-bit Database Hash is generated as follows:

Database Hash = AES-CMAC$_k$(m), where *m* is calculated as follows:

In ascending order of attribute handles, starting with the first handle, concatenate the fields *Attribute Handle*, *Attribute Type*, and *Attribute Value* if the attribute has one of the following types: «Primary Service», «Secondary Service», «Included Service», «Characteristic», or «Characteristic Extended Properties», concatenate the fields *Attribute Handle* and *Attribute Type* if the attribute has one of the following types: «Characteristic User Description», «Client Characteristic Configuration», «Server Characteristic Configuration», «Characteristic Presentation Format», or «Characteristic Aggregate Format», and ignore the attribute if it has any other type (such attributes are not part of the concatenation).
For each *Attribute Handle*, the fields shall be concatenated in the order given above. The byte order used for each field or subfield value shall be little-endian. If a field contains subfields, the subfields shall be concatenated in the order they appear in Section 3 (Service Interoperability Requirements). For instance, a characteristic declaration value of {0x02, 0x0005, 0x2A00} is represented after concatenation as 02 05 00 00 2A.

The formats of the fields *Attribute Handle*, *Attribute Type*, and *Attribute Value* for the Attribute Types listed above are defined in Section 3 (Service Interoperability Requirements).

If the length of *m* is not a multiple of the AES-CMAC block length of 128 bits, padding shall be applied as specified in RFC-4493 Section 2.4.

7.4 Server Supported Features

The *Server Supported Features* characteristic is a read-only characteristic that shall be used to indicate support for server features. The server shall set a bit only if the corresponding feature is supported.

Attribute Handle	Attribute Type	Attribute Value			Attribute Permission
0xNNNN	0x2803 – UUID for «Characteristic»	Characteristic Properties = 0x02	0xMMMM = Handle of Characteristic Value	0x2B3A – UUID for «Server Supported Features»	Read Only, No Authentication, No Authorization

Table 7.9: Server Supported Features characteristic declaration

Attribute Handle	Attribute Type	Attribute Value	Attribute Permission
0xMMMM	0x2B3A – UUID for «Server Supported Features»	0xuu - Server Supported Features	Readable

Table 7.10: Server Supported Features value declaration

The *Server Supported Features* characteristic is an array of octets, each of which is a bit field. The allocation of these bits is specified in Table 7.11. All bits not listed are reserved for future use. The array should not have any trailing all-zero octets.

Server Supported Features	Octet	Bit	Ref.	Description
EATT Supported	0	0	5.3	Enhanced ATT bearer supported

Table 7.11: Server Supported Features bit assignments

If any octet number in Table 7.11 does not appear in the attribute value because it is too short, the client shall behave as if that octet were present with the value of zero.

There shall be only one instance of the *Server Supported Features* characteristic within the GATT service definition.

8 SECURITY CONSIDERATIONS

8.1 Authentication requirements

Authentication in the GATT Profile is applied to each characteristic independently. Authentication requirements are specified in this profile, related higher layer specifications or are implementation specific if not specified otherwise.

The GATT Profile procedures are used to access information that may require the client to be authenticated and have an encrypted connection before a characteristic can be read or written.

If such a request is issued when the physical link is unauthenticated or unencrypted, the server shall send an ATT_ERROR_RSP PDU. The client wanting to read or write this characteristic can then request that the physical link be authenticated using the GAP authentication procedure, and once this has been completed, send the request again.

The list of services and characteristics that a device supports is not considered private or confidential information, and therefore the Service and Characteristic Discovery procedures shall always be permitted. This implies that an Error Code parameter set to *Insufficient Authentication* (0x05) shall not be used in an ATT_ERROR_RSP PDU for a *Find Information Request*.

Note: A characteristic may be allowed to be read by any device, but only written by an authenticated device. An implementation should take this into account, and not assume that if it can read a *Characteristic Value*, it will also be able to write the *Characteristic Value*. Similarly, if a characteristic can be written, it does not mean the characteristic can also be read. Each individual characteristic could have different security properties.

Once sufficient authentication of the client has been established to allow access to one characteristic within a service definition, a server may also allow access to other characteristics within the service definition depending on the higher level or implementation specific requirements.

A server may allow access to most characteristics within a service definition once sufficient authentication has been performed, but restrict access to other characteristics within the same service definition. This may result due to some characteristics requiring stronger authentication requirements than currently enabled.

Once a server has authenticated a client for access to characteristics in one service definition, it may automatically allow access to characteristics in other service definitions.

8.2 Authorization requirements

Authorization in the GATT Profile is applied to each characteristic independently. Authorization requirements may be specified in this profile, related higher layer specifications or are implementation specific if not specified otherwise.

The GATT Profile can be used to access information that may require authorization before a characteristic can be read or written.

If such a request is issued to a characteristic contained in a service definition that is not authorized, the responder shall send an ATT_ERROR_RSP PDU with the Error Code parameter set to *Insufficient Authorization* (0x08).

Once a server has authorized a client for access to characteristics in one group or service definition, it may automatically allow access to characteristics in other service definitions.

9 SDP INTEROPERABILITY REQUIREMENTS

A device that supports GATT over BR/EDR and only one of ATT or EATT shall publish the SDP record shown in Table 9.1; if both ATT and EATT are supported, the device shall publish the SDP record shown in Table 9.2. The GATT Service Start Handle shall be set to the attribute handle of the «GATT Service» service declaration. The GATT Service End Handle shall be set to the attribute handle of the last attribute within the «GATT Service» service definition group.

Item	Type	Value	Meaning
Attribute ID	uint16	0x0001	ServiceClassIDList
Attribute Value	Data element sequence (1 item)		
Service Class	UUID	«GATT Service»	
Attribute ID	uint16	0x0004	ProtocolDescriptorList
Attribute Value	Data element sequence (2 items)		
Protocol Descriptor	Data element sequence (2 items)		
Protocol	UUID	«L2CAP»	
Parameter 0	uint16	0x001F *or* 0x0027	PSM = ATT *or* PSM = EATT
Protocol Descriptor	Data element sequence (3 items)		
Protocol	UUID	«ATT»	
Parameter 0	uint16	0xHHHH	GATT service start handle
Parameter 1	uint16	0xHHHH	GATT service end handle

Appendix A Example ATT Server contents

Table A.1 shows an example ATT Server and the attributes contained on the server.

Note: This example does not necessarily use UUIDs or services defined by the Bluetooth SIG or in adopted profiles.

Handle	Attribute Type	Attribute Value
0x0001	«Primary Service»	«GAP Service»
0x0004	«Characteristic»	{0x02, 0x0006, «Device Name»}

Table A.1: Examples of ATT Server contents

As can be seen, the ATT Server indicates support for ten services: GAP Service, GATT Service, Battery State Service, Thermometer Humidity Service, Weight Service, Position Service, Alert Service, two Manufacturer Services, and a Vendor Specific Service.

The server contains the following information about each of the services:

- The characteristic containing the name of the device is “Example Device”.
- The characteristic indicating the server supports all the attribute opcodes, and supports two prepared write values.

- The characteristic containing the battery state with a value of 0x04, meaning it is discharging.
- The characteristic containing the outside temperature with a value of 6.5 °C.
- The characteristic containing the outside relative humidity with a value of 39%.
- The characteristic containing the weight hanging off the device with a value of 21.89 kg.
- The characteristic containing the position of this device with the value of 68.3585444 degrees north, 18.7830222 degrees east, with an elevation of 374 meters.
- The characteristic containing the temperature sensor manufacturer with the value of ACME Temperature Sensor.
- The characteristic containing the serial number for the temperature sensor with a value of 237495-3282-A.
- The characteristic containing the weighing sensor is manufacturer with a value of ACME Weight Scales.
- The characteristic containing the serial number for the weighing sensor with a value of 11267-2327A00239.

The device is therefore on the side of the Abisko Turiststation, Norrbottens Län, Sweden, with a battery in good state, measuring a relatively warm day, with low humidity, and a heavy rucksack.

Appendix B Example Database Hash

Table B.1 shows how the variable length data *m* for calculating the Database Hash is constructed from an example GATT database. The column *Included in Hash* indicates whether the *Attribute Handle* (H), *Attribute Type* (T), or *Attribute Value* (V) are included in *m*.

Attribute Handle	Attribute Type	Attribute Value	Notes	Included in Hash	Data Included in m
0x0001	0x2800	0x1800	Primary Service: GAP Service	HTV	01 00 00 28 00 18
0x0002	0x2803	{0x0A, 0x0003, 0x2A00}	Characteristic (Read, Write): Device Name	HTV	02 00 03 28 0A 03 00 00 2A
0x0003	0x2A00	*any*	Characteristic Value: Device Name	No	*none*
0x0004	0x2803	{0x02, 0x0005, 0x2A01}	Characteristic (Read): Appearance	HTV	04 00 03 28 02 05 00 01 2A
0x0005	0x2A01	*any*	Characteristic Value: Appearance	No	*none*
0x0006	0x2800	0x1801	Primary Service: GATT Service	HTV	06 00 00 28 01 18
0x0007	0x2803	{0x20, 0x0008, 0x2A05}	Characteristic (Indicate): Service Changed	HTV	07 00 03 28 20 08 00 05 2A
0x0008	0x2A05	*any*	Characteristic Value: Service Changed	No	*none*
0x0009	0x2902	0x0002	Client Characteristic Configuration Descriptor	HT	09 00 02 29
0x000A	0x2803	{0x0A, 0x000B, 0x2B29}	Characteristic (Read, Write): Client Supported Features	HTV	0A 00 03 28 0A 0B 00 29 2B
0x000B	0x2B29	*any*	Characteristic Value: Client Supported Features	No	*none*
0x000C	0x2803	{0x02, 0x000D, 0x2B2A}	Characteristic (Read): Database Hash	HTV	0C 00 03 28 02 0D 00 2A 2B
0x000D	0x2B2A	*any*	Characteristic Value: Database Hash	No	*none*

Attribute Handle	Attribute Type	Attribute Value	Notes	Included in Hash	Data Included in m
0x000E	0x2800	0x1808	Primary Service: Glucose Service	HTV	0E 00 00 28 08 18
0x000F	0x2802	{0x0014, 0x0016, 0x180F}	Included Service: Battery Service	HTV	0F 00 02 28 14 00 16 00 0F 18
0x0010	0x2803	{0xA2, 0x0011, 0x2A18}	Characteristic (Read, Indicate, Extended Properties): Glucose Measurement	HTV	10 00 03 28 A2 11 00 18 2A
0x0011	0x2A18	*any*	Characteristic Value: Glucose Measurement	No	*none*
0x0012	0x2902	0x0002	Client Characteristic Configuration Descriptor	HT	12 00 02 29
0x0013	0x2900	0x0000	Extended Properties	HTV	13 00 00 29 00 00
0x0014	0x2801	0x180F	Secondary Service: Battery Service	HTV	14 00 01 28 0F 18
0x0015	0x2803	{0x02, 0x0016, 0x2A19}	Characteristic (Read): Battery Level	HTV	15 00 03 28 02 16 00 19 2A
0x0016	0x2A19	*any*	Characteristic Value: Battery Level	No	*none*

Table B.1: Example database

The resulting variable length data m divided into blocks M0 to M6 is:

M0: 01000028 00180200 03280A03 00002A04
M1: 00032802 0500012A 06000028 01180700
M2: 03282008 00052A09 0002290A 0003280A
M3: 0B00292B 0C000328 020D002A 2B0E0000
M4: 2808180F 00022814 0016000F 18100003
M5: 28A21100 182A1200 02291300 00290000
M6: 14000128 0F181500 03280216 00192A

The resulting Database Hash is (MSB to LSB):

Database Hash = AES-CMAC$_k$(m) = F1 CA 2D 48 EC F5 8B AC 8A 88 30 BB B9 FB A9 90

Note: The bytes in M0 to M6 and the Database Hash are ordered from the most significant on the left to the least significant on the right.

Host
Part H

SECURITY MANAGER SPECIFICATION

The Security Manager (SM) defines the protocol and behavior to manage pairing, authentication, and encryption between LE-only or BR/EDR/LE devices.

CONTENTS

1 INTRODUCTION

1.1 Scope

The Security Manager defines methods of pairing and key distribution, a protocol for those methods and a security toolbox to be used by those methods and other parts of an LE-only or BR/EDR/LE device.

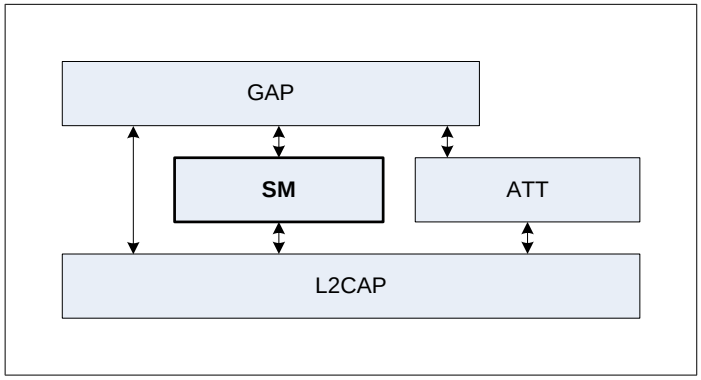

Figure 1.1: Relationship of the Security Manager to the rest of the LE Bluetooth architecture

The document describes Central and Peripheral roles in terms of protocol and requirements; these have the same meaning and are mapped to the LE device roles described in [Vol 1] Part A, Section 1.2 or BR/EDR device roles (see [Vol 1] Part A, Section 1.1).

1.2 Conventions

1.2.1 Bit and byte ordering conventions

When multiple bit fields are contained in a single octet and represented in a drawing in this Part, the least significant (low-order) bits are shown toward the left and most significant (high-order) bits toward the right.

Multiple-octet fields are drawn with the least significant octets toward the left and the most significant octets toward the right. Multiple-octet fields shall be transmitted with the least significant octet first.

Multiple-octet values written in hexadecimal notation have the most significant octet towards the left and the least significant octet towards the right, for example if ‘12’ is the most significant octet and ‘34’ is the least significant octet it would be written as 0x1234.

1.2.2 Random numbers

In this Part, the term "random number" includes pseudo-random numbers. Random number generators should conform to the requirements of [Vol 2] Part H, Section 2.

2 SECURITY MANAGER

2.1 Introduction

The Security Manager (SM) uses a key distribution approach to perform identity and encryption functionalities in radio communication. This means that each device generates and controls the keys it distributes and no other device affects the generation of these keys. The strength of a key is as strong as the algorithms implemented inside the distributing device.

The security architecture is designed such that memory and processing requirements for a responding device are lower than the memory and processing requirement for an initiating device.

Pairing is performed to establish keys which can then be used to encrypt a link. A transport-specific key distribution is then performed to share the keys, which can be used to encrypt a link in future reconnections, to verify signed data, and to resolve private addresses.

Pairing is a three-phase process. The first two phases are always used and may be followed by an optional transport specific key distribution phase (see Figure 2.1):

- Phase 1: Pairing Feature Exchange
- Phase 2 (LE legacy pairing): Short Term Key (STK) Generation
- Phase 2 (LE Secure Connections): Long Term Key (LTK) Generation
- Phase 3: Transport Specific Key Distribution

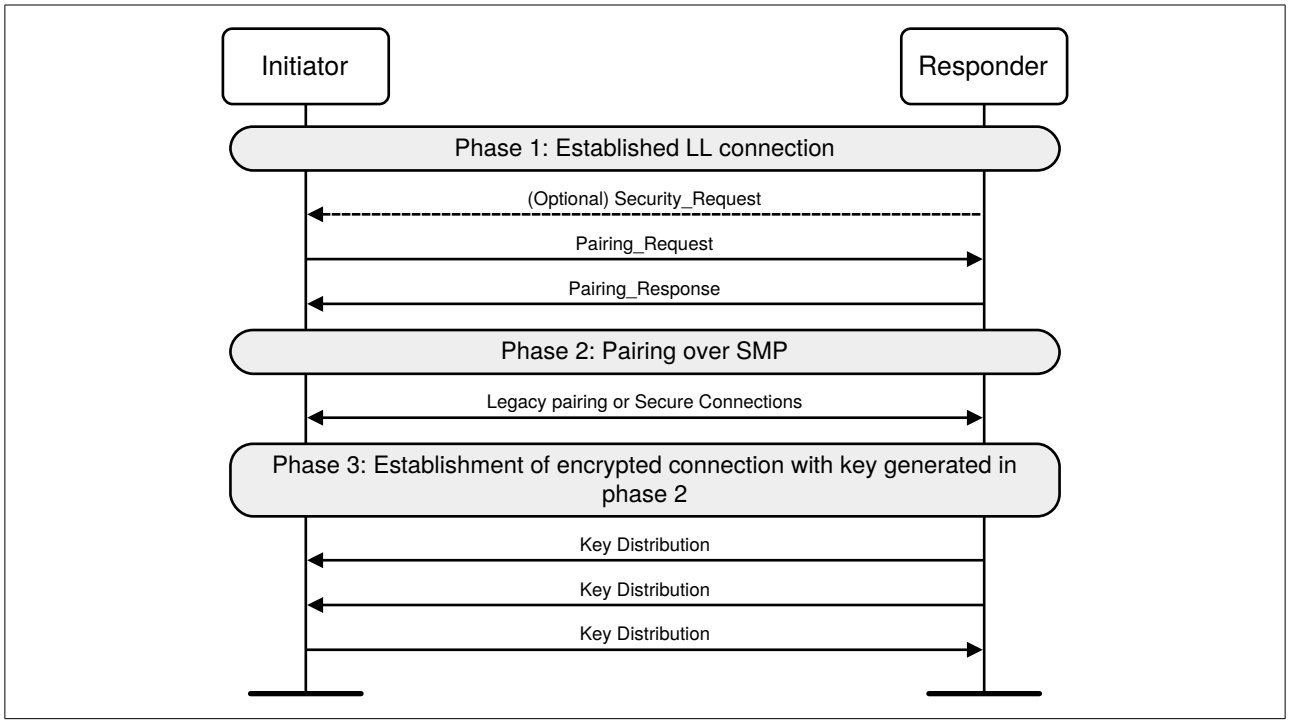

Figure 2.1: LE pairing phases

The devices shall first exchange authentication requirements and IO capabilities in the Pairing Feature Exchange to determine which of the following methods shall be used in Phase 2:

- Just Works
- Numeric Comparison (Only for LE Secure Connections)
- Passkey Entry
- Out Of Band (OOB)

Authentication requirements retrieved from the Pairing Feature Exchange also determine whether LE Secure Connections or LE legacy pairing is used.

Optionally, Phase 3 may then be performed to distribute transport specific keys, for example the Identity Resolving Key (IRK) value and Identity Address information. Phase 1 and Phase 3 are identical regardless of the method used in Phase 2.

Phase 3 shall only be performed on a link which is encrypted using:

- The STK generated in Phase 2 when using LE legacy pairing or
- The LTK generated in Phase 2 when using LE Secure Connections or
- The shared Link Key generated using BR/EDR pairing (see Section 2.3.5.7).

Phase 1 and Phase 2 may be performed on a link which is either encrypted or not encrypted.

2.2 Cryptographic toolbox

In order to support random addressing, pairing and other operations SM provides a toolbox of cryptographic functions. The following cryptographic functions are defined:

- *ah* is used to create a 24-bit hash used in random address creation and resolution.

The following cryptographic functions are defined to support the LE legacy pairing process:

- *c1* is used to generate confirm values used during the pairing process.
- *s1* is used to generate the STK during the pairing process.

The following cryptographic functions are defined to support the LE Secure Connections pairing process:

- *f4* is used to generate confirm values during the pairing process.
- *f5* is used to generate the LTK and the MacKey during the pairing process.
- *f6* is used to generate the check values during authentication stage 2 in the pairing process.
- *g2* is used to generate the 6-digit numeric comparison values during authentication stage 1 in the pairing process.
- *h6* is used to generate the LE LTK from a BR/EDR link key derived from Secure Connections and is used to generate the BR/EDR link key from an LE LTK derived from Secure Connections.
- *h7* is used to generate intermediate keys while generating the LE LTK from a BR/EDR link key derived from Secure Connections and the BR/EDR link key from an LE LTK derived from Secure Connections.

The building block for the cryptographic functions *ah*, *c1* and *s1* is the security function *e*.

The building block for the cryptographic functions *f4, f5, f6, g2, h6,* and *h7* is the security function AES-CMAC.

Inside the *f4, f5, f6, g2, h6,* and *h7* functions when a multi-octet integer parameter is used as input to AES-CMAC the most significant octet of the integer shall be the first octet of the stream and the least significant octet of the integer shall be the last octet of the stream. The output of AES-CMAC inside these functions is a multi-octet integer where the first octet is MSB and the last octet is LSB of this integer.

2.2.1 Security function *e*

Security function *e* generates 128-bit *encryptedData* from a 128-bit key and 128-bit *plaintextData* using the AES-128-bit block cypher as defined in FIPS-197[1]:

encryptedData = *e*(*key*, *plaintextData*)

The most significant octet of *key* corresponds to key[0], the most significant octet of *plaintextData* corresponds to in[0] and the most significant octet of *encryptedData* corresponds to out[0] using the notation specified in FIPS-197[1].

Note: The security function *e* can be implemented in a Host or be implemented using the HCI_LE_Encrypt command (see [Vol 4] Part E, Section 7.8.22).

2.2.2 Random address hash function *ah*

The random address hash function *ah* is used to generate a hash value that is used in resolvable private addresses, see [Vol 3] Part C, Section 10.8.2.

The following are inputs to the random address hash function *ah*:

k is 128 bits
r is 24 bits
padding is 104 bits

r is concatenated with *padding* to generate *r'* which is used as the 128-bit input parameter *plaintextData* to security function *e*:

r' = padding || r

The least significant octet of *r* becomes the least significant octet of *r'* and the most significant octet of *padding* becomes the most significant octet of *r'*.

For example, if the 24-bit value *r* is 0x423456 then *r'* is 0x000000000000000000000000423456.

The output of the random address function *ah* is:

ah(k, r) = *e*(k, r') *mod* 2^{24}

The output of the security function *e* is then truncated to 24 bits by taking the least significant 24 bits of the output of *e* as the result of *ah*.

[1]NIST Publication FIPS-197 (http://csrc.nist.gov/publications/fips/fips197/fips-197.pdf)

2.2.3 Confirm value generation function *c1* for LE legacy pairing

During the LE legacy pairing process confirm values are exchanged. This confirm value generation function *c1* is used to generate the confirm values.

The following are inputs to the confirm value generation function *c1*:

k is 128 bits
r is 128 bits
pres is 56 bits
preq is 56 bits
iat is 1 bit
ia is 48 bits
rat is 1 bit
ra is 48 bits
padding is 32 zero bits

iat is concatenated with 7 zero bits to create *iat'* which is 8 bits in length. *iat* is the least significant bit of *iat'*.

rat is concatenated with 7 zero bits to create *rat'* which is 8 bits in length. *rat* is the least significant bit of *rat'*.

pres, *preq*, *rat'* and *iat'* are concatenated to generate *p1* which is XORed with *r* and used as 128-bit input parameter *plaintextData* to security function *e*:

p1 = pres || preq || rat' || iat'

The octet of *iat'* becomes the least significant octet of *p1* and the most significant octet of *pres* becomes the most significant octet of *p1*.

For example, if the 8-bit *iat'* is 0x01, the 8-bit *rat'* is 0x00, the 56-bit *preq* is 0x07071000000101 and the 56 bit *pres* is 0x05000800000302 then *p1* is 0x05000800000302070710000001010001.

ra is concatenated with *ia* and *padding* to generate *p2* which is XORed with the result of the security function *e* using *p1* as the input parameter *plaintextData* and is then used as the 128-bit input parameter *plaintextData* to security function *e*:

p2 = padding || ia || ra

The least significant octet of *ra* becomes the least significant octet of *p2* and the most significant octet of *padding* becomes the most significant octet of *p2*.

For example, if 48-bit *ia* is 0xA1A2A3A4A5A6 and the 48-bit *ra* is 0xB1B2B3B4B5B6 then *p2* is 0x00000000A1A2A3A4A5A6B1B2B3B4B5B6.

The output of the confirm value generation function *c1* is:

c1 (k, r, preq, pres, iat, rat, ia, ra) = e(k, e(k, r ⊕ p1) ⊕ p2)

The 128-bit output of the security function *e* is used as the result of confirm value generation function *c1*.

For example, if the 128-bit *k* is 0x00000000000000000000000000000000, the 128-bit value *r* is 0x5783D52156AD6F0E6388274EC6702EE0, the 128-bit value *p1* is 0x05000800000302070710000001010001 and the 128-bit value *p2* is 0x00000000A1A2A3A4A5A6B1B2B3B4B5B6 then the 128-bit output from the *c1* function is 0x1E1E3FEF878988EAD2A74DC5BEF13B86.

2.2.4 Key generation function *s1* for LE legacy pairing

The key generation function *s1* is used to generate the STK during the LE legacy pairing process.

The following are inputs to the key generation function *s1*:

k is 128 bits
r1 is 128 bits
r2 is 128 bits

The most significant 64-bits of r1 are discarded to generate r1' and the most significant 64-bits of r2 are discarded to generate r2'.

For example if the 128-bit value r1 is 0x000F0E0D0C0B0A091122334455667788 then r1' is 0x1122334455667788. If the 128-bit value r2 is 0x010203040506070899AABBCCDDEEFF00 then r2' is 0x99AABBCCDDEEFF00.

r1' is concatenated with *r2'* to generate *r'* which is used as the 128-bit input parameter *plaintextData* to security function *e*:

r' = *r1'* || *r2'*

The least significant octet of *r2'* becomes the least significant octet of r' and the most significant octet of *r1'* becomes the most significant octet of *r'*.

For example, if the 64-bit value *r1'* is 0x1122334455667788 and *r2'* is 0x99AABBCCDDEEFF00 then *r'* is 0x11223344556778899AABBCCDDEEFF00.

The output of the key generation function *s1* is:

s1(k, *r1*, *r2*) = e(k, r')

The 128-bit output of the security function e is used as the result of key generation function *s1*.

For example if the 128-bit value *k* is

0x00000000000000000000000000000000

and the 128-bit value *r'* is

0x11223344556677889AABBCCDDEEFF00

then the output from the key generation function *s1* is

0x9a1fe1f0e8b0f49b5b4216ae796da062.

2.2.5 Function AES-CMAC

RFC-4493[1] defines the Cipher-based Message Authentication Code (CMAC) that uses AES-128 as the block cipher function, also known as AES-CMAC.

The inputs to AES-CMAC are:

m is the variable length data to be authenticated
k is the 128-bit key

The 128-bit message authentication code (MAC) is generated as follows:[2]

$MAC = AES\text{-}CMAC_k(m)$

A device can implement AES functions in the Host or can use the HCI_LE_Encrypt command (see [Vol 4] Part E, Section 7.8.22) in order to use the AES function in the Controller.

2.2.6 LE Secure Connections confirm value generation function *f4*

During the LE Secure Connections pairing process, confirm values are exchanged. These confirm values are computed using the confirm value generation function *f4*.

This confirm value generation function makes use of the MAC function $AES\text{-}CMAC_X$, with a 128-bit key X.

The inputs to function f4 are:

U is 256 bits
V is 256 bits

[1] http://www.ietf.org/rfc/rfc4493.txt

[2] RFC4493 uses the notation MAC = AES-CMAC(k,m) where k is the key. This is functionally the same as the notation used in this specification $MAC = AES\text{-}CMAC_k(m)$

X is 128 bits
Z is 8 bits

Z is zero (i.e. 8 bits of zeros) for Numeric Comparison and OOB protocol. In the Passkey Entry protocol, the most significant bit of Z is set equal to one and the least significant bit is made up from one bit of the passkey e.g. if the passkey bit is 1, then Z = 0x81 and if the passkey bit is 0, then Z = 0x80.

U, V and Z are concatenated and used as input *m* to the function AES-CMAC and X is used as the key *k*.

The inputs to *f4* are different depending on different association models:

Numeric Comparison/ Just Works	**Out-Of-Band**	**Passkey Entry**
Ca = *f4*(PKax, PKbx, Na, 0) Cb = *f4*(PKbx, PKax, Nb, 0)	Ca = *f4*(PKax, PKax, ra, 0) Cb = *f4*(PKbx, PKbx, rb, 0)	Cai = *f4*(PKax, PKbx, Nai, rai) Cbi = *f4*(PKbx, PKax, Nbi, rbi)

Table 2.1: Inputs to f4 for the different protocols

PKax denotes the x-coordinate of the public key PKa of A.

Similarly, PKbx denotes the x-coordinate of the public key PKb of B.

Nai is the nonce value of i^{th} round. For each round Nai value is a new 128-bit number. Similarly, rai is a one bit value of the passkey expanded to 8 bits (either 0x80 or 0x81).

Na and Nb are nonces from Devices A and B. ra and rb are random values generated by devices A and B.

The output of the confirm value generation function *f4* is as follows:

$f4(U, V, X, Z) = \text{AES-CMAC}_X (U \,||\, V \,||\, Z)$

The least significant octet of Z becomes the least significant octet of the AES-CMAC input message *m* and the most significant octet of U becomes the most significant octet of the AES-CMAC input message *m*.

2.2.7 LE Secure Connections key generation function *f5*

The LE Secure Connections key generation function *f5* is used to generate derived keying material in order to create the LTK and keys for the commitment function f6 during the LE Secure Connections pairing process.

The definition of this key generation function makes use of the MAC function AES-CMAC_T with a 128-bit key T.

The inputs to function *f5* are:

W is 256 bits
N_1 is 128 bits
N_2 is 128 bits
A_1 is 56 bits
A_2 is 56 bits

The key (T) is computed as follows:

$T = AES\text{-}CMAC_{SALT}(W)$

SALT is the 128-bit value:

`0x6C888391_AAF5A538_60370BDB_5A6083BE`

Counter, keyID, N1, N2, A1, A2, and Length are concatenated and used as input *m* to the function AES-CMAC and T is used as the key *k*.

Counter is one octet. Length is two octets.

The string “btle” is mapped into a keyID using ASCII as 0x62746C65.

The output of the key generation function f5 is as follows:

$f5(W, N1, N2, A1, A2) = AES\text{-}CMAC_T(Counter = 0 \,||\, keyID \,||\, N1 \,||\, N2 \,||\, A1 \,||\, A2 \,||\, Length = 256) \,||\, AES\text{-}CMAC_T(Counter = 1 \,||\, keyID \,||\, N1 \,||\, N2 \,||\, A1 \,||\, A2 \,||\, Length = 256)$

The least significant octet of Length becomes the least significant octet of the AES-CMAC input message *m* and the most significant octet of Counter becomes the most significant octet of the AES-CMAC input message *m*.

The LTK and MacKey are calculated as:

$MacKey \,||\, LTK = f5(DHKey, Nc, Np, BD\_ADDR\_C, BD\_ADDR\_P)$

DHKey is the shared secret Diffie-Hellman key generated during LE Secure Connections pairing phase 2.

Nc is whichever of N1 and N2 was generated by the Central and sent to the Peripheral; Np is the other.

BD_ADDR_C is the device address of the Central and BD_ADDR_P is the device address of the Peripheral. The device addresses are the values used during connection setup. The least significant bit in the most significant octet in both BD_ADDR_C and

BD_ADDR_P is set to 1 if the address is a random address and set to 0 if the address is a public address. The 7 most significant bits of the most significant octet in both BD_ADDR_C and BD_ADDR_P are set to 0.

The LTK is the least significant 128 bits (Counter = 1) of *f5*. The MacKey (see Section 2.2.8) is the most significant 128 bits (Counter = 0) of *f5*.

A device can implement Diffie-Hellman key generation in the Host or can use the HCI_LE_Generate_DHKey command (see [Vol 4] Part E, Section 7.8.37) to generate the key in the Controller.

Note: When using the HCI_LE_Generate_DHKey command, the device can only pair one remote device at a time.

2.2.8 LE Secure Connections check value generation function *f6*

The LE Secure Connections check value generation function *f6* is used to generate check values during authentication stage 2 of the LE Secure Connections pairing process.

The definition of the *f6* function makes use of the MAC function AES-CMAC$_W$ with a 128-bit key W.

The inputs to function *f6* are:

W is 128 bits
N1 is 128 bits
N2 is 128 bits
R is 128 bits
IOcap is 24 bits
A1 is 56 bits
A2 is 56 bits

N1, N2, R, IOcap, A1 and A2 are concatenated and used as input *m* to the function AES-CMAC and W is used as the key *k*.

The inputs to f6 are different depending on different association models:

Numeric Comparison/ Just Works	**Out-Of-Band**	**Passkey Entry**
Ea = *f6*(MacKey, Na, Nb, 0, IOcapA, A, B)	Ea = *f6*(MacKey, Na, Nb, rb, IOcapA, A, B)	Ea = *f6*(MacKey, Na20, Nb20, rb, IOcapA, A, B)
Eb = *f6*(MacKey, Nb, Na, 0, IOcapB, B, A)	Eb = *f6*(MacKey, Nb, Na, ra, IOcapB, B, A)	Eb = *f6*(MacKey, Nb20, Na20, ra, IOcapB, B, A)

Table 2.2: Inputs to f6 for the different protocols

MacKey is the 128-bit MSBs of the output of f5.

Na is the random number sent by the Central to the Peripheral and Nb is the random number sent by the Peripheral to the Central.

IOcapA is the capabilities of the Central and IOcapB is the capabilities of the Peripheral. IOcapA and IOcapB are both three octets with the most significant octet as the AuthReq parameter, the middle octet as the OOB data flag and the least significant octet as the IO capability parameter. The AuthReq, OOB data flag and IO capability parameters are present in the Pairing Request and Pairing Response SMP packets.

In Passkey Entry, ra and rb are 6-digit passkey values expressed as a 128-bit integer. For instance, if the 6-digit value of ra is 131313 then

ra = 0x 00 00 00 00 00 00 00 00 00 00 00 00 02 00 f1

A is the device address of the Central and B is the device address of the Peripheral. The least significant bit in the most significant octet in both A and B is set to 1 if the address is a random address and set to 0 if the address is a public address. The 7 most significant bits of the most significant octet in both A and B are set to 0.

The output of the check value generation function *f6* is as follows:

f6(W, N1, N2, R, IOcap, A1, A2) =
$AES\text{-}CMAC_W$ (N1 || N2 || R || IOcap || A1 || A2)

The least significant octet of A2 becomes the least significant octet of the AES-CMAC input message *m* and the most significant octet of N1 becomes the most significant octet of the AES-CMAC input message *m*.

2.2.9 LE Secure Connections numeric comparison value generation function *g2*

The LE Secure Connections numeric comparison value generation function *g2* is used to generate the numeric comparison values during authentication stage 1 of the LE Secure Connections pairing process.

The definition of *g2* makes use of the MAC function $AES\text{-}CMAC_X$ with 128-bit key X.

The inputs to function *g2* are:

U is 256 bits
V is 256 bits
X is 128 bits
Y is 128 bits

U, V, and Y are concatenated and used as input *m* to the function AES-CMAC and X is used as the key *k*.

The output of the numeric comparison value generation function *g2* is as follows:

$$g2(U, V, X, Y) = \text{AES-CMAC}_X(U \,||\, V \,||\, Y) \; mod \; 2^{32}$$

The least significant octet of Y becomes the least significant octet of the AES-CMAC input message *m* and the most significant octet of U becomes the most significant octet of the AES-CMAC input message *m*.

The numeric verification value is taken as the six least significant digits of the 32-bit integer *g2*(PKax, PKbx, Na, Nb) where PKax denotes the x-coordinate of the public key PKa of A and PKbx denotes the x-coordinate of the public key PKb of B. Na and Nb are nonces from devices A and B. The value is then converted to decimal numeric value. The checksum used for numeric comparison is the least significant six digits.

$$\text{Compare Value} = g2\,(U, V, X, Y) \; mod \; 10^6$$

For example, if output = 0x 01 2e b7 2a then decimal value = 19838762 and the checksum used for numeric comparison is 838762.

2.2.10 Link key conversion function *h6*

The function *h6* is used to convert keys of a given size from one key type to another key type with equivalent strength.

The definition of the *h6* function makes use of the hashing function AES-CMAC_W with 128-bit key W.

The inputs to function *h6* are:

W is 128 bits
keyID is 32 bits

keyID is used as input *m* to the hashing function AES-CMAC and the most significant 128-bits of W are used as the key *k* (2.2.5).

The output of *h6* is as follows:

$$h6(W, \text{keyID}) = \text{AES-CMAC}_W(\text{keyID})$$

2.2.11 Link key conversion function *h7*

The function *h7* is used to convert keys of a given size from one key type to another key type with equivalent strength.

The definition of the *h7* function makes use of the hashing function AES-CMAC_{SALT} with 128-bit key SALT.

The inputs to function *h7* are:

SALT is 128 bits
W is 128 bits

W is used as input *m* to the hashing function AES-CMAC and SALT is used as the key *k* (2.2.5).

The output of *h7* is as follows:

$h7(SALT, W) = AES\text{-}CMAC_{SALT}(W)$

2.3 Pairing methods

There are two types of pairing: LE legacy pairing and LE Secure Connections pairing. All Security Manager implementations shall support one of these and may support both.

When pairing is started, the Pairing Feature Exchange shall be initiated by the initiating device. If the responding device does not support pairing or pairing cannot be performed then the responding device shall respond using the Pairing Failed message with the error code “Pairing Not Supported” otherwise it responds with a Pairing Response message.

The Pairing Feature Exchange is used to exchange IO capabilities, OOB authentication data availability, authentication requirements, key size requirements and which transport specific keys to distribute. The IO capabilities, OOB authentication data availability and authentication requirements are used to determine the key generation method used in Phase 2.

All of the LE legacy pairing methods use and generate 2 keys:

1. Temporary Key (TK): a 128-bit temporary key used in the pairing process which is used to generate STK (see Section 2.3.5.5).
2. Short Term Key (STK): a 128-bit temporary key used to encrypt a connection following pairing.

The LE Secure Connections pairing methods use and generate 1 key:

1. Long Term Key (LTK): a 128-bit key used to encrypt the connection following pairing and subsequent connections.

Authentication requirements are set by GAP, (see [Vol 3] Part C, Section 10.3). The authentication requirements include the type of bonding and man-in-the-middle protection (MITM) requirements.

The initiating device indicates to the responding device which transport specific keys it would like to send to the responding device and which keys it would like the responding device to send to the initiator. The responding device replies with the keys that the initiating device shall send and the keys that the responding device shall send. The keys that can be distributed are defined in Section 2.4.3. If the device receives a command with invalid parameters, it shall respond with Pairing Failed command with the error code “Invalid Parameters.”

2.3.1 Security Properties

Security Properties provided by SM are classified into the following categories:

- LE Secure Connections pairing
- Authenticated MITM protection
- Unauthenticated no MITM protection
- No security requirements

LE Secure Connections pairing utilizes the P-256 elliptic curve (see [Vol 2] Part H, Section 7.6).

In LE legacy pairing, Authenticated man-in-the-middle (MITM) protection is obtained by using the passkey entry pairing method or may be obtained using the out of band pairing method. In LE Secure Connections pairing, Authenticated man-in-the-middle (MITM) protection is obtained by using the passkey entry pairing method or the numeric comparison method or may be obtained using the out of band pairing method. To ensure that Authenticated MITM Protection is generated, the selected Authentication Requirements option must have MITM protection specified.

Unauthenticated no MITM Protection does not have protection against MITM attacks.

For LE Legacy Pairing, none of the pairing methods provide protection against a passive eavesdropper during the pairing process as predictable or easily established values for *TK* are used. If the pairing information is distributed without an eavesdropper being present then all the pairing methods provide confidentiality.

An initiating device shall maintain a record of the Security Properties for the distributed keys in a security database.

A responding device may maintain a record of the distributed key sizes and Security Properties for the distributed keys in a security database. Depending upon the key generation method and negotiated key size a responding device may have to shorten the key length (see Section 2.3.4) so that the initiator and responder are using identical keys.

Security Properties of the key generated in phase 2 under which the keys are distributed shall be stored in the security database.

2.3.2 IO capabilities

Input and output capabilities of a device are combined to generate its IO capabilities. The input capabilities are described in Table 2.3. The output capabilities are described in Table 2.4.

Capability	Description
No input	Device does not have the ability to indicate ‘yes’ or ‘no’
Yes / No	Device has at least two buttons that can be easily mapped to 'yes' and 'no' or the device has a mechanism whereby the user can indicate either 'yes' or 'no' (see note below).
Keyboard	Device has a numeric keyboard that can input the numbers '0' to '9' and a confirmation. Device also has at least two buttons that can be easily mapped to 'yes' and 'no' or the device has a mechanism whereby the user can indicate either 'yes' or 'no' (see note below).

Table 2.3: User input capabilities

Note: 'yes' could be indicated by pressing a button within a certain time limit otherwise 'no' would be assumed.

Capability	Description
No output	Device does not have the ability to display or communicate a 6 digit decimal number
Numeric output	Device has the ability to display or communicate a 6 digit decimal number

Table 2.4: User output capabilities

The individual input and output capabilities are mapped to a single IO capability for that device which is used in the pairing feature exchange. The mapping is described in Table 2.5.

		Local output capacity	
		No output	**Numeric output**
Local input capacity	**No input**	NoInputNoOutput	DisplayOnly
	Yes/No	NoInputNoOutput[1]	DisplayYesNo
	Keyboard	KeyboardOnly	KeyboardDisplay

Table 2.5: IO capabilities mapping

[1]None of the pairing algorithms can use Yes/No input and no output, therefore NoInputNoOutput is used as the resulting IO capability.

2.3.3 OOB authentication data

An out of band mechanism may be used to communicate information which is used during the pairing process. The information shall be a sequence of AD structures (see [Vol 3] Part C, Section 11).

The OOB data flag shall be set if a device has the peer device's out of band authentication data. A device uses the peer device's out of band authentication data to authenticate the peer device. In LE legacy pairing, the out of band method is used if both the devices have the other device's out of band authentication data available. In LE Secure Connections pairing, the out of band method is used if at least one device has the peer device's out of band authentication data available.

2.3.4 Encryption key size

Each device shall have maximum and minimum encryption key length parameters which defines the maximum and minimum size of the encryption key allowed in octets. The maximum and minimum encryption key length parameters shall be between 7 octets (56 bits) and 16 octets (128 bits), in 1 octet (8 bit) steps. This is defined by a profile or device application.

The shorter of the initiating and responding devices' maximum encryption key length parameters shall be used as the encryption key size.

Both the initiating and responding devices shall check that the resultant encryption key size is not shorter than the minimum key size parameter for that device and if it is, the device shall send the Pairing Failed command with error code "Encryption Key Size".

The encryption key size may be stored so it can be checked by any service that has minimum encryption key length requirements.

If a key has an encryption key size that is shorter than 16 octets (128 bits), it shall be created by masking the appropriate number of most significant octets of the generated key to provide a resulting key that has the agreed encryption key size. The key shall be masked after generation and, if required, after the key is used to derive a BR/EDR link key. The key shall be masked before the key is distributed, used for encryption, or stored.

For example, if a 128-bit encryption key is

0x12345678_9ABCDEF0_12345678_9ABCDEF0

and it is reduced to 7 octets (56 bits), then the resulting key is

0x00000000_00000000_00345678_9ABCDEF0.

2.3.5 Pairing algorithms

The information exchanged in Phase 1 is used to select which key generation method is used in Phase 2.

When LE legacy pairing is used, the pairing is performed by each device generating a Temporary Key (*TK*). The method to generate *TK* depends upon the pairing method chosen using the algorithm described in Section 2.3.5.1. If Just Works is used then *TK* shall be generated as defined in Section 2.3.5.2. If Passkey Entry is used then *TK* shall be generated as defined in Section 2.3.5.3. If Out Of Band is used then *TK* shall be generated as defined in Section 2.3.5.4. The *TK* value shall be used in the authentication mechanism defined in Section 2.3.5.5 to generate the STK and encrypt the link.

2.3.5.1 Selecting key generation method

If both devices have not set the MITM option in the Authentication Requirements Flags, then the IO capabilities shall be ignored and the Just Works association model shall be used.

In LE legacy pairing, if both devices have Out of Band authentication data, then the Authentication Requirements Flags shall be ignored when selecting the pairing method and the Out of Band pairing method shall be used. Otherwise, the IO capabilities of the device shall be used to determine the pairing method as defined in Table 2.8.

In LE Secure Connections pairing, if one or both devices have out of band authentication data, then the Authentication Requirements Flags shall be ignored when selecting the pairing method and the Out of Band pairing method shall be used. Otherwise, the IO capabilities of the device shall be used to determine the pairing method as defined in Table 2.8.

Table 2.6 defines the STK generation method when at least one of the devices does not support LE Secure Connections.

			Initiator			
			OOB Set		OOB Not Set	
			MITM Set	MITM Not Set	MITM Set	MITM Not Set
Responder	OOB Set	MITM Set	Use OOB	Use OOB	Use IO Capabilities	Use IO Capabilities

Keyboard Display	Passkey Entry: initiator displays, responder inputs Authenticated	Passkey Entry (For LE Legacy Pairing): initiator displays, responder inputs Authenticated	Passkey Entry: responder displays, initiator inputs Authenticated	Just Works Unauthenticated	Passkey Entry (For LE Legacy Pairing): initiator displays, responder inputs Authenticated
		Numeric Comparison (For LE Secure Connections) Authenticated			Numeric Comparison (For LE Secure Connections) Authenticated

Table 2.8: Mapping of IO capabilities to key generation method

The generated key will either be an Authenticated or Unauthenticated key. If the out of band authentication method is used and the Out of Band mechanism is known to be secure from eavesdropping the key is assumed to be Authenticated; however, the exact strength depends upon the method used to transfer the out of band information. If the Out of Band method is used and the Out of Band mechanism is not secure from eavesdropping or the level of eavesdropping protection is unknown, the key shall be Unauthenticated. The mapping of IO capabilities to an authenticated or unauthenticated key is described in Table 2.8.

In LE legacy pairing, if the initiating device has Out of Band data and the responding device does not have Out of Band data then the responding device may send the Pairing Failed command with the error code “OOB Not Available” instead of the Pairing Response command.

If the key generation method does not result in a key that provides sufficient Security Properties (see Section 2.3.1) then the device shall send the Pairing Failed command with the error code “Authentication Requirements”.

2.3.5.2 LE legacy pairing - Just Works

The Just Works STK generation method provides no protection against eavesdroppers or man in the middle attacks during the pairing process. If the attacker is not present during the pairing process then confidentiality can be established by using encryption on a future connection.

Both devices set the TK value used in the authentication mechanism defined in Section 2.3.5.5 to zero.

2.3.5.3 LE legacy pairing - Passkey Entry

The Passkey Entry STK generation method uses 6 numeric digits passed out of band by the user between the devices. A 6 digit numeric randomly generated passkey achieves approximately 20 bits of entropy.

If the IO capabilities of a device are DisplayOnly or if Table 2.8 defines that the device displays the passkey, then that device shall display a randomly generated passkey value between 000,000 and 999,999. The display shall ensure that all 6 digits are displayed – including zeros. The other device shall allow the user to input a value between 000,000 and 999,999.

If the IO capabilities of both devices are KeyboardOnly then the user generates a random 6-digit passkey value and enters it into both devices. Both devices shall allow the user to input a value between 000,000 and 999,999.

The passkey should be generated randomly during each pairing procedure and not be reused from a previous procedure. Static passkeys should not be used since they can compromise the security of the link.

If entry of passkey in UI fails to occur or is cancelled then the device shall send Pairing Failed command with reason code “Passkey Entry Failed”.

For example, if the user entered passkey is ‘019655’ then *TK* shall be 0x00000000000000000000000000004CC7.

The passkey Entry method does not provide protection against active “man-in-the-middle” (MITM) attacks.

The Passkey Entry STK generation method provides very limited protection against eavesdroppers during the pairing process because of the limited range of possible TK values which STK is dependent upon. If the attacker is not present during the pairing process then confidentiality and authentication can be established by using encryption on a future connection.

The TK value shall then be used in the authentication mechanism defined in Section 2.3.5.5.

2.3.5.4 Out of band

An out of band mechanism may be used to communicate information to help with device discovery, for example device address, and the 128-bit *TK* value used in the pairing process. The *TK* value shall be a 128-bit random number using the requirements for random generation defined in [Vol 2] Part H, Section 2.

If the OOB communication is resistant to MITM attacks, then this association method is also resistant to MITM attacks. Also, in the Out of Band method, the size of authentication parameter (*TK*) need not be restricted by what the user can comfortably read or type. For that reason, the Out of Band method can be more secure than using the Passkey Entry or Just Works methods. However, both devices need to have matching OOB interfaces.

MITM protection is only provided if an active man-in-the-middle chance of a successful attack has a probability of 0.000001 or less in succeeding.

2.3.5.5 LE legacy pairing phase 2

The initiating device generates a 128-bit random number (LP_RAND_I).

The initiating device calculates the 128-bit confirm value (LP_CONFIRM_I) using the confirm value generation function *c1* (see Section 2.2.3) with the input parameter *k* set to *TK*, the input parameter *r* set to LP_RAND_I, the input parameter *preq* set to Pairing

Request command as exchanged with the peer device (i.e. without any modifications), the input parameter *pres* set to the Pairing Response command as exchanged with the peer device (i.e. without any modifications), the input parameter *iat* set to the initiating device address type, *ia* set to the initiating device address, *rat* set to the responding device address type and *ra* set to the responding device address:

LP_CONFIRM_I = *c1*(*TK*, LP_RAND_I,
Pairing Request command, Pairing Response command,
initiating device address type, initiating device address,
responding device address type, responding device address)

Initiating and responding device addresses used for confirmation generation shall be device addresses used during connection setup, see [Vol 3] Part C, Section 9.3

The responding device generates a 128-bit random number (LP_RAND_R).

The responding device calculates the 128-bit confirm value (LP_CONFIRM_R) using the confirm value generation function c1 (see Section 2.2.3) with the input parameter *k* set to *TK*, the input parameter *r* set to LP_RAND_R, the input parameter *preq* set to Pairing Request command, the input parameter *pres* set to the Pairing Response command, the input parameter *iat* set to the initiating device address type, *ia* set to the initiating device address, *rat* set to the responding device address type and *ra* set to the responding device address:

LP_CONFIRM_R = *c1*(*TK*, LP_RAND_R,
Pairing Request command, Pairing Response command,
initiating device address type, initiating device address,
responding device address type, responding device address)

The initiating device transmits LP_CONFIRM_I to the responding device. When the responding device receives LP_CONFIRM_I it transmits LP_CONFIRM_R to the initiating device. When the initiating device receives LP_CONFIRM_R it transmits LP_RAND_I to the responding device.

The responding device verifies the LP_CONFIRM_I value by repeating the calculation the initiating device performed, using the LP_RAND_I value received.

If the responding device's calculated LP_CONFIRM_I value does not match the received LP_CONFIRM_I value from the initiating device then the pairing process shall be aborted and the responding device shall send the Pairing Failed command with reason code "Confirm Value Failed".

If the responding device's calculated LP_CONFIRM_I value matches the received LP_CONFIRM_I value from the initiating device the responding device transmits LP_RAND_R to the initiating device.

The initiating device verifies the received LP_CONFIRM_R value by repeating the calculation the responding device performed, using the LP_RAND_R value received.

If the initiating devices calculated LP_CONFIRM_R value does not match the received LP_CONFIRM_R value from the responding device then the pairing process shall be aborted and the initiating device shall send the Pairing Failed command with the reason code “Confirm Value Failed”.

If the initiating device’s calculated LP_CONFIRM_R value matches the received LP_CONFIRM_R value from the responding device the initiating device then calculates STK and tells the Controller to enable encryption.

STK is generated using the key generation function *s1* defined in Section 2.2.4 with the input parameter *k* set to *TK*, the input parameter r1 set to LP_RAND_R, and the input parameter *r2* set to LP_RAND_I:

STK = *s1*(*TK*, LP_RAND_R, LP_RAND_I)

If the encryption key size is shorter than 128 bits then the STK shall be masked to the correct key size as described in Section 2.3.4.

The initiator shall use the generated STK to either enable encryption on the link or if encryption has already been enabled, perform the encryption pause procedure (see Section 2.4.4.1).

2.3.5.6 LE Secure Connections pairing phase 2

The Long Term Key is generated in LE Secure Connections pairing phase 2.

2.3.5.6.1 Public key exchange

Initially, each device generates its own Elliptic Curve Diffie-Hellman (ECDH) public-private key pair (phase 1). The public-private key pair contains a private (secret) key, and a public key. The private keys of devices A and B are denoted as SKa and SKb respectively. The public keys of devices A and B are denoted as PKa and PKb respectively. See Section 2.3.6 for recommendations on how frequently this key pair should be changed.

Pairing is initiated by the initiating device sending its public key to the receiving device (phase 1a). The responding device replies with its own public key (phase 1b). If the two public keys have the same X coordinate and neither is the debug key, each device shall fail the pairing process. These public keys are not regarded as secret although they may identify the devices.

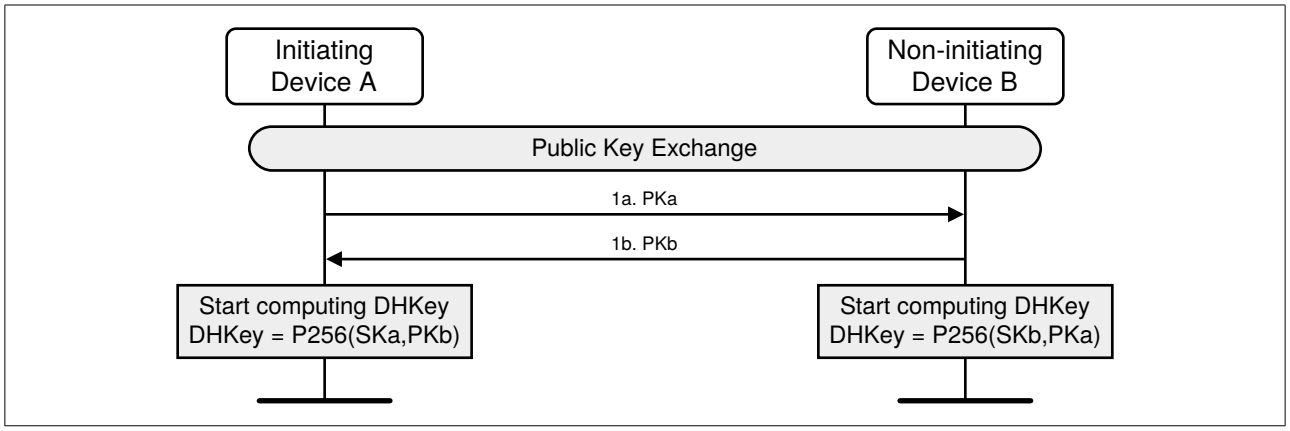

Figure 2.2: Public key exchange

A device shall validate that any public key received from any BD_ADDR is on the correct curve (P-256).

A valid public key Q = (X_Q, Y_Q) is one where X_Q and Y_Q are both in the range 0 to p - 1 and satisfy the equation $(Y_Q)^2 = (X_Q)^3 + aX_Q + b$ (*mod* p) in the relevant curve's finite field. See [Vol 2] Part H, Section 7.6 for the values of a, b, and p.

A device can validate a public key by directly checking the curve equation, by implementing elliptic curve point addition and doubling using formulas that are valid only on the correct curve, or by other means.

A device that detects an invalid public key from the peer at any point during the LE Secure Connections pairing process shall not use the resulting LTK, if any.

After the public keys have been exchanged, the device can then start computing the Diffie-Hellman Key.

When the Security Manager is placed in a Debug mode it shall use the following Diffie-Hellman private / public key pair:

```
Private key:   3f49f6d4 a3c55f38 74c9b3e3 d2103f50 4aff607b eb40b799 5899b8a6 cd3c1abd
Public key (X): 20b003d2 f297be2c 5e2c83a7 e9f9a5b9 eff49111 acf4fddb cc030148 0e359de6
Public key (Y): dc809c49 652aeb6d 63329abf 5a52155c 766345c2 8fed3024 741c8ed0 1589d28b
```

If a device receives this debug public key and it is in a mode in which it cannot accept the debug key then it may send the Pairing Failed command with the reason set to "Invalid Parameters".

Note: Only one side (initiator or responder) needs to set Secure Connections debug mode in order for debug equipment to be able to determine the LTK and, therefore, be able to monitor the encrypted connection.

2.3.5.6.2 Authentication stage 1 – Just Works or Numeric Comparison

The Numeric Comparison association model will be used during pairing if the MITM bit is set to 1 in the Authentication Requirements in the Pairing Request PDU and/or Pairing Response PDU and both devices have IO capabilities set to either DisplayYesNo or KeyboardDisplay.

The sequence diagram of Authentication stage 1 for the Just Works or Numeric Comparison protocol from the cryptographic point of view is shown in Figure 2.3.

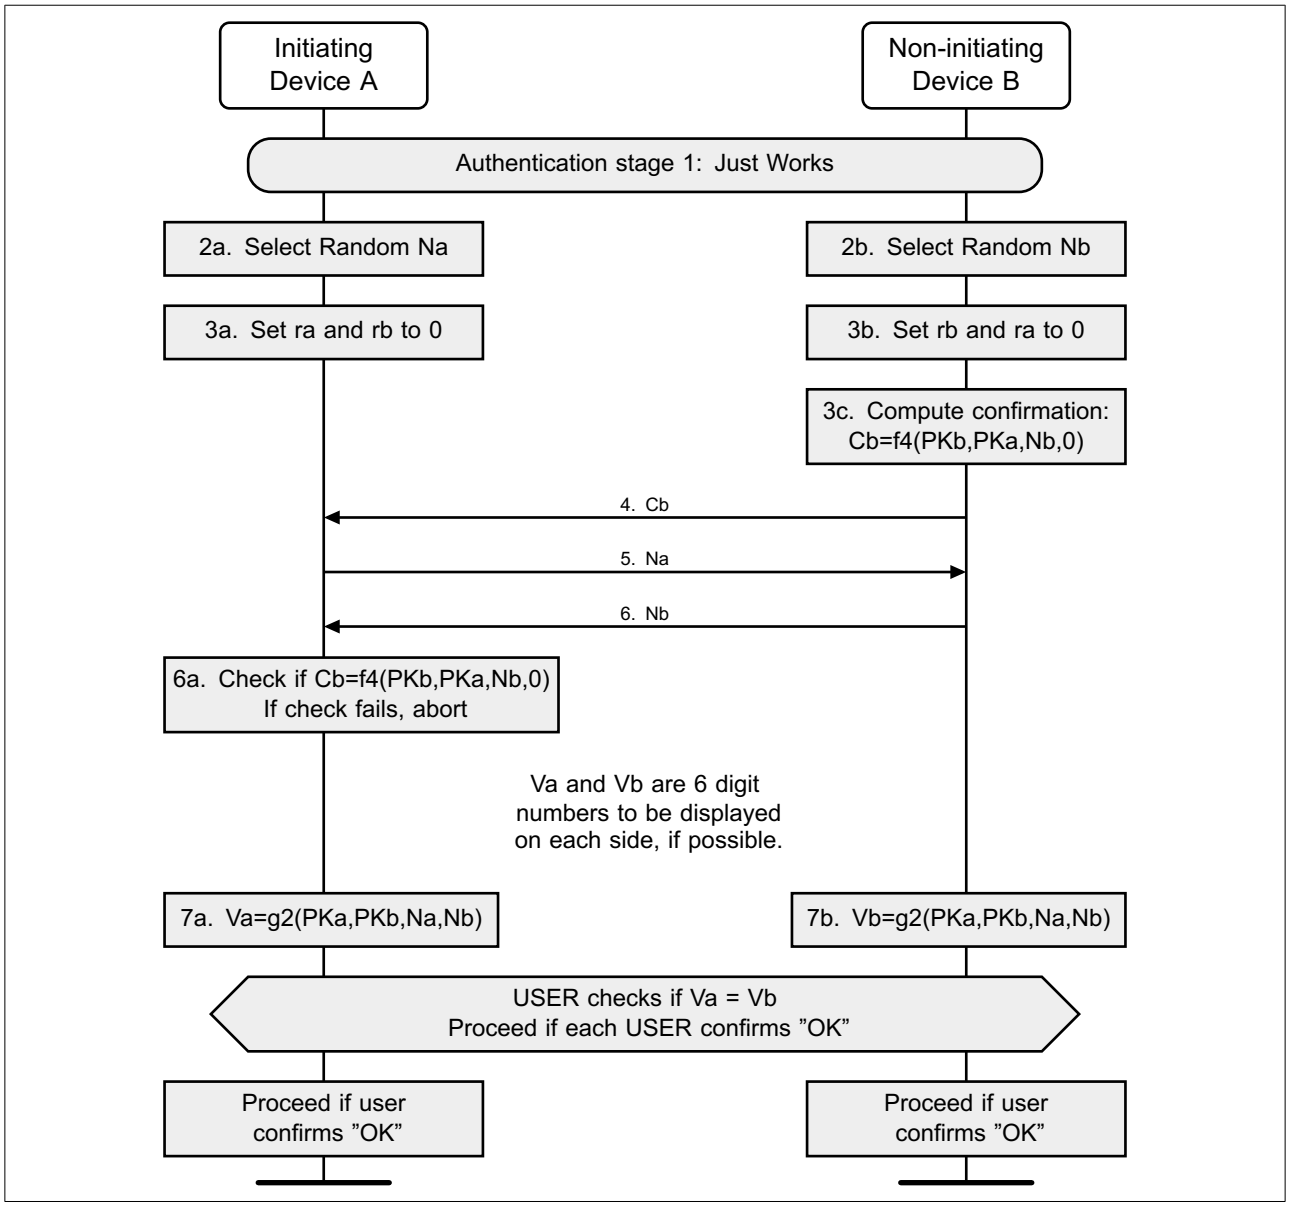

Figure 2.3: "Authentication stage 1: Just Works or Numeric Comparison, LE Secure Connections

After the public keys have been exchanged, each device selects a random 128-bit nonce (step 2). This value is used to mitigate replay attacks and shall be freshly

generated with each instantiation of the pairing protocol. This value shall be generated using a random number generator that meets the requirements of [Vol 2] Part H, Section 2.

Following this the responding device then computes a commitment to the two public keys that have been exchanged and its own nonce value (step 3c). This commitment is computed as a one-way function of these values and is transmitted to the initiating device (step 4). The commitment prevents an attacker from changing these values at a later time.

The initiating and responding devices then exchange their respective nonce values (steps 5 and 6) and the initiating device confirms the commitment (step 6a). A failure at this point indicates the presence of an attacker or other transmission error and causes the protocol to abort. The protocol may be repeated with or without the generation of new public-private key pairs, but new nonces shall be generated if the protocol is repeated.

When Just Works is used, the commitment checks (steps 7a and 7b) are not performed and the user is not shown the 6-digit values.

When Numeric Comparison is used, assuming that the commitment check succeeds, the two devices each compute 6-digit confirmation values that are displayed to the user on their respective devices (steps 7a, 7b, and 8). The user is expected to check that these 6-digit values match and to confirm if there is a match. If there is no match, the protocol aborts and, as before, new nonces shall be generated if the protocol is to be repeated.

An active MITM must inject its own key material into this process to have any effect other than denial-of-service. A simple MITM attack will result in the two 6-digit display values being different with probability 0.999999. A more sophisticated attack may attempt to engineer the display values to match, but this is thwarted by the commitment sequence. If the attacker first exchanges nonces with the responding device, it must commit to the nonce that it will use with the initiating device before it sees the nonce from the initiating device. If the attacker first exchanges nonces with the initiating device, it must send a nonce to the responding device before seeing the nonce from the responding device. In each case, the attacker must commit to at least the second of its nonces before knowing the second nonce from the legitimate devices. It therefore cannot choose its own nonces in such a way as to cause the display values to match.

2.3.5.6.3 Authentication stage 1 – Passkey Entry

The Passkey Entry protocol is used when SMP IO capability exchange sequence indicates that Passkey Entry shall be used.

The sequence diagram for Authentication stage 1 for Passkey Entry from the cryptographic point of view is shown in Figure 2.4.

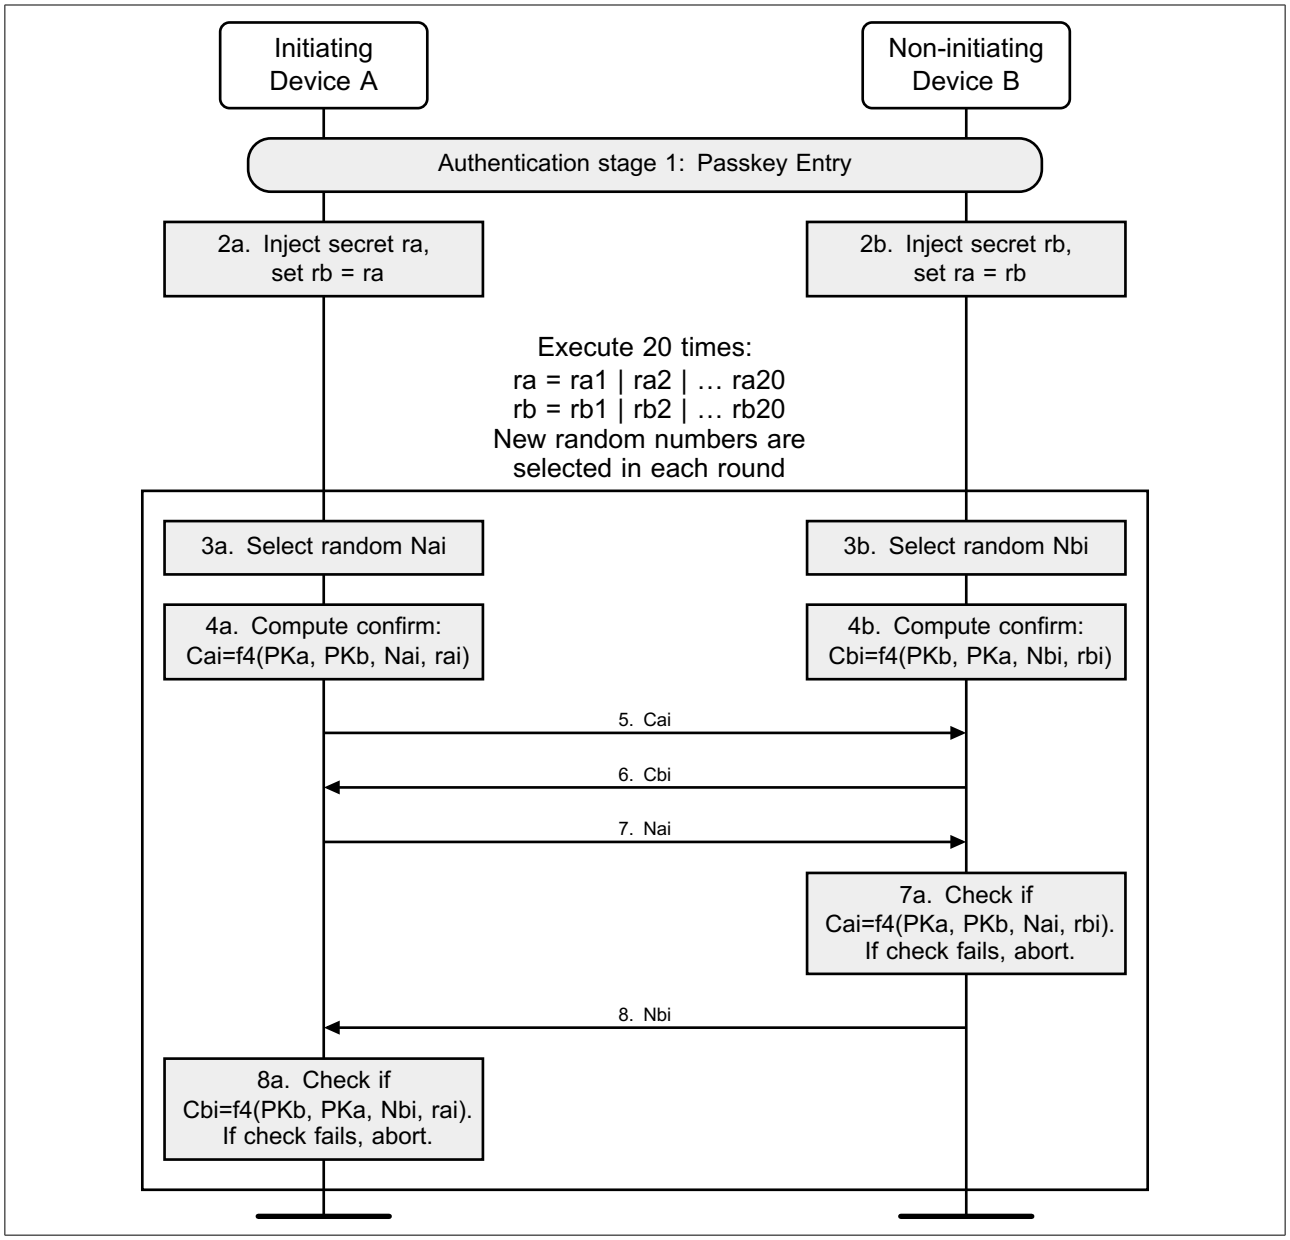

Figure 2.4: Authentication stage 1: Passkey Entry, LE Secure Connections

The user inputs an identical Passkey into both devices. Alternately, the Passkey may be generated and displayed on one device, and the user then inputs it into the other (step 2). This short shared key will be the basis of the mutual authentication of the devices. The Passkey should be generated randomly during each pairing procedure and not be reused from a previous procedure. Static Passkeys should not be used since they can compromise the security of the link.

Steps 3 to 8 are repeated 20 times since a 6-digit Passkey is 20 bits (999999=0xF423F). If the device allows a shorter passkey to be entered, it shall be prefixed with zeros (e.g. “1234” is equivalent to “001234”).

In Steps 3 to 8, each side commits to each bit of the Passkey, using a long nonce (128 bits), and sending the hash of the nonce, the bit of the Passkey, and both public keys to the other party. The parties then take turns revealing their commitments until the entire Passkey has been mutually disclosed. The first party to reveal a commitment for a given bit of the Passkey effectively reveals that bit of the Passkey in the process, but the other party then has to reveal the corresponding commitment to show the same bit value for that bit of the Passkey, or else the first party will then abort the protocol, after which no more bits of the Passkey are revealed.

This "gradual disclosure" prevents leakage of more than 1 bit of un-guessed Passkey information in the case of a MITM attack. A MITM attacker with only partial knowledge of the Passkey will only receive one incorrectly-guessed bit of the Passkey before the protocol fails. Hence, a MITM attacker who engages first one side, then the other will only gain an advantage of at most two bits over a simple brute-force guesser, making the probability of success 0.000004 instead of 0.000001.

The long nonce is included in the commitment hash to make it difficult to brute force even after the protocol has failed. The public Diffie-Hellman values are included to tie the Passkey protocol to the original ECDH key exchange, to prevent a MITM from substituting the attacker's public key on both sides of the ECDH exchange in standard MITM fashion.

At the end of this stage, Na is set to Na20 and Nb is set to Nb20 for use in Authentication stage 2.

2.3.5.6.4 Authentication stage 1 – Out of Band

The Out-of-Band protocol is used when authentication information has been received by at least one of the devices and indicated in the OOB data flag parameter included in the SMP Pairing Request and SMP Pairing Response PDU. The mode in which the discovery of the peer device is first done in-band and then followed by the transmission of authentication parameters through OOB interface is not supported. The sequence diagram for Authentication stage 1 for Out of Band from the cryptographic point of view is shown in Figure 2.5.

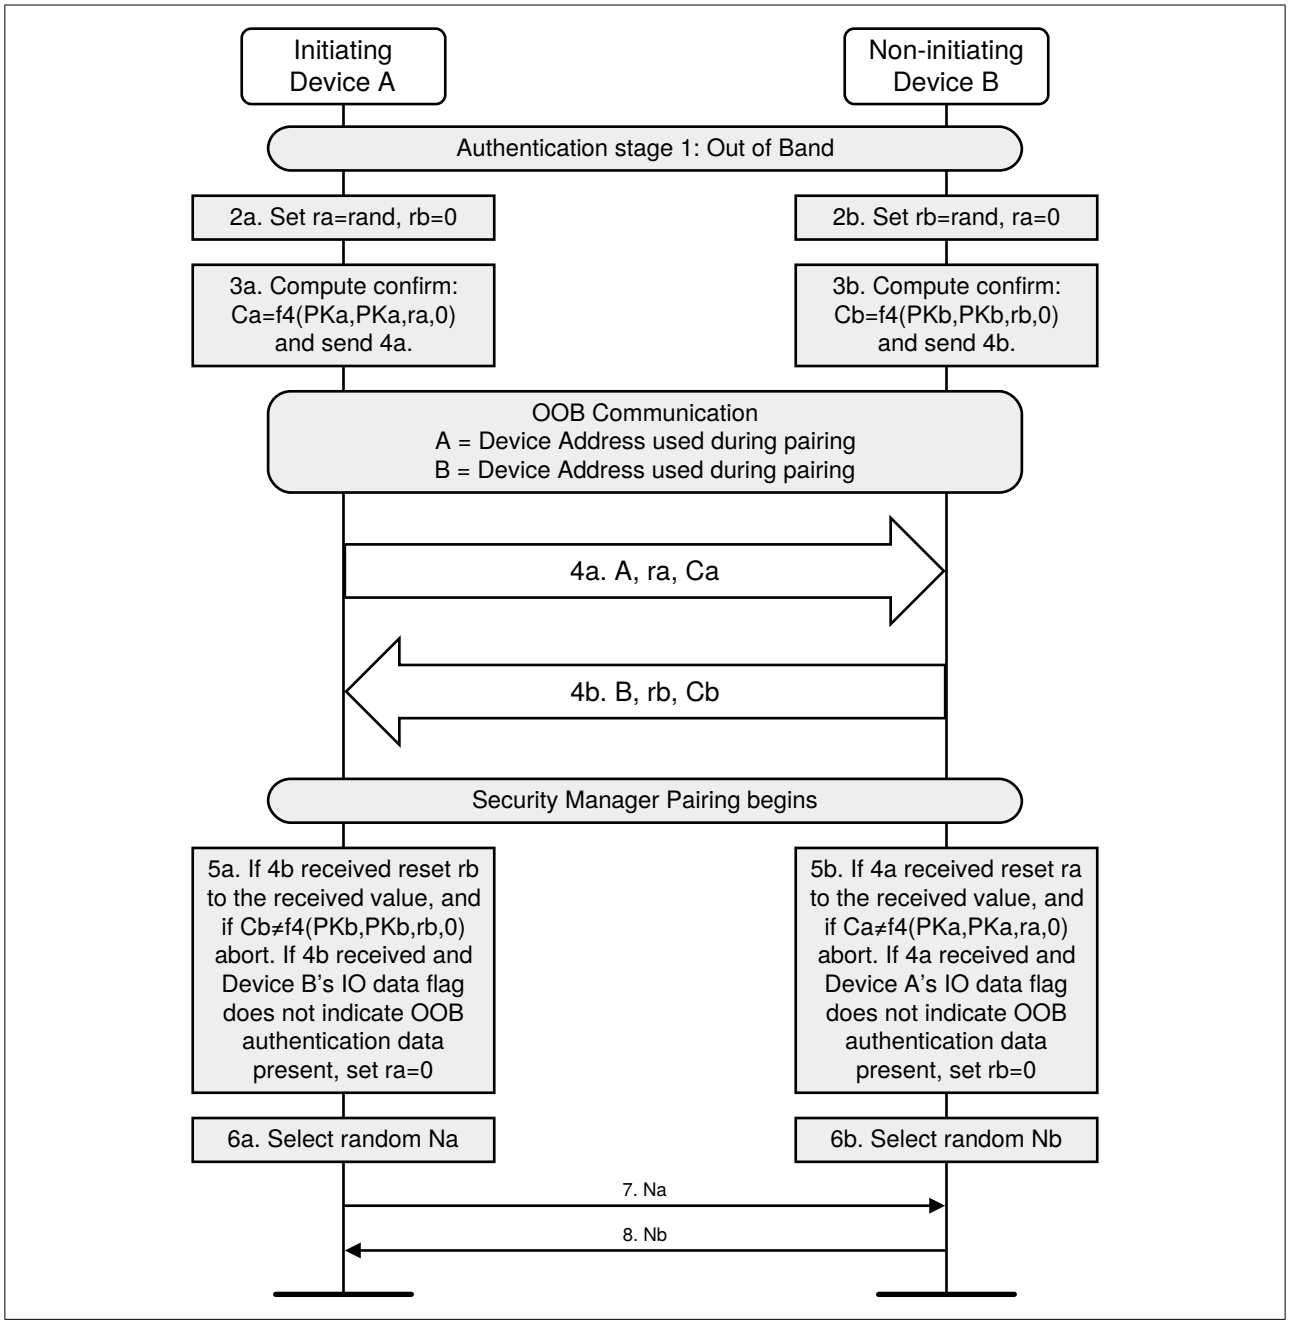

Figure 2.5: Authentication stage 1: Out of Band, LE Secure Connections

Principle of operation. If both devices can transmit and/or receive data over an out-of-band channel, then mutual authentication will be based on the commitments of the public keys (Ca and Cb) exchanged OOB in Authentication stage 1. If OOB communication is possible only in one direction, then authentication of the device receiving the OOB communication will be based on that device knowing a random number r sent via OOB. In this case, r must be secret: r can be created afresh every time, or access to the device sending r must be restricted. If r is not sent by a device, it is assumed to be 0 by the device receiving the OOB information in step 4a or 4b.

Roles of A and B. The OOB Authentication stage 1 protocol is symmetric with respect to the roles of A and B. It does not require that device A always will initiate pairing and it automatically resolves asymmetry in the OOB communication.

Order of steps. The public key exchange must happen before the verification step 5. In the diagram the in-band public key exchange between the devices (step 1) is done before the OOB communication (step 4). But when the pairing is initiated by an OOB interface, public key exchange will happen after the OOB communication (step 1 will be between steps 4 and 5).

Values of ra and rb: Since the direction of the peer's OOB interface cannot be verified before the OOB communication takes place, a device should always generate and if possible transmit through its OOB interface a random number r to the peer. Each device applies the following rules locally to set the values of its own r and the value of the peer's r:

1. Initially, r of the device is set to a random number and r of the peer is set to 0 (step 2).
2. If a device has received OOB, it sets the peer's r value to what was sent by the peer (Step 5).
3. If the remote device's OOB data flag sent in the SMP Pairing Request or SMP Pairing Response is set to “OOB Authentication data not present”, it sets its own r value to 0 (Step 5)

2.3.5.6.5 Authentication stage 2 and long term key calculation

The second stage of authentication then confirms that both devices have successfully completed the exchange. This stage is identical in all three protocols and is shown in Figure 2.6.

Each device computes the MacKey and the LTK using the previously exchanged values and the newly derived shared key (step 9). Each device then computes a new key confirmation value that includes the previously exchanged values and the newly derived MacKey (step 10a and 10b). The initiating device then transmits its key confirmation value, which is checked by the responding device (step 11). If this check fails, it indicates that the initiating device has not confirmed the pairing, and the protocol shall be aborted. The responding device then transmits its key confirmation value, which is checked by the initiating device (step 12). A failure indicates that the responding device has not confirmed the pairing and the protocol shall abort.

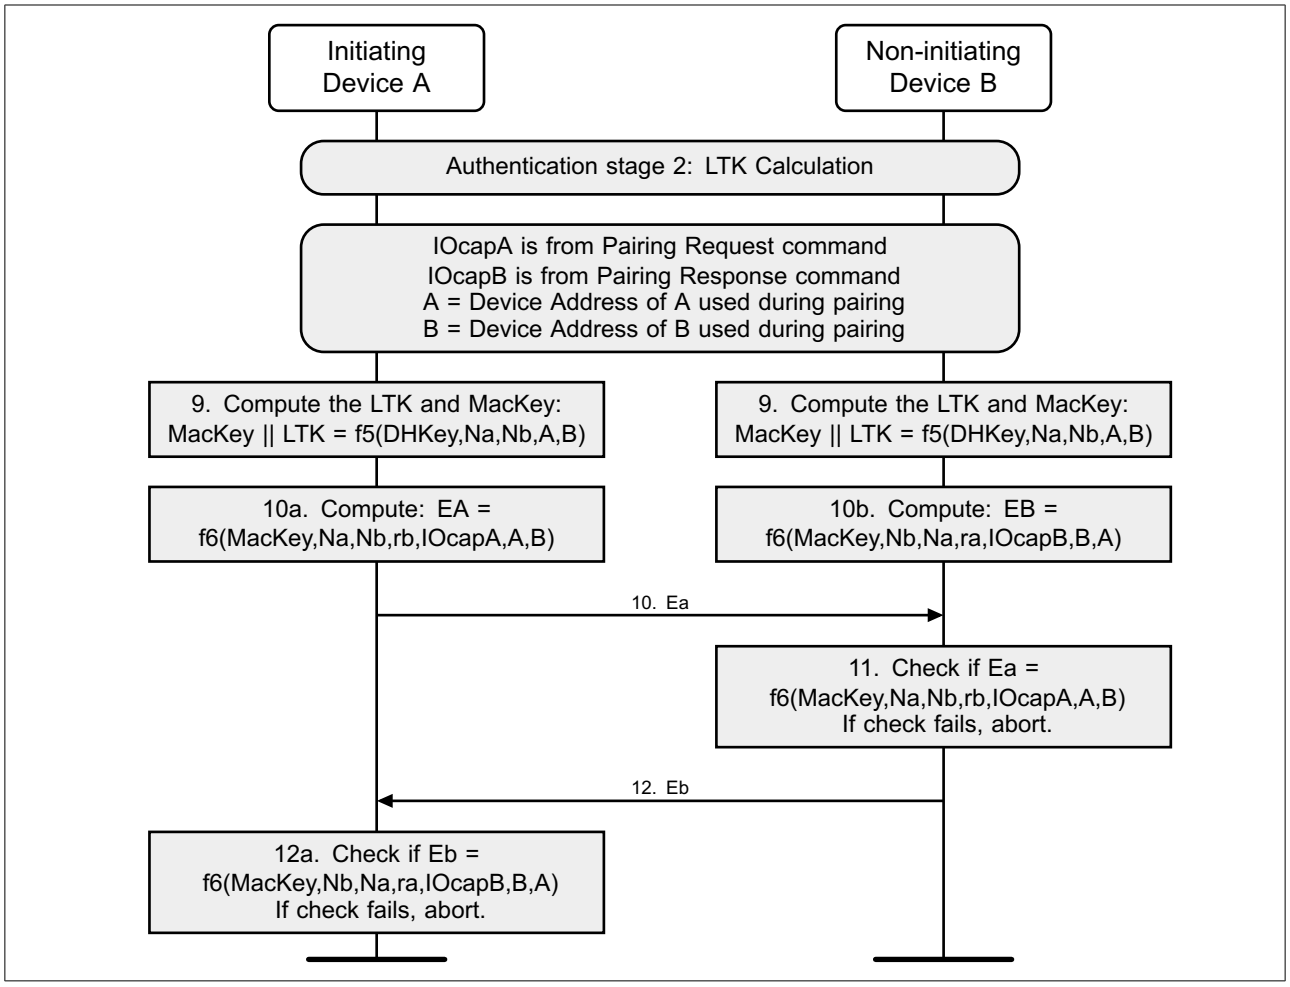

Figure 2.6: Authentication stage 2 and long term key calculation

2.3.5.7 Cross-transport key derivation

When a pair of BR/EDR/LE devices support Secure Connections on a transport, the devices may optionally generate a key of identical strength for the other transport. There are two sequences:

- If Secure Connections pairing occurs on the LE transport, the procedures in Section 2.4.2.4 may be used.
- If Secure Connections pairing occurs on the BR/EDR transport, the procedures in Section 2.4.2.5 may be used.

2.3.6 Repeated attempts

When a pairing procedure fails a waiting interval shall pass before the verifier will initiate a new Pairing Request command or Security Request command to the same claimant, or before it will respond to a Pairing Request command or Security Request command initiated by a device claiming the same identity as the failed device. For

each subsequent failure, the waiting interval shall be increased exponentially. That is, after each failure, the waiting interval before a new attempt can be made, could be for example, twice as long as the waiting interval prior to the previous attempt[1]. The waiting interval should be limited to a maximum.

The maximum waiting interval depends on the implementation. The waiting time shall exponentially decrease to a minimum when no new failed attempts are made during a certain time period. This procedure restricts the rate at which an intruder can repeat the pairing procedure with different keys.

To protect a device's private key, a device should implement a method to prevent an attacker from retrieving useful information about the device's private key. For this purpose, a device should change its private key after every pairing (successful or failed). Otherwise, it should change its private key whenever S + 3F > 8, where S is the number of successful pairings and F the number of failed attempts since the key was last changed.

2.4 Security in Bluetooth Low Energy

Security shall be initiated by the Security Manager in the device in the Central role. The device in the Peripheral role shall be the responding device. The Peripheral may request the Central to initiate pairing or other security procedures, see Section 2.4.6.

The Peripheral in the key distribution phase gives keys to the Central so a reconnection can be encrypted, its random addresses can be resolved, or the Central can verify signed data from the Peripheral.

The Central may also provide keys to the Peripheral so a reconnection can be encrypted if the roles are reversed, the Central’s random addresses can be resolved, or the Peripheral can verify signed data from the Central.

2.4.1 Definition of keys and values

LE security uses the following keys and values for encryption, signing, and random addressing:

1. Identity Resolving Key (IRK) is a 128-bit key used to generate and resolve random addresses.
2. Connection Signature Resolving Key (CSRK) is a 128-bit key used to sign data and verify signatures on the receiving device.
3. Long Term Key (LTK) is a 128-bit key used to generate the contributory session key for an encrypted connection. Link Layer encryption is described in [Vol 6] Part B, Section 5.1.3.

[1]Another appropriate integer value larger than 1 may be used.

4. Encrypted Diversifier (EDIV) is a 16-bit stored value used to identify the LTK distributed during LE legacy pairing. A new EDIV is generated each time a unique LTK is distributed.
5. Random Number (Rand) is a 64-bit stored valued used to identify the LTK distributed during LE legacy pairing. A new Rand is generated each time a unique LTK is distributed.

2.4.2 Generation of distributed keys

Any method of generation of keys that are being distributed that results in the keys having 128 bits of entropy can be used, as the generation method is not visible outside the Peripheral (see Appendix B). The keys shall not be generated only from information that is distributed to the Central or only from information that is visible outside of the Peripheral.

2.4.2.1 Generation of IRK

The Identity Resolving Key (IRK) is used for resolvable private address construction (see [Vol 3] Part C, Section 10.8.2). A Central that has received IRK from a Peripheral can resolve that Peripheral's random device addresses. A Peripheral that has received IRK from a Central can resolve that Central's random device addresses. The privacy concept only protects against devices that are not part of the set to which the IRK has been given.

IRK can be assigned, or randomly generated by the device during manufacturing, or some other method could be used. If IRK is randomly generated then the requirements for random generation defined in [Vol 2] Part H, Section 2 shall be used.

The encryption key size does not apply to IRK; therefore, its size does not need to be shortened before distribution.

2.4.2.2 Generation of CSRK

The Connection Signature Resolving Key (CSRK) is used to sign data in a connection. A device that has received CSRK can verify signatures generated by the distributing device. The signature only protects against devices that are not part of the set to which CSRK has been given.

CSRK can be assigned or randomly generated by the device during manufacturing, or some other method could be used. If CSRK is randomly generated then the requirements for random generation defined in [Vol 2] Part H, Section 2 shall be used.

The encryption key size does not apply to CSRK, therefore its size does not need to be shortened before distribution.

2.4.2.3 LE legacy pairing - generation of LTK, EDIV and Rand

Devices which support encryption in the Link Layer Connection state in the Peripheral Role shall be capable of generating LTK, EDIV, and Rand.

The EDIV and Rand are used by the Peripheral to establish a previously shared LTK in order to start an encrypted connection with a previously paired Central.

The generated LTK size shall not be longer than the negotiated encryption key size, so its size may need to be shortened (see Section 2.3.4).

New values of LTK, EDIV, and Rand shall be generated each time they are distributed.

The Peripheral may store the mapping between EDIV, Rand and LTK in a security database so the correct LTK value is used when the Central requests encryption. Depending upon the LTK generation method additional information may be stored, for example the size of the distributed LTK.

The Central may also distribute EDIV, Rand, and LTK to the Peripheral which can be used to encrypt a reconnection if the device roles are reversed in a future connection.

2.4.2.4 Derivation of BR/EDR link key from LE LTK

The LTK from the LE physical transport can be converted to the BR/EDR link key for the BR/EDR transport as follows, using intermediate link key (ILK) as an intermediate value:

If at least one device sets CT2 = 0 then

1. ILK = *h6*(LTK, “tmp1”)
2. BR/EDR link key = *h6*(ILK, “lebr”)

If both devices set CT2 = 1 then

1. ILK = *h7*(SALT, LTK)
2. BR/EDR link key = *h6*(ILK, “lebr”)

The string “lebr” is mapped into a keyID using ASCII as 0x6C656272.

The string “tmp1” is mapped into a keyID using ASCII as 0x746D7031 and into a SALT as 0x00000000_00000000_00000000_746D7031.

Note: If the LTK has an encryption key size that is shorter than 16 octets (128 bits), then the BR/EDR link key is derived before the LTK gets masked.

2.4.2.5 Derivation of LE LTK from BR/EDR link key

The BR/EDR Link Key from the BR/EDR physical transport can be converted to the LTK for the LE transport as follows, using intermediate long term key (ILTK) as an intermediate value:

If at least one device sets CT2 = 0 then

1. ILTK = *h6*(Link Key, “tmp2”)
2. LTK = *h6*(ILTK, “brle”)

If both devices set CT2 = 1 then

1. ILTK = *h7*(SALT, Link Key)
2. LTK = *h6*(ILTK, “brle”)

The string “brle” is mapped into a keyID using ASCII as 0x62726C65.

The string “tmp2” is mapped into a keyID using ASCII as 0x746D7032 and into a SALT as 0x00000000_00000000_00000000_746D7032.

2.4.3 Distribution of keys

Key distribution for LE Legacy Pairing and LE Secure Connections is described in the following sections.

2.4.3.1 LE legacy pairing key distribution

The Peripheral may distribute to the Central the following keys:

- LTK, EDIV, and Rand
- IRK
- CSRK

The Central may distribute to the Peripheral the following keys:

- LTK, EDIV, and Rand
- IRK
- CSRK

The security properties of the distributed keys shall be set to the security properties of the STK that was used to distribute them. For example if STK has Unauthenticated no MITM Protection security properties then the distributed keys shall have Unauthenticated no MITM Protection security properties.

The link shall be encrypted or re-encrypted using STK generated in Phase 2 (see Section 2.4.4.1) before any keys are distributed.

Note: The distributed EDIV and Rand values are transmitted in clear text by the Central to the Peripheral during encrypted session setup.

The BD_ADDR that is received in the Identity Address Information command shall only be considered valid once a reconnection has occurred using the BD_ADDR and LTK distributed during that pairing. Once this is successful the BD_ADDR and the distributed keys shall be associated with that device in the security database.

A device may request encrypted session setup to use the LTK, EDIV, and Rand values distributed by the Peripheral when the key distribution phase has completed; however, this does not provide any additional security benefit. If an attacker has established the distributed LTK value then performing encrypted session setup to use the distributed values does not provide any protection against that attacker.

2.4.3.2 LE Secure Connections key distribution

The Central and Peripheral may distribute the following keys:

- IRK
- CSRK

The security properties of the distributed keys shall be set to the security properties of the LTK that was used to distribute them. For example if LTK has Unauthenticated no MITM Protection security properties then the distributed keys shall have Unauthenticated no MITM Protection security properties.

The link shall be encrypted or re-encrypted using LTK generated in Phase 2 (see Section 2.4.4.1) before any keys are distributed.

The BD_ADDR that is received in the Identity Address Information command shall only be considered valid once a reconnection has occurred using the BD_ADDR and LTK generated during that pairing. Once this is successful the BD_ADDR and the distributed keys shall be associated with that device in the security database.

2.4.4 Encrypted session setup

During the encrypted session setup the Central sends a 16-bit Encrypted Diversifier value, *EDIV,* and a 64-bit Random Number, *Rand*, distributed by the Peripheral during pairing, to the Peripheral. The Central's Host provides the Link Layer with the Long Term Key to use when setting up the encrypted session. The Peripheral's Host receives the *EDIV* and *Rand* values and provides a Long Term Key to the Peripheral's Link Layer to use when setting up the encrypted link.

When both devices support LE Secure Connections, the *EDIV* and *Rand* are set to zero.

2.4.4.1 Encryption setup using STK

To distribute LTK and other keys in pairing Phase 3 an encrypted session needs to be established (see Section 2.3.5.5).

The encrypted session is setup using STK generated in Phase 2 (see Section 2.3.5.5) as the Long Term Key provided to the Link Layer, (see [Vol 6] Part B, Section 5.1.3.1) *EDIV*, and *Rand* values shall be set to zero.

If the link is already encrypted then the encryption pause procedure is performed using STK generated in Phase 2 as the Long Term Key provided to the Link Layer (see [Vol 6] Part B, Section 5.1.3.2). *EDIV* and *Rand* values shall be set to zero.

2.4.4.2 Encryption setup using LTK

The Central must have the security information (*LTK*, *EDIV*, and *Rand*) distributed by the Peripheral in LE legacy pairing or the LTK generated in LE Secure Connections to setup an encrypted session.

The Central initiates the encrypted session using the security information; see [Vol 6] Part B, Section 5.1.3.1. If the link is already encrypted the encryption pause procedure is performed using the security information; see [Vol 6] Part B, Section 5.1.3.2.

In LE legacy pairing, the *EDIV* and *Rand* values are used to establish *LTK* which is used as the Long Term Key on the Peripheral. If LTK cannot be established from EDIV and Rand values then the Peripheral shall reject the request to encrypt the link and may optionally disconnect the link.

The LTK size shall not be longer than the negotiated encryption key size, so its size may need to be shortened (see Section 2.3.4).

When the security information is stored, subsequent encryption setups may fail if the remote device has deleted the security information. Table 2.9 defines what shall be done depending on the type of the security properties and whether or not bonding was performed when subsequent encryption setup fails.

Security Properties	Devices Bonded	Action to take when enabling encryption fails
Unauthenticated, no MITM protection	No	Depends on security policy of the device: • Option 1: Automatically initiate pairing. • Option 2: Notify user and ask if pairing is ok. Option 1 is recommended.
Unauthenticated, no MITM protection	Yes	Notify user of security failure.
Authenticated MITM protection	No	Depends on security policy of the device: • Option 1: Automatically initiate pairing. • Option 2: Notify user and ask if pairing is ok. Option 2 is recommended.
Authenticated MITM protection	Yes	Notify user of security failure.

Table 2.9: Action after encryption setup failure

2.4.5 Signing algorithm

An LE device can send signed data without having to establish an encrypted session with a peer device. Data shall be signed using CSRK. A device performing signature verification must have received CSRK from the signing device. The sending device will use its CSRK to sign the transmitted data.

The following are inputs to the signing algorithm:

m is variable length
k is 128 bits
SignCounter is 32 bits

Signing shall be performed using the algorithm defined in the NIST Special Publication 800-38B [1] using AES-128 as the block cipher. NIST SP 800-38B defines the message authentication code (MAC) generation function:

$MAC = CMAC(K, M, Tlen)$

The bit length of the MAC (*Tlen*) shall be 64 bits. The key used for signature generation (*k*) shall be set to CSRK.

The message to be signed (*M*) by the CMAC function is the concatenation of the variable length message to be signed (*m*) and 4 octet string representing the 32-bit counter value (*SignCounter*) least significant octet first.

$$M = m \,||\, SignCounter$$

For example, if data to be signed is the 7 octet sequence '3456789ABCDEF1' and *SignCounter* is set to 67653874 (0x040850F2) then *M* is the octet sequence '3456789ABCDEF1F2500804'. Examples of CMAC generation using AES-128 as the block cipher are included in NIST Special Publication 800-38B Appendix D.

The *SignCounter* shall be initialized to zero when CSRK is generated and incremented for every message that is signed with a given CSRK.

Note: If a device generates 100,000 signed events a day, a 32-bit counter will wrap after approximately 117 years.

The 64-bit result of the CMAC function is used as the result of the signing algorithm.

To verify a signature a device computes the MAC of a received message and *SignCounter* and compares it with the received MAC. If the MAC does not match then the signature verification has failed. If the MACs match then the signature verification has succeeded.

The device performing verification should store the last verified *SignCounter* in the security database and compare it with a received *SignCounter* to prevent replay attacks. If the received *SignCounter* is greater than the stored value then the message has not been seen by the local device before and the security database can be updated.

2.4.6 Peripheral Security Request

The Peripheral may request security by transmitting a Security Request command to the Central. When a Central receives a Security Request command it may encrypt the link, initiate the pairing procedure, or reject the request.

The Peripheral shall not send the Security Request command if the pairing procedure is in progress, or if the encryption procedure is in progress.

The Security Request command includes the required security properties. A security property of MITM protection required shall only be set if the Peripheral's IO capabilities would allow the Passkey Entry association model to be used or out of band authentication data is available.

The Central shall ignore the Peripheral's Security Request if the Central has sent a Pairing Request without receiving a Pairing Response from the Peripheral or if the Central has initiated encryption mode setup.

If pairing or encryption mode is not supported or cannot be initiated at the time when the Peripheral's Security Request command is received, then the Central shall respond with a Pairing Failed command with the reason set to "Pairing Not Supported."

After receiving a Security Request, the Central shall first check whether it has the required security information to enable encryption; see Section 2.4.4.2. If this information is missing or does not meet the security properties requested by the Peripheral, then the Central shall initiate the pairing procedure. If the pairing procedure is successful, the Central's security database is updated with the keys and security properties are distributed during the pairing procedure.

If the Central has the required security information to enable encryption and it meets the security properties request by the Peripheral, it shall perform encryption setup using LTK, see Section 2.4.4.2.

Figure 2.7 shows a summary of the actions and decisions that a Central shall take when receiving a Security Request.

The Peripheral shall check that any Pairing Request command received from the Central after sending a Security Request command contains Authentication Requirements that meet the requested security properties.

If the Peripheral requests a security property that is not Just Works and receives an encryption procedure request after sending a Security Request command then it shall check that any existing Security Information is of sufficient security properties.

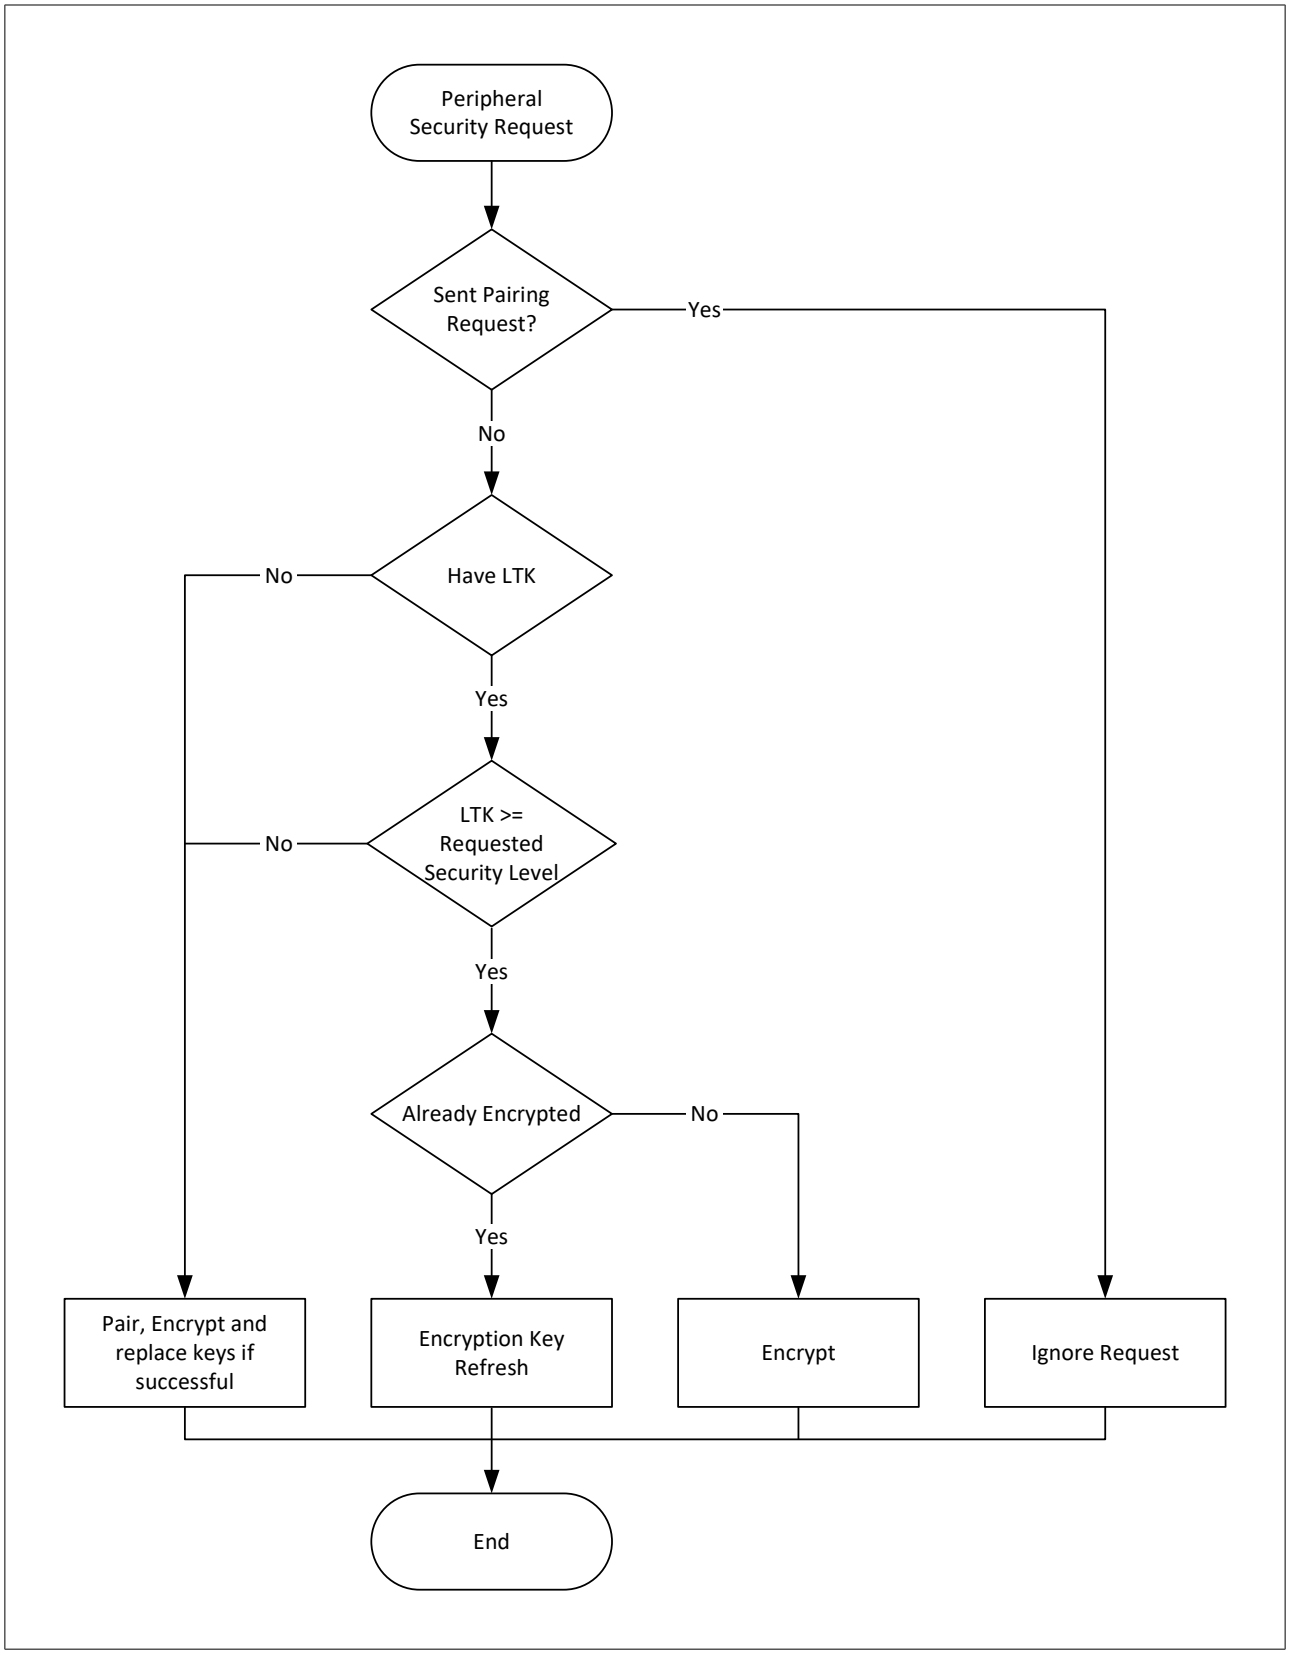

Figure 2.7: Central actions after receiving Security Request command

3 SECURITY MANAGER PROTOCOL

3.1 Introduction

The Security Manager Protocol (SMP) is used for pairing and transport specific key distribution.

3.2 Security Manager Channel over L2CAP

All SMP commands are sent over the Security Manager Channel which is an L2CAP fixed channel (see [Vol 3] Part A, Section 2.1). The configuration parameters for the Security Manager Channel when LE Secure Connections is not supported shall be as shown below in Table 3.1.

Parameter	Value
MTU	23
Flush Timeout	0xFFFF (Infinite)
QoS	Best Effort
Mode	Basic Mode

Table 3.1: Security Manager Channel configuration parameters without LE Secure Connections

The configuration parameters for the Security Manager Channel when LE Secure Connections is supported shall be as shown below in Table 3.2.

Parameter	Value
MTU	65
Flush Timeout	0xFFFF (Infinite)
QoS	Best Effort
Mode	Basic Mode

Table 3.2: Security Manager Channel configuration parameters with LE Secure Connections

3.3 Command format

The general format for all SMP commands is shown in Figure 3.1.

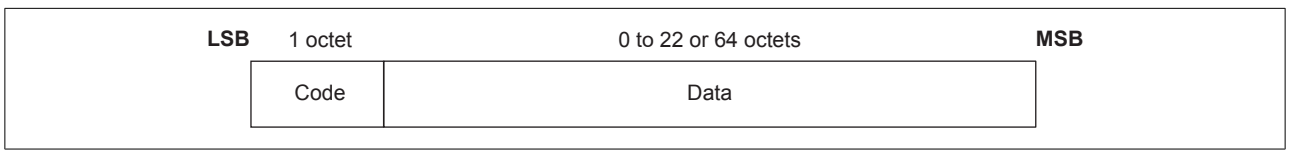

Figure 3.1: SMP command format

The following are the fields shown:

- *Code (1 octet)*

  The Code field is one octet long and identifies the type of command. Table 3.3 lists the codes defined by this document. If a packet is received with a Code that is reserved for future use it shall be ignored.

Code	Description	Logical Link Supported
0x01	Pairing Request	LE-U, ACL-U
0x02	Pairing Response	LE-U, ACL-U
0x03	Pairing Confirm	LE-U
0x04	Pairing Random	LE-U
0x05	Pairing Failed	LE-U, ACL-U
0x06	Encryption Information	LE-U
0x07	Central Identification	LE-U
0x08	Identity Information	LE-U, ACL-U
0x09	Identity Address Information	LE-U, ACL-U
0x0A	Signing Information	LE-U, ACL-U
0x0B	Security Request	LE-U
0x0C	Pairing Public Key	LE-U
0x0D	Pairing DHKey Check	LE-U
0x0E	Pairing Keypress Notification	LE-U
All other values	Reserved for future use	

Table 3.3: SMP command codes

- *Data (0 or more octets)*

  The Data field is variable in length. The Code field determines the format of the Data field.

If a device does not support pairing then it shall respond with a Pairing Failed command with the reason set to “Pairing Not Supported” (see Section 3.5.5) when any command is received. If pairing is supported then all commands shall be supported.

3.4 SMP timeout

To protect the Security Manager protocol from stalling, a Security Manager Timer is used. Upon transmission of the Security Request command or reception of the Security Request command, the Security Manager Timer shall be reset and restarted. Upon transmission of the Pairing Request command or reception of the Pairing Request command, the Security Manager Timer shall be reset and started.

The Security Manager Timer shall be reset when an L2CAP SMP command is queued for transmission. The Security Manager Timer should be reset upon reception of a Keypress Notification (if the timer is not reset on receipt of a Keypress Notification, the Security Manager can time out before the peer's Security Manager because there is no response to a Keypress Notification).

When a Pairing process completes (whether successfully or not), the Security Manager Timer shall be stopped.

If the Security Manager Timer reaches 30 seconds, the procedure shall be considered to have failed, and the local higher layer shall be notified. No further SMP commands shall be sent over the L2CAP Security Manager Channel. A new Pairing process shall only be performed when a new physical link has been established.

3.5 Pairing methods

The SMP commands defined in this section are used to perform Pairing Feature Exchange and key generation (see Section 2.1).

3.5.1 Pairing Request

The initiator starts the Pairing Feature Exchange by sending a Pairing Request command to the responding device. The Pairing Request command is defined in Figure 3.2.

The rules for handing a collision between a pairing procedure on the LE transport and a pairing procedure on the BR/EDR transport are defined in [Vol 3] Part C, Section 14.2.

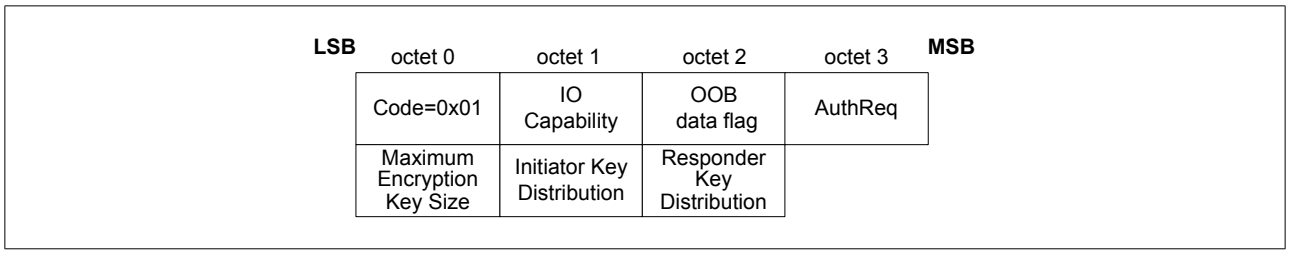

Figure 3.2: Pairing Request packet

The following data fields are used:

- *IO Capability (1 octet)*

  Table 3.4 defines the values which are used when exchanging IO capabilities (see Section 2.3.2).

Value	Description
0x00	DisplayOnly
0x01	DisplayYesNo
0x02	KeyboardOnly
0x03	NoInputNoOutput
0x04	KeyboardDisplay
0x05 to 0xFF	Reserved for future use

Table 3.4: IO capability values

- *OOB data flag (1 octet)*

  Table 3.5 defines the values which are used when indicating whether OOB authentication data is available (see Section 2.3.3).

Value	Description
0x00	OOB Authentication data not present
0x01	OOB Authentication data from remote device present
0x02 to 0xFF	Reserved for future use

Table 3.5: OOB data present values

- *AuthReq (1 octet)*

  The AuthReq field is a bit field that indicates the requested security properties (see Section 2.3.1) for the STK and LTK and GAP bonding information (see [Vol 3] Part C, Section 9.4).

  Figure 3.3 defines the authentication requirements bit field.

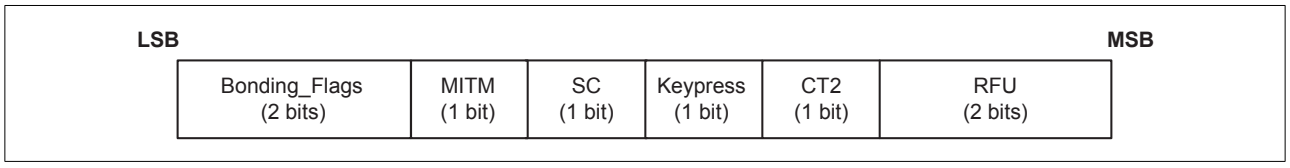

Figure 3.3: Authentication requirements flags

The Bonding_Flags field is a 2-bit field that indicates the type of bonding being requested by the initiating device as defined in Table 3.6.

Bonding_Flags b_1b_0	Bonding Type
00	No Bonding
01	Bonding

Bonding_Flags b_1b_0	Bonding Type
10	Reserved for future use
11	Reserved for future use

Table 3.6: Bonding flags

The MITM field is a 1-bit flag that is set to one if the device is requesting MITM protection, otherwise it shall be set to 0. A device sets the MITM flag to one to request an Authenticated security property for the STK when using LE legacy pairing and the LTK when using LE Secure Connections.

The SC field is a 1 bit flag. If LE Secure Connections pairing is supported by the device, then the SC field shall be set to 1, otherwise it shall be set to 0. If both devices support LE Secure Connections pairing, then LE Secure Connections pairing shall be used, otherwise LE Legacy pairing shall be used.

The keypress field is a 1-bit flag that is used only in the Passkey Entry protocol and shall be ignored in other protocols. When both sides set that field to one, Keypress notifications shall be generated and sent using SMP Pairing Keypress Notification PDUs.

The CT2 field is a 1-bit flag that shall be set to 1 upon transmission to indicate support for the *h7* function. See Section 2.4.2.4 and Section 2.4.2.5.

- *Maximum Encryption Key Size (1 octet)*

  This value defines the maximum encryption key size in octets that the device can support. The maximum key size shall be in the range 7 to 16 octets.

- *Initiator Key Distribution / Generation (1 octet)*

  The Initiator Key Distribution / Generation field indicates which keys the initiator is requesting to distribute / generate or use during the Transport Specific Key Distribution phase (see Section 2.4.3). The Initiator Key Distribution / Generation field format and usage is defined in Section 3.6.1.

- *Responder Key Distribution / Generation (1 octet)*

  The Responder Key Distribution / Generation field indicates which keys the initiator is requesting the responder to distribute / generate or use during the Transport Specific Key Distribution phase (see Section 2.4.3). The Responder Key Distribution / Generation field format and usage is defined in Section 3.6.1.

If Secure Connections pairing has been initiated over BR/EDR, the following fields of the SM Pairing Request PDU are reserved for future use:

- the IO Capability field,
- the OOB data flag field, and
- all bits in the Auth Req field except the CT2 bit.

3.5.2 Pairing Response

This command is used by the responding device to complete the Pairing Feature Exchange after it has received a Pairing Request command from the initiating device, if the responding device allows pairing. The Pairing Response command is defined in Figure 3.4.

The rules for handing a collision between a pairing procedure on the LE transport and a pairing procedure on the BR/EDR transport are defined in [Vol 3] Part C, Section 14.2.

If a Pairing Request is received over the BR/EDR transport when either cross-transport key derivation/generation is not supported or the BR/EDR transport is not encrypted using a Link Key generated using P256, a Pairing Failed shall be sent with the error code *Cross-Transport Key Derivation/Generation Not Allowed* (0x0E).

If a Pairing Request is received and the device is not ready to perform the pairing procedure, a Pairing Failed may be sent with the error code *Busy* (0x10).

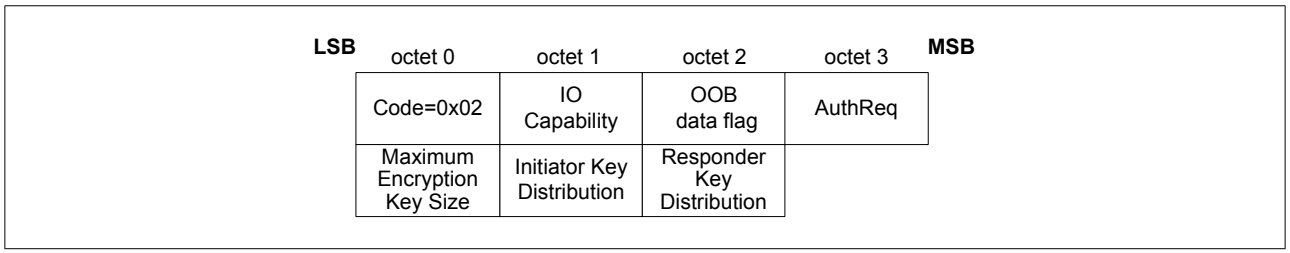

Figure 3.4: Pairing Response packet

The following data fields are used:

- *IO Capability (1 octet)*

  Table 3.4 defines the values which are used when exchanging IO capabilities (see Section 2.3.2).

- *OOB data flag (1 octet)*

  Table 3.5 defines the values which are used when indicating whether OOB authentication data is available (see Section 2.3.3).

- *AuthReq (1 octet)*

  The AuthReq field is a bit field that indicates the requested security properties (see Section 2.3.1) for the STK or LTK and GAP bonding information (see [Vol 3] Part C, Section 9.4).

  Figure 3.3 defines the authentication requirements bit field.

  The Bonding_Flags field is a 2-bit field that indicates the type of bonding being requested by the responding device as defined in Table 3.6.

  The MITM field is a 1-bit flag that is set to one if the device is requesting MITM protection, otherwise it shall be set to 0. A device sets the MITM flag to one to request an Authenticated security property for the STK when using LE legacy pairing and the LTK when using LE Secure Connections.

  The SC field is a 1 bit flag. If LE Secure Connections pairing is supported by the device, then the SC field shall be set to 1, otherwise it shall be set to 0. If both devices support LE Secure Connections pairing, then LE Secure Connections pairing shall be used, otherwise LE Legacy pairing shall be used.

  The keypress field is a 1-bit flag that is used only in the Passkey Entry protocol and shall be ignored in other protocols. When both sides set that field to one, Keypress notifications shall be generated and sent using SMP Pairing Keypress Notification PDUs.

  The CT2 field is a 1-bit flag that shall be set to 1 upon transmission to indicate support for the *h7* function. See Section 2.4.2.4 and Section 2.4.2.5.

- *Maximum Encryption Key Size (1 octet)*

  This value defines the maximum encryption key size in octets that the device can support. The maximum key size shall be in the range 7 to 16 octets.

- *Initiator Key Distribution (1 octet)*

  The Initiator Key Distribution field defines which keys the initiator shall distribute and use during the Transport Specific Key Distribution phase (see Section 2.4.3). The Initiator Key Distribution field format and usage are defined in Section 3.6.1.

- *Responder Key Distribution (1 octet)*

  The Responder Key Distribution field defines which keys the responder shall distribute and use during the Transport Specific Key Distribution phase (see Section 2.4.3). The Responder Key Distribution field format and usage are defined in Section 3.6.1.

If Secure Connections pairing has been initiated over BR/EDR, the following fields of the SM Pairing Response PDU are reserved for future use:

- the IO Capability field,
- the OOB data flag field, and
- all bits in the Auth Req field except the CT2 bit.

3.5.3 Pairing Confirm

This is used following a successful Pairing Feature Exchange to start STK Generation for LE legacy pairing and LTK Generation for LE Secure Connections pairing. The Pairing Confirm command is defined in Figure 3.5.

This command is used by both devices to send the confirm value to the peer device, see Section 2.3.5.5 for LE legacy pairing and Section 2.3.5.6 for LE Secure Connections pairing.

The initiating device starts key generation by sending the Pairing Confirm command to the responding device. If the initiating device wants to abort pairing it can transmit a Pairing Failed command instead.

The responding device sends the Pairing Confirm command after it has received a Pairing Confirm command from the initiating device.

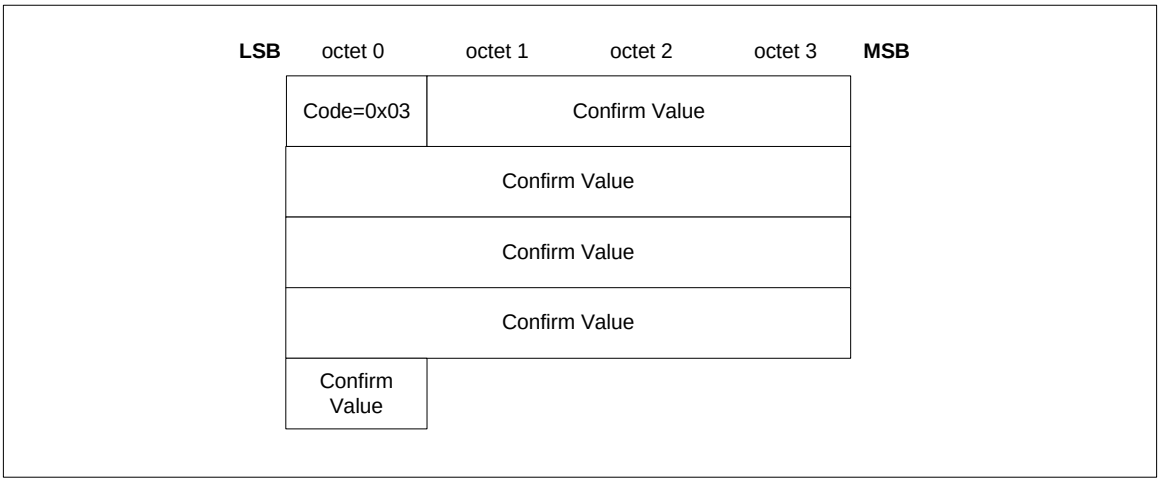

Figure 3.5: Pairing Confirm packet

The following data field is used:

- *Confirm value (16 octets)*

  In LE legacy pairing, the initiating device sends LP_CONFIRM_I and the responding device sends LP_CONFIRM_R as defined in Section 2.3.5.5. In LE Secure Connections, Ca and Cb are defined in Section 2.2.6.

3.5.4 Pairing Random

This command is used by the initiating and responding device to send the random number used to calculate the Confirm value sent in the Pairing Confirm command. The Pairing Random command is defined in Figure 3.6.

The initiating device sends a Pairing Random command after it has received a Pairing Confirm command from the responding device.

In LE legacy pairing, the responding device shall send a Pairing Random command after it has received a Pairing Random command from the initiating device if the Confirm value calculated on the responding device matches the Confirm value received from the initiating device. If the calculated Confirm value does not match then the responding device shall respond with the Pairing Failed command.

In LE Secure Connections, the responding device shall send a Pairing Random command after it has received a Pairing Random command from the initiating device. If the calculated Confirm value does not match then the responding device shall respond with the Pairing Failed command.

The initiating device shall encrypt the link using the generated key (STK in LE legacy pairing or LTK in LE Secure Connections) if the Confirm value calculated on the initiating device matches the Confirm value received from the responding device. The successful encryption or re-encryption of the link is the signal to the responding device that key generation has completed successfully. If the calculated Confirm value does not match then the initiating device shall respond with the Pairing Failed command.

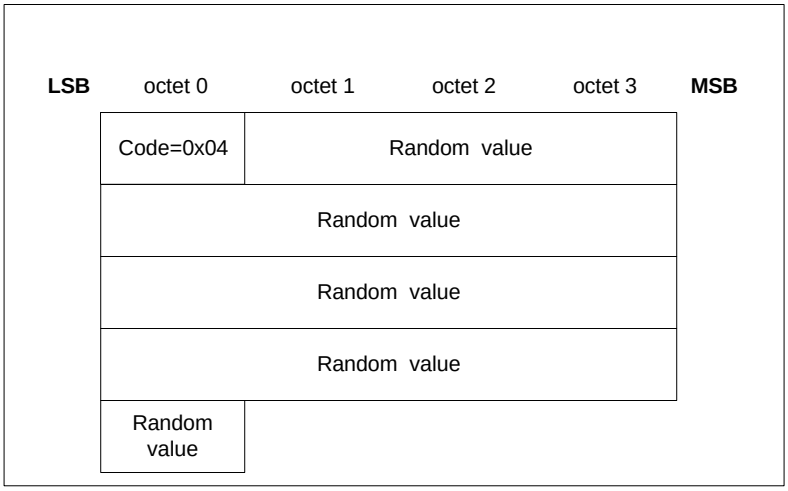

Figure 3.6: Pairing Random packet

The following are the data fields:

- *Random value (16 octets)*

  In LE legacy pairing, the initiating device sends LP_RAND_I and the responding device sends LP_RAND_R as defined in Section 2.3.5.5. In LE Secure Connections, the initiating device sends Na and the responding device sends Nb.

3.5.5 Pairing Failed

This is used when there has been a failure during pairing and reports that the pairing procedure has been stopped and no further communication for the current pairing procedure is to occur. The Pairing Failed command is defined in Figure 3.7.

Any subsequent pairing procedure shall restart from the Pairing Feature Exchange phase.

This command may be sent at any time during the pairing process by either device in response to a message from the remote device.

During LE Secure Connections pairing, this command shall be sent if the remote device's public key is invalid (see Section 2.3.5.6.1). The Reason field shall be set to "DHKey Check Failed".

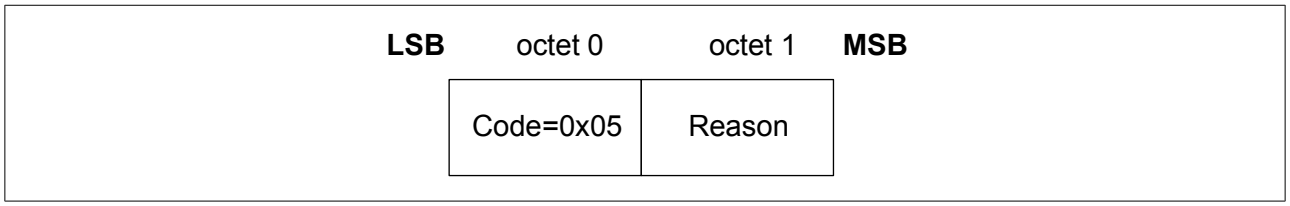

Figure 3.7: Pairing Failed packet

The following data field is used:

- *Reason (1 octets)*

The Reason field indicates why the pairing failed. The reason codes are defined in Table 3.7.

Value	Name	Description
0x01	Passkey Entry Failed	The user input of passkey failed, for example, the user cancelled the operation.
0x02	OOB Not Available	The OOB data is not available.
0x03	Authentication Requirements	The pairing procedure cannot be performed as authentication requirements cannot be met due to IO capabilities of one or both devices.
0x04	Confirm Value Failed	The confirm value does not match the calculated compare value.
0x05	Pairing Not Supported	Pairing is not supported by the device.
0x06	Encryption Key Size	The resultant encryption key size is not long enough for the security requirements of this device.
0x07	Command Not Supported	The SMP command received is not supported on this device.
0x08	Unspecified Reason	Pairing failed due to an unspecified reason.
0x09	Repeated Attempts	Pairing or authentication procedure is disallowed because too little time has elapsed since last pairing request or security request.
0x0A	Invalid Parameters	The Invalid Parameters error code indicates that the command length is invalid or that a parameter is outside of the specified range.
0x0B	DHKey Check Failed	Indicates to the remote device that the DHKey Check value received doesn't match the one calculated by the local device.
0x0C	Numeric Comparison Failed	Indicates that the confirm values in the numeric comparison protocol do not match.
0x0D	BR/EDR pairing in progress	Indicates that the pairing over the LE transport failed due to a Pairing Request sent over the BR/EDR transport in progress.
0x0E	Cross-transport Key Derivation/Generation not allowed	Indicates that the BR/EDR Link Key generated on the BR/EDR transport cannot be used to derive and distribute keys for the LE transport or the LE LTK generated on the LE transport cannot be used to derive a key for the BR/EDR transport.
0x0F	Key Rejected	Indicates that the device chose not to accept a distributed key.

Value	Name	Description
0x10	Busy	Indicates that the device is not ready to perform a pairing procedure.
All other values		Reserved for future use.

Table 3.7: Pairing Failed reason codes

3.5.6 Pairing Public Key

This message is used to transfer the device's local public key (X and Y co-ordinates) to the remote device. This message is used by both the initiator and responder. This PDU is only used for Secure Connections. Its format is specified in Figure 3.8.

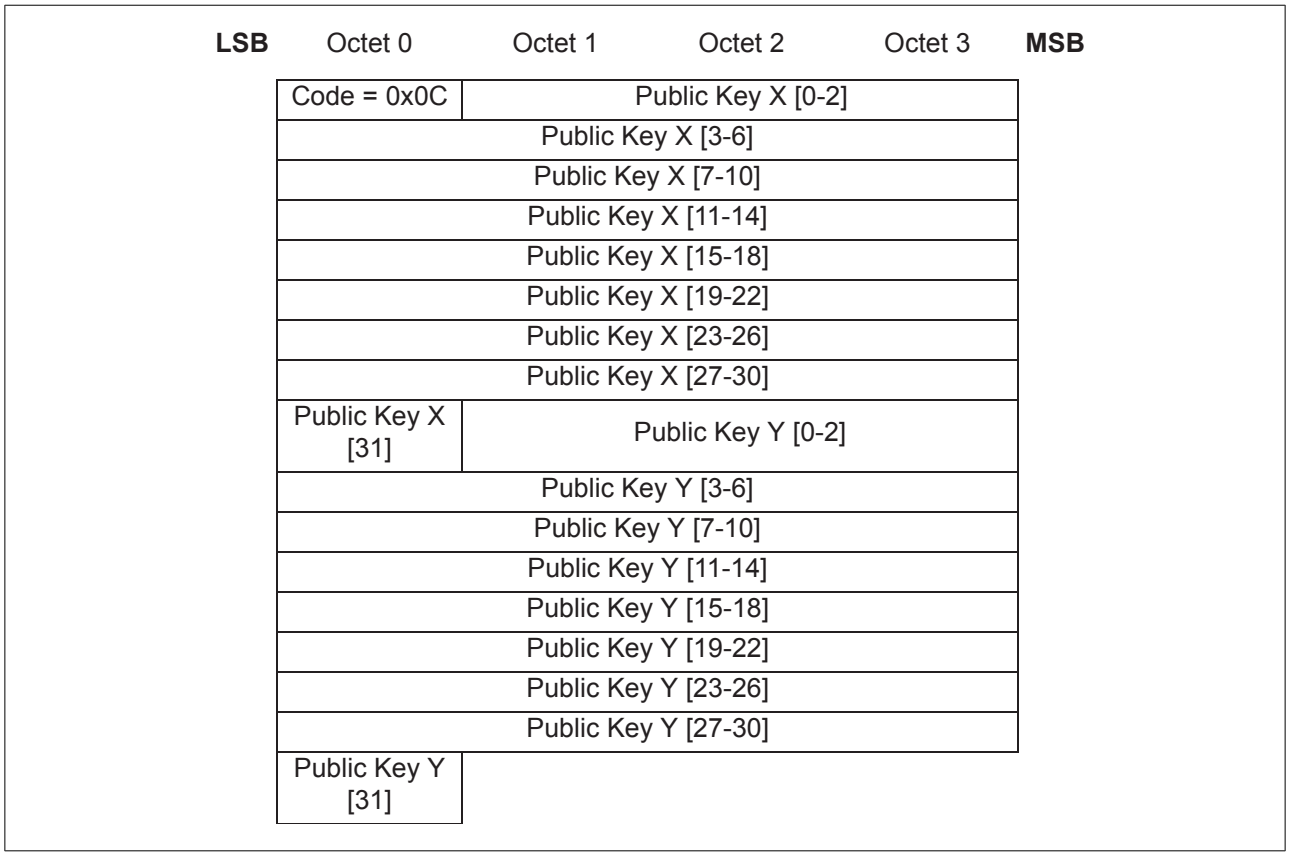

Figure 3.8: Pairing Public Key PDU

3.5.7 Pairing DHKey Check

This message is used to transmit the 128-bit DHKey Check values (Ea and Eb) generated using f6. These are confirmation values generated using the DHKey. This message is used by both initiator and responder. This PDU is only used for LE Secure Connections. Its format is specified in Figure 3.9.

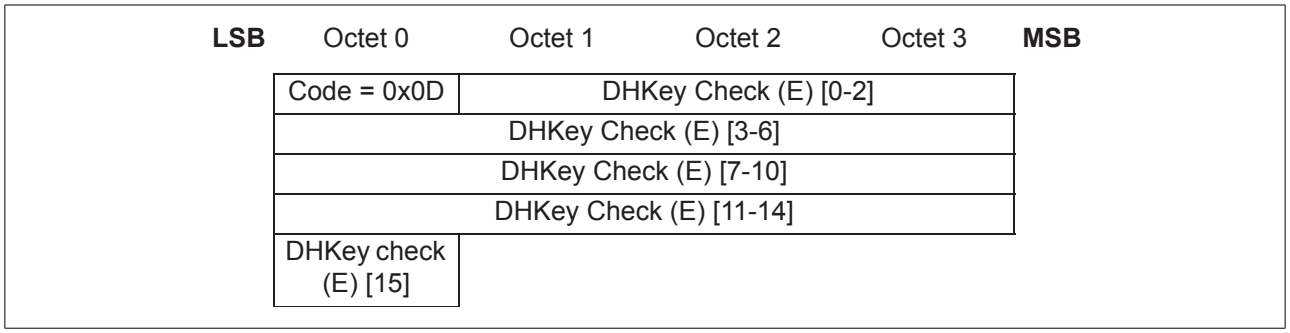

Figure 3.9: Pairing DHKey Check PDU

3.5.8 Keypress Notification

This message is used during the Passkey Entry protocol by a device with KeyboardOnly IO capabilities to inform the remote device when keys have been entered or erased. Its format is specified in Figure 3.10.

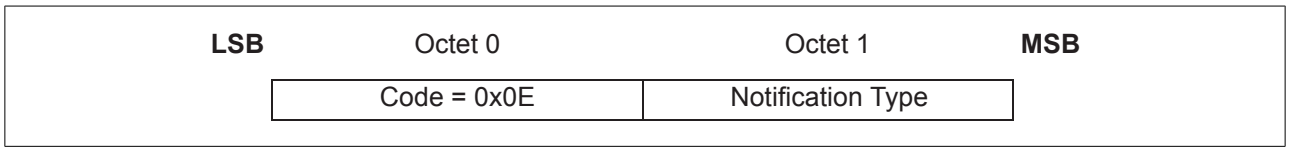

Figure 3.10: Pairing Keypress Notification PDU

Notification Type can take one of the following values:

Value	Parameter Description
0	Passkey entry started
1	Passkey digit entered
2	Passkey digit erased
3	Passkey cleared
4	Passkey entry completed
5 to 255	Reserved for future use

Table 3.8: Notification Type

3.6 Security in Bluetooth Low Energy

3.6.1 Key distribution and generation

Bluetooth Low Energy devices can distribute keys from the Peripheral to the Central and from the Central to the Peripheral. When using LE legacy pairing, the following keys may be distributed from the Peripheral to the Central:

- LTK using Encryption Information command

- EDIV and Rand using Central Identification command
- IRK using Identity Information command
- Public device or static random address using Identity Address Information command
- CSRK using Signing Information command

When using LE Secure Connections, the following keys may be distributed from the Peripheral to the Central:

- IRK using Identity Information command
- Public device or static random address using Identity Address Information command
- CSRK using Signing Information command

When using LE legacy pairing, the Central may distribute to the Peripheral the following key:

- LTK using Encryption Information command
- EDIV and Rand using Central Identification command
- IRK using Identity Information command
- Public device or static random address using Identity Address Information command
- CSRK using Signing Information command

When using LE Secure Connections, the Central may distribute to the Peripheral the following key:

- IRK using Identity Information command
- Public device or static random address using Identity Address Information command
- CSRK using Signing Information command

The keys which are to be distributed in the Transport Specific Key Distribution phase are indicated in the Key Distribution field of the Pairing Request and Pairing Response commands see Section 3.5.1 and Section 3.5.2.

The format of the Initiator Key Distribution / Generation field and Responder Key Distribution / Generation field in the Pairing Request and Pairing Response commands for LE is defined in Figure 3.11.

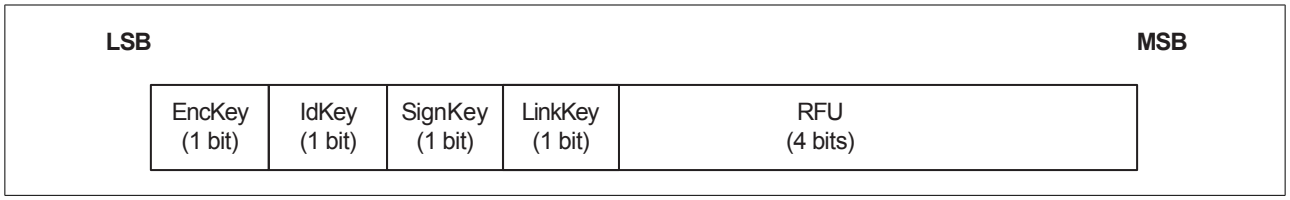

Figure 3.11: LE Key Distribution format

The Key Distribution / Generation field has the following flags:

- In LE legacy pairing, EncKey is a 1-bit field that is set to one to indicate that the device shall distribute LTK using the Encryption Information command followed by EDIV and Rand using the Central Identification command.

  In LE Secure Connections pairing, when SMP is running on the LE transport, then the EncKey field shall be ignored. EDIV and Rand shall be set to zero and shall not be distributed.

  When SMP is running on the BR/EDR transport, the EncKey field is set to one to indicate that the device would like to derive the LTK from the BR/EDR Link Key. When EncKey is set to 1 by both devices in the initiator and responder Key Distribution / Generation fields, the procedures for calculating the LTK from the BR/EDR Link Key shall be used.
- IdKey is a 1-bit field that is set to one to indicate that the device shall distribute IRK using the Identity Information command followed by its public device or static random address using Identity Address Information.
- SignKey is a 1-bit field that is set to one to indicate that the device shall distribute CSRK using the Signing Information command.
- LinkKey is a 1-bit field. When SMP is running on the LE transport, the LinkKey field is set to one to indicate that the device would like to derive the Link Key from the LTK. When LinkKey is set to 1 by both devices in the initiator and responder Key Distribution / Generation fields, the procedures for calculating the BR/EDR link key from the LTK shall be used. Devices not supporting LE Secure Connections shall set this bit to zero and ignore it on reception. When SMP is running on the BR/EDR transport, the LinkKey field is reserved for future use.

The Initiator Key Distribution / Generation field in the Pairing Request command is used by the Central to request which keys are distributed or generated by the initiator to the responder. The Responder Key Distribution / Generation field in the Pairing Request command is used by the Central to request which keys are distributed or generated by the responder to the initiator. The Initiator Key Distribution / Generation field in the Pairing Response command from the Peripheral defines the keys that shall be distributed or generated by the initiator to the responder. The Responder Key Distribution / Generation field in the Pairing Response command from the Peripheral

defines the keys that shall be distributed or generated by the responder to the initiator. The Peripheral shall not set to one any flag in the Initiator Key Distribution / Generation or Responder Key Distribution / Generation field of the Pairing Response command that the Central has set to zero in the Initiator Key Distribution / Generation and Responder Key Distribution / Generation fields of the Pairing Request command.

When using LE legacy pairing, the keys shall be distributed in the following order:

1. LTK by the Peripheral
2. EDIV and Rand by the Peripheral
3. IRK by the Peripheral
4. BD_ADDR by the Peripheral
5. CSRK by the Peripheral
6. LTK by the Central
7. EDIV and Rand by the Central
8. IRK by the Central
9. BD_ADDR by the Central
10. CSRK by the Central

When using LE Secure Connections, the keys shall be distributed in the following order:

1. IRK by the Peripheral
2. BD_ADDR by the Peripheral
3. CSRK by the Peripheral
4. IRK by the Central
5. BD_ADDR by the Central
6. CSRK by the Central

If a key is not being distributed then the command to distribute that key shall not be sent.

Note: If a key is not distributed, then the capabilities that use this key will not be available. For example, if an LTK is not distributed from the Peripheral to the Central, then the Central cannot encrypt a future link with that Peripheral, therefore pairing would have to be performed again.

Note: The initiator should determine the keys needed based on the capabilities that are required by higher layer specifications. For example, if the initiator determines that encryption is required in a future link with that Peripheral, then the initiator must request that Peripheral's LTK is distributed by setting the EncKey bit to one in the Responder Key Distribution / Generation field of the Pairing Request command.

A device may reject a distributed key by sending the Pairing Failed command with the reason set to "Key Rejected".

If EncKey, IdKey, and SignKey are set to zero in the Initiator Key Distribution / Generation and Responder Key Distribution / Generation fields, then no keys shall be distributed or generated and the link will be encrypted using the generated STK when using LE legacy pairing and LTK when using LE Secure Connections pairing.

Key distribution is complete in the device sending the final key when it receives the Baseband acknowledgment for that key and is complete in the receiving device when it receives the final key being distributed.

3.6.2 Encryption Information

Encryption Information is used in the LE legacy pairing Transport Specific Key Distribution to distribute LTK that is used when encrypting future connections. The Encryption Information command is defined in Figure 3.12.

The Encryption Information command shall only be sent when the link has been encrypted or re-encrypted using the generated STK.

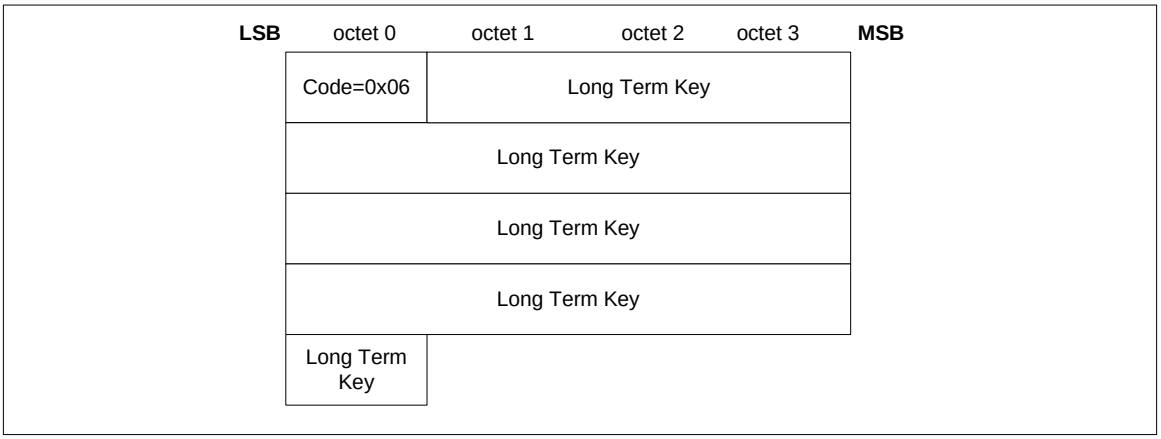

Figure 3.12: Encryption Information packet

The following is the data field:

- *Long Term Key (16 octets)*

  The generated LTK value being distributed, see Section 2.4.2.3.

3.6.3 Central Identification

Central Identification is used in the LE legacy pairing Transport Specific Key Distribution phase to distribute EDIV and Rand which are used when encrypting future connections. The Central Identification command is defined in Figure 3.13.

The Central Identification command shall only be sent when the link has been encrypted or re-encrypted using the generated STK.

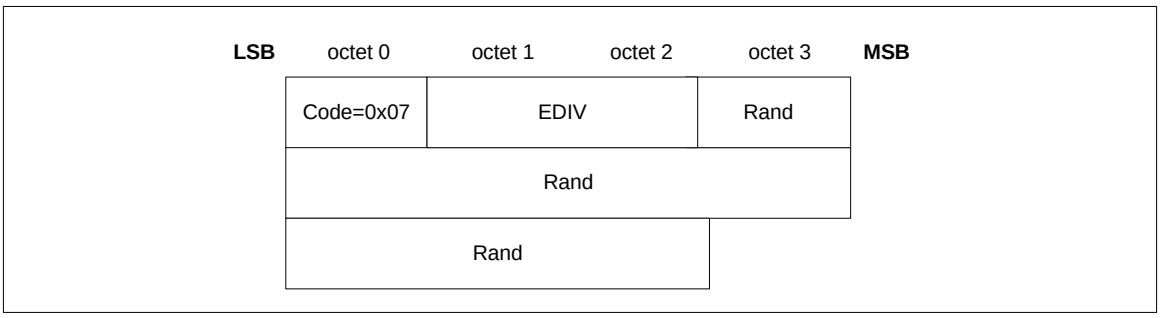

Figure 3.13: Central Identification packet

The following data fields are used:

- *EDIV (2 octets)*

  The EDIV value being distributed (see Section 2.4.2.3).

- *Rand (8 octets)*

  64-bit Rand value being distributed (see Section 2.4.2.3).

3.6.4 Identity Information

Identity Information is used in the Transport Specific Key Distribution phase to distribute the IRK. The Identity Information command is defined in Figure 3.14.

The Identity Information command shall only be sent when the link has been encrypted or re-encrypted using the generated key.

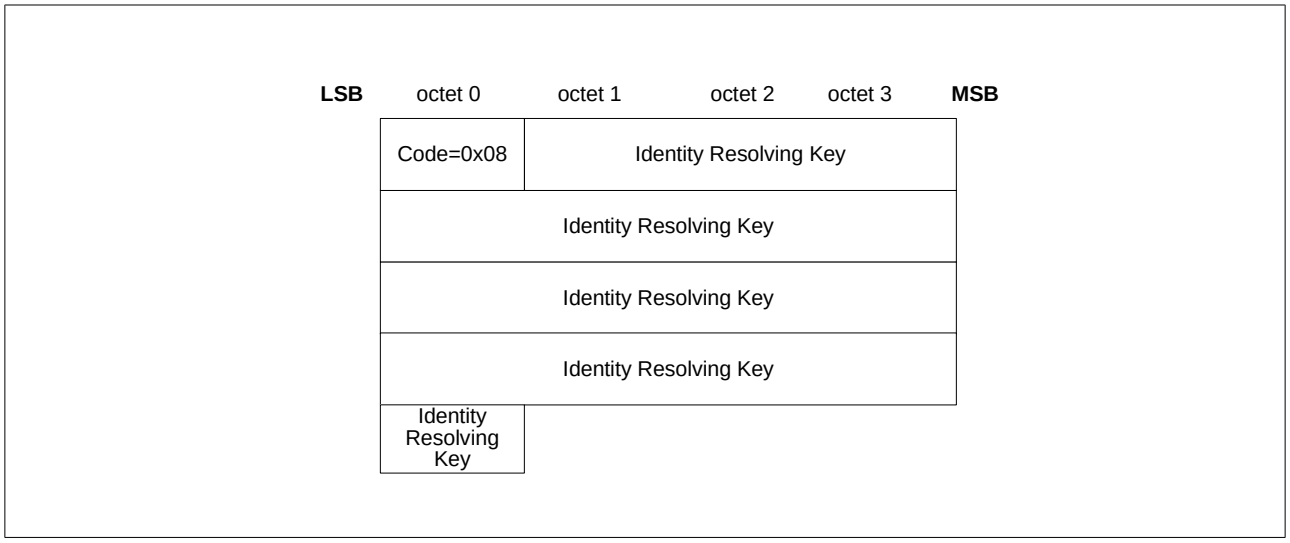

Figure 3.14: Identity Information packet

The following are the data fields:

- *Identity Resolving Key (16 octets)*

  128-bit IRK value being distributed (see Section 2.4.2.1).

Note: An all zero Identity Resolving Key data field indicates that a device does not have a valid resolvable private address.

3.6.5 Identity Address Information

Identity Address Information is used in the Transport Specific Key Distribution phase to distribute its public device address or static random address. The Identity Address Information command is defined in Figure 3.15.

The Identity Address Information command shall only be sent when the link has been encrypted or re-encrypted using the generated key.

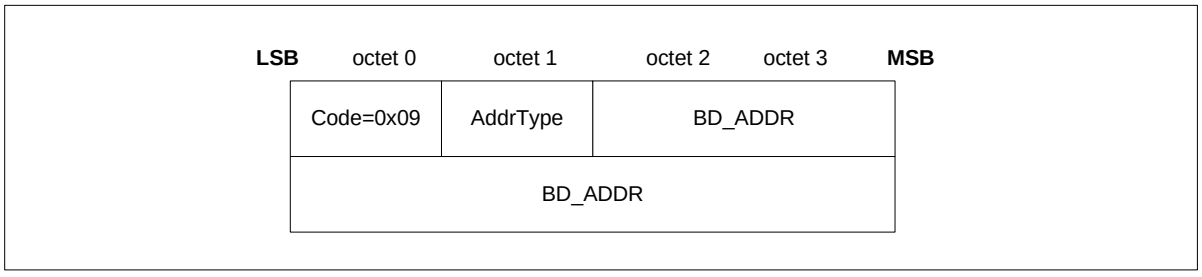

Figure 3.15: Identity Address Information packet

The data fields are:

- *AddrType (1 octet)*

  If BD_ADDR is a public device address, then AddrType shall be set to 0x00. If BD_ADDR is a static random device address then AddrType shall be set to 0x01.

- *BD_ADDR (6 octets)*

  This field is set to the distributing device's public device address or static random address.

3.6.6 Signing Information

Signing Information is used in the Transport Specific Key Distribution to distribute the CSRK which a device uses to sign data. The Signing Information command is defined in Figure 3.16.

The Signing Information command shall only be sent when the link has been encrypted or re-encrypted using the generated key.

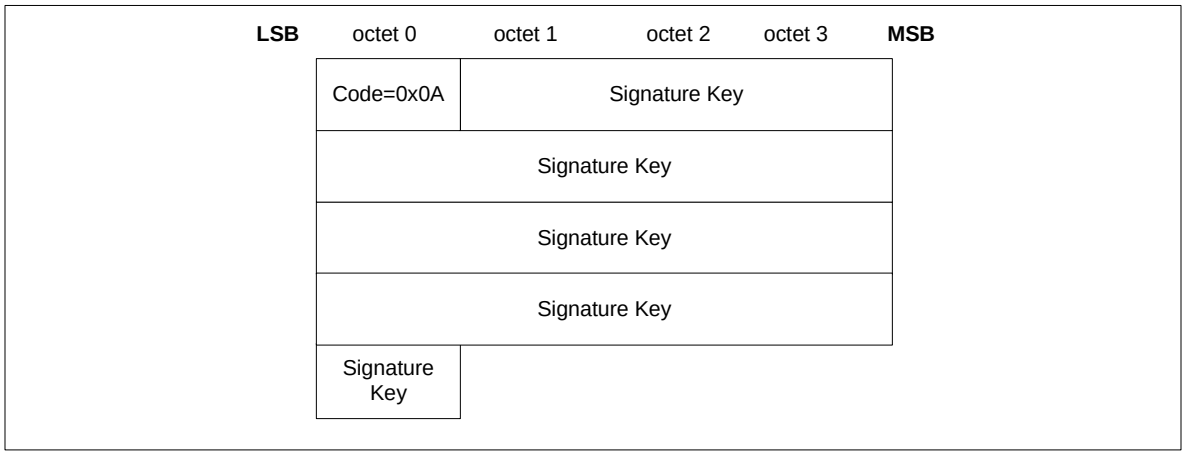

Figure 3.16: Signing Information packet

The following data field is used:

- *Signature Key (16 octets)*

  128-bit CSRK that is being distributed; see Section 2.4.2.2.

3.6.7 Security Request

The Security Request command is used by the Peripheral to request that the Central initiates security with the requested security properties, see Section 2.4.6. The Security Request command is defined in Figure 3.17.

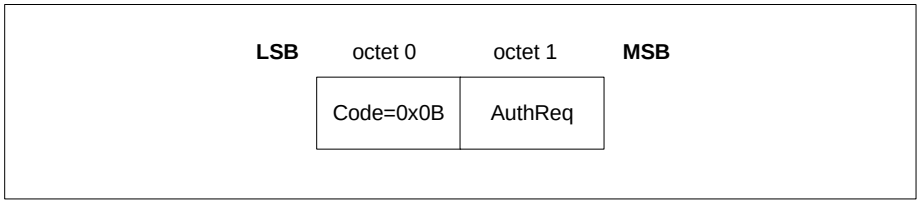

Figure 3.17: Security Request packet

The following data field is used:

- *AuthReq (1 octet)*

  The AuthReq field is a bit field that indicates the requested security properties (see Section 2.3.1) for the STK or LTK and GAP bonding information (see [Vol 3] Part C, Section 9.4).

  Figure 3.3 defines the authentication requirements bit field.

  The Bonding_Flags field is a 2-bit field that indicates the type of bonding being requested by the responding device as defined in Table 3.6.

  The MITM field is a 1-bit flag that is set to one if the device is requesting MITM protection, otherwise it shall be set to 0. A device sets the MITM flag to one to request an Authenticated security property for the STK when using LE legacy pairing and the LTK when using LE Secure Connections.

  The SC field is a 1 bit flag. If LE Secure Connections pairing is supported by the device, then the SC field shall be set to 1, otherwise it shall be set to 0. If both devices support LE Secure Connections pairing, then LE Secure Connections pairing shall be used, otherwise LE Legacy pairing shall be used.

  The keypress field is a 1-bit flag that is used only in the Passkey Entry protocol and shall be ignored in other protocols. When both sides set that field to one, Keypress notifications shall be generated and sent using SMP Pairing Keypress Notification PDUs.

Appendix A EDIV and Rand Generation

EDIV and Rand are used by the responding device to identify an initiator and recover LTK. This section provides an example of how the distributed EDIV value is a masked version of the real value (DIV) which is used to recover LTK. Other methods can be used that provide equal or higher levels of confidentially for DIV.

A.1 EDIV masking

The masking process uses a Diversifier Hiding Key (DHK) which is a 128-bit key that is never distributed.

DHK can be assigned, randomly generated by the device during manufacturing, part of a key hierarchy (see Appendix B, Section B.2.3) or some other method could be used, that results in DHK having 128 bits of entropy. If DHK is randomly generated then the requirements for random generation defined in [Vol 2] Part H, Section 2 shall be used.

If DHK is changed then DIV values cannot be recovered from previously distributed EDIV values.

Section A.1.1 defines a cryptographic function that is used by the responding device when generating EDIV and recovering DIV.

Section A.1.2 describes how a responding device generates an EDIV value to be distributed to an initiating device and Section A.1.3 describes how the responding device recovers DIV from a distributed EDIV value.

A.1.1 DIV mask generation function *dm*

DIV is masked before distribution and unmasked during the encryption session setup using the output of the DIV mask generation function *dm*.

The following are inputs to the DIV mask generation function *dm*:

k is 128 bits
r is 64 bits
padding is 64 bits

r is concatenated with padding to generate *r'* which is used as the 128-bit input parameter *plaintextData* to security function *e*:

r' = padding || r

The least significant octet of *r* becomes the least significant octet of *r'* and the most significant octet of *padding* becomes the most significant octet of *r'*.

For example, if the 64-bit value *r* is 0x123456789ABCDEF0 then *r'* is 0x0000000000000000123456789ABCDEF0.

The output of the DIV mask generation function *dm* is

$$dm(k, r) = e(k, r') \ mod \ 2^{16}$$

The output of the security function e is then truncated to 16 bits by taking the least significant 16 bits of the output of *e* as the result of *dm*.

A.1.2 EDIV generation

The responding device generates a 64-bit random value, *Rand.* The *Rand* value is used to generate 16-bit Y using the DIV mask generation function *dm* with the input parameter *k* set to DHK and the input parameter *r* set to *Rand*.

$$Y = dm(DHK, Rand)$$

The responding device then masks the DIV value to be distributed by bitwise XORing it with Y to generate EDIV.

$$EDIV = Y \text{ xor } DIV$$

EDIV and Rand are distributed to an initiating device during the transport specific key distribution phase using the Central Identification command.

A.1.3 DIV recovery

When the responding device receives a request to encrypt a session it calculates Y using the DIV mask generation function *dm* with the input parameter *k* set to DHK and the input parameter *r* set to *Rand.* The Y value is bitwise XORed with *EDIV* from the initiator to recover DIV.

$$DIV = Y \text{ xor } EDIV$$

The recovered DIV value can then used to recover LTK which is used to enable encryption on the link.

Appendix B Key Management

The security provided by different methods can vary and care should be taken to ensure that a chosen method is suitable for a device's requirements.

Section B.1 uses a database for managing the keys. Section B.2 uses a key hierarchy to manage the keys.

B.1 Database lookup

The LTK which is distributed is a 128-bit random number which is stored in a database, using EDIV as an index. There is no direct relationship between LTK and EDIV.

The requirements for random generation defined in [Vol 2] Part H, Section 2 shall be used when generating LTK. This method provides an LTK with 128 bits of entropy.

CSRK, IRK, and other keys shall also be stored in the database. There is no relationship between the keys stored in the database or distributed LTKs, EDIVs, or Rands.

If the example EDIV and Rand generation method described in Section A.1 is used then the database shall be used to store DHK. DIV should be used as the index to recover LTK.

B.2 Key hierarchy

A key hierarchy can be used to generate the keys.

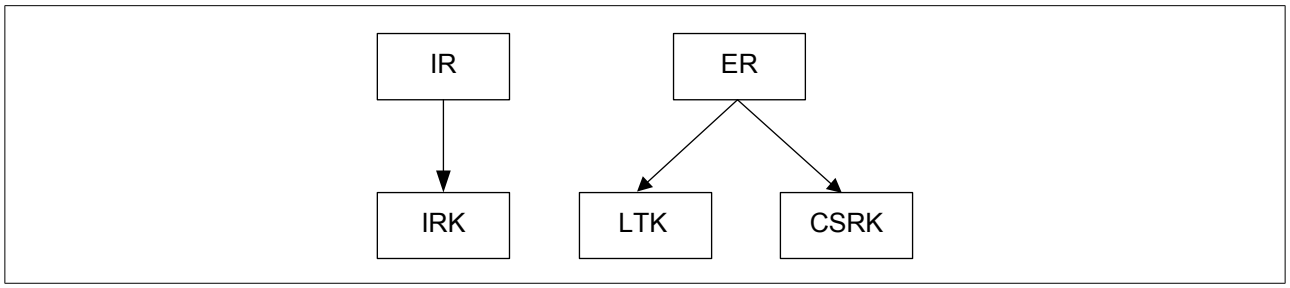

Figure B.1: Example key hierarchy

Figure B.1 is an example key hierarchy where LTK and CSRK are generated from a common ER key, and IRK is generated from a common IR key.

1. ER is a 128-bit key generated for each LE device that supports encrypted connections. It is used to generate LTK using EDIV; see Section B.2.2.
2. IR is a 128-bit key generated for each LE device that supports encrypted connections, uses random addresses or signing data. IR is used to generate IRK and CSRK, see Section B.2.3. It can also be used to generate DHK; see Section A.1.

New LTK, EDIV, Rand, and CSRK values shall be generated each time they are distributed. If ER is changed then any previously distributed LTK or CSRK keys will no longer be valid.

The distributed IRK shall be the same for all devices it is distributed to. If IR is changed then any previously distributed IRK keys will no longer be valid.

The distributing device only needs to store IR and ER. LTK, IRK, and CSRK can be regenerated when they are required. This reduces the storage requirements on the distributing device.

Section B.2.1 defines an example of the key diversifying function which can be used to generate LTK, IRK, CSRK, and other keys. Other implementations of this function can be used depending upon the exact security requirements of the device.

The NIST Special Publication 800-108 (http://csrc.nist.gov/publications/PubsSPs.html) defines key derivation functions which could be used instead of the example diversifying function *d1*.

B.2.1 Diversifying function *d1*

Diversified keys are generated with function *d1*. The diversifying function *d1* makes use of the security function *e*.

The following are inputs to diversifying function *d1*:

k is 128 bits
d is 16 bits
r is 16 bits
padding is 96 bits

d is concatenated with *r* and *padding* to generate *d',* which is used as the 128-bit input parameter *plaintextData* to security function *e*:

d' = padding || r || d

The least significant octet of *d* becomes the least significant octet of *d'* and the most significant octet of *padding* becomes the most significant octet of *d'*.

For example, if the 16-bit value *d* is 0x1234 and the 16-bit value *r* is 0xABCD, then *d'* is 0x000000000000000000000000ABCD1234.

The output diversifying function *d1* is:

d1(k, d, r) = e(k, d')

The 128-bit output of the security function *e* is used as the result of diversifying function *d1*.

B.2.2 Generating keys from ER

ER is used to generate LTK and CSRK. ER can be assigned, randomly generated by the device during manufacturing or some other method could be used, that results in ER having 128 bits of entropy. If ER is randomly generated then the requirements for random generation defined in [Vol 2] Part H, Section 2 shall be used.

The EDIV and Rand generation method described in Appendix A shall be used. LTK is the result of the diversifying function *d1* with the ER as the input parameter *k*, the DIV as the input parameter *d*, and the value 0 as the input parameter *r*; see Section B.2.1.

LTK = *d1*(ER, DIV, 0)

LTK can be recovered from ER and DIV by repeating the calculation when LTK is required.

CSRK is the result of the diversifying function *d1* with the ER as the input parameter *k*, the DIV as the input parameter *d*, and the value 1 as the input parameter *r*; see Section B.2.1.

CSRK = *d1*(ER, DIV, 1)

CSRK can be recovered from ER and DIV by repeating the calculation when CSRK is required.

This method provides an LTK and CSRK with limited amount of entropy because LTK and CSRK are directly related to EDIV and may be less secure than other generation methods.

To reduce the probability of the same LTK or CSRK value being generated, the DIV values must be unique for each CSRK, LTK, EDIV, and Rand set that is distributed.

A method for preventing a malicious device from repeatedly pairing and collecting CSRK, LTK and DIV information, which could be used in a known plain text attack in ER, should be implemented.

Note: The generation of LTK using ER is only applicable when doing LE Legacy Pairing. The generation of CSRK using ER is applicable both when doing LE Legacy Pairing and LE Secure Connections Pairing.

B.2.3 Generating keys from IR

IR can be used to generate IRK and other required keys. IR can be assigned, randomly generated by the device during manufacturing or some other method could be used, that results in IR having 128 bits of entropy. If IR is randomly generated then the requirements for random generation defined in Section A.1 shall be used.

IRK is the result of the diversifying function *d1* with IR as the input parameter *k* and the value 1 as the input parameter *d* and the value 0 as the input parameter r; see Section B.2.1.

IRK = *d1*(IR, 1, 0)

If the example EDIV and Rand generation method described in Appendix A, Section A.1 is used then DHK can be the result of diversifying function *d1* with IR as the input parameter *k* and the value 3 as the input parameter *d* and the value 0 as the input parameter r.

DHK = *d1*(IR, 3, 0)

Other keys can be generated by using different values for *k* as the input to the diversifying function *d1*. If the value of *k* is reused for a given IR then the resulting key will be the same.

Note: The generation of DHK using IR is only applicable when doing LE Legacy Pairing. The generation of IRK using IR is applicable both when doing LE Legacy Pairing and LE Secure Connections Pairing.

Appendix C Message sequence charts

This appendix illustrates only the most common scenarios; it does not cover all possible alternatives. Furthermore, the message sequence charts do not consider errors over the air interface or Host interface. If any of these charts differ with text elsewhere in this Part, then that text overrides these charts.

A flow diagram of pairing is shown in Figure C.1. The process has 4 steps. Step 2 has a number of different options.

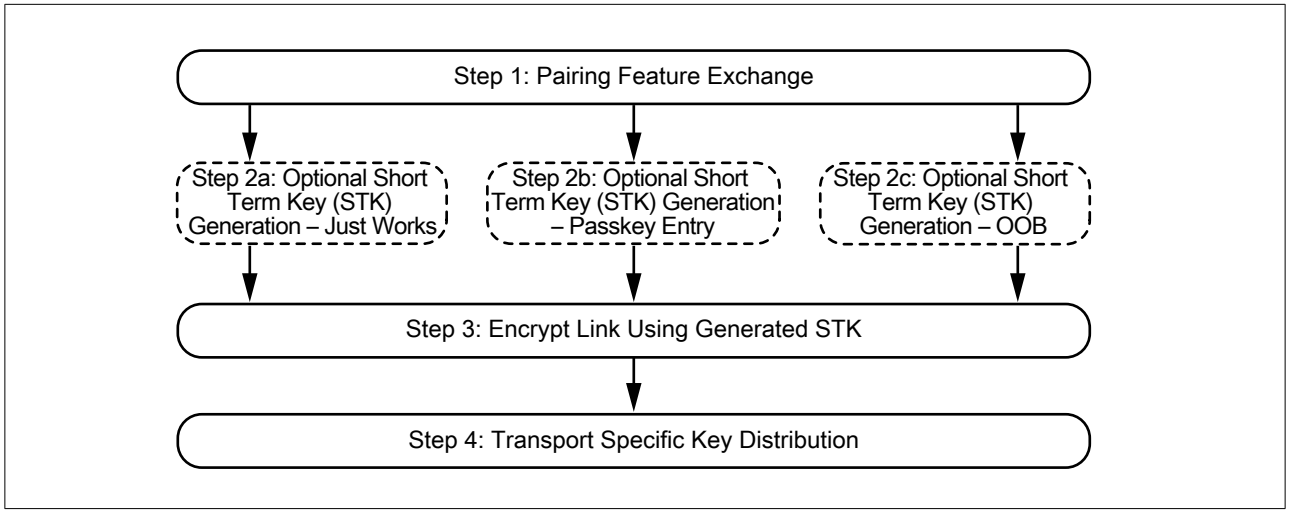

Figure C.1: Pairing process overview

Note: In all the MSCs, the Central is also the Initiating Device and the Peripheral is also the Responding (non-Initiating) Device.

C.1 Phase 1: Pairing feature exchange

The Central initiates the pairing procedure using Pairing Request command as shown in Figure C.2.

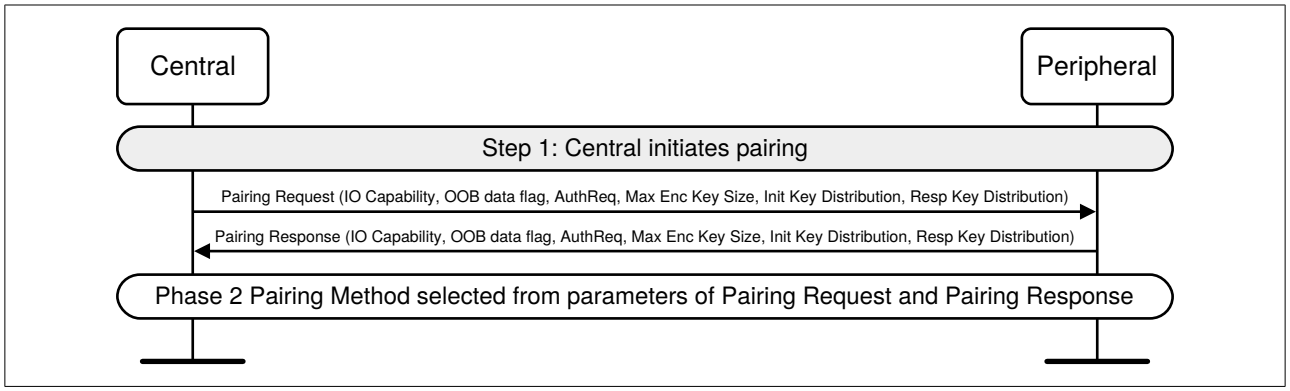

Figure C.2: Pairing initiated by Central

C.1.1 Peripheral security request – Central requests pairing

The Peripheral may request the Central initiates security procedures. Figure C.3 shows an example where the Peripheral requests security and the Central initiates pairing in response.

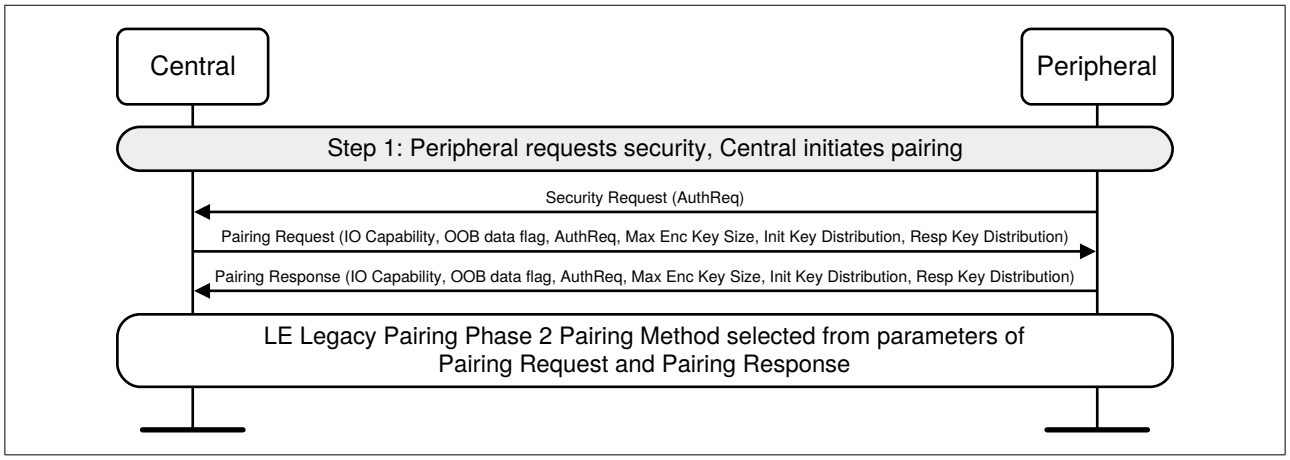

Figure C.3: Peripheral security request, Central initiated pairing

C.2 Phase 2: Authenticating and encrypting

After Pairing Feature Exchange has completed a pairing method is selected one of the possible short term key generation sequences are used. This can be Just Works, Passkey Entry or Out of Band pairing method.

C.2.1 LE legacy pairing

The following subsections include message sequence charts for LE legacy pairing.

C.2.1.1 Legacy Phase 2: Short Term Key generation – Just Works

After Pairing Feature Exchange has completed a pairing method is selected. Figure C.4 shows the Just Works pairing method.

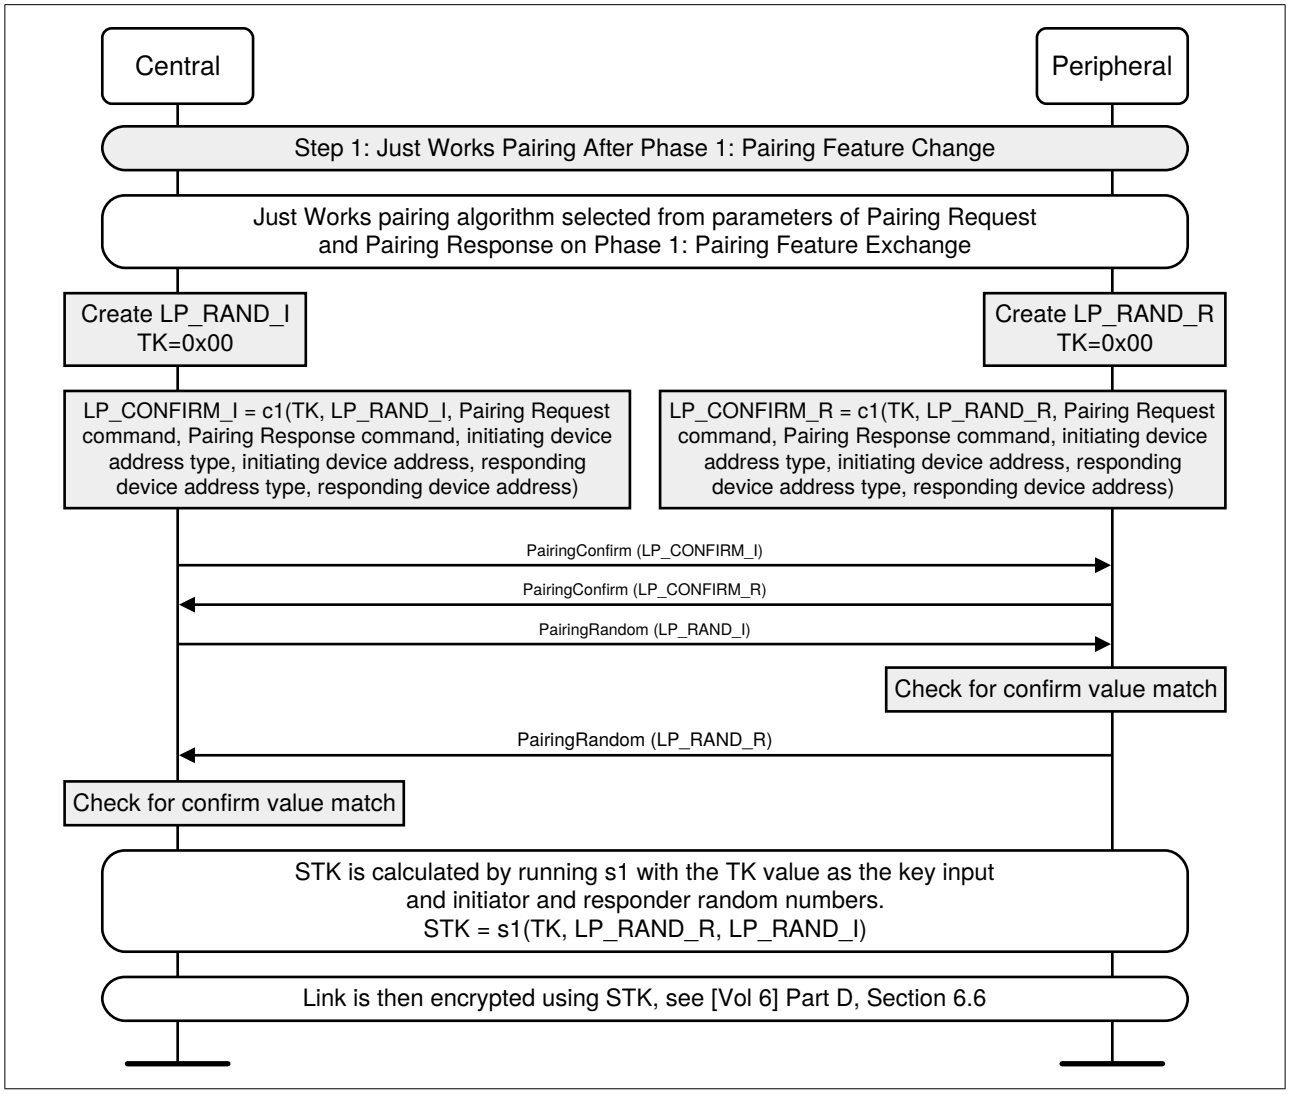

Figure C.4: Legacy Just Works pairing method

C.2.1.2 Legacy Phase 2: Short Term Key generation – Passkey Entry

After Pairing Feature Exchange has completed, a pairing method is selected. Figure C.5 shows the Passkey Entry pairing method.

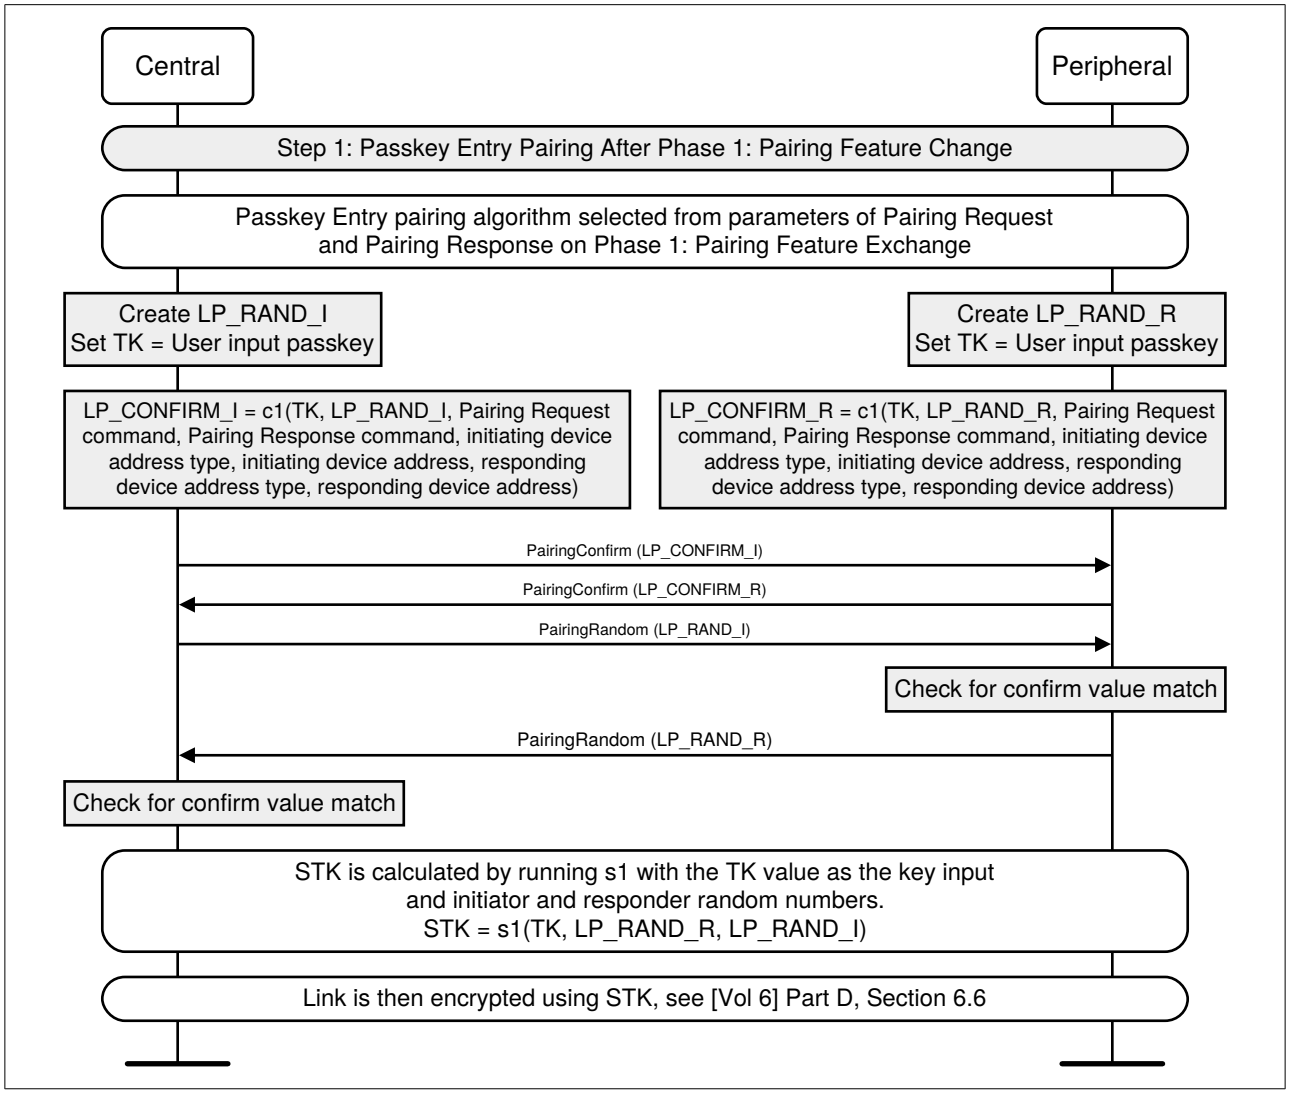

Figure C.5: Legacy Passkey Entry pairing method

C.2.1.3 Legacy Phase 2: Short Term Key generation – Out of Band

After Pairing Feature Exchange has completed, a pairing method is selected. Figure C.6 shows the Out of Band pairing method.

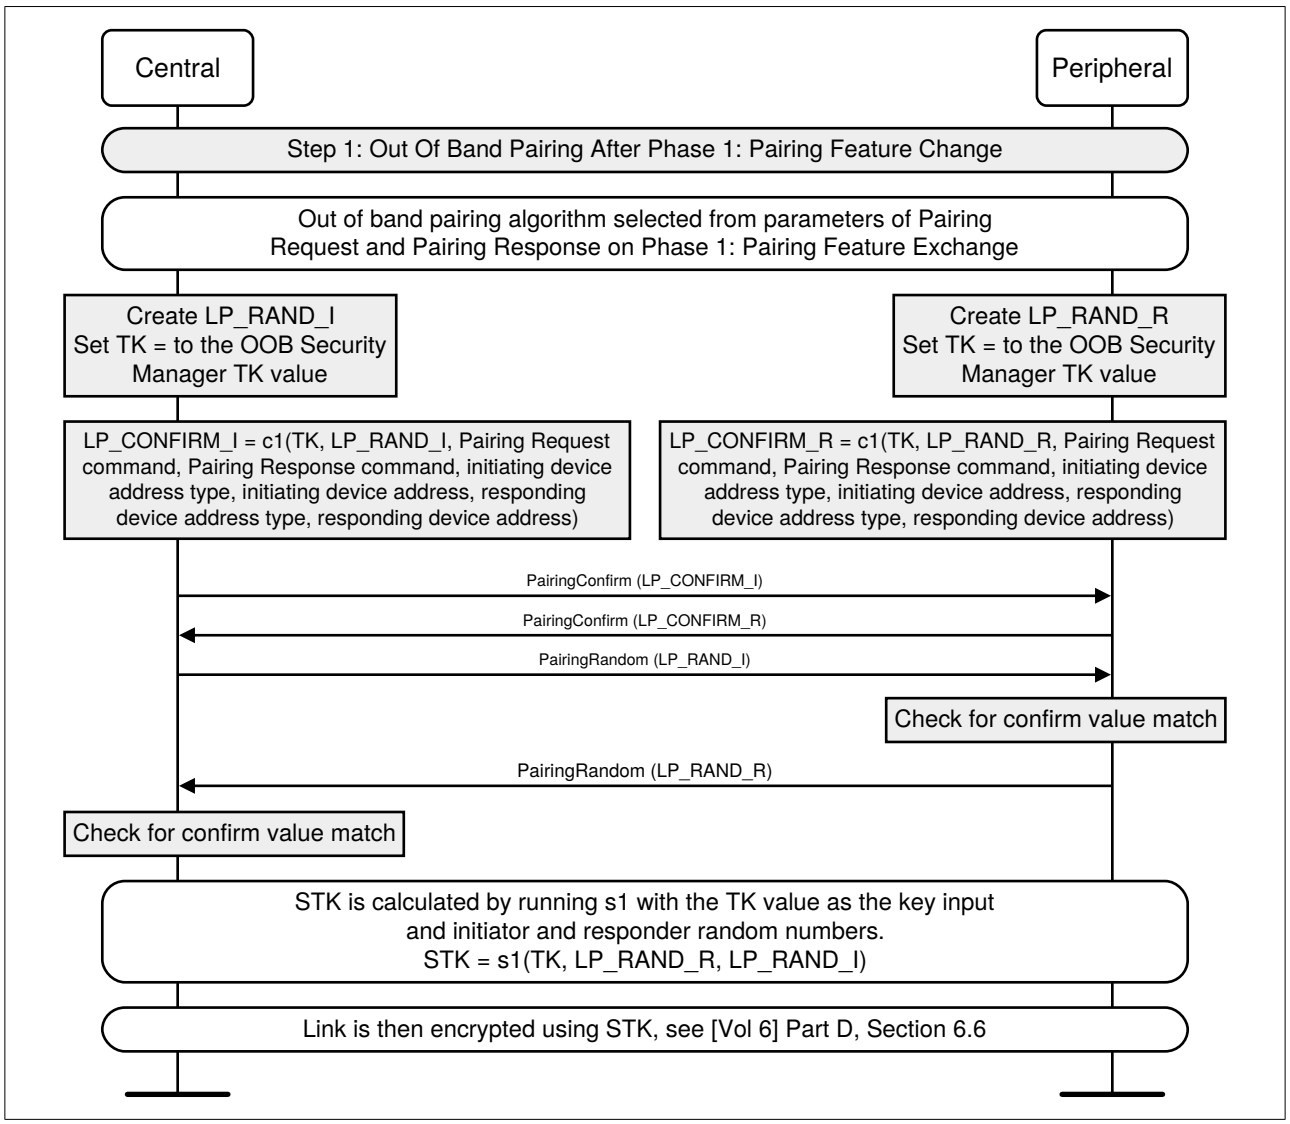

Figure C.6: Legacy OOB pairing method

C.2.2 LE Secure Connections

The following subsections include message sequence charts for LE Secure Connections.

C.2.2.1 Public key exchange

In Step 1a and 1b, the two devices exchange public keys. The Central sends its public key to the Peripheral followed by Peripheral sending its public key to the Central.

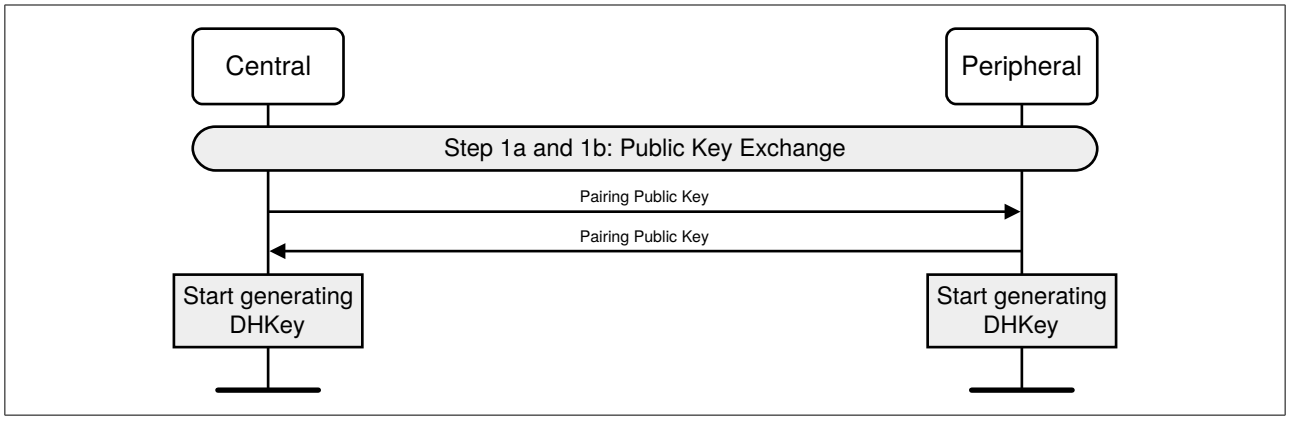

Figure C.7: Pairing Phase 2 – Public Key Exchange

C.2.2.2 Authentication stage 1

The following subsections include message sequence charts for the success and failure cases in each association model.

C.2.2.2.1 Successful Numeric Comparison (or Just Works)

The numeric comparison step will be done when both devices have output capabilities, or if one of the devices has no input or output capabilities. If both devices have output capabilities, this step requires the displaying of a user confirmation value. This value should be displayed until the end of step 2. If one or both devices do not have output capabilities, the same protocol is used but the Hosts will skip the step asking for the user confirmation.

Note: The sequence for Just Works is identical to that of Numeric Comparison with the exception that the Host will not show the numbers to the user.

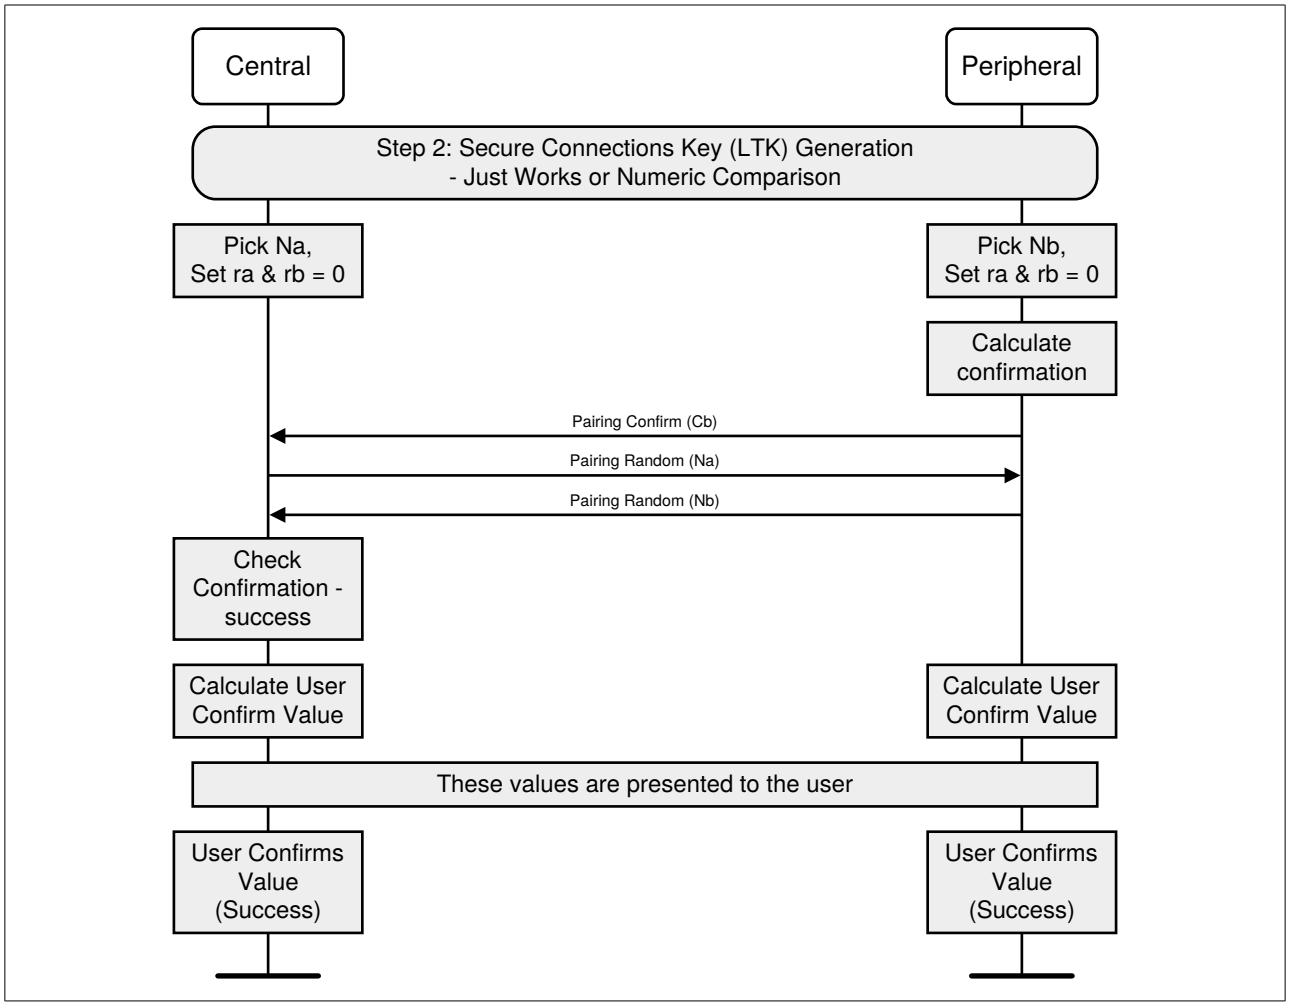

Figure C.8: Pairing Phase 2, authentication stage 1, successful Numeric Comparison

C.2.2.2.2 Numeric Comparison – Confirm Check failure on the Initiator side

If the Confirm value calculated by the Initiator is not equal to the Commitment value received from the Responder, the Initiator will abort Pairing process by sending Pairing Failed with reason “Confirm Value Failed”.

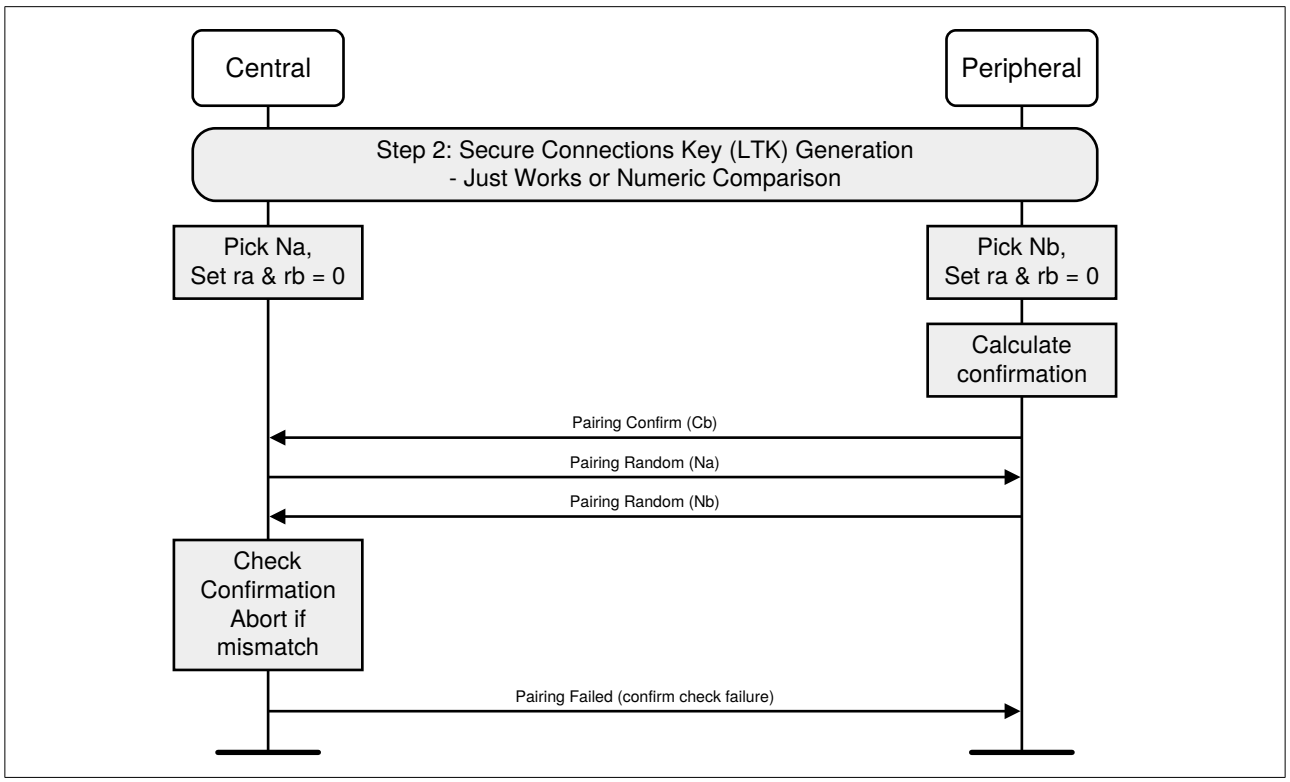

Figure C.9: Pairing Phase 2, authentication stage 1, Numeric Comparison – Confirm Check failure on Initiator side

C.2.2.2.3 Numeric Comparison failure on the Initiator side

If the numeric comparison fails on the initiating side due to the user indicating that the confirmation values do not match, Pairing is terminated.

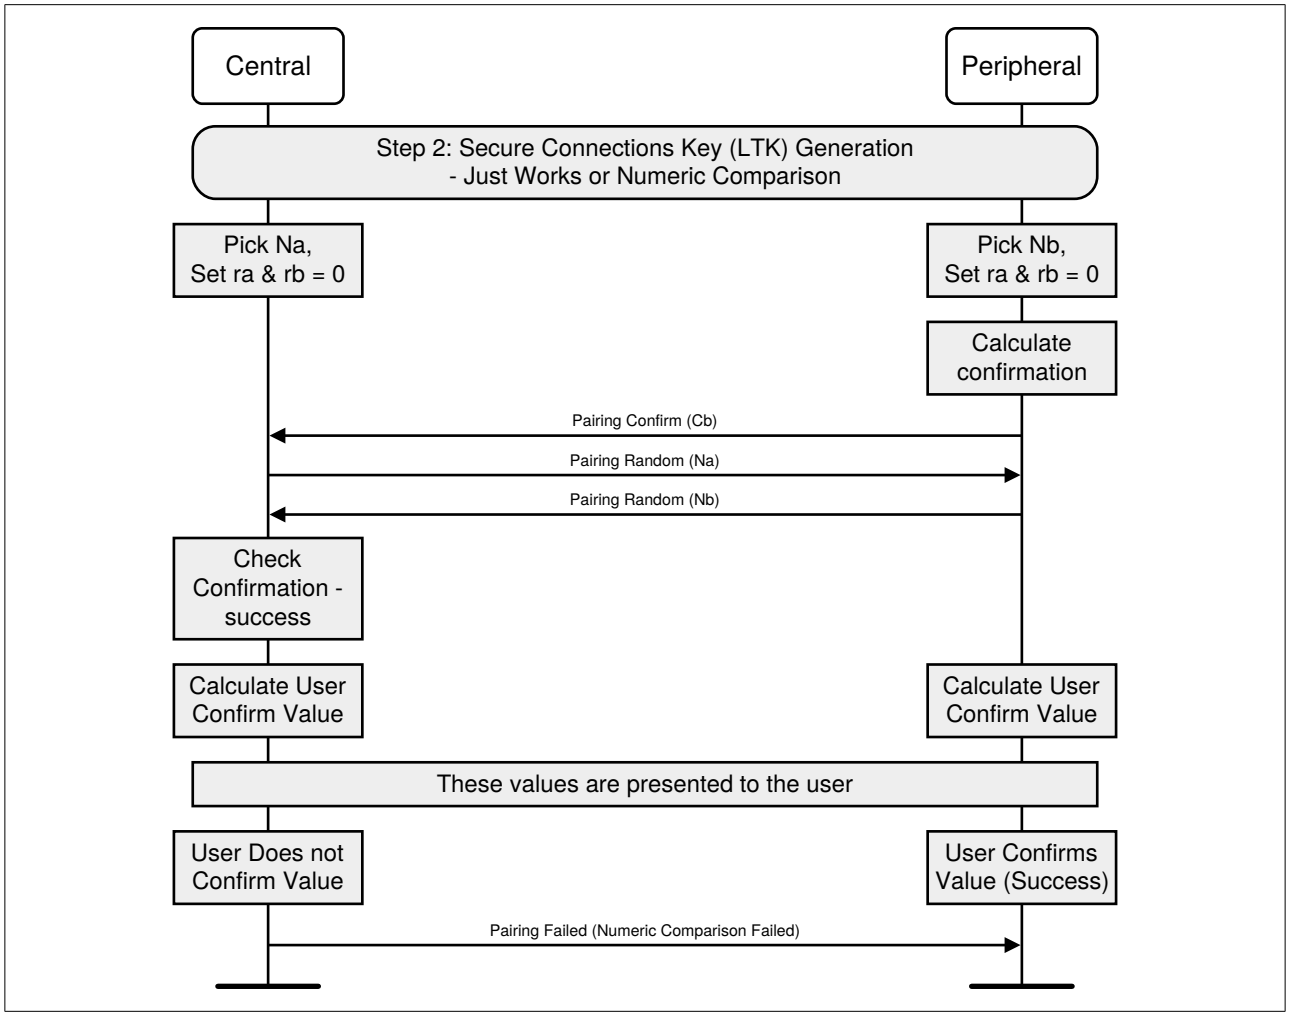

Figure C.10: Pairing Phase 2, authentication stage 1, Numeric Comparison failure on Initiator side

C.2.2.2.4 Numeric Comparison failure on the Responding side

If the numeric comparison fails on the responding side due to the user indicating that the confirmation values do not match, Pairing is terminated.

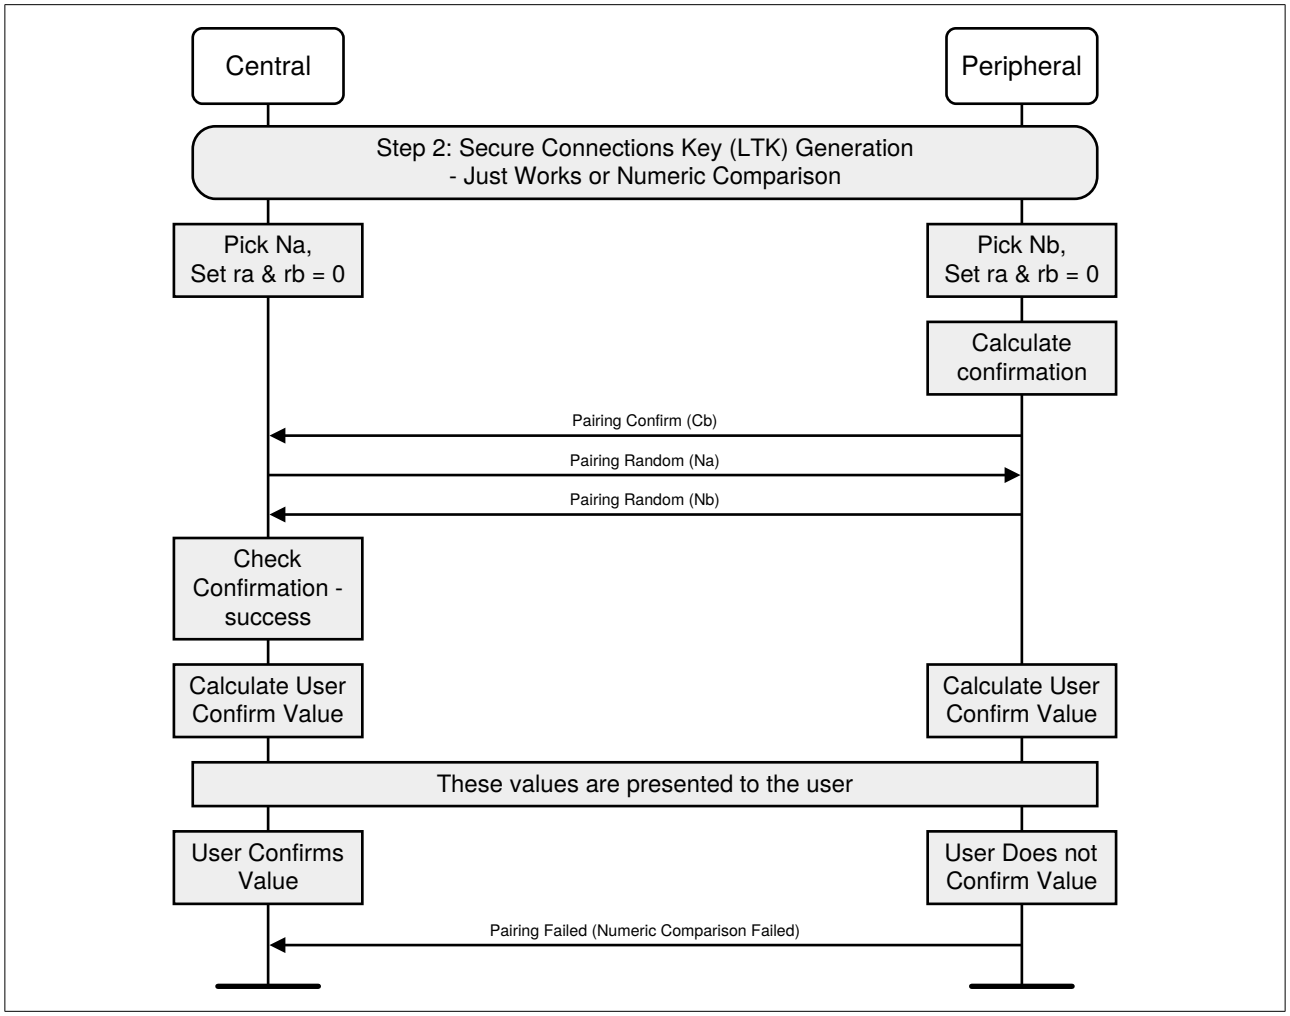

Figure C.11: Pairing Phase 2, authentication stage 1, Numeric Comparison failure on Responding side

C.2.2.2.5 Successful Passkey Entry

The Passkey Entry step is used in two cases: when one device has numeric input only and the other device has either a display or numeric input capability. In this step, one device display a number to be entered by the other device or the user enters a

number on both devices. Key press notification messages are shown during the user input phase.

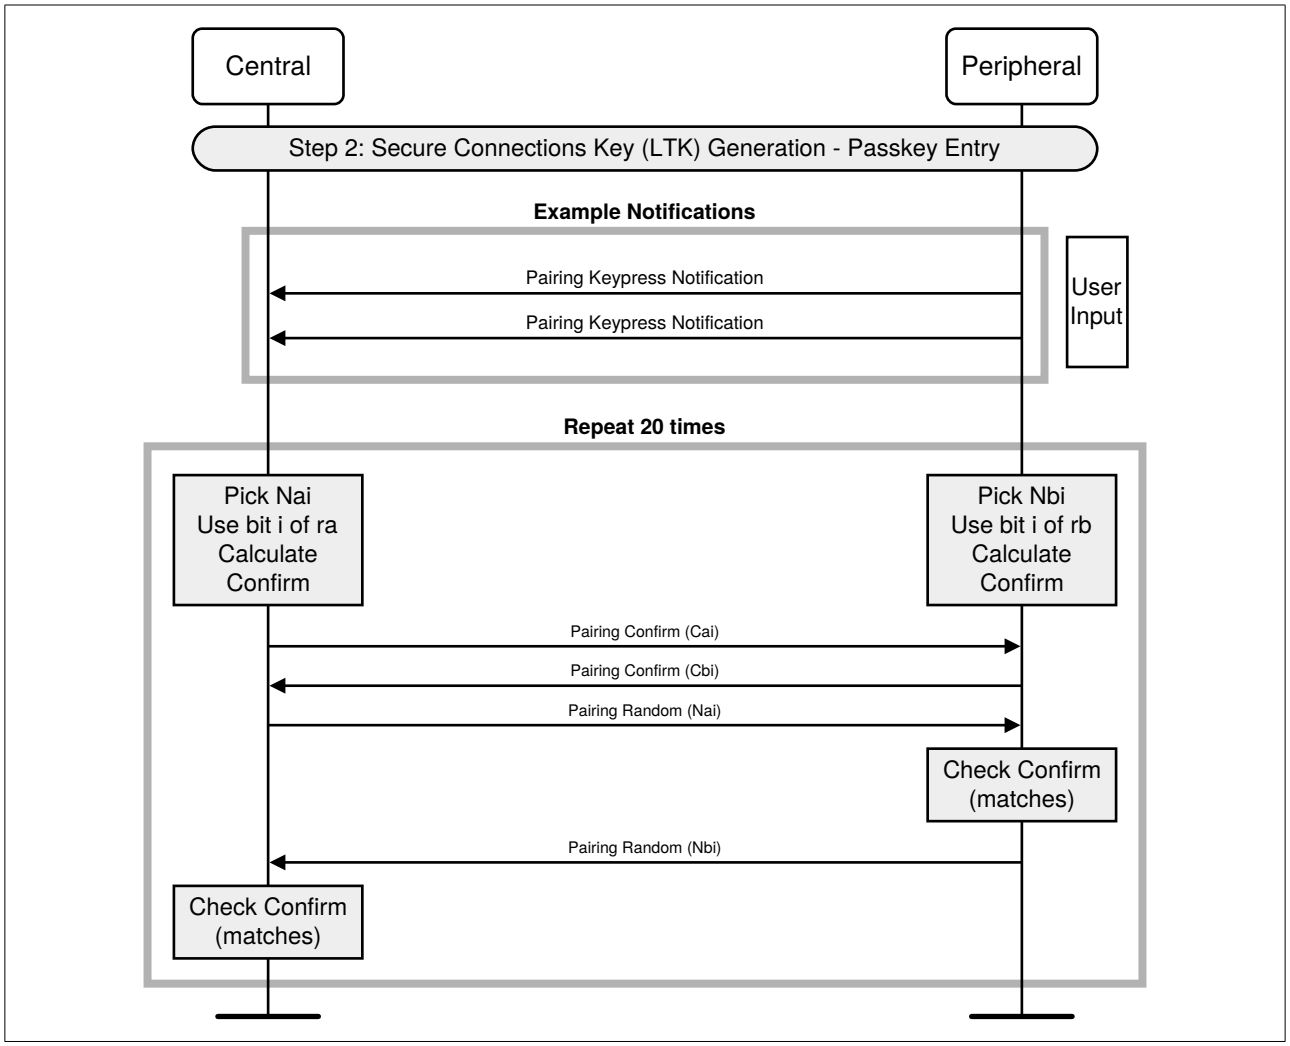

Figure C.12: Pairing Phase 2, authentication stage 1, Successful Passkey Entry

Note: Passkey Entry may prolong pairing experience because of the time required to execute 20 repetitions over SMP.

C.2.2.2.6 Passkey Entry – Confirm Check failure on the Responder side

If during one of the 20 repetitions, the Confirm calculated by the Responder is not equal to the one received from the Initiator, the Responder will abort the Pairing process by sending Pairing Failed with reason “Confirm Value Failed.”

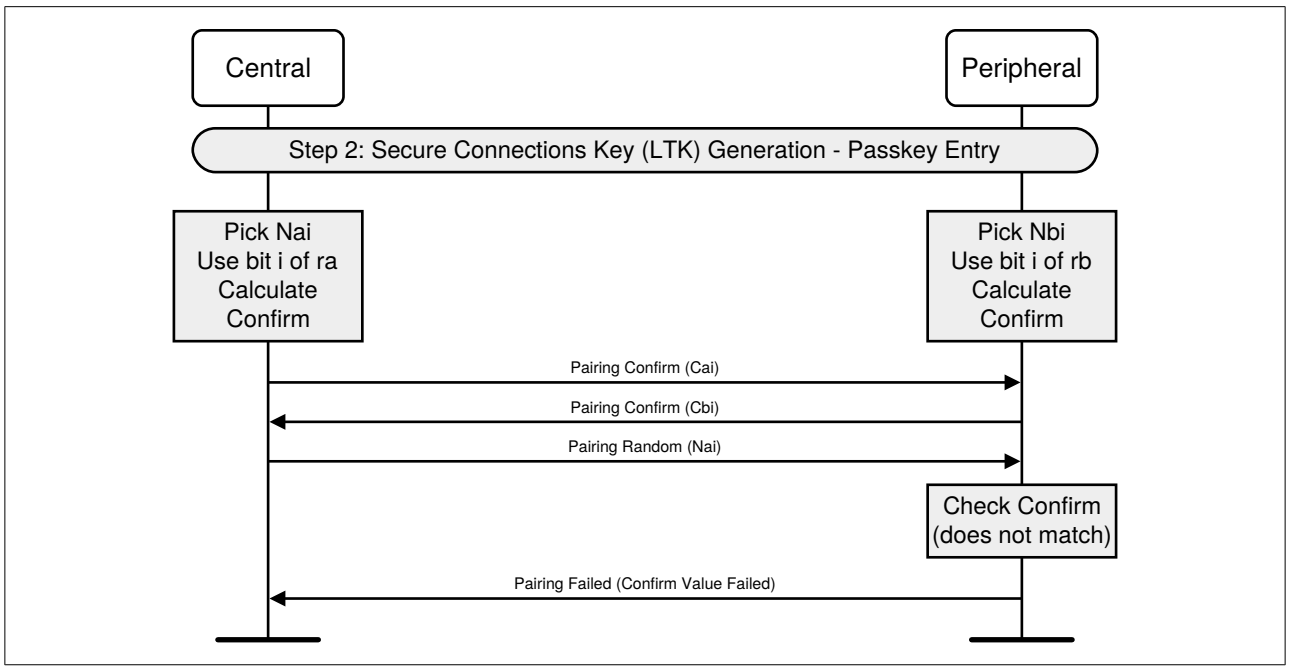

Figure C.13: Pairing Phase 2, authentication stage 1, Passkey Entry – Confirm Check failure on Responder side

C.2.2.2.7 Passkey Entry – Confirm Check failure on the Initiator side

If during one of the 20 repetitions, the Confirm calculated by the Initiator is not equal to the one received from the Responder, the Initiator will abort the Pairing process by sending Pairing Failed with reason “Confirm Value Failed”.

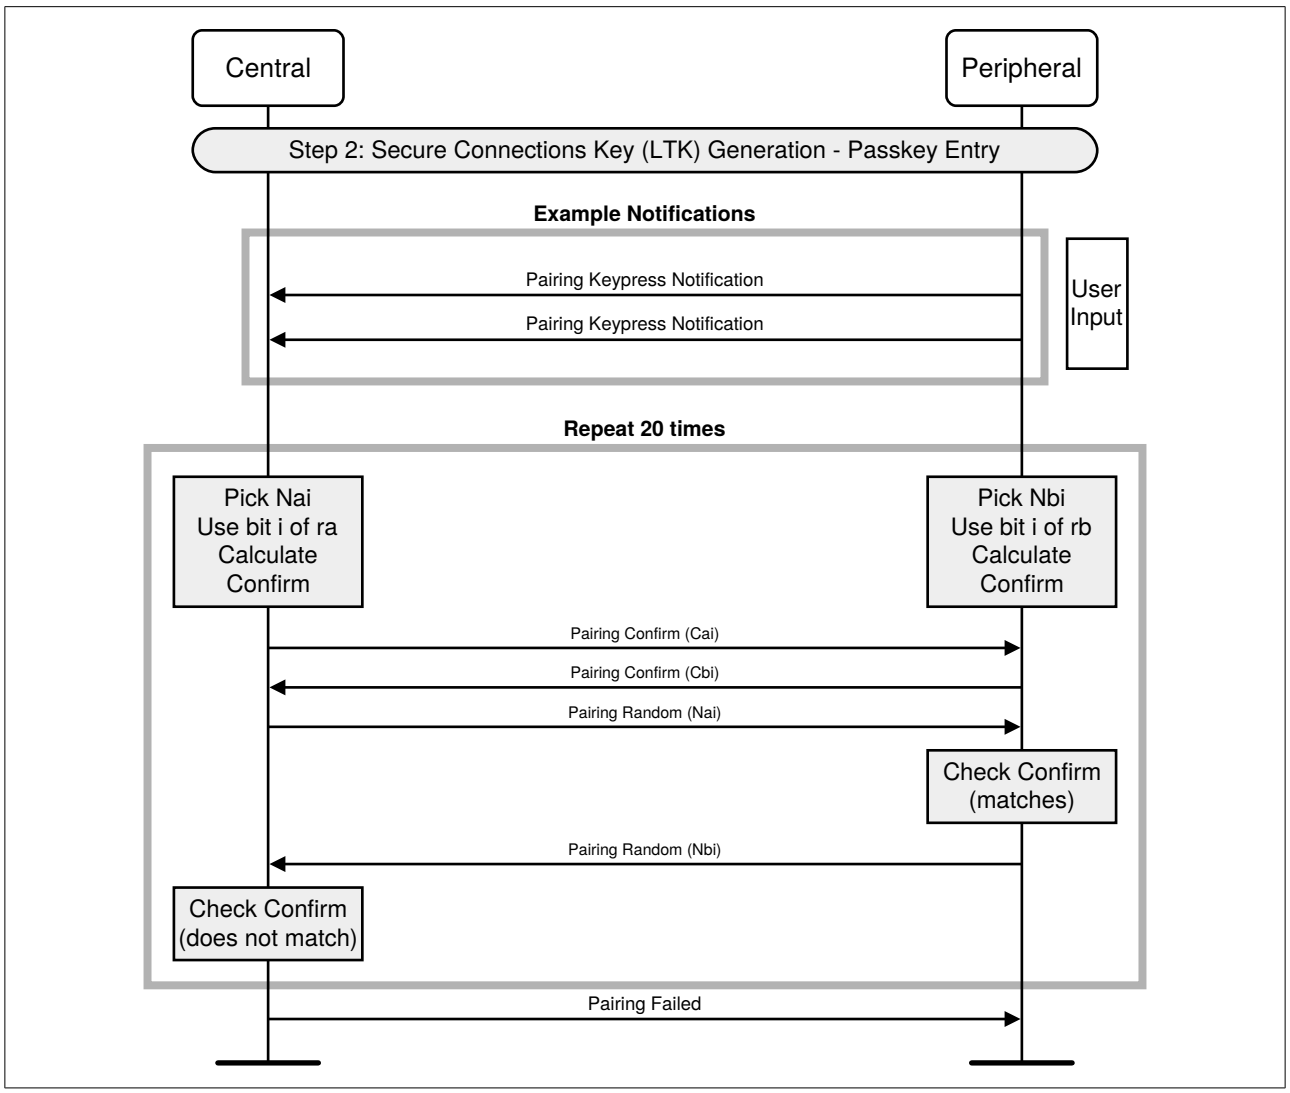

Figure C.14: Pairing Phase 2, authentication stage 1, Passkey Entry – Confirm Check failure on Initiator side

C.2.2.2.8 Passkey Entry failure on the Responding side

If the passkey entry fails on the responding side, Pairing is terminated.

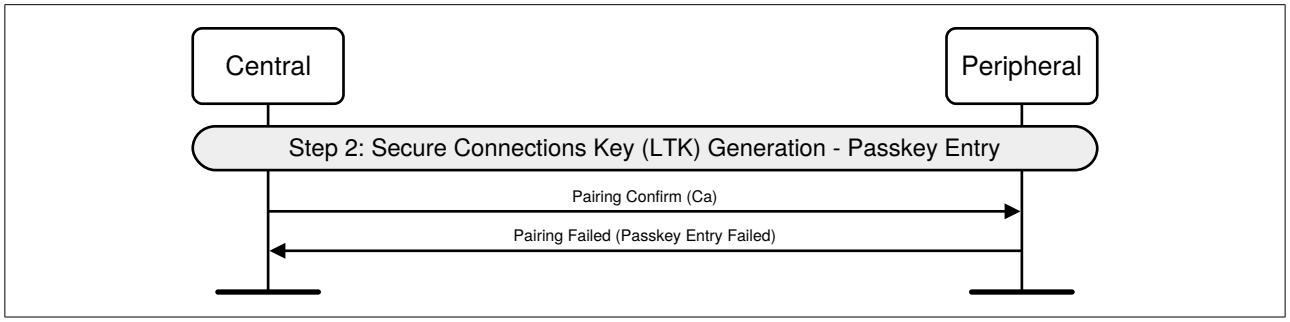

Figure C.15: Pairing Phase 2, authentication stage 1, Passkey Entry failure on Responding side

C.2.2.2.9 Passkey Entry Failure on the Initiator Side

If the passkey entry fails on the initiating side, Pairing is terminated.

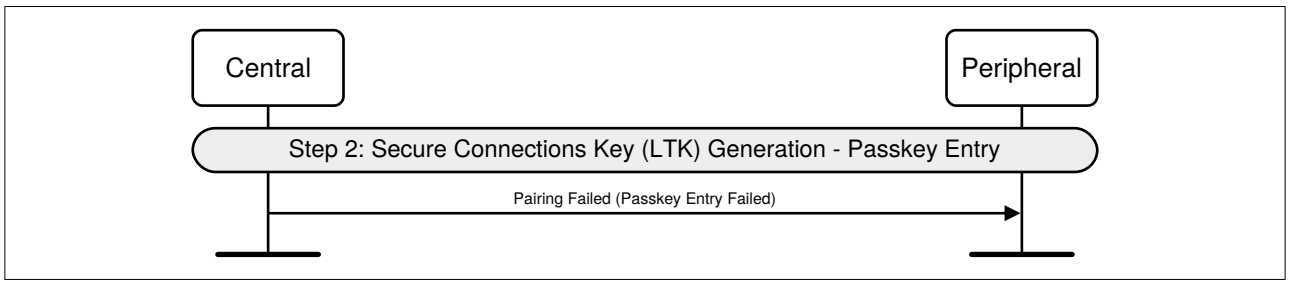

Figure C.16: Pairing Phase 2, authentication stage 1, Passkey Entry failure on Initiator side

C.2.2.2.10 Successful Out of Band

The OOB authentication will only be done when at least one device has some OOB information to use. This step requires no user interaction.

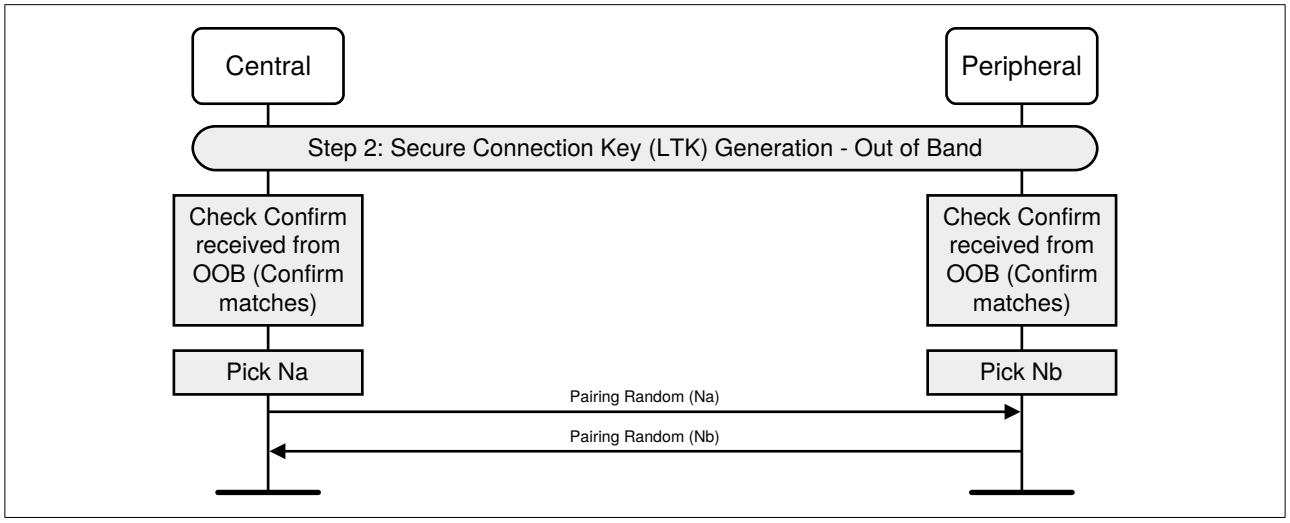

Figure C.17: Pairing Phase 2, authentication stage 1, successful Out of Band

C.2.2.2.11 Out of Band – Confirm Check failure on the Responder side

If the Confirm value received from OOB is not equal to the calculated Confirm value, the Responder will abort the Pairing process by sending Pairing Failed with reason “Confirm Value Failed”.

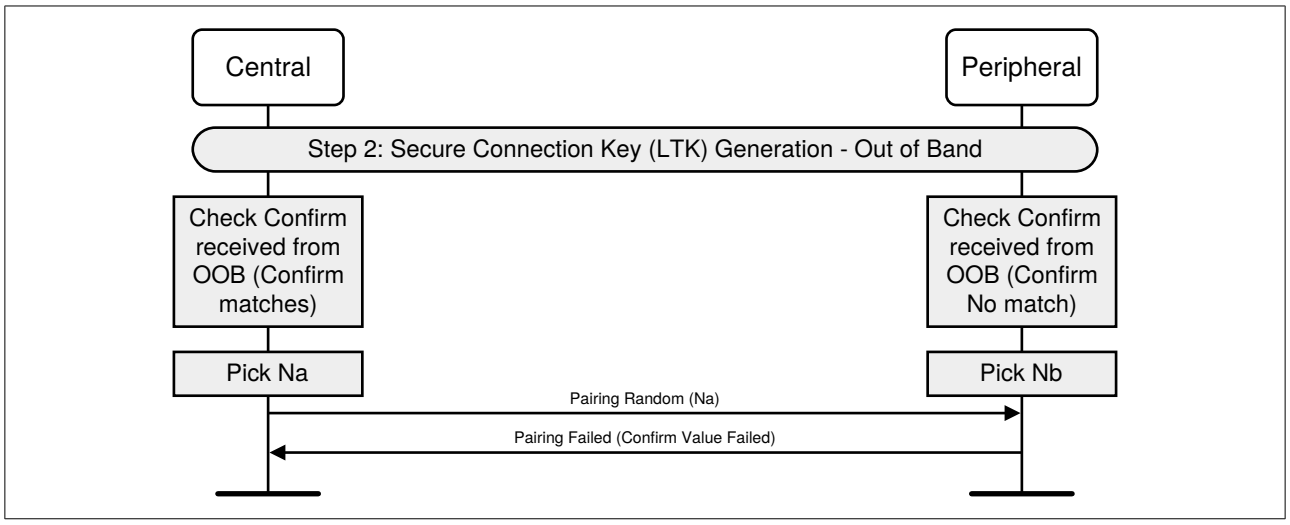

Figure C.18: Pairing Phase 2, authentication stage 1, Out of Band – Confirm Check failure on Responder side

C.2.2.2.12 Out of Band - Confirm Check failure on the Initiating side

If the Confirm value received from OOB is not equal to the calculated Confirm value, the Initiator will abort the Pairing process by sending Pairing Failed with reason "Confirm Value Failed".

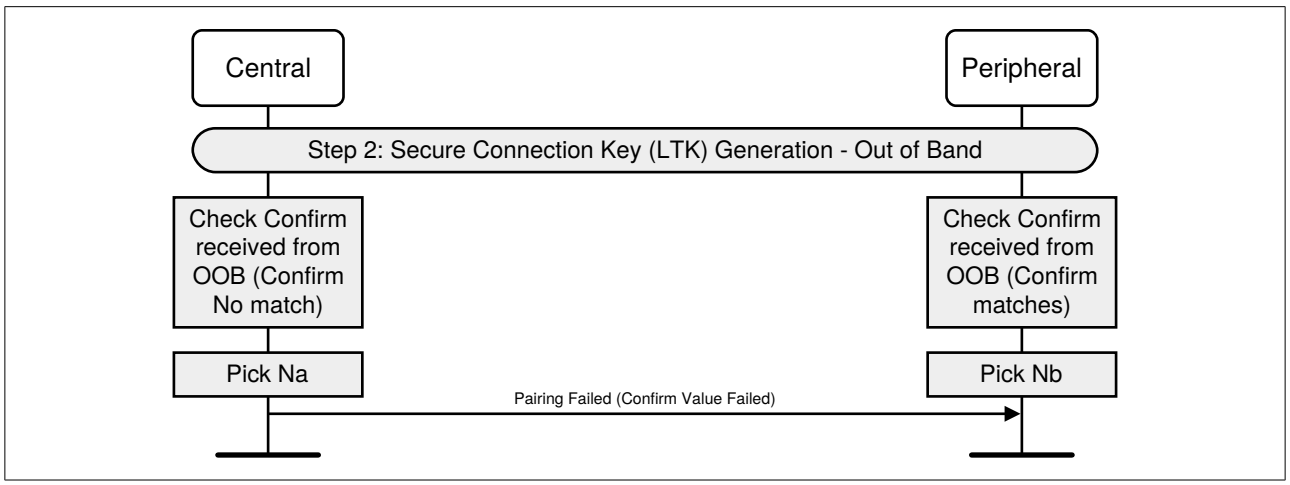

Figure C.19: Pairing Phase 2: authentication stage 1, Out of Band – Confirm Check failure on Initiator side

C.2.2.2.13 Out of Band Failure on the Initiator side (OOB information not available)

If the initiating side does not have the responder's OOB information, Pairing is terminated.

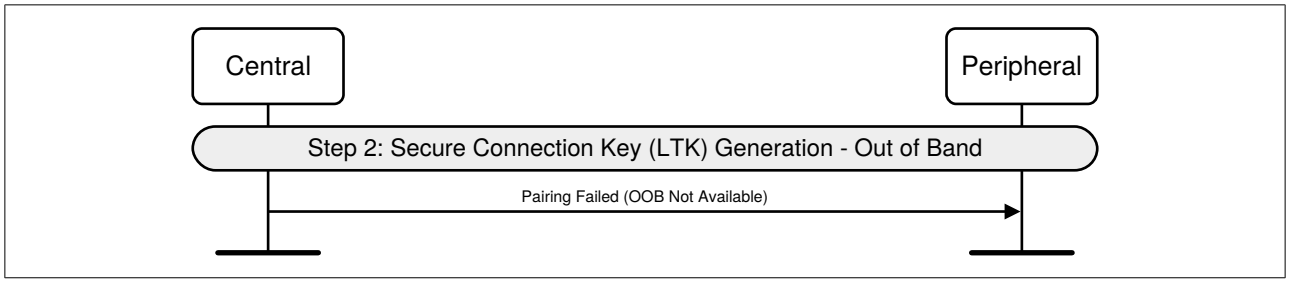

Figure C.20: Pairing Phase 2, authentication stage 1, Out of Band failure on Initiator side

C.2.2.2.14 Out of Band Failure on the Responding side (OOB information not available)

If the responding side does not have the initiator's OOB information, Pairing is terminated.

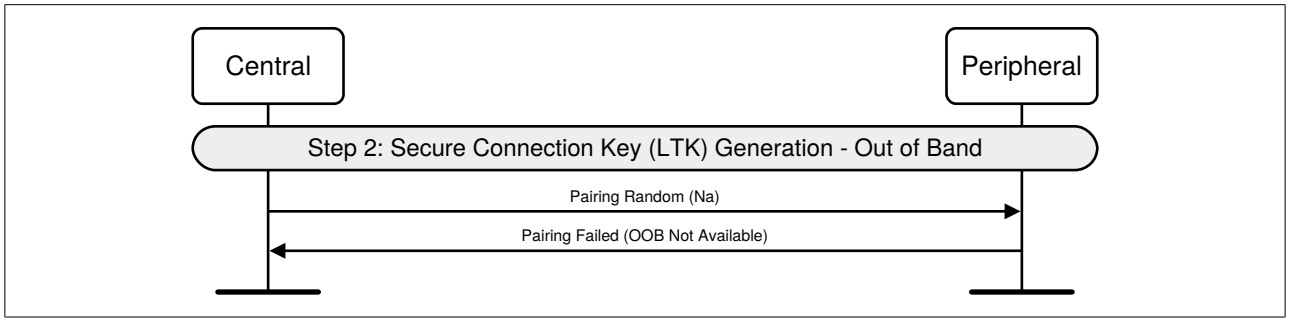

Figure C.21: Pairing Phase 2, authentication stage 1, Out of Band failure on Responding side

C.2.2.3 Long Term Key calculation

Once the DHKey generation is complete, the Long Term Key (LTK) is calculated from the DHKey.

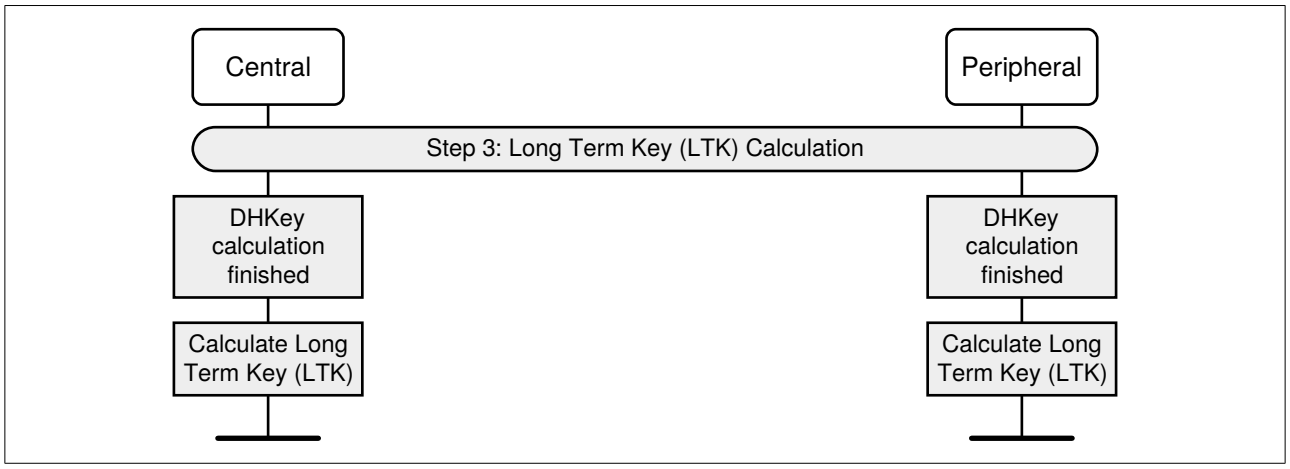

Figure C.22: Long Term Key calculation

C.2.2.4 Authentication stage 2 (DHKey checks)

Once the LTK calculation and authentication stage 1 have completed, the DHKey value generated is checked by exchanging DHKey Check values generated using the DHKey.

If this succeeds, then both devices would have finished displaying information to the user about the process, and therefore the Host can stop displaying this information.

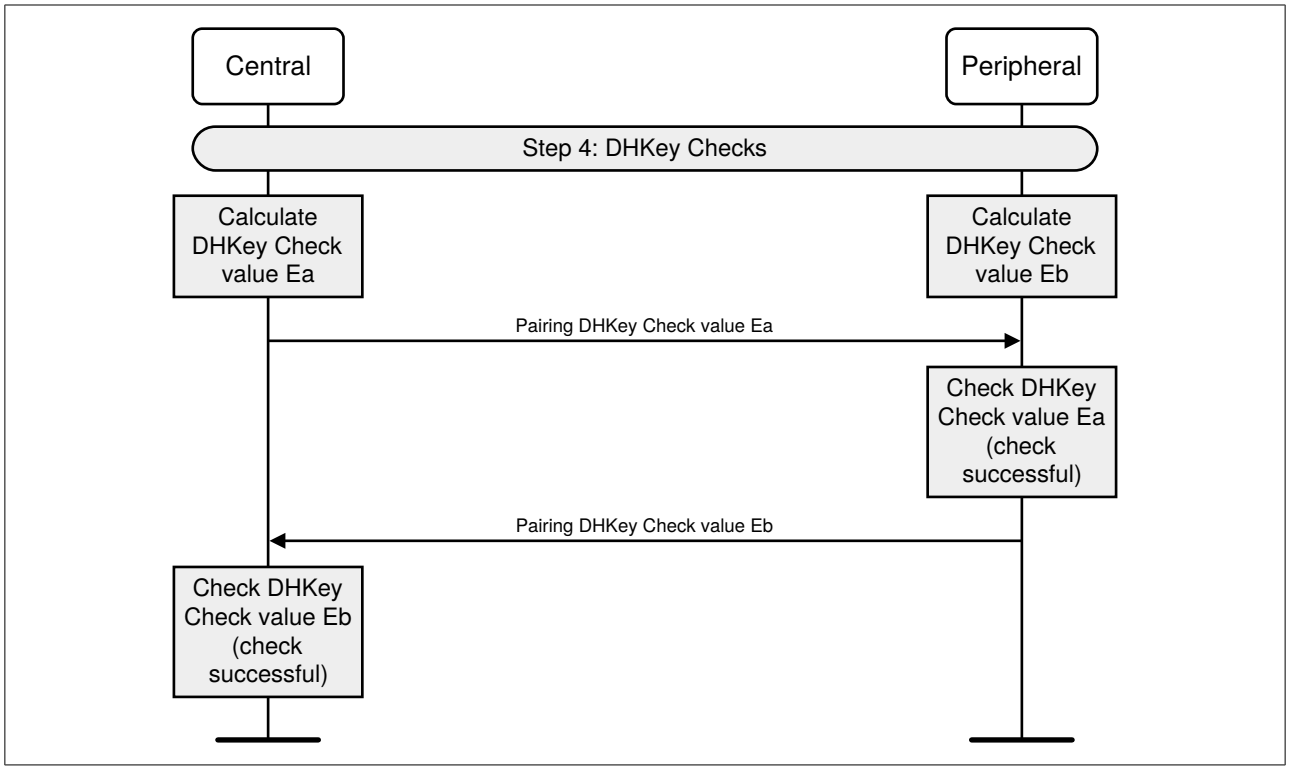

Figure C.23: Pairing Phase 2, authentication stage 2, DHKey checks

C.3 Phase 3: Transport specific key distribution

After short term key generation and the link has been encrypted, transport specific keys are distributed. Figure C.24 shows an example of all keys and values being distributed by Central and Peripheral.

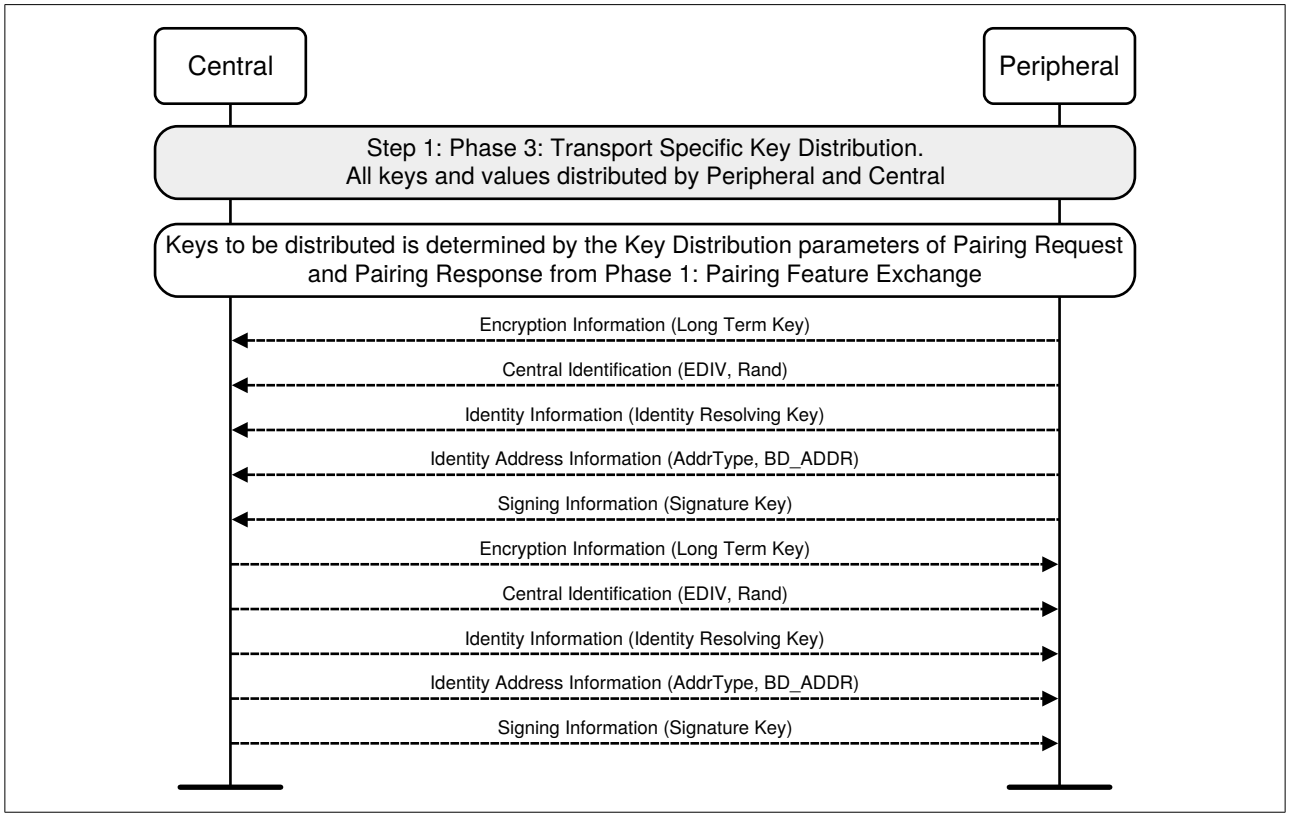

Figure C.24: Transport specfic key distribution

C.4 Security re-established using previously distributed LTK

Devices may re-establish security using a previously distributed LTK. The Central always initiates the encryption procedures, and therefore there are two possible sequences: Central initiated and Peripheral requested.

C.4.1 Central initiated security - Central initiated Link Layer encryption

The Central initiates encryption procedures. There is no SM signaling to enable this; the Central initiates Link Layer encryption only. See [Vol 6] Part D, Section 6.6.

C.4.2 Peripheral security request - Central initiated Link Layer encryption

The Peripheral may request the Central initiates security procedures. Figure C.25 shows an example where the Peripheral requests security and the Central initiates Link Layer encryption.

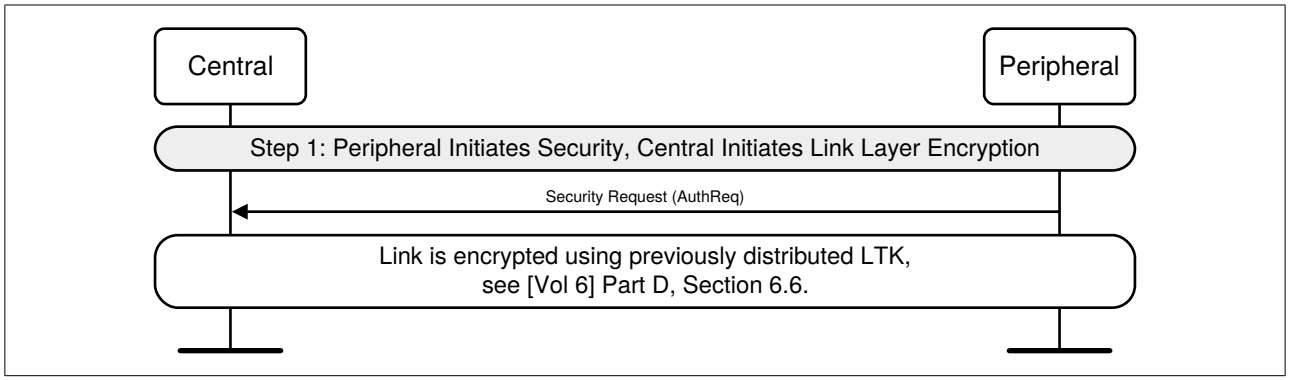

Figure C.25: Peripheral security request, Central initiates Link Layer encryption

C.5 Failure conditions

The following sequences show possible failure conditions and their associated signaling.

C.5.1 Pairing not supported by Peripheral

If the Peripheral does not support pairing or pairing cannot be performed the Peripheral can reject the request from the Central. Figure C.26 shows the Peripheral rejecting a Pairing Request command from the Central.

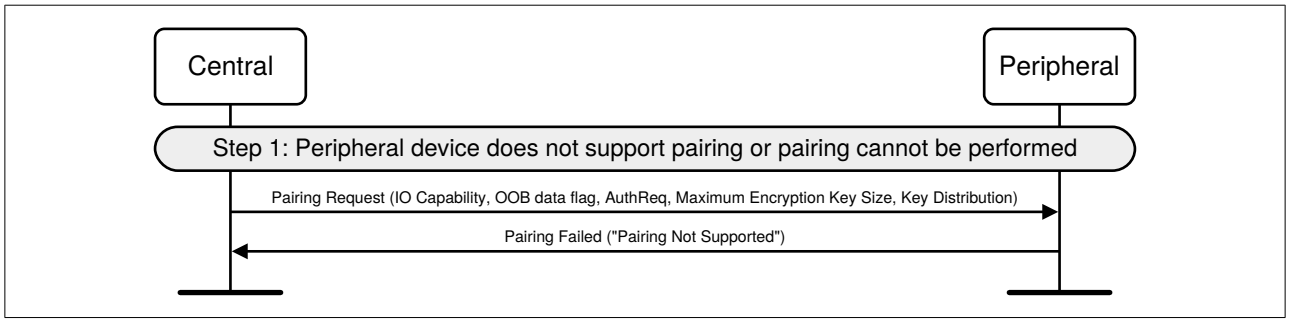

Figure C.26: Peripheral rejects pairing attempt

C.5.2 Central rejects pairing because of key size

During Pairing Feature Exchange the size of the Encryption Key is negotiated. Figure C.27 shows an example where the Central terminates the pairing procedure because the resulting key size is not acceptable.

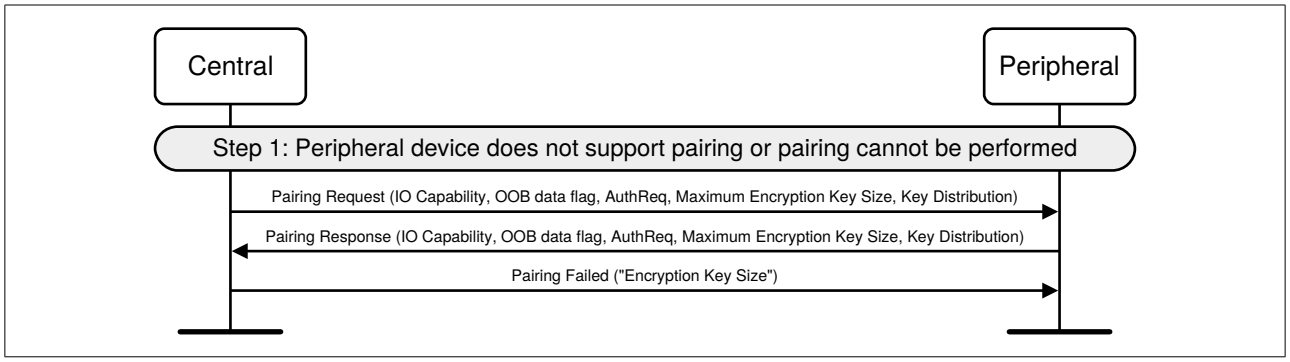

Figure C.27: Central rejects pairing because of key size

C.5.3 Peripheral rejects pairing because of key size

During Pairing Feature Exchange the size of the Encryption Key is negotiated. Figure C.28 shows an example where the Peripheral terminates the pairing procedure because the resulting key size is not acceptable.

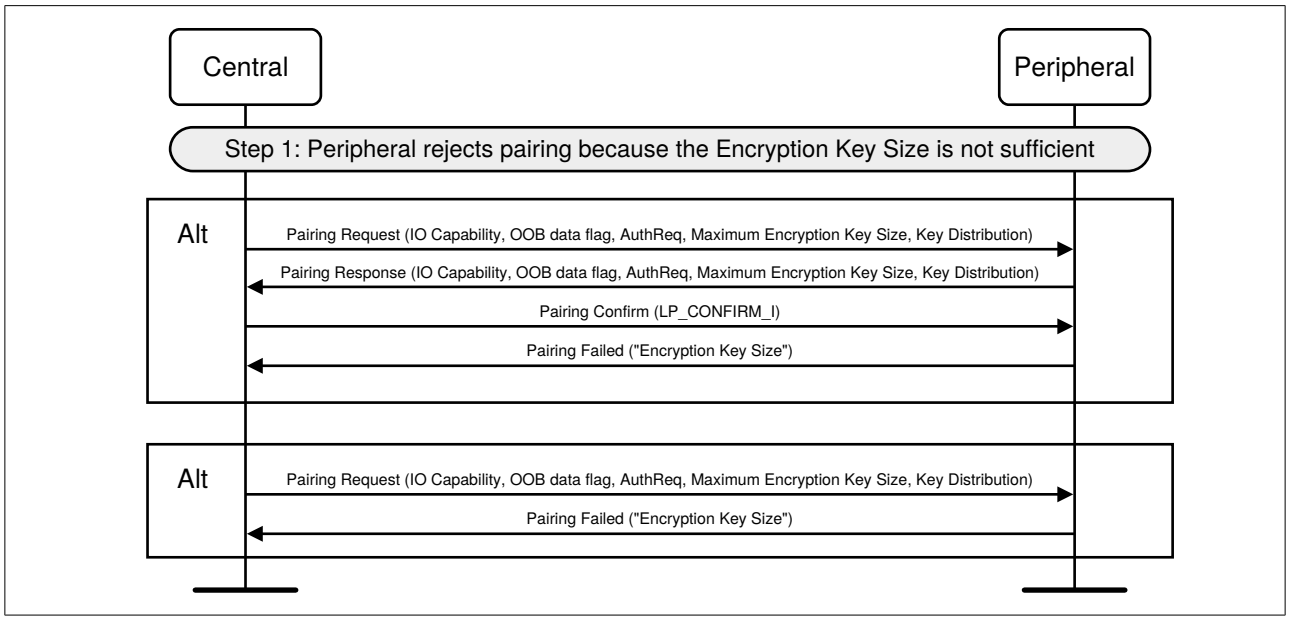

Figure C.28: Peripheral rejects pairing because of key size

C.5.4 Passkey Entry failure on Central

During Passkey Entry pairing the user enters a passkey on both devices. Figure C.29 shows an example where the passkey entry fails on the Central.

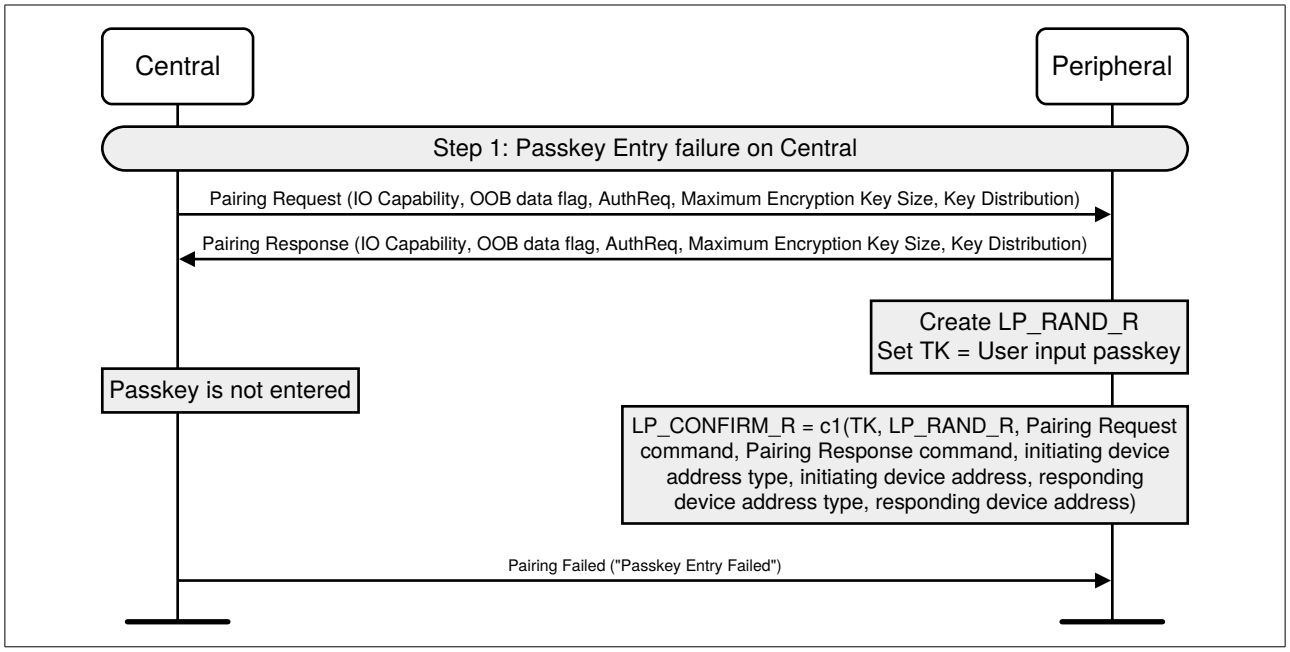

Figure C.29: Passkey Entry failure on Central

C.5.5 Passkey Entry failure on Peripheral

During Passkey Entry pairing the user enters a passkey on both devices. Figure C.30 shows an example where the passkey entry fails on the Peripheral.

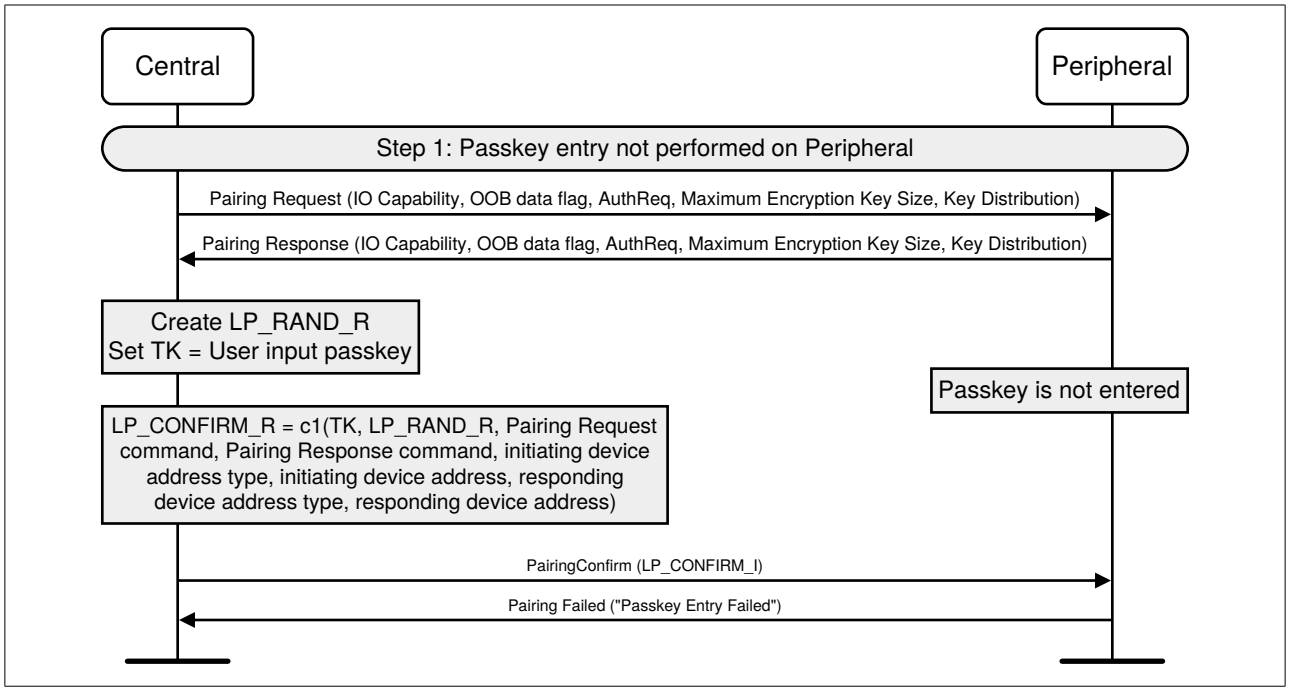

Figure C.30: Passkey Entry failure on Peripheral

C.5.6 Peripheral rejects Central's confirm value

During Passkey Entry pairing the user enters a passkey on both devices. Figure C.31 shows an example where a different passkey is entered on both devices. This sequence could also occur if any of the inputs to c1 (Passkey, LP_RAND_I, LP_RAND_R, Pairing

Request command, Pairing Response command, address types or addresses) are incorrect or altered.

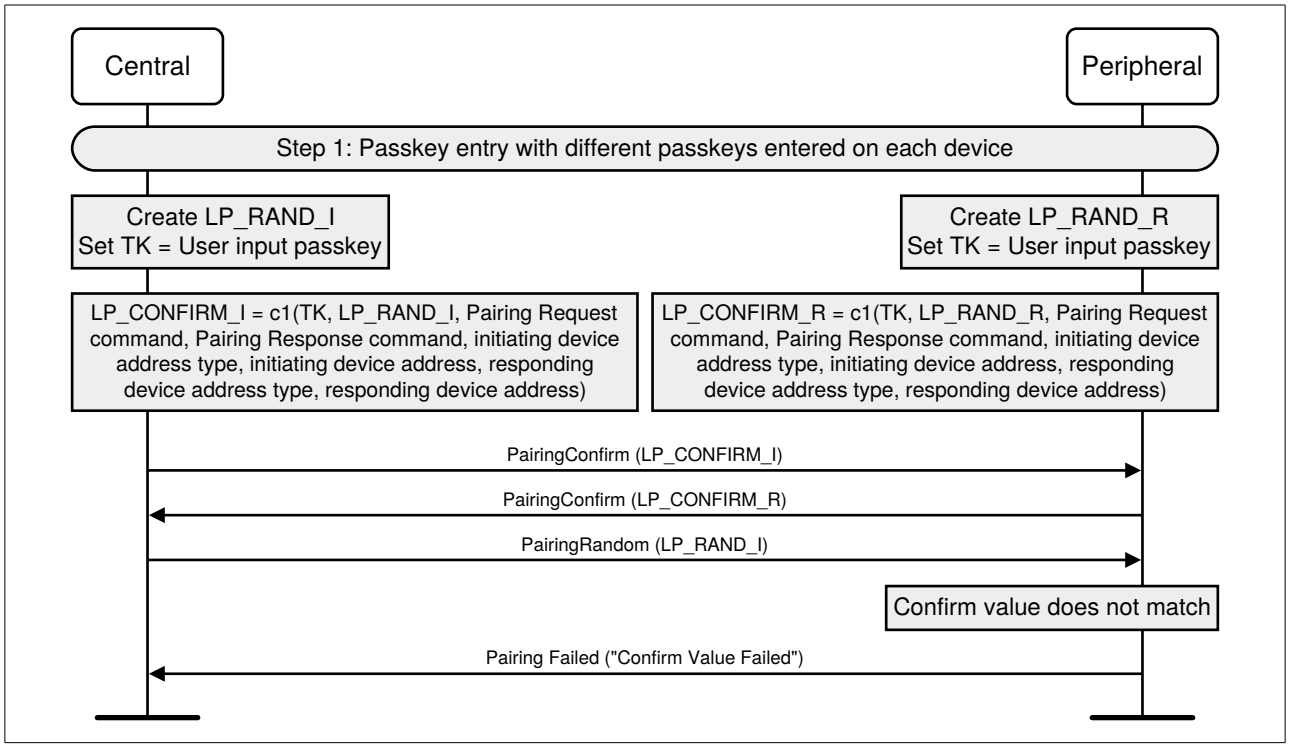

Figure C.31: Different passkeys entered

C.5.7 Central rejects Peripheral's confirm value

During all the pairing methods the Central and Peripheral send random numbers and confirm values. Figure C.32 shows an example where the Central rejects pairing because it cannot verify the confirm value from the Peripheral because any of the

inputs to c1 (Passkey, LP_RAND_I, LP_RAND_R, Pairing Request command, Pairing Response command, address types or addresses) are incorrect or altered.

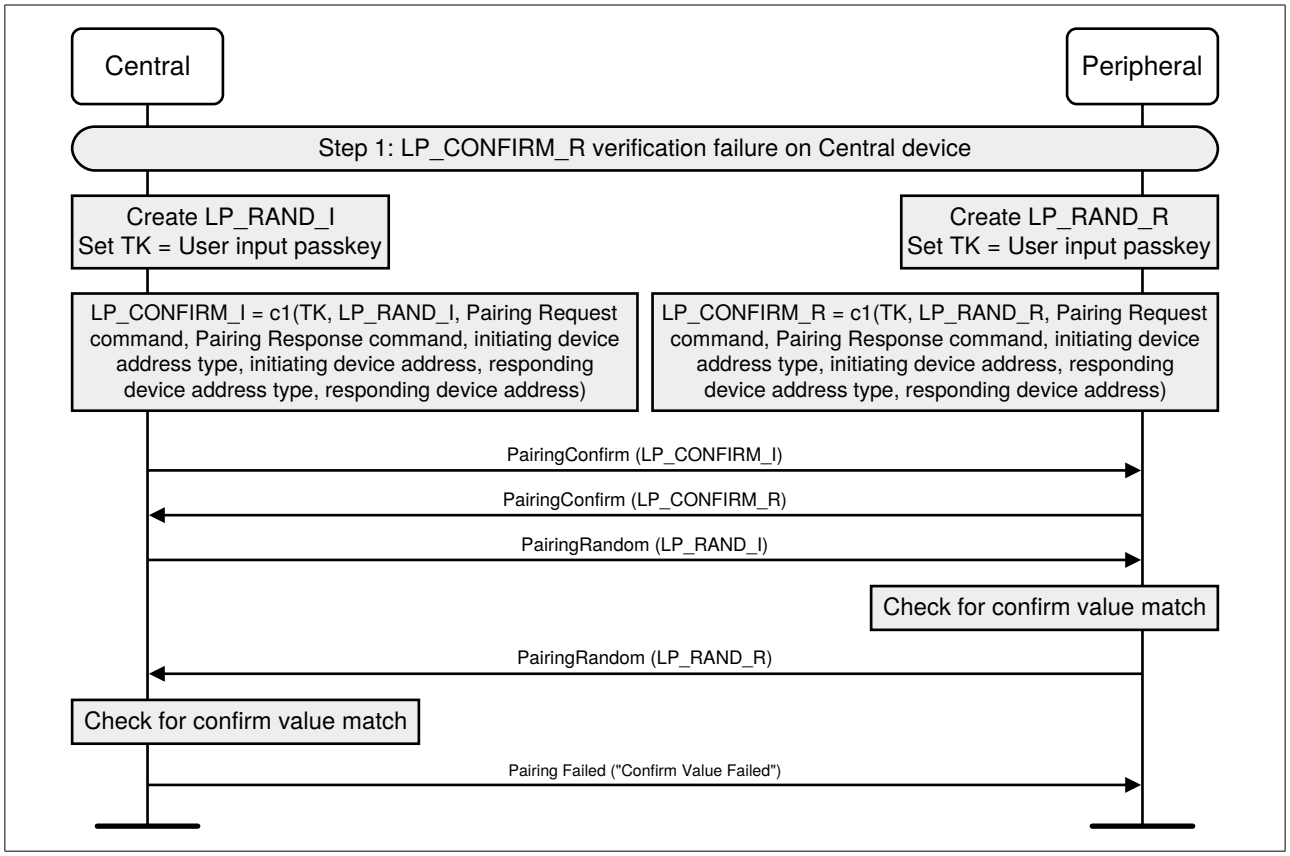

Figure C.32: Central rejects LP_CONFIRM_R value from Peripheral

Appendix D Sample data

In each data set in this section, the bytes are ordered from most significant on the left to least significant on the right. ‘M’ represents the message byte array for which the AES CMAC is calculated.

D.1 AES-CMAC RFC4493 test vectors

The following test vectors are referenced from RFC4493.

Host Controller Interface

Specification of the *Bluetooth*® System

Volume 4

Covered Core Package Version: v6.1

Version Date: 2025-04-29

UART TRANSPORT LAYER

This Part describes the UART transport layer (between the Host and the Controller). HCI command, event, and data packets flow through this layer, but the layer does not decode them.

CONTENTS

1 GENERAL

The objective of this HCI UART Transport Layer is to make it possible to use the Bluetooth HCI over a serial interface between two UARTs on the same PCB. The HCI UART Transport Layer assumes that the UART communication is free from line errors.

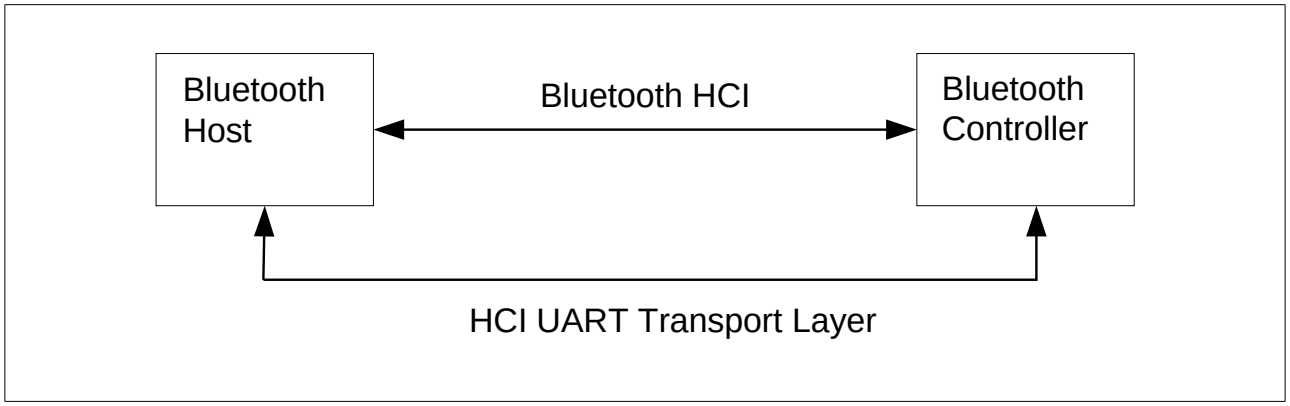

Figure 1.1: HCI UART Transport Layer

See [Vol 4] Part D for an alternative UART transport layer for use in the presence of line errors.

2 PROTOCOL

There are five kinds of HCI packets that can be sent via the UART Transport Layer; i.e. HCI Command packet, HCI Event packet, HCI ACL Data packet, HCI Synchronous Data packet, and HCI ISO Data packet (see [Vol 4] Part E, Section 5.4). HCI Command packets can only be sent to the Bluetooth Controller, HCI Event packets can only be sent from the Bluetooth Controller, and HCI ACL/Synchronous/ISO Data Packets can be sent both to and from the Bluetooth Controller.

HCI does not provide the ability to differentiate the five HCI packet types. Therefore, if the HCI packets are sent via a common physical interface, an HCI packet indicator has to be added according to Table 2.1 below.

HCI packet type	HCI packet indicator
HCI Command packet	0x01
HCI ACL Data packet	0x02
HCI Synchronous Data packet	0x03
HCI Event packet	0x04
HCI ISO Data packet	0x05

Table 2.1: HCI packet indicators

The HCI packet indicator shall be sent immediately before the HCI packet. All five kinds of HCI packets have a length field, which is used to determine how many bytes are expected for the HCI packet. When an entire HCI packet has been received, the next HCI packet indicator is expected for the next HCI packet. Over the UART Transport Layer, only HCI packet indicators followed by HCI packets are allowed.

3 RS232 SETTINGS

The HCI UART Transport Layer uses the following settings for RS232:

Baud rate:	**manufacturer-specific**
Number of data bits:	8
Parity bit:	no parity
Stop bit:	1 stop bit
Flow control:	RTS/CTS
Flow-off response time:	manufacturer specific

Table 3.1: RS232 settings

Flow control with RTS/CTS is used to prevent temporary UART buffer overrun. It should not be used for flow control of HCI, since HCI has its own flow control mechanisms for HCI commands, HCI events and HCI data.

If CTS is 1, then the Host/Controller is allowed to send.

If CTS is 0, then the Host/Controller is not allowed to send.

The flow-off response time defines the maximum time from setting RTS to 0 until the byte flow actually stops.

The RS232 signals should be connected in a null-modem fashion; i.e. the local TXD should be connected to the remote RXD and the local RTS should be connected to the remote CTS and vice versa.

4 ERROR RECOVERY

If the Host or the Controller lose synchronization in the communication over RS232, then a reset is needed. A loss of synchronization means that an incorrect HCI packet indicator has been detected, or that the length field in an HCI packet is out of range.

If the UART synchronization is lost in the communication from Host to Controller, then the Controller shall send an HCI_Hardware_Error event to tell the Host about the synchronization error. The Controller will then expect to receive an HCI_Reset command from the Host in order to perform a reset. The Controller will also use the HCI_Reset command in the byte stream from Host to Controller to re-synchronize.

If the UART synchronization is lost in the communication from Controller to Host, then the Host shall send the HCI_Reset command in order to reset the Controller. The Host shall then re-synchronize by looking for the HCI_Command_Complete event for the HCI_Reset command in the byte stream from Controller to Host.

USB TRANSPORT LAYER

This Part describes the USB transport layer (between a Host and the Controller). HCI commands flow through this layer, but the layer does not decode the commands.

CONTENTS

1 OVERVIEW

This document discusses the requirements of the Universal Serial Bus (USB) interface for Bluetooth hardware. Readers should be familiar with USB, USB design issues, Advanced Configuration Power Interface (ACPI), the overall Bluetooth architecture, and the basics of the radio interface.

The reader should also be familiar with the Bluetooth Host Controller interface.

Referring to Figure 1.1, notice that this document discusses the implementation details of the two-way arrow labeled “USB Function.”

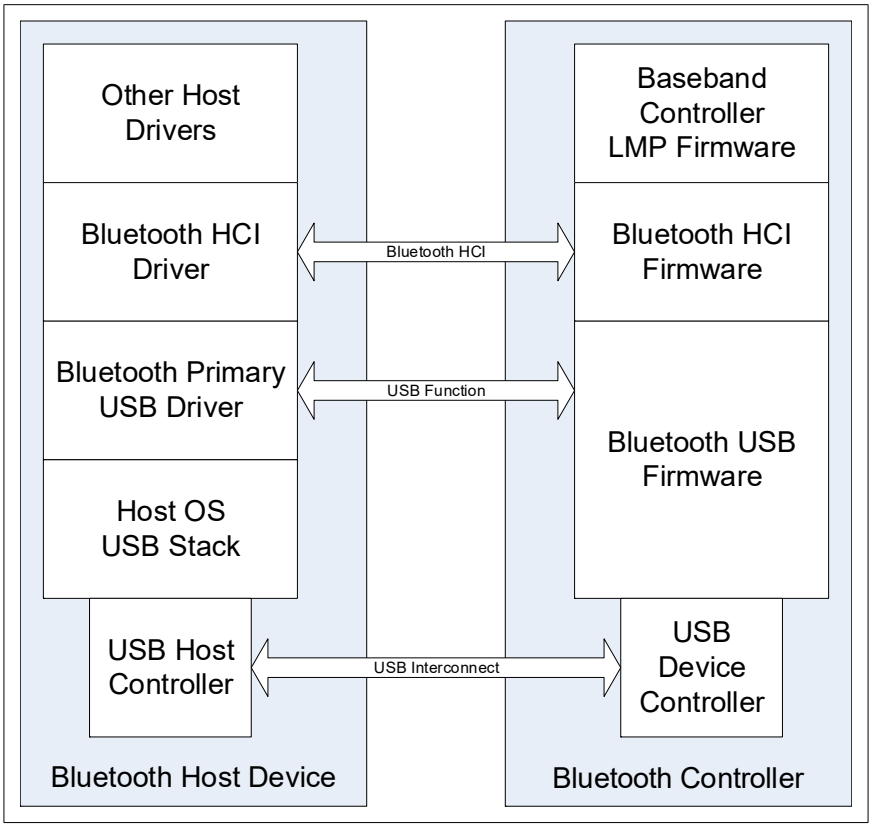

Figure 1.1: Relationship between the Host and Bluetooth Controller

The USB hardware can be embodied in one of several ways:

1. As a USB dongle (e.g. cabled USB)
2. As a USB module integrated into the product and connected internally via a cable or connector

3. Integrated onto the motherboard of a notebook PC or other device and connected via circuit board traces with standard USB, Inter-Chip USB or High Speed Inter-Chip USB
4. Integrated as a subsystem on a single-chip System-on-Chip (SoC) design connected on-chip as part of a compound device.

Finally, for an overview of the connection that is established between two Bluetooth devices, reference Figure 1.2.

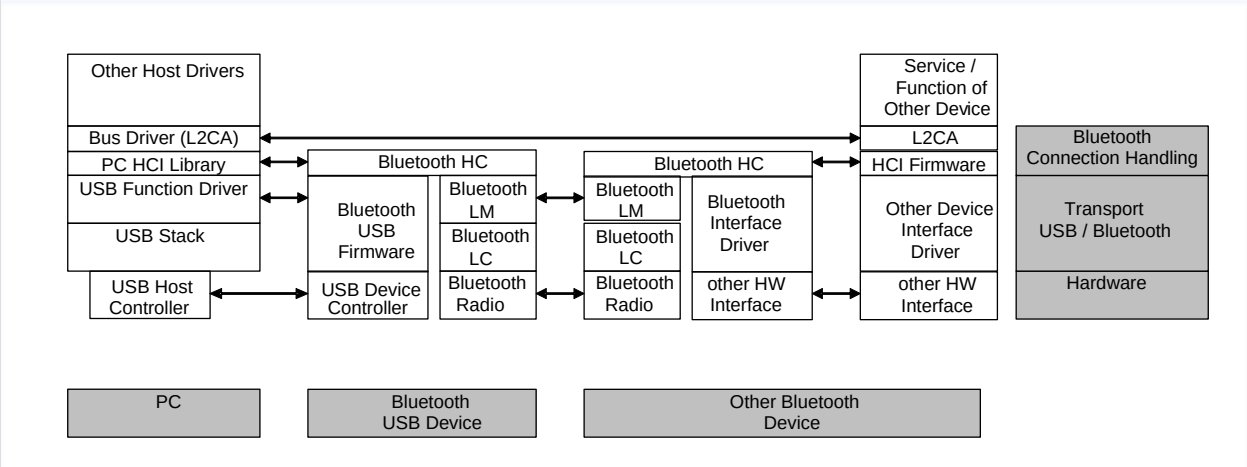

Figure 1.2: Flow of data from one Bluetooth device to another

2 USB ENDPOINT EXPECTATIONS

This section outlines specific USB endpoints that are required in order to function properly with the Host. This section assumes a basic familiarity with USB. The endpoint numbers (labeled 'Suggested Endpoint Address' below) may be dynamically recognized upon driver initialization – this depends on the implementation.

2.1 Descriptor overview

The Universal Serial Bus is intended for high data rates. USB defines several physical layers, ranging from 1.5 Mb/s to several Gb/s of bus bandwidth. A Bluetooth USB device should provide a USB transport with sufficient bus bandwidth to support the Bluetooth radio transports included in the device.

2.1.1 Controller descriptors

The Controller configuration consists of two interfaces. The first interface has no alternate settings and contains the bulk and interrupt endpoints. The second interface provides scalable isochronous bandwidth. The recommended configuration for the second interface has four alternate settings that provide different bandwidth. The default interface is empty so that the device is capable of scaling down to zero isochronous bandwidth.

An HCI packet consisting of an HCI header and HCI data shall be contained in one USB Transfer. A USB transfer is defined by the USB specification as one or more USB transactions that contain the data from one IO request. For example, an ACL data packet containing 256 bytes (both HCI header and HCI data) would be sent over the bulk endpoint in one IO request. That IO request will require four 64-byte full speed USB Transactions or a single 256-byte High-speed USB Transaction, and forms a Transfer. If the Maximum Packet Size for the endpoint on which the transfer is sent is 64 bytes, then that IO request will require four 64-byte USB transactions.

The endpoints are spread across two interfaces so that when adjusting isochronous bandwidth consumption (via select interface calls), any pending bulk and/or interrupt transactions do not have to be terminated or resubmitted.

Table 2.1 and the following example calculations illustrate recommended endpoint descriptor parameter values and how they are derived. The maximum packet sizes for control endpoints, interrupt endpoints and bulk endpoints may be any value allowed by the relevant USB core specifications. The maximum packet size for isochronous endpoints must be large enough to accommodate the maximum average traffic; they may be set to accommodate the largest HCI transfer, subject to the capabilities of the

Controller. In Table 2.1, the service interval is assumed to be 1 millisecond, for USB Full Speed (FS) frames.

Examples:

1. For a single 8 kHz audio channel with of 64 kb/s CVSD audio the Host may break HCI data into one USB transfers for each USB frame (e.g. 1 ms); in that case, the max packet size must be at least 11 = 3 octet HCI header + 8 octets of data. To reduce HCI header overhead, a common strategy (see Table 2.2) is to consolidate 3 ms of data into a 27 octet HCI packet of 24 octets of data + 3 octets of HCI header. These HCI packets can be exchanged as a single USB transfer on 3 ms intervals; this requires a max packet size of 27÷3 = 9 octets per 1 millisecond USB Full Speed Frame.
2. For two 8 kHz audio channels of 64 kb/s CVSD audio the Host may double the payload size of each HCI packet, which would be 3 octets HCI header + 48 octets of data = 51 octets. Posting these at 3 ms intervals requires 51÷3 = 17 octets of maximum packet size.
3. For one 16 kHz audio channel the HCI packets need to be large enough to accommodate single octet (128 kb/s) or 2-octet (256 kb/s) encoding. On 3 ms intervals, these would have to be (48+3)÷3 = 17 octets or (96+3)÷3 = 33 octets respectively.
4. For one mSBC[1] compressed wideband audio channel the HCI packets will be 3 octets of HCI header + 60 octets of data. If the Controller can support a maximum packet size of 63 (or 64) octets, an entire mSBC frame may be exchanged in one USB transaction. If the maximum packet size is smaller than 63 octets, additional latency will be introduced. The USB Host Controller will reserve bandwidth that will only be used when the Bluetooth Host or Controller has data to transfer.
5. For combinations of audio channels, if the max packet size can accommodate the largest HCI packets, there is also sufficient bandwidth for the audio channels that have smaller HCI packets. See example 4 above.

Table 2.1 outlines a recommended configuration for a USB Full Speed device.

Interface Number	Alternate Setting	Suggested Endpoint Address	Endpoint Type	Suggested Max Packet Size	USB Polling Interval/HCI Packet Interval
HCI commands					
none	*none*	0x00	Control	8/16/32/64	*none*

[1]For information about modified Sub Band Codec (mSBC), see Hands-Free Profile v1.6 or later

Interface Number	Alternate Setting	Suggested Endpoint Address	Endpoint Type	Suggested Max Packet Size	USB Polling Interval/HCI Packet Interval
HCI events					
0	0	0x81	Interrupt (IN)	16	variable
ACL Data					
0	0	0x82	Bulk (IN)	32/64	variable
0	0	0x02	Bulk (OUT)	32/64	variable
No active voice channels (for USB compliance)					
1	0	0x83	Isoch (IN)	0	*none*
1	0	0x03	Isoch (OUT)	0	*none*
One 8 kHz voice channel with 8-bit encoding					
1	1	0x83	Isoch (IN)	9	1 ms/3 ms
1	1	0x03	Isoch (OUT)	9	1 ms/3 ms
Two 8 kHz voice channels with 8-bit encoding or one 8 kHz voice channel with 16-bit encoding					
1	2	0x83	Isoch (IN)	17	1 ms/3 ms
1	2	0x03	Isoch (OUT)	17	1 ms/3 ms
Three 8 kHz voice channels with 8-bit encoding					
1	3	0x83	Isoch (IN)	25	1 ms/3 ms
1	3	0x03	Isoch (OUT)	25	1 ms/3 ms
Two 8 kHz voice channels with 16-bit encoding or one 16 kHz voice channel with 16-bit encoding					
1	4	0x83	Isoch (IN)	33	1 ms/3 ms
1	4	0x03	Isoch (OUT)	33	1 ms/3 ms
Three 8 kHz voice channels with 16-bit encoding or one 8 kHz voice channel with 16-bit encoding and one 16 kHz voice channel with 16-bit encoding					
1	5	0x83	Isoch (IN)	49	1 ms/3 ms
1	5	0x03	Isoch (OUT)	49	1 ms/3 ms
One mSBC voice channel					
1	6	0x83	Isoch (IN)	63	1 ms/7.5 ms
1	6	0x03	Isoch (OUT)	63	1 ms/7.5 ms

Table 2.1: USB firmware interface and endpoint settings

The following two examples are used to demonstrate the flow of data given the described endpoints. Table 2.2 shows one voice channel and Table 2.3 shows two voice

channels. In both examples, the duration of the voice data is 3 ms per IO request and the encoding is 8 bits.

Time (ms)	USB data (header refers to HCI header) (Receive & Send from the Host)	Queued data (read / write)	Time (ms)	Air data	Amount Received/ Sent (ms)
0	Receive 0 bytes Send 9 bytes (3 header, 6 data)	0 / 6	0	Send 0	0 / 0
		10 / 6	0.625	Receive 10	1.25 / 0
1	Receive 0 bytes Send 9 bytes (9 bytes HCI data)	10 / 15	1.25	Send 0	1.25 / 0
		20 / 15	1.875	Receive 10	2.50 / 0
2	Receive 0 bytes Send 9 bytes (9 bytes HCI data)	20 / 24	2.50	Send 0	2.50 / 0
		30 / 24	3.125	Receive 10	3.75 / 0
3	Receive 9 bytes (3 header, 6 data) Send 9 bytes (3 header, 6 data)	24 / 20	3.75	Send 10	3.75 / 1.25
4	Receive 9 bytes (9 bytes data) Send 9 bytes (9 bytes HCI data)	25 / 29	4.375	Receive 10	5.0 / 1.25
5	Receive 9 bytes (9 bytes data) Send 9 bytes (9 bytes HCI data)	16 / 28	5.0	Send 10	5.0 / 2.50
		26 / 28	5.625	Receive 10	6.25 / 2.50
6	Receive 9 bytes (3 header, 6 data) Send 9 bytes (3 header, 6 data)	20 / 24	6.25	Send 10	6.25 / 3.75
		30 / 24	6.875	Receive 10	7.5 / 3.75
7	Receive 9 bytes (9 bytes data) Send 9 bytes (9 bytes HCI data)	21 / 23	7.5	Send 10	7.5 / 5.0
8	Receive 9 bytes (9 bytes data) Send 9 bytes (9 bytes HCI data)	22 / 32	8.125	Receive 10	8.75 / 5.0
		22 / 22	8.75	Send 10	8.75 / 6.25

Time (ms)	USB data (header refers to HCI header) (Receive & Send from the Host)	Queued data (read / write)	Time (ms)	Air data	Amount Received/ Sent (ms)
9	Receive 9 bytes (3 header, 6 data) Send 9 bytes (3 header, 6 data)	26 / 28	9.375	Receive 10	10.0 / 6.25
10	Receive 9 bytes (9 bytes data) Send 9 bytes (9 bytes HCI data)	17 / 27	10	Send 10	10.0 / 7.5
		27 / 27	10.625	Receive 10	11.25 / 7.5
11	Receive 9 bytes (9 bytes data) Send 9 bytes (9 bytes HCI data)	18 / 26	11.25	Send 10	11.25 / 8.75

Table 2.2: Example USB single-channel voice traffic data flow

Convergence is expected because the radio is sending out an average of eight bytes of voice data every millisecond and USB is sending eight bytes of voice data every millisecond.

Time (ms	USB data (header refers to HCI header) (Receive & Send from the Host)	Queued data (read / write)	Time (ms)	Air data	Amount Received / Sent (ms)
0	Receive 0 bytes for Channel #1 Send 17 bytes (3 header, 14 data) for Channel #1	C1- 0/14 C2- 0/0	0	Send 0 for C1	C1- 0/0 C2- 0/0
		C1- 20/14 C2- 0/0	0.625	Receive 20 for C1	C1- 2.5/0 C2- 0/0
1	Receive 0 bytes for Channel #1 Send 17 bytes (17 bytes HCI data) for Channel #1	C1- 20/31 C2- 0/0	1.25	Send 0 for C2	C1- 2.5/0 C2- 0/0
		C1- 20/31 C2- 20/0	1.875	Receive 20 for C2	C1- 2.5/0 C2- 2.5/0
2	Receive 0 bytes for Channel #1 Send 17 bytes (17 bytes HCI data) for Channel #1	C1- 20/28 C2- 20/0	2.50	Send 20 for C1	C1- 2.5/2.5 C2- 2.5/0

Time (ms	USB data (header refers to HCI header) (Receive & Send from the Host)	Queued data (read / write)	Time (ms)	Air data	Amount Received / Sent (ms)
		C1- 40/28 C2- 0/0	3.125	Receive 20 for C1	C1- 5.0/2.5 C2- 2.5/0
3	Receive 0 bytes for Channel #2 Send 17 bytes (3 header, 14 data) for Channel #2	C1- 40/28 C2- 20/14	3.75	Send 0 for C2	C1- 5.0/2.5 C2- 2.5/0
4	Receive 0 bytes for Channel #2 Send 17 bytes (17 bytes HCI data) for Channel #2	C1- 40/28 C2- 40/31	4.375	Receive 20 for C2	C1- 5.0/2.5 C2- 5.0/0
5	Receive 0 bytes for Channel #2 Send 17 bytes (17 bytes HCI data) for Channel #2	C1- 40/8 C2- 40/48	5.0	Send 20 for C1	C1- 5.0/5.0 C2- 5.0/0
		C1- 60/8 C2- 40/48	5.625	Receive 20 for C1	C1- 7.5/5.0 C2- 5.0/0
6	Receive 17 bytes (3 header, 14 data) for Channel #1 Send 17 bytes (3 header, 14 data) for Channel #1	C1- 46/22 C2- 40/28	6.25	Send 20 for C2	C1- 7.5/5.0 C2- 5.0/2.5
		C1- 46/22 C2- 60/28	6.875	Receive 20 for C2	C1- 7.5/5.0 C2- 7.5/2.5
7	Receive 17 bytes (17 bytes data) for Channel #1 Send 17 bytes (17 bytes HCI data) for Channel #1	C1- 29/19 C2- 60/28	7.5	Send 20 for C1	C1- 7.5/7.5 C2- 7.5/2.5
8	Receive 17 bytes (17 bytes data) for Channel #1 Send 17 bytes (17 bytes HCI data) for Channel #1	C1- 32/36 C2- 60/28	8.125	Receive 20 for C1	C1- 10/7.5 C2- 7.5/2.5
		C1- 32/36 C2- 60/8	8.75	Send 20 for C2	C1- 10/7.5 C2- 7.5/5.0

Time (ms	USB data (header refers to HCI header) (Receive & Send from the Host)	Queued data (read / write)	Time (ms)	Air data	Amount Received / Sent (ms)
9	Receive 17 bytes (3 header, 14 data) for Channel #2 Send 17 bytes (3 header, 14 data) for Channel #2	C1- 32/36 C2- 54/22	9.375	Receive 20 for C2	C1- 10/7.5 C2- 10/5.0
10	Receive 17 bytes (17 bytes data) for Channel #2 Send 17 bytes (17 bytes HCI data) for Channel #2	C1- 32/16 C2- 37/39	10	Send 20 for C1	C1- 10/10 C2- 10/5.0
		C1- 52/16 C2- 37/39	10.625	Receive 20 for C1	C1- 12.5/10 C2- 10/5.0
11	Receive 17 bytes (17 bytes data) for Channel #2 Send 17 bytes (17 bytes HCI data) for Channel #2	C1- 52/16 C2- 20/36	11.25	Send 20 for C2	C1- 12.5/10 C2- 10/7.5

Table 2.3: Example USB dual-channel voice traffic data flow

2.1.2 [This section is no longer used]

2.2 Control endpoint expectations

Endpoint 0 is used to configure and control the USB device. Endpoint 0 will also be used to allow the Host to send HCI-specific commands to the Controller. HCI command packets should be sent with the following parameters:

bmRequestType = 0x20 (Host-to-device class request, device as target)
bRequest = 0x00
wValue = 0x00
wIndex = 0x00

Some Host devices on the market set bRequest to 0xE0. Hence, for historical reasons, if the Bluetooth Controller firmware receives a class request over this endpoint, it should treat the packet as an HCI command packet regardless of the value of bRequest, wValue and wIndex.

All HCI Control packets delivered to Endpoint 0 are addressed in the Setup Data structure (See 9.3 of [1]). This structure contains fields which determine the destination within the device. The bmRequestType can be used to select the Device or the Interface. If Interface is selected, the wIndex parameter shall select the Index for the targeted Bluetooth Controller.

2.2.1 Single function Controller

For a single function Controller, the Host should address HCI command packets to the Device. HCI command packets should be sent with the following parameters:

bmRequestType = 0x20 (Host-to-device class request, device as target)
bRequest = 0x00
wValue = 0x00
wIndex = 0x00

Note: For historical reasons, if the Controller firmware receives a packet over this endpoint, it should treat the packet as an HCI command packet regardless of the value of bRequest, wValue and wIndex. Some Host devices set bRequest to 0xE0.

2.2.2 Controller function in a composite device

For a Controller included in a composite (multi-function) device, the Host should address HCI control packets to the Interface of the Controller. HCI command packets should be sent with the following parameters:

bmRequestType = 0x21 (Host-to-Interface class request, interface as target)
bRequest = 0x00
wValue = 0x00
wIndex = the actual Interface number within the composite device

If the Host system driver addresses USB requests containing HCI command packets to the Device (see Section 2.2.1) instead of to the Interface, the device implementation shall recognize these HCI command packets and correctly route them to the Controller function. This allows correct operation of the Controller function and avoids malfunctions in other functions contained in the composite device.

2.2.3 [This section is no longer used]

2.3 Bulk endpoints expectations

Data integrity is a critical aspect for ACL data. This, in combination with bandwidth requirements, is the reason for using a bulk endpoint. Multiple 64-byte packets can be shipped per USB Frame (1 millisecond, full speed) or 512-byte packets per USB Microframe (125 microseconds, high-speed), across the bus.

Suggested bulk max packet size is 64 bytes for full-speed, or 512 bytes for high speed.

Bulk has the ability to detect errors and correct them. In order to avoid starvation, a flow control model similar to the shared endpoint model is recommended for the Controller.

2.4 Interrupt endpoint expectations

An interrupt endpoint is used to deliver events in a predictable and timely manner. Event packets can be sent across USB with a known latency.

The interrupt endpoint should have an interval of 1 ms (full speed). For a Controller using USB high-speed the interrupt interval may have an interval of 125 microseconds.

The USB software and firmware requires no intimate knowledge of the events passed to the Controller.

2.5 Isochronous endpoints expectations

These isochronous endpoints transfer synchronous data to and from the Controller of the radio.

Time is the critical aspect for this type of data. The USB firmware should transfer the contents of the data to the Controllers' synchronous FIFOs. If the FIFOs are full, the data should be overwritten with new data.

These endpoints have a one (1) ms interval, as required by Chapter 9 of the USB Specification, Versions 1.0 and 1.1.

The radio is capable of three (3) 64 kb/s voice channels (and can receive the data coded in different ways – 16-bit linear audio coding is the method that requires the most data). A suggested max packet size for this endpoint would be at least 64 bytes. (It is recommended that max packet sizes be on power of 2 boundaries for optimum throughput.) However, if it is not necessary to support three voice channels with 16-bit coding, 32 bytes could also be considered an acceptable max packet size.

3 CLASS CODE

A class code will be used that is specific to all USB Bluetooth devices. This will allow the proper driver stack to load, regardless of which vendor built the device.

3.1 Bluetooth codes

The values shown in Table 3.1 shall be used in the Device Descriptor for Bluetooth Controller devices with USB HCI transport.

Code	Label	Value	Description
Class	bDeviceClass	0xE0	Wireless Controller
Subclass	bDeviceSubClass	0x01	RF Controller
Protocol	bDeviceProtocol	0x01	Bluetooth Controller

Table 3.1: USB codes for Controllers

These values should also be used in the interface descriptors for the interfaces described in Section 2.1 that apply to the Controller.

The bDeviceProtocol value 0x04 is previously used.

3.1.1 [This section is no longer used]

3.1.2 [This section is no longer used]

3.1.3 [This section is no longer used]

3.1.4 [This section is no longer used]

4 DEVICE FIRMWARE UPGRADE

Firmware upgrade capability is not a required feature. If implemented, the firmware upgrade should be compliant with the “Universal Serial Bus Device Class Specification for Device Firmware Upgrade” (version 1.1 or later) available on the USB Forum web site at http://www.usb.org.

5 LIMITATIONS

5.1 Power specific limitations

Some USB Host Controllers in portable devices will not receive power while the system is in a sleep mode. For example, many PCs do not supply power to the USB port in system power states S3 or S4, as defined in ACPI. Hence, USB wake-up can only occur when the system is in S1 or S2. Furthermore, all connections and state information of the USB Bluetooth Controller will be lost in the system sleep state if power is lost necessitating re-initialization when the device returns to the active state.

Some USB Host Controllers further continually snoop memory when a device is attached to see if there is any work that needs to be done. The snoop is typically performed every 1 ms for USB full-speed devices. This prevents the processor from dropping into a low power state known as C3. Because the processor is not able to enter the C3 state, significant power consumption may occur. This is a major concern for battery-powered Hosts such notebook computers. Some Host Controllers are capable of scheduling polling of USB devices at short intervals while snooping the Host's memory much less frequently. Systems with such Host Controllers may be able to greatly increase the percentage of time spent in the C3 state even if Bluetooth connections are maintained.

A feature called Link Power Management is also recommended for implementation by Bluetooth devices. It is described in an ECN (Engineering Change Notice) from the USB Implementers' Forum.

5.2 Other limitations

Data corruption may occur across isochronous endpoints. Endpoints one and two may suffer from data corruption.

USB provides 16-CRC on all data transfers. The USB has a bit error rate of 10^{-13}.

Note: When a dongle is removed from the system, the radio will lose power (assuming this is a bus-powered device), which means that devices will lose connection.

6 BLUETOOTH COMPOSITE DEVICE IMPLEMENTATION

A USB Composite contains multiple independent functions. This section describes how to implement Bluetooth functions within a USB Composite device. This may require the use of Interface Association Descriptors (IAD) to aggregate multiple Interfaces. This also requires the Host to address USB requests to the specific Interface (see [1]).

6.1 Configurations

Bluetooth Controller functions may be included in a USB composite device:

- Controller in a multi-radio device
- Controller in a device also containing non-radio functions (e.g. memory)

6.2 Using USB Interface Association Descriptors for a Controller function

A Controller ([Vol 1] Part A, Section 2) shall contain at least two interfaces:

- HCI events and ACL data (3 endpoints)
- HCI SCO data (2 endpoints, multiple alternate settings)

and may also contain

- Device Firmware Upgrade (see [2])

When used in a USB Composite device, a Controller function shall use an IAD descriptor to associate the provided interfaces. The following is an example IAD for a Controller function without Device Firmware Upgrade:

- It would be contained within a Configuration Descriptor set.
- It would be followed by two Interface Descriptors and associated Endpoint Descriptors.

Offset	Field	Size	Value	Description
0	bLength	1	0x08	Size of this descriptor in octets
1	bDescriptorType	1	0x0B	INTERFACE ASSOCIATION DESCRIPTOR
2	bFirstInterface	1	number	Interface number of the first interface associated with this device

Offset	Field	Size	Value	Description
3	bInterfaceCount	1	0x02	Number of contiguous interfaces associated with the function
4	bFunctionClass	1	0xE0	Wireless Controller
5	bFunctionSubClass	1	0x01	RF Controller
6	bFunctionProtocol	1	0x01	Bluetooth Controller
7	iFunction	1	Index	Pointer to a name string for this function, if any is provide

SECURE DIGITAL (SD) TRANSPORT LAYER

This Part describes the SD transport layer (between the Host and Controller). HCI command, event and data packets flow through this layer, but the layer does not decode them. The Bluetooth SD transport layer is defined in a document owned and maintained by the Secure Digital Association. Information regarding that document is described herein.

CONTENTS

1 INTRODUCTION

This document discusses the requirements of the Secure Digital (SD) interface for Bluetooth hardware. Readers should be familiar with SD, SD design issues, and the overall Bluetooth architecture. The reader should also be familiar with the Bluetooth Host Controller interface.

The SD Bluetooth Protocol is documented in the SDIO Card Type-A Specification for Bluetooth, which is owned and maintained by the Secure Digital Association (SDA). The full specification is available to members of the SDA that have signed all appropriate SD NDA and license requirements. The SDA also makes a Non-NDA version available, the Simplified Version of: SDIO Card Type-A Specification for Bluetooth. There are no changes to the SDA document to comply with the requirements of the Bluetooth SIG.

2 GOALS

2.1 Hardware goals

The Bluetooth SD transport interface specification is designed to take advantage of both the SD Physical Transport bus and the packet orientation of the Bluetooth HCI protocol. Thus, all data is transferred in blocks as packets. Since the block size used on the SD bus may be smaller than the HCI packet, a segmentation and recombination protocol is defined.

SDIO [2] provides different data rate options, including different bit path widths and clock rates. Systems using SDIO should choose options that provide sufficient bandwidth to support the needs of the Controller, both for device control (HCI commands and events) and for data (ACL, SCO).

The specification supports an SDIO-connected Controller.

2.2 Software goals

The Bluetooth SD transport interface specification is designed for non-embedded solutions. It is assumed that the Host software does not necessarily have a priori knowledge of the SD Bluetooth device.

The interface is not designed for embedded applications where much of the information passed via the interface is known in advance.

The SDA also defines a Bluetooth interface for embedded applications where the Controller contains protocol layers above HCI (RFComm, SDP etc.). This specification is called SDIO Card Type-B Specification for Bluetooth. Information about this specification can be obtained from the SDA:

https://www.sdcard.org

2.3 Configuration goals

The SDIO Card Specification [2] defines SDIO Standard Function Codes in Table 6-4:

0x2 This function supports the SDIO Type-A for Bluetooth standard interface

0x3 This function supports the SDIO Type-B for Bluetooth standard interface

The SDIO Card Type-A Specification for Bluetooth [3] specifies how to implement a Controller. Table 2.1 defines Service ID codes to route HCI messages (codes 0x01 to 0x05).

SDIO Type-A service ID	Controller
0x00	reserved for future use
0x01	HCI Command packet
0x02	ACL data
0x03	SCO data
0x04	HCI Event packet
0x05	HCI ISO Data packet
All other values	Reserved as per [3]

Table 2.1: Bluetooth SDIO Controller Service ID codes

2.4 Configuration for multiple Controllers

An SDIO device may contain one or more Controllers as defined in [3]. These Controller functions shall conform to the requirements of [2] section 6.12.

3 PHYSICAL INTERFACE DOCUMENTS

This specification references the SD SDIO Card Type-A Specification for Bluetooth. This SDA document defines the Bluetooth HCI for all SD devices that support an HCI level interface. Any SD Bluetooth device claiming compliance with the SD Bluetooth Transport must support this interface and additionally adhere to its device type specification, which is set by the Secure Digital Association. The SDIO Card Type-A Specification for Bluetooth document is based on the SDIO Card Specification, which in turn is based on the SD Memory Card Specification: Part 1 Physical Layer Specification. All of these documents are copyrighted by the SDA and are available ONLY to SDA member companies that have signed the appropriate NDA documents with the SDA. As an introduction to the SD Bluetooth Type A specification, the SDA has created ‘Simplified’ versions of each of these documents. The simplified versions do not contain enough information to fully implement a device, however they do contain enough information to convey the structure and intent of the specifications.

Applicable SDA Documents available to members of the SDA:

SD Memory Card Specification: Part 1 Physical Layer Specification

SDIO Card Specification

SDIO Card Type-A Specification for Bluetooth.

Applicable Simplified SDA Documents available to non-members and members of the SDA:

Simplified Version of: SD Memory Card Specification: Part 1 Physical Layer Specification

Simplified Version of: SDIO Card Specification:

Simplified Version of: SDIO Card Type-A Specification for Bluetooth

More information on the Secure Digital Association and the SD specifications can be found at the SDA web site at https://www.sdcard.org.

4 COMMUNICATION

4.1 Overview

Figure 4.1 below is a diagram of the communication interface between a Bluetooth SD device and the Bluetooth Host protocol stack. Modifications to this diagram might be needed for operating systems that do not support a miniport model:

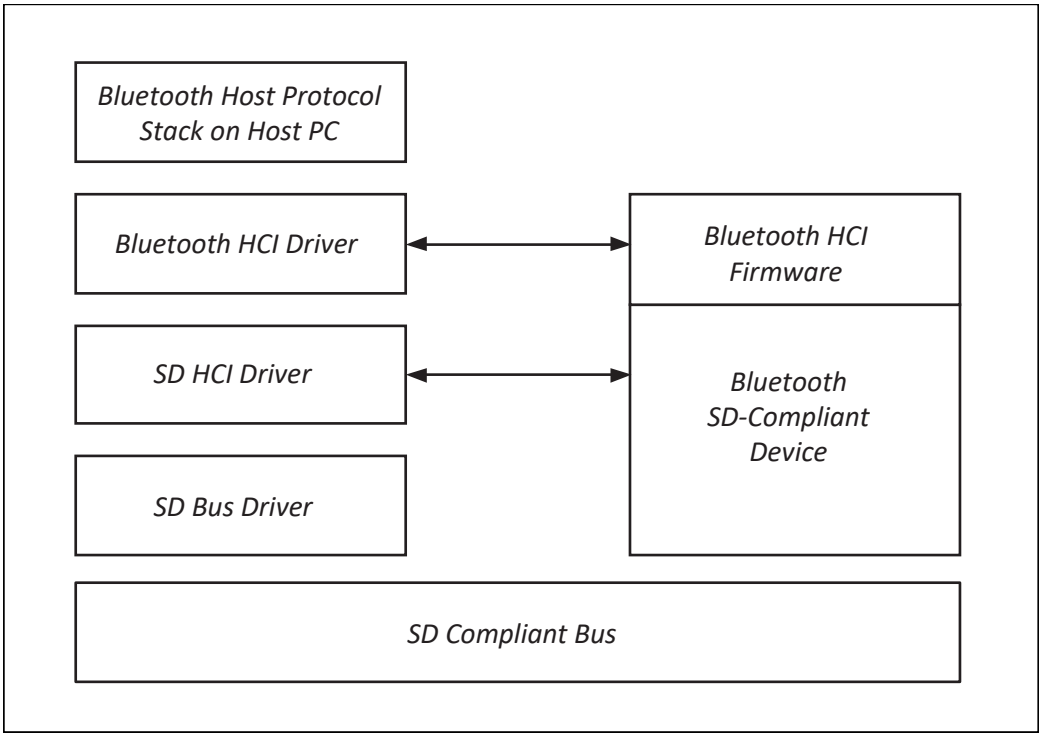

Figure 4.1: SD communication diagram

Appendix A Acronyms and Abbreviations

Acronym	Description
HCI	Host Controller interface
NDA	Non-Disclosure Agreement
OS	Operating System
SD	Secure Digital
SDA	Secure Digital Association
SDIO	Secure Digital Input/Output
SDP	Service Discovery protocol
SIG	Special Interest Group

Appendix C Tests

The SDA has defined formal test procedures for SDIO Type A Bluetooth cards (Controller) and Hosts. It is expected that both Controllers and Hosts will comply with all test requirements set forth by the SDA in accordance with the rules of the SDA. The Bluetooth SIG does not require any formal testing to comply with SIG requirements. The test document names are listed in Appendix B.

C.1 Test suite structure

There are two types of tests defined for the HCI SD Transport Layer:

1. Functional Tests
2. Protocol Tests

Tests of both types are defined for both the Host and Controller.

The purpose of the functional tests is to verify that the SD Bluetooth Type A Specification, SDIO Standard and SD Physical Standard have been implemented according to the specifications. These tests and the test environment for these tests are defined in documents provided by the SDA.

The purpose of the protocol tests are to verify that the Bluetooth Controller SD implementation or the Host implementation are according to the SD Bluetooth Type A specification.

The test environment for the protocol tests consists of the tester and the implementation under test (IUT) as illustrated in Figure C.1 below.

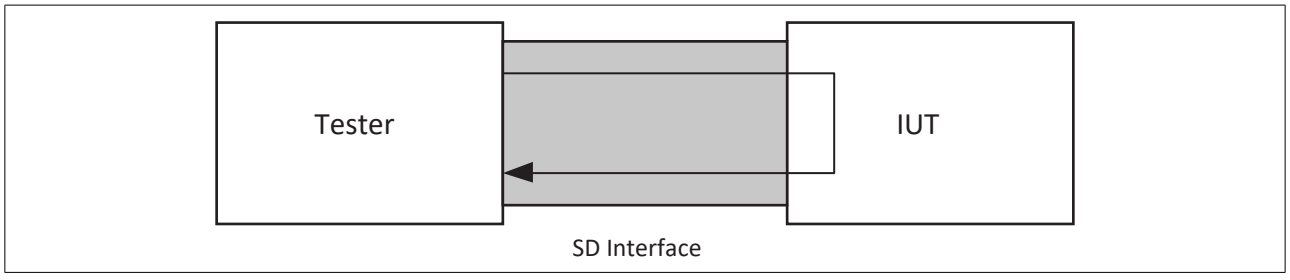

Figure C.1: Protocol test environment

The tester is typically a PC with an SD interface. The IUT is placed into local loopback mode and standard HCI commands are used to drive the tests. The test results are verified in the tester.

THREE-WIRE UART TRANSPORT LAYER

This Part describes the Three-Wire UART transport layer (between the Host and Controller). HCI command, event, and data packets flow through this layer, but the layer does not decode them.

CONTENTS

1 GENERAL

The HCI Three-Wire UART Transport Layer makes it possible to use the Bluetooth HCI over a serial interface between two UARTs. The HCI Three-Wire UART Transport Layer assumes that the UART communication may have bit errors, overrun errors or burst errors. See also [Vol 4] Part A, UART Transport Layer.

2 OVERVIEW

The HCI Three-Wire UART Transport Layer is a connection based protocol that transports HCI commands, events, ACL and Synchronous packets between the Host and the Controller. Packet construction is in done in two steps. First, it adds a packet header onto the front of every HCI packet which describes the payload. Second, it frames the packets using a SLIP protocol. Finally, it sends this packet over the UART interface.

The SLIP layer converts an unreliable octet stream into an unreliable packet stream. The SLIP layer places start and end octets around the packet. It then changes all occurrences of the frame start or end octet in the packet to an escaped version.

The packet header describes the contents of the packet, and if this packet needs to be reliably transferred, a way of identifying the packet uniquely, allowing for retransmission of erroneous packets.

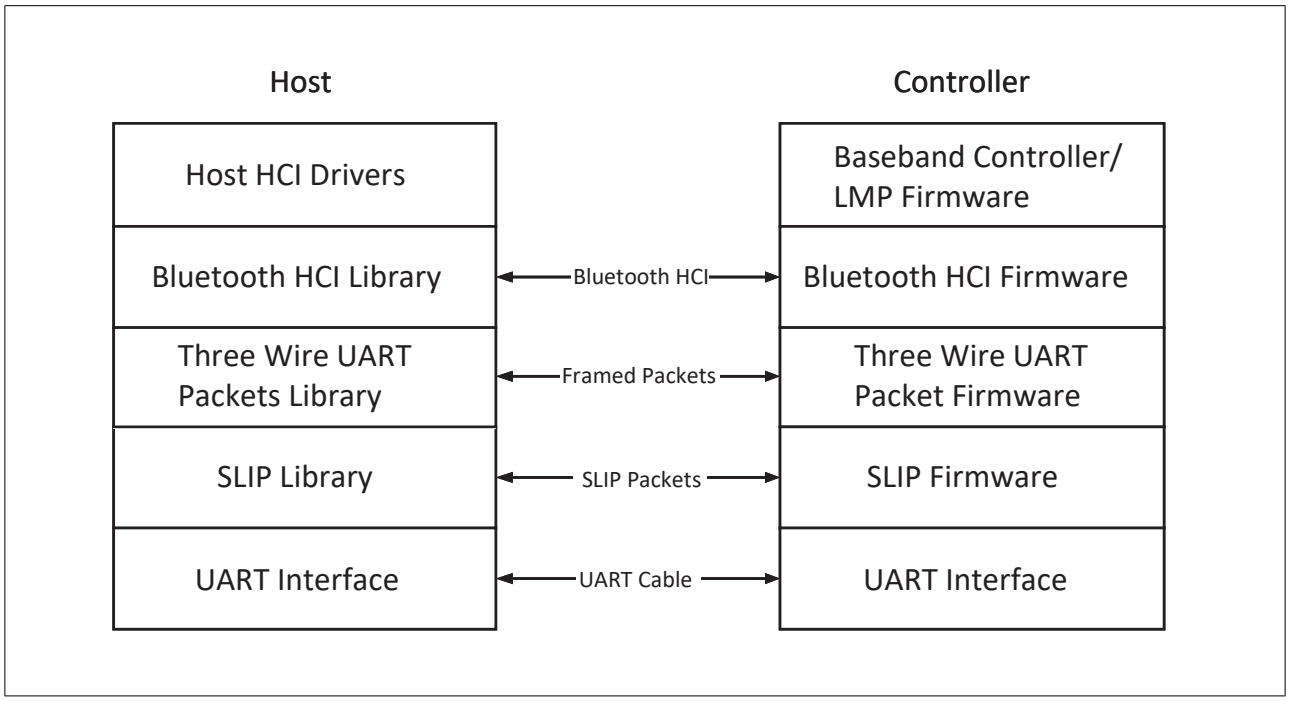

Figure 2.1: The relationship between the Host and the Controller

3 SLIP LAYER

The SLIP layer places packet framing octets around each packet being transmitted over the Three-Wire UART Transport Layer. This delimits the packets and allows packet boundaries to be detected if the receiver loses synchronization. The SLIP layer is based upon the RFC 1055 Standard [1].

3.1 Encoding a packet

The SLIP layer performs octet stuffing on the octets entering the layer so that specific octet codes which may occur in the original data do not occur in the resultant stream.

The SLIP layer places octet 0xC0 at the start and end of every packet it transmits. Any occurrence of 0xC0 in the original packet is changed to the sequence 0xDB 0xDC before being transmitted. Any occurrence of 0xDB in the original packet is changed to the sequence 0xDB 0xDD before being transmitted. These sequences, 0xDB 0xDC and 0xDB 0xDD are SLIP escape sequences. All SLIP escape sequences start with 0xDB. All SLIP escape sequences are listed in Table 3.1.

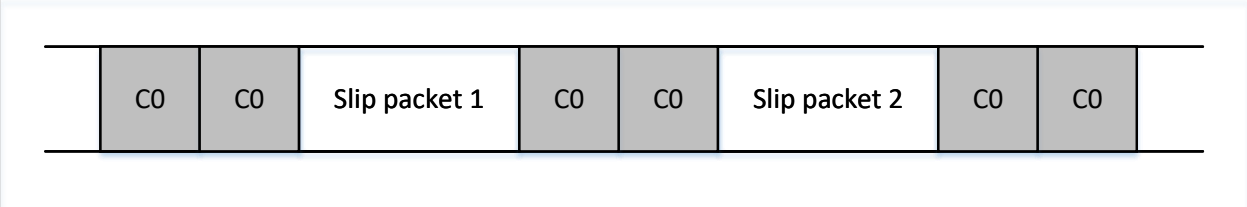

Figure 3.1: SLIP packets with 0xC0 at the start and end of each packet

3.2 Decoding a packet

When decoding a SLIP stream, a device will first be in an unknown state, not knowing if it is at the start of a packet or in the middle of a packet. The device shall therefore discard all octets until it finds a 0xC0. If the 0xC0 is followed immediately by a second 0xC0, then the device will discard the first 0xC0 as it was presumably the end of the last packet, and the second 0xC0 was the start of the next packet. The device shall then be in the decoding packet state. It can then decode the octets directly changing any SLIP escape sequences back into their unencoded form. When the device decodes the 0xC0 at the end of the packet, it will calculate the length of the SLIP packet, and pass the packet data into the packet decoder. The device will then seek the next packet. If the device does not receive an 0xC0 for the start of the next packet, then all octets up to and including the next 0xC0 will be discarded.

SLIP Escape Sequence	Unencoded form	Notes
0xDB 0xDC	0xC0	
0xDB 0xDD	0xDB	
0xDB 0xDE	0x11	Only valid when OOF Software Flow Control is enabled
0xDB 0xDF	0x13	Only valid when OOF Software Flow Control is enabled

Table 3.1: SLIP escape sequences

4 PACKET HEADER

Every packet that is sent over the Three-Wire UART Transport Layer has a packet header. It also has an optional Data Integrity Check at the end of the payload. The Transport Layer does not support packet segmentation and reassembly. Each transport packet will contain at most one higher layer packet.

A packet consists of a Packet Header of 4 octets, a Payload of 0 to 4095 octets, and an optional Data Integrity Check of 2 octets. See Figure 4.1.

The packet header consists of a Sequence Number of 3 bits, an Acknowledge Number of 3 bits, a Data Integrity Check Present bit, a Reliable Packet bit, a Packet Type of 4 bits, a Payload Length of 12 bits and an 8 bit Header Checksum. See Figure 4.2.

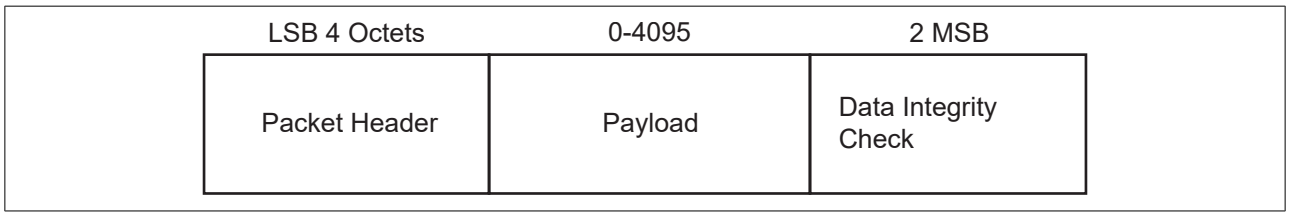

Figure 4.1: Packet format

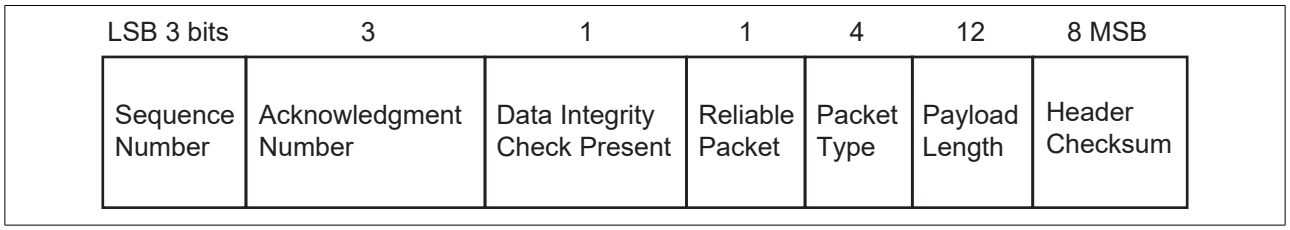

Figure 4.2: Packet header format

4.1 Sequence Number

For unreliable packets this field shall be set to 0 on transmit and ignored on receive.

Each new reliable packet shall be assigned a sequence number which is equal to the sequence number of the previous reliable packet plus one *mod* eight. A packet shall use the same sequence number each time it is retransmitted.

4.2 Acknowledge Number

The acknowledge number shall be set to the sequence number of the next reliable packet this device expects to receive. See Section 6.4.

4.3 Data Integrity Check Present

If a 16 bit CCITT-CRC Data Integrity Check is appended to the end of the payload, this bit shall be set to 1.

4.4 Reliable Packet

If this bit it set to 1, then this packet is reliable. This means that the sequence number field is valid, and the receiving end shall acknowledge its receipt. If this bit is set to 0, then this packet is unreliable.

4.5 Packet Type

There are five kinds of HCI packets that can be sent via the Three-Wire UART Transport Layer; these are HCI Command packet, HCI Event packet, HCI ACL Data packet, HCI Synchronous Data packet, and HCI ISO Data packet (see [Vol 4] Part E, Section 5.4). HCI Command packets can be sent only to the Controller, HCI Event packets can be sent only from the Controller, and HCI ACL/Synchronous/ISO Data packets can be sent both to and from the Controller.

HCI packet coding does not provide the ability to differentiate the five HCI packet types. Therefore, the Packet Type field is used to distinguish the different packets. The acceptable values for this Packet Type field are given in Table 4.1.

HCI Packet Type	Packet Type
Acknowledgment packets	0
HCI Command packet	1
HCI ACL Data packet	2
HCI Synchronous Data packet	3
HCI Event packet	4
HCI ISO Data packet	5
Vendor Specific	14
Link Control packet	15
Reserved for future use	All other values

Table 4.1: Three-Wire UART packet type

HCI Command packets, HCI ACL Data packets, HCI Event packets, and HCI ISO Data packets are always sent as reliable packets. HCI Synchronous Data packets are sent as unreliable packets unless HCI Synchronous Flow Control is enabled, in which case they are sent as reliable packets.

In addition to the five HCI packet types, other packet types are defined. One packet type is defined for pure Acknowledgment packets, and one additional packet type is to

support link control. One packet type is made available to vendors for their own use. All other Three-Wire UART Packet Types are reserved for future use.

4.6 Payload Length

The payload length is the number of octets in the payload data. This does not include the length of the packet header, or the length of the optional data integrity check.

4.7 Packet Header Checksum

The packet header checksum validates the contents of the packet header against corruption. This is calculated by setting the Packet Header Checksum to a value such that the (unsigned) sum *mod* 256 of the four octets of the Packet Header, including the Packet Header Checksum, is 0xFF.

5 DATA INTEGRITY CHECK

The Data Integrity Check field is optional. It can be used to ensure that the packet is valid. The Data Integrity Check field is appended onto the end of the packet. Each octet of the Packet Header and Packet Payload is used to compute the Data Integrity Check.

5.1 16-bit CCITT-CRC

The CRC is defined using the CRC-CCITT generator polynomial

$g(D) = D^{16} + D^{12} + D^5 + 1$

(see Figure 5.1)

The CRC shift register is filled with 1s before calculating the CRC for each packet. Octets are fed through the CRC generator least significant bit first.

The most significant parity octet is transmitted first (where the CRC shift register is viewed as shifting from the least significant bit towards the most significant bit). Therefore, the transmission order of the parity octets within the CRC shift register is as follows:

x[8] (first), x[9],..., x[15], x[0], x[1],..., x[7] (last)

where x[15] corresponds to the highest power CRC coefficient and x[0] corresponds to the lowest power coefficient.

The switch S shall be set in position 1 while the data is shifted in. After the last bit has entered the LFSR, the switch shall be set in position 2, and the registers contents shall be read out for transmission.

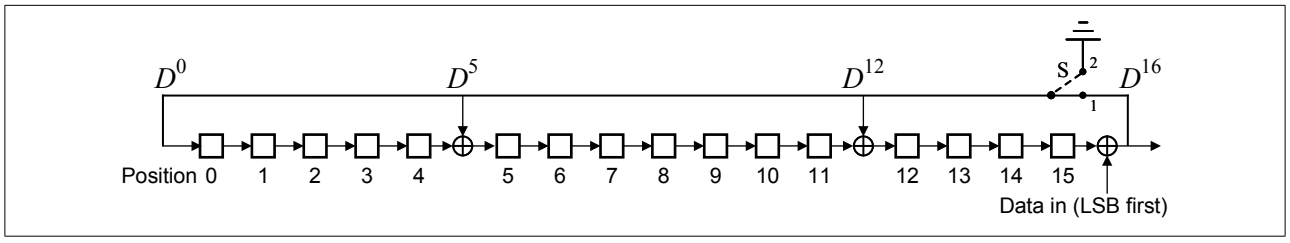

Figure 5.1: The LFSR circuit generating the CRC

6 RELIABLE PACKETS

To allow the reliable transmission of packets through the transport, a method needs to be defined to recover from packet errors. The Host or Controller can detect a number of different errors in the packet.

6.1 Header Checksum error

The header of the packet is protected by a Packet Header Checksum. If the (unsigned) sum *mod* 256 of the four octets of the header is not 0xFF, then the packet has an unrecoverable error and all information contained in the packet shall be discarded.

6.2 Slip Payload Length error

The length of the SLIP packet shall be checked against the Packet Payload Length. If the Data Integrity Check Present bit is set to 1, then the SLIP packet length should be 6 + Packet Payload Length. If the Data Integrity Check Present bit is set to 0, then the SLIP packet length should be 4 + Packet Payload Length. If this check fails, then all information contained in the packet shall be discarded. The SLIP packet length is the length of the data received from the SLIP layer after the SLIP framing, and SLIP escape codes have been processed.

6.3 Data Integrity Check error

The packet may have a Data Integrity Check at the end of the payload. This is controlled by the Data Integrity Check Present bit in the header. If this is set to 1, then the Data Integrity Check at the end of the payload is checked. If this is different from the value expected, then the packet shall be discarded. If the link is configured to not use data integrity checks, and a packet is received with the Data Integrity Check Present bit set to 1, then the packet shall be discarded.

6.4 Out Of Sequence Packet error

Each device keeps track of the sequence number it expects to receive next. This will be one more than the sequence number of the last successfully received reliable packet, *mod* eight. If a reliable packet is received which has the expected sequence number, then this packet shall be accepted.

If a reliable packet is received which does not have the expected sequence number, then the packet shall be discarded.

6.5 Acknowledgment

Whenever a reliable packet is received, an acknowledgment shall be generated.

If a packet is available to be sent, the Acknowledgment Number of that packet shall be updated to the latest expected sequence number.

If a requirement to send an acknowledgment value is pending, but there are no other packets available to be sent, the device may send a pure Acknowledgment packet. This is an Unreliable packet, with the Packet Type set to 0, Payload Length set to 0, and the Sequence Number set to 0.

The maximum number of reliable packets that can be sent without acknowledgment defines the sliding window size of the link. This is configured during link establishment. See Section 8.6, Section 8.7, and Section 8.8.

6.6 Resending packets

A Reliable packet shall be resent until it is acknowledged. Devices should refrain from resending packets too quickly to avoid saturating the link with retransmits. See Section 12.1.2.

6.7 Example reliable packet flow

Figure 6.1 shows the transmission of reliable packets between two devices. Device A sends a packet with a Sequence Number of 6, and an Acknowledgment Number of 3. Device B receives this packet correctly, so needs to generate an acknowledgment. Device B then sends a packet with Sequence Number 3 with its Acknowledgment Number set to the next expected packet Sequence Number from Device A of 7.

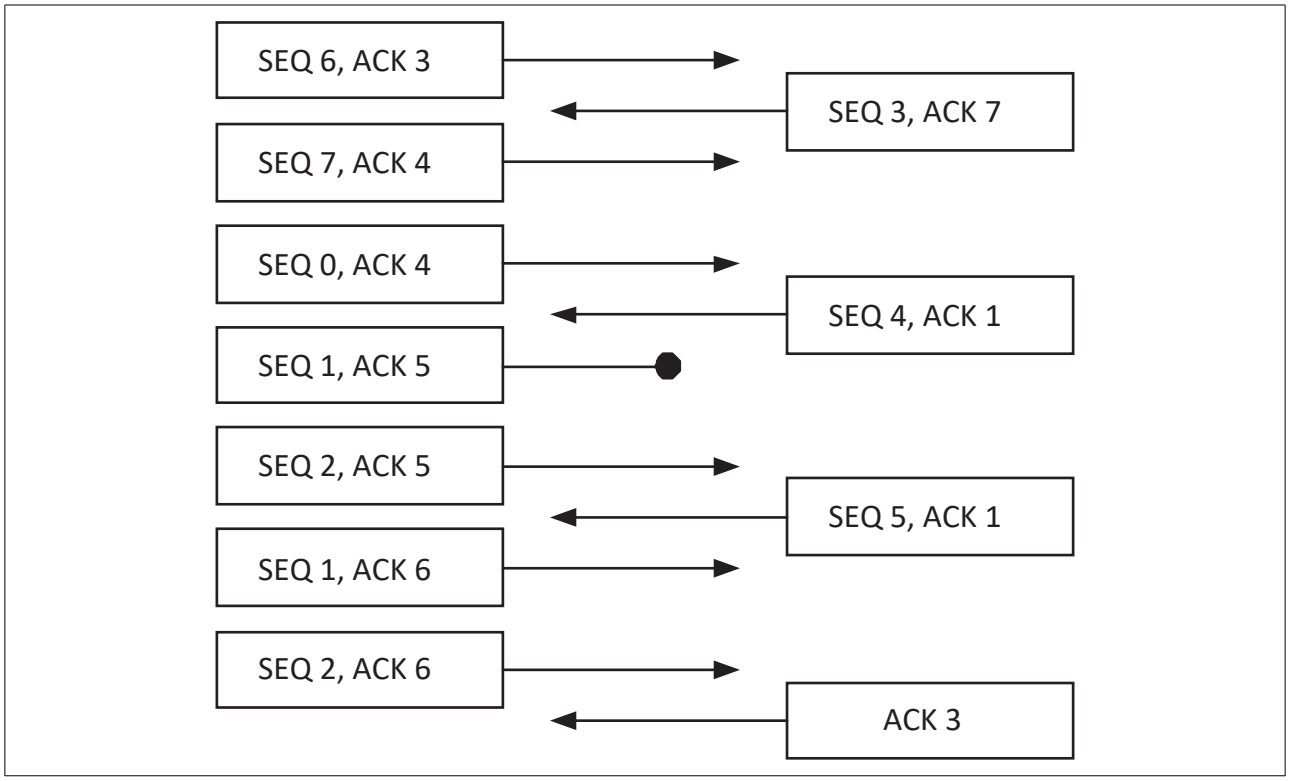

Figure 6.1: Message diagram showing transmission of reliable packets

Device A receives a packet with Sequence Number 3 and an Acknowledgment Number of 7. Device A was expecting this sequence number so needs to generate an acknowledgment. The Acknowledgment Number of 7 is one greater than the last Sequence Number that was sent, meaning that this packet was received correctly (see Section 6.6).

Device A sends two packets, Sequence Numbers 7 and 0. Both packets have the Acknowledgment Number of 4, the next sequence number it expects from Device B. Device B receives the first correctly, and increments its next expected sequence number to 0. It then receives the second packet correctly, and increments the next expected sequence number to 1.

Device B sends a packet with Sequence Number 4, and the Acknowledgment Number of 1. This will acknowledge both of the previous two packets sent by Device A.

Device A now sends two more packets, Sequence Numbers 1 and 2. Unfortunately, the first packet is corrupted. Device B receives the first packet, and discovers the error, so discards this packet (see Section 6.1, Section 6.2 or Section 6.3). It generates an acknowledgment of this erroneously received reliable packet. Device B then receives the second packet. This is received out of sequence, as it is currently expecting Sequence Number 1, but has received Sequence Number 2 (see Section 6.4). Again, it generates an acknowledgment.

Device B sends another packet with Sequence Number 5. It is still expecting a packet with Sequence Number 1 next, so the Acknowledgment Number is set to 1. Device A receives this, and accepts this packet.

Device A has not had either of its last two packets acknowledged, so it resends them (see Section 6.6) and updates the Acknowledgment Number of the original packets that were sent (see Section 6.5). The Sequence Numbers of these packets stay the same (see Section 4.1).

Device B receives these packets correctly, and schedules the sending of an acknowledgment. Because Device B doesn't have any data packets that need to be sent, it sends a pure Acknowledgment packet (see Section 6.5).

7 UNRELIABLE PACKETS

To allow the transmission of unreliable packets through the transport, the following method shall be used.

7.1 Unreliable packet header

An unreliable packet header always has the Reliable Packet bit set to 0. The sequence number shall be set to 0. The Data Integrity Check Present, Acknowledgment Number, Packet Type, Payload Length and Packet Header Checksum shall all be set the same as a Reliable packet.

7.2 Unreliable packet error

If a packet that is marked as unreliable and the packet has an error, then the packet shall be discarded.

8 LINK ESTABLISHMENT

Before any packets except Link Control packets can be sent, the Link Establishment procedure shall be performed. This ensures that the sequence numbers are initialized correctly and that the two sides are using the same baud rate, allows detection of peer reset, and allows the device to be configured.

Link Establishment is defined by a state machine with three states: Uninitialized, Initialized and Active. When the transport is first started, the link is in the Uninitialized State. There are four messages that are defined: SYNC, SYNC RESPONSE, CONFIG and CONFIG RESPONSE. All four link establishment messages shall be sent with the Data Integrity Present flag set to 0.

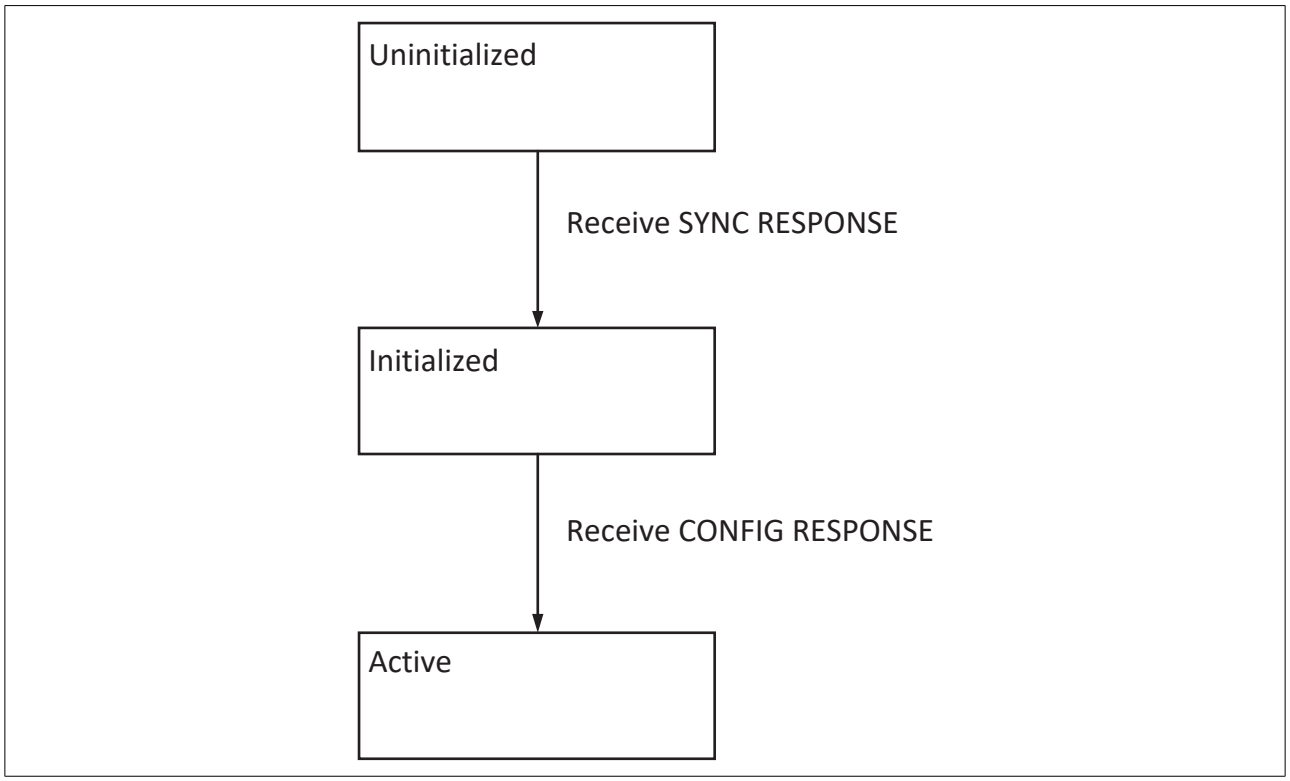

Figure 8.1: Link Establishment state diagram

8.1 Uninitialized state

In the Uninitialized State a device periodically[1] sends SYNC messages. If a SYNC message is received, the device shall respond with a SYNC RESPONSE message. If a SYNC RESPONSE message is received, the device shall move to the Initialized

[1]During link establishment, various messages are sent periodically. It is suggested to send 4 messages per second.

State. In the Uninitialized State only SYNC and SYNC RESPONSE messages are valid, all other messages that are received shall be discarded. If an invalid packet is received, the device shall respond with a SYNC message. The device shall not send any acknowledgment packets in the Uninitialized State[1].

In the Uninitialized State the Controller may wait until it receives a SYNC message before sending its first SYNC message. This allows the Host to control when the Controller starts to send data.

The SYNC message can be used for automatic baud rate detection. It is assumed that the Controller shall stay on a single baud rate, while the Host could hunt for the baud rate. Upon receipt of a SYNC RESPONSE message, the Host can assume that the correct baud rate has been detected.

8.2 Initialized state

In the Initialized State a device periodically sends CONFIG messages. If a SYNC message is received, the device shall respond with a SYNC RESPONSE message. If a CONFIG message is received, the device shall respond with a CONFIG RESPONSE message. If a CONFIG RESPONSE message is received, the device will move to the Active State. All other messages that are received shall be ignored.

8.3 Active state

In the Active State, a device can transfer higher layer packets through the transport. If a CONFIG message is received, the device shall respond with a CONFIG RESPONSE message. If a CONFIG RESONSE message is received, the device shall discard this message.

If a SYNC message is received while in the Active State, it is assumed that the peer device has reset. The local device should therefore perform a full reset of the upper stack, and start Link Establishment again at the Uninitialized State.

Upon entering the Active State, the first packet sent shall have its SEQ and ACK numbers set to zero.

8.4 Sync message

The SYNC message is an unreliable message sent with the Packet Type of 15 and a Payload Length of 2.

[1]Any packet that was erroneous would normally be acknowledged, as the recipient does not know if the packet was a reliable packet or not. The recipient cannot do this in the Uninitialized State, as it is possible to receive corrupt data while in the Uninitialized state.

The payload is composed of the octet pattern 0x01 0x7E[1].

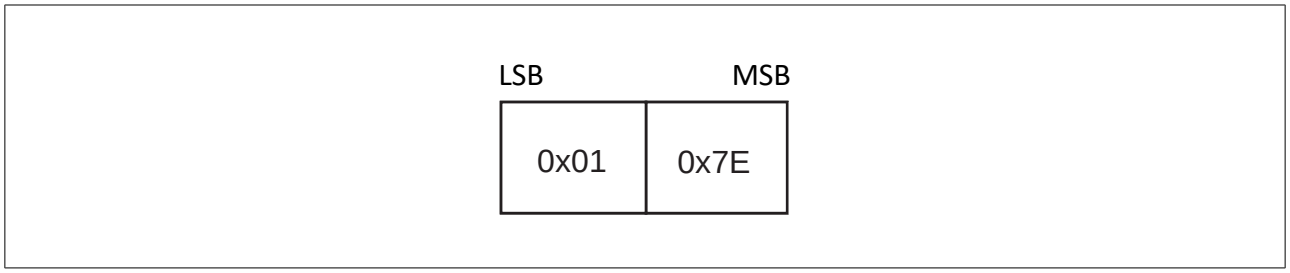

Figure 8.2: Sync message format

8.5 Sync Response message

The SYNC RESPONSE message is an unreliable message sent with the Packet Type of 15 and a Payload Length of 2. The payload is composed of the octet pattern 0x02 0x7D.

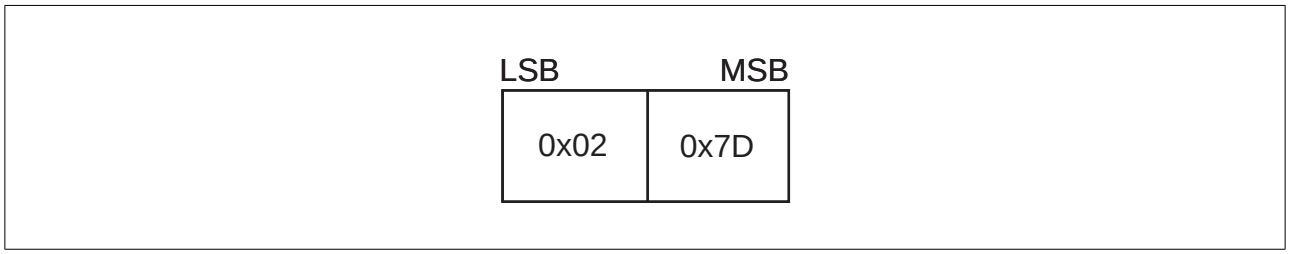

Figure 8.3: Sync Response message format

8.6 Config message

The CONFIG message is an unreliable message sent with the Packet Type of 15 and a Payload Length of 2 plus the size of the Configuration Field. The payload is composed of the octet pattern 0x03 0xFC and the Configuration Field.

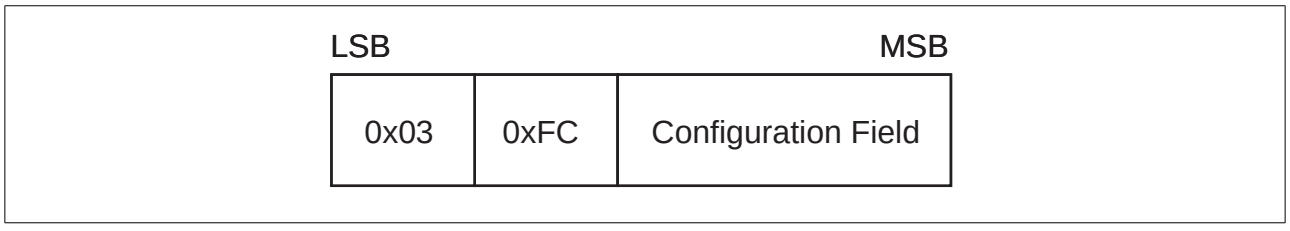

Figure 8.4: Configuration message format

[1]The second octet for all Link Control packets equals the least significant 7 bits of the first octet, inverted, with the most significant bit set to ensure even parity.

8.7 Config Response message

The CONFIG RESPONSE message is an unreliable message sent with the Packet Type of 15 and a Payload Length of 2 plus the size of the Configuration Field. The payload is composed of the octet pattern 0x04 0x7B and the Configuration Field.

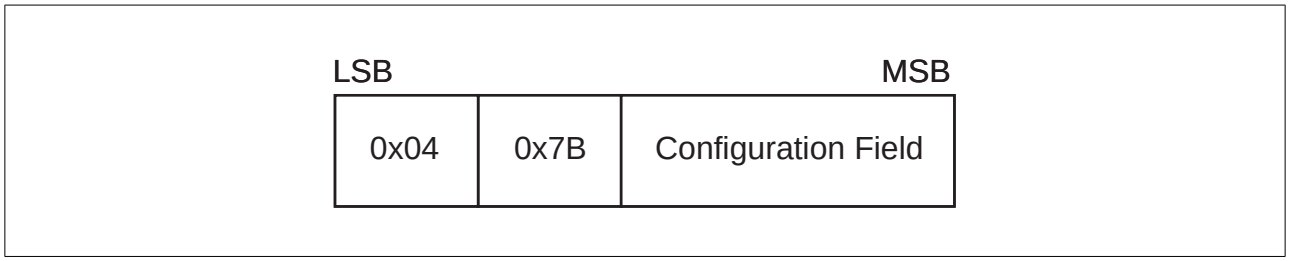

Figure 8.5: Configuration Response message format

8.8 Configuration Field

The Configuration Field contains the Version Number, Sliding Window Size, the Data Integrity Check Type, and if Out Of Frame (OOF) Software Flow Control is allowed. The format of this field is specified in Figure 8.6.

The Configuration Field in a CONFIG message sent by the Host determines what the Host can transmit and accept. The Configuration Field in a CONFIG RESPONSE message sent by the Controller determines what the Host and Controller shall transmit and can expect to receive.

The Controller sends CONFIG messages without a Configuration Field. The Host sends CONFIG RESPONSE messages without a Configuration Field.

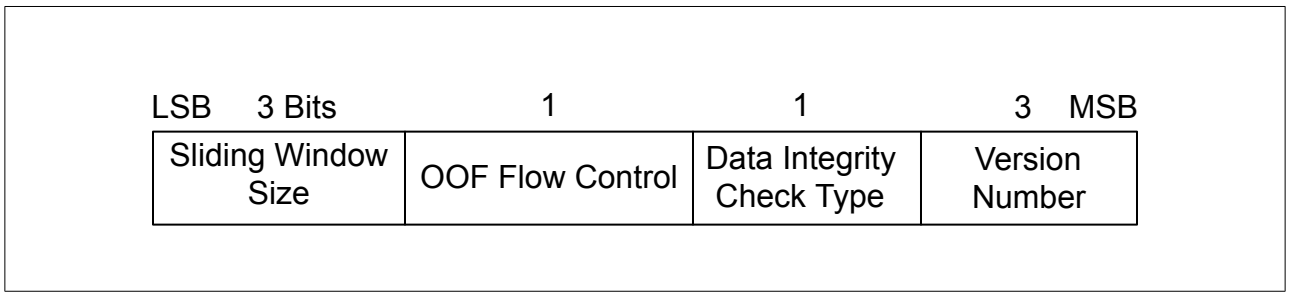

Figure 8.6: Configuration Field detail

To allow for future extension of the Configuration Field, the size of the message determines the number of significant Configuration Octets in the payload. Future versions of the specification may use extra octets. Any bits that are not included in the message shall be set to 0. Any bits that are not defined are reserved for future use.

A device shall not change the values if sends in the Configuration Field during Link Establishment.

8.8.1 Configuration messages

The CONFIG – CONFIG RESPONSE message sequence configures the link in both directions. Until a CONFIG RESPONSE message is received only unreliable Link Establishment messages may be sent. Once CONFIG RESPONSE message has been received all other packet types may be sent, and received messages passed up to the Host.

The CONFIG and CONFIG RESPONSE messages contain a set of options for both devices on the link. The Host sends a CONFIG message with the set of options that the Host would like to use. The Controller responds with a CONFIG RESPONSE message with the set of options that the Host and the Controller will use. This means that the Controller is in full control of the set of options that will be used for all messages sent by both the Host and Controller.

8.8.2 Sliding window size

This is the maximum number of reliable packets a sender of the CONFIG message can send without requiring an acknowledgment. The value of this field shall be in the range one to seven. The value in the CONFIG RESPONSE message shall be less than or equal to the value in the CONFIG message. For example, the Host may suggest a window size of five in its CONFIG message and the Controller may respond with a value of three in its CONFIG RESPONSE message, but not six or seven. Both devices will then use a maximum sliding window size of three.

8.8.3 Level of Data Integrity Check

The CONFIG message contains a bit field describing the types of Data Integrity Checks the sender is prepared to transmit. The peer will select the one it is prepared to use and send its choice in the CONFIG RESPONSE message.

If data integrity checks are not required, then the Data Integrity Check Present bit shall be set to 0 by the Host and Controller.

Level of Data Integrity	Parameter Description for CONFIG Message
0	No Data Integrity Check is supported.
1	16 bit CCITT-CRC may be used.

Table 8.1: Data Integrity Check type in the CONFIG message

Level of Data Integrity	Parameter Description for CONFIG RESPONSE Message
0	No Data Integrity Check is used.
1	16 bit CCITT-CRC may be used.

Table 8.2: Data Integrity Check type in the CONFIG RESPONSE message

8.8.4 Out of Frame Software Flow Control

By default, the transport uses no flow control except that mandated by the HCI Functional Specification and the flow control achieved by not acknowledging reliable Host messages. If Software Flow Control is to be used, this needs to be negotiated.

The CONFIG message specifies whether the sender of the CONFIG message is prepared to receive Out of Frame Software Flow Control messages. The CONFIG RESPONSE message specifies whether the peer can send Out of Frame Software Flow Control messages. The CONFIG RESPONSE message may have the field set to 1 only if the CONFIG message had it set to 1. (See Section 10.1)

8.8.5 Version Number

The Version Number of this protocol shall determine which facilities are available to be used.

The CONFIG message specifies the Version Number supported by the Host. The CONFIG RESPONSE message specifies the Version Number that shall be used by the Host and Controller when sent by the Controller. The value in the CONFIG RESPONSE message shall be less than or equal to the value in the CONFIG message. The Version Numbers are enumerated in Table 8.3. This specification defines version 1.0 (Version Number = 0).

Version Number	Parameter Description for CONFIG and CONFIG RESPONSE Message
0	Version 1.0 of this Protocol
All other values	Reserved for future use

Table 8.3: Version number in the CONFIG and CONFIG RESPONSE messages

9 LOW POWER

After a device is in the Active State, either side of the transport link may wish to enter a low power state. Because recovery from a loss of synchronization is possible, it is allowable to stop listening for incoming packets at any time.

To make the system more responsive after a device has entered a low power state, a system of messages is employed to allow either side to notify the other that they are entering a low power state and to wake a device from that state. These messages are sent as Link Control packets. It is optional for a device to support the Sleep message. The Wakeup and Woken messages are mandatory.

9.1 Wakeup message

The Wakeup message shall be the first message sent whenever the device believes that the other side is asleep. The device shall then repeatedly send the Wakeup message until the Woken message is received. There shall be at least a one character gap between the sending of each Wakeup message to allow the UART to resynchronize. The Wakeup message is an unreliable message sent with a Packet Type of 15, and a Payload Length of 2. The payload is composed of the octet pattern 0x05 0xFA. The Wakeup message shall be used after a device has sent a Sleep message. It is mandatory to respond to the Wakeup message.

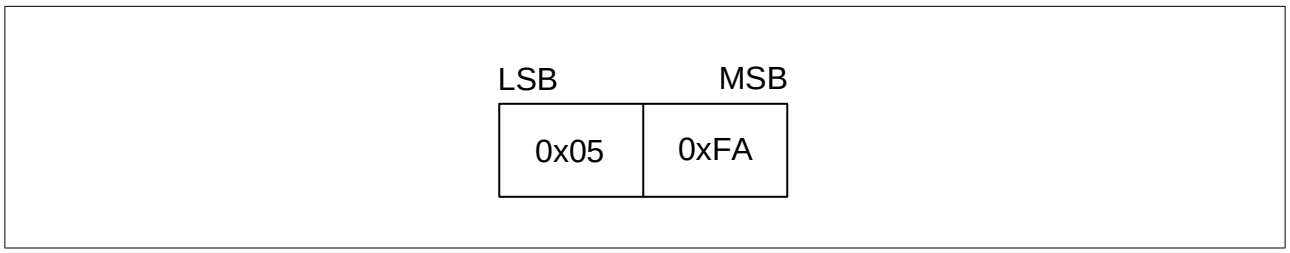

Figure 9.1: Wakeup message payload format

9.2 Woken message

The Woken message shall be sent whenever a Wakeup message is received even if the receiver is currently not asleep. Upon receiving a Woken message, a device can determine that the other device is not in a low power state and can send and receive data. The Woken message is an unreliable message sent with a Packet Type of 15, and a Payload Length of 2. The payload is composed of the octet pattern 0x06 0xF9.

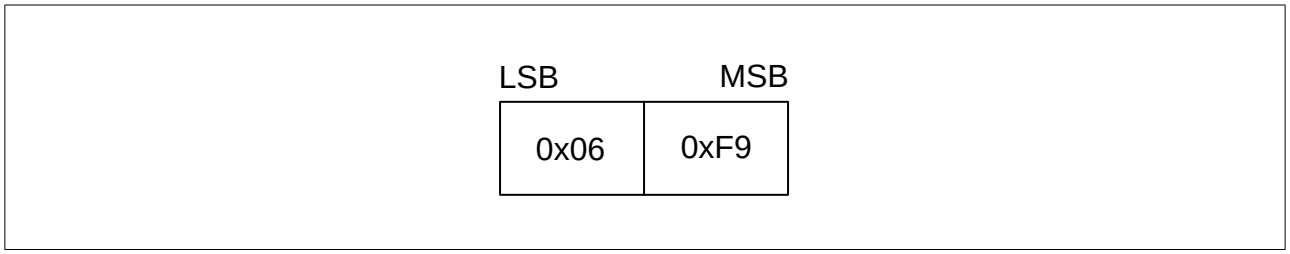

Figure 9.2: Woken message payload format

9.3 Sleep message

A Sleep message can be sent at any time after Link Establishment has finished. It notifies the other side that this device is going into a low power state, and that it may also go to sleep. If a device sends a Sleep message it shall use the Wakeup / Woken message sequence before sending any data. If a device receives a Sleep message, then it should use the Wakeup / Woken message sequence before sending any data. The Sleep message is an unreliable message sent with a Packet Type of 15, and a Payload Length of 2. The payload is composed of the octet pattern 0x07 0x78.

The sending of this message is optional. The receiver of this message need not go to sleep, but cooperating devices may be able to schedule sleeping more effectively with this message.

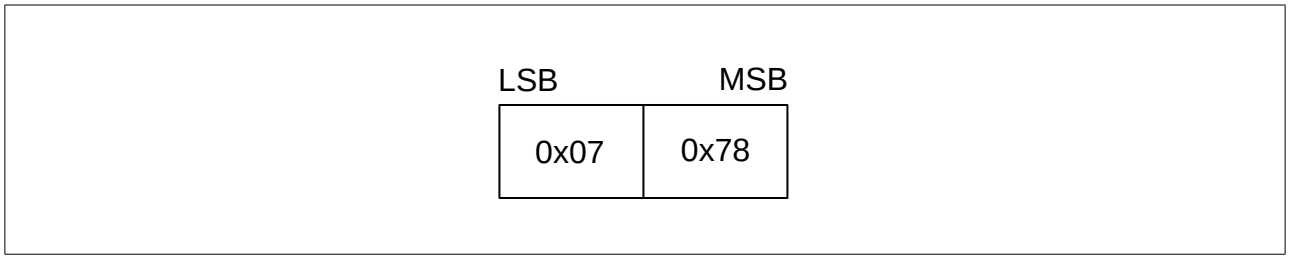

Figure 9.3: Sleep message payload format

10 OUT OF FRAME CONTROL

It is possible to embed information in the SLIP data stream after a SLIP ESCAPE character that can allow for Software Flow Control. This feature is optional and may be negotiated in the Link Establishment configuration messages.

10.1 Software Flow Control

If Software Flow Control is enabled, then the standard XON / XOFF (0x11 and 0x13) characters will control the flow of data over the transport. To allow the XON / XOFF characters to be sent in the payload, they shall be escaped as follows: 0x11 shall be changed to 0xDB 0xDE, 0x13 shall be changed to 0xDB DF. This means that the XON / XOFF characters in the data stream are used only by software flow control.

If Software Flow Control is disabled, then the SLIP escape sequences 0xDB 0xDE and 0xDB 0xDF are undefined. In this case, the original octets of 0x11 and 0x13 shall not be changed. Flow control should always be provided by the tunneled protocols, e.g. HCI Flow Control. Flow control is still available using the standard Sequence Number / Acknowledge Number. This can be done by not acknowledging packets until traffic can resume.

11 HARDWARE CONFIGURATION

The HCI Three-Wire UART Transport uses the following configurations.

11.1 Wires

There are three wires used by the HCI Three-Wire UART Transport. These are Transmit, Receive, and Ground.

11.1.1 Transmit & receive

The transmit line from one device shall be connected to the receive line of the other device.

11.1.2 Ground

A common ground reference shall be used.

11.2 Hardware flow

Hardware flow control may be used. The signaling shall be the same as a standard RS232 flow control lines. If used, the signals shall be connected in a null-modem fashion; for example, the local RTS shall be connected to the remote CTS and vice versa.

11.2.1 RTS & CTS

Request to Send indicates to the remote side that the local device is able to accept more data.

Clear to Send indicates if the remote side is able to receive data.

(See ITU.T recommendations V.24 [2] and V.28 [3])

12 RECOMMENDED PARAMETERS

12.1 Timing parameters

Because this transport protocol can be used with a wide variety of baud rates, it is not possible to specify a single timing value. However, it is possible to specify the time based on the baud rate in use. If T_{max} is defined as the maximum time, in seconds, it will take to transmit the largest packet over this transport, T_{max} can be expressed as:

T_{max} = maximum size of a packet in bits / baud rate

The maximum size of a packet in bits is either the number of bits in a 4095 octet packet (32,760) or less if required in an embedded system or as determined by the Host or Controller[1]. Thus, at a baud rate of 921,600 and the maximum packet size of 4095 octets, T_{max} is: (4095×10) ÷ 921,600 = 44.434 ms.

12.1.1 Acknowledgment of packets

It is not necessary to acknowledge every packet with a pure acknowledgment packet if there is a data packet that will be sent soon. The recommended maximum time before starting to send an acknowledgment is 2 × T_{max}.

12.1.2 Resending reliable packets

A reliable packet shall be resent until it is acknowledged. The recommended time between starting to send the same packet is 3 × T_{max}.

[1]This can be determined using the HCI_Read_Buffer_Size command.

Host Controller Interface
Part E

HOST CONTROLLER INTERFACE FUNCTIONAL SPECIFICATION

This Part describes the functional specification for the Host Controller interface (HCI). The HCI provides a uniform command interface to a Controller.

CONTENTS

1 INTRODUCTION

This Part of the specification describes the functional specifications for the Host Controller interface (HCI). The HCI provides a uniform command method for the Host to access Controller capabilities and to control connections to other Controllers. For the BR/EDR or LE Controller, these commands typically involve the Link Manager (LM) to exchange LMP commands or the Link Layer (LL) to exchange LL Control packets with remote Bluetooth devices. For details, see [Vol 2] Part C, Link Manager Protocol Specification and [Vol 6] Part B, Link Layer Specification.

The HCI layer spans the boundary between the Host and Controller. As a result, HCI has two roles: the Upper HCI, used by and residing within the Host, and the Lower HCI, used by and residing within the Controller.

The rest of this section provides a brief overview of the lower layers of the Bluetooth software stack and of the Bluetooth hardware. Section 2 provides an overview of the Host Controller Transport Layer. Section 3 lists the HCI commands and events and specifies the support requirements on different types of implementation. Section 4 describes the flow control used between the Host and the Controller. Section 5 describes the various data formats used by HCI. Section 6 further describes certain parameters that are common to several commands. Section 7 describes each of the HCI commands in detail, identifies parameters for each of the commands, and lists events associated with each command.

The specification is applicable to the following types of Controllers:

- BR/EDR Controller
- BR/EDR/LE Controller
- LE Controller

In the following sections, the term “BR/EDR Controller” is used to describe the BR/EDR functionality of a Controller which may be either a BR/EDR only Controller or a BR/EDR/LE Controller. Similarly, the term “LE Controller” is used to describe the LE functionality of a Controller which may be either an LE only Controller or a BR/EDR/LE Controller.

1.1 Lower Layers of the Bluetooth software stack

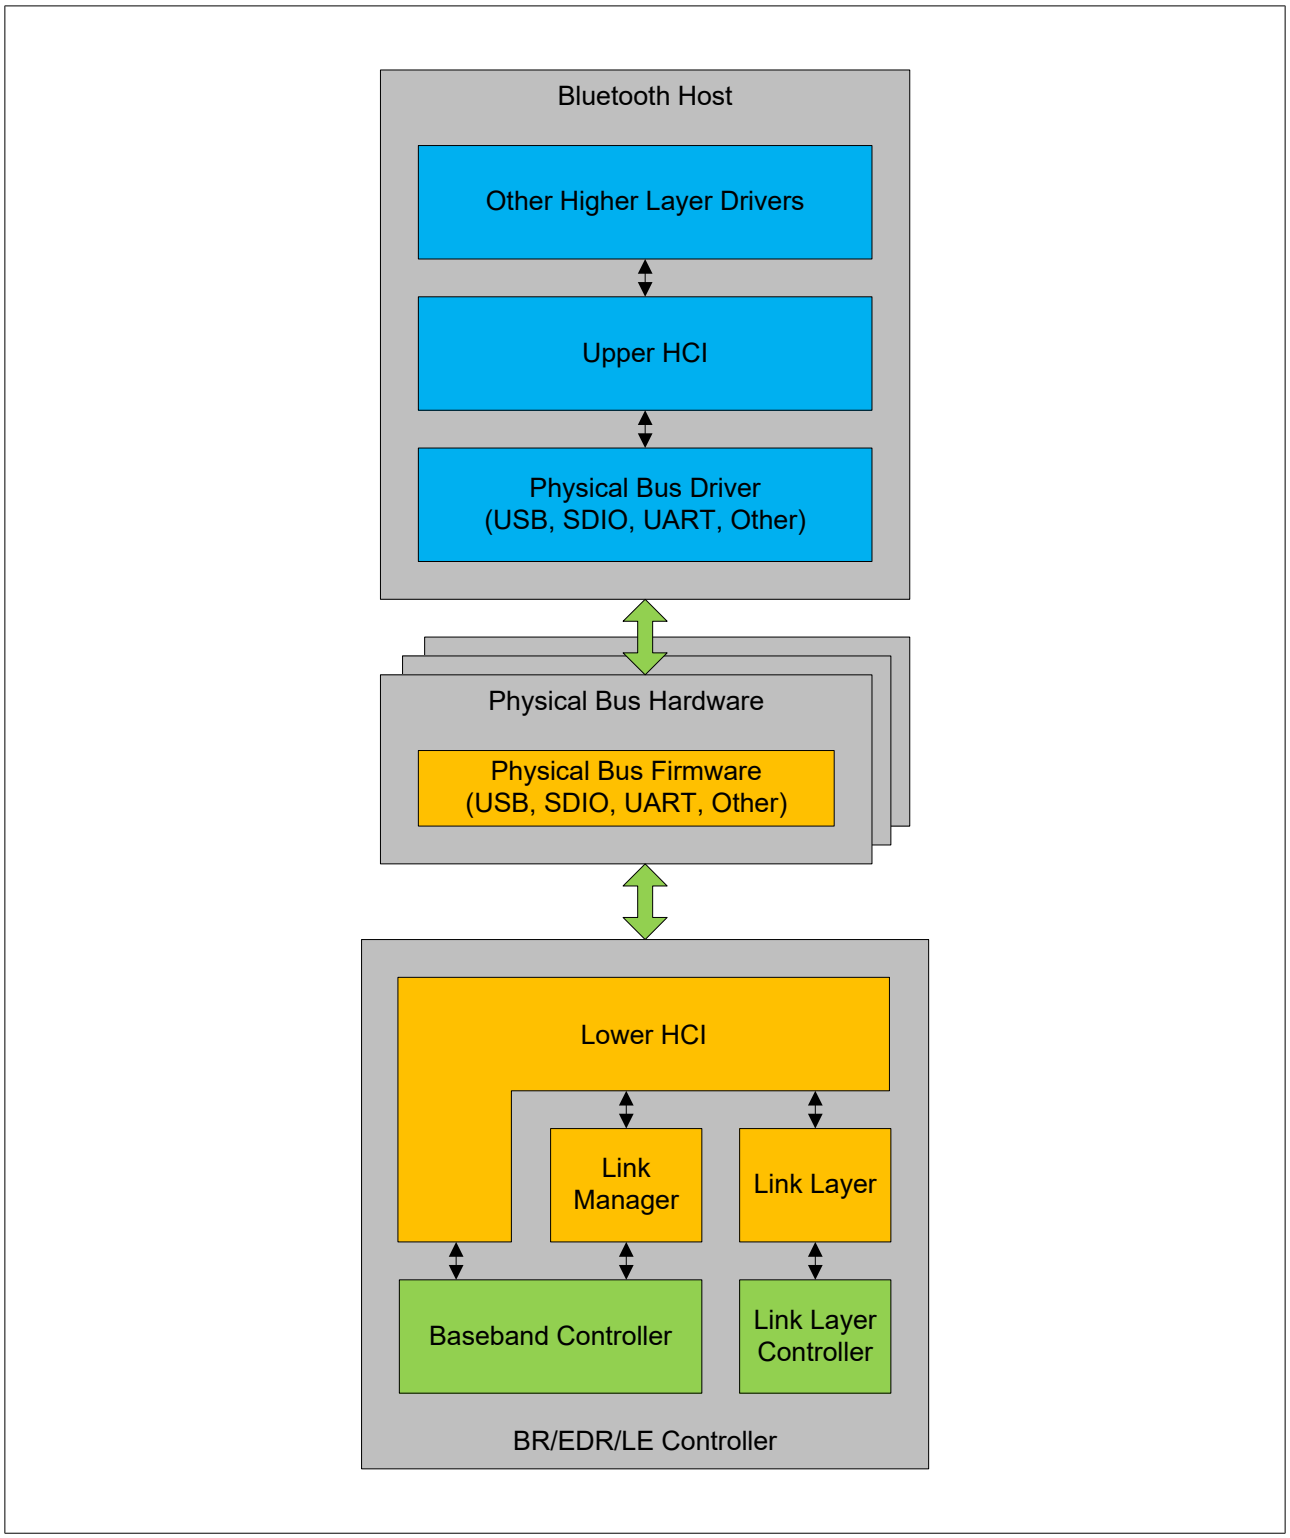

Figure 1.1: Overview of the lower software layers

Figure 1.1 provides an overview of the lower software layers.

Several layers may exist between the Upper HCI and the Lower HCI. These intermediate layers, collectively the "Host Controller Transport Layer", provide the ability to transfer data without intimate knowledge of the data.

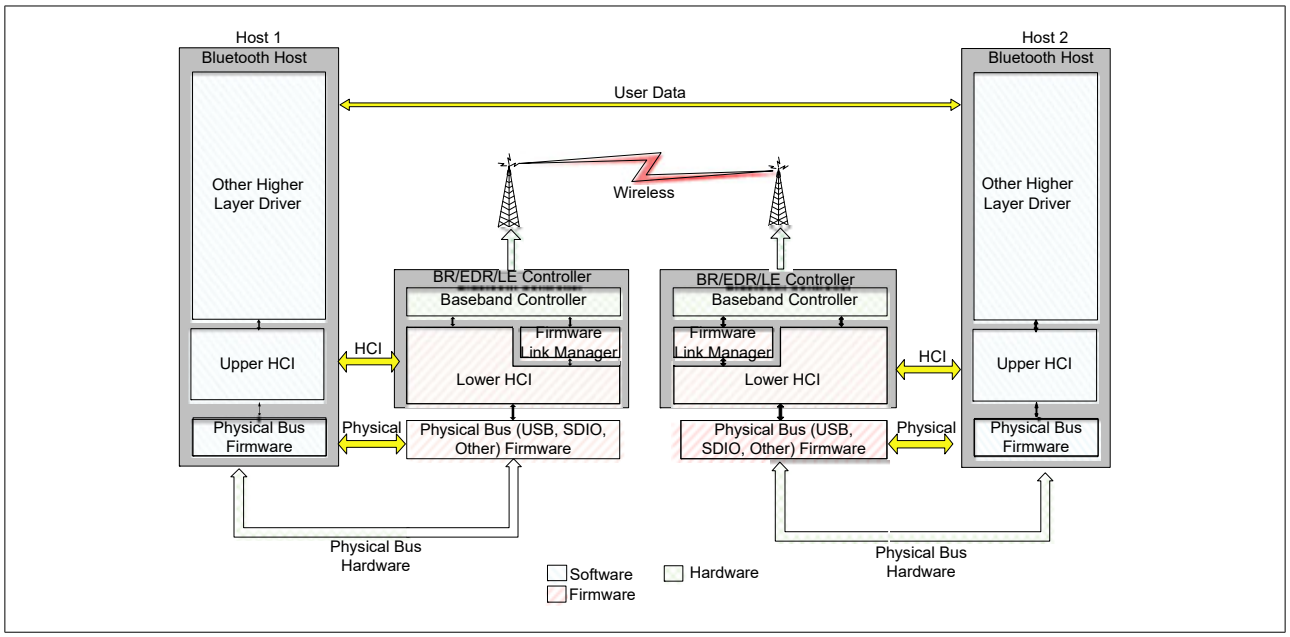

Figure 1.2: End to end overview of lower software layers to transfer data

Figure 1.2 illustrates the path of a data transfer from one device to another. The Upper HCI on the Host exchanges data and commands with the Lower HCI on the Bluetooth hardware. The Host Controller Transport Layer provides both HCI roles with the ability to exchange information with each other.

The Host will receive asynchronous notifications of HCI events independent of which Host Controller Transport Layer is used. HCI events are used for notifying the Host when something occurs. When the Host discovers that an event has occurred it will then parse the received event packet to determine which event occurred.

A BR/EDR/LE Controller uses one shared command buffer and flow control for BR/EDR and LE. Data buffers can be either shared between BR/EDR and LE or there may be separate data buffers for BR/EDR and LE. The configuration of a Controller is determined through HCI.

1.2 Cross-version issues

The Host and Controller communicating through HCI are not required to support the same version of this specification (see [Vol 0] Part D, Section 4).

If the Controller conforms to a newer version of the specification than the Host, events (including HCI_Command_Status and HCI_Command_Complete) may include values

that are reserved for future use in the version supported by the Host. In the case of the Status parameter of the HCI_Command_Status and HCI_Command_Complete events, a value that is reserved for future use must be treated as if it were the error code *Unspecified Error* (0x1F) (see [Vol 1] Part F, Section 1.3). In all other circumstances the Host must obey the requirements for devices receiving reserved values (see [Vol 1] Part E, Section 2.4).

Note: If the Host conforms to a newer version of the specification than the Controller and uses a command feature that is not part of the older specification version, then the Controller will report an error. Failure to handle such errors could result in unexpected behavior.

2 OVERVIEW OF HOST CONTROLLER TRANSPORT LAYER

The Host driver stack has a transport layer between the Host Controller Interface driver and the Host.

The main goal of this transport layer is transparency. The Host Controller Interface driver (which interfaces to the Controller) should be independent of the underlying transport technology. In addition, the transport should not require any understanding of the data that the Host Controller Interface driver passes to the Controller. This allows the logical interface (HCI) or the Controller to be upgraded without affecting the transport layer.

The specified Host Controller Transport Layers are described in the other parts of Volume 4.

2.1 [This section is no longer used]

3 OVERVIEW OF COMMANDS AND EVENTS

The commands and events are sent between the Host and the Controller.

Table 3.1 lists each HCI command and event together with specification version information, a summary description, and the support requirements.

A command or event may have more than one version. All versions of a command or event implement the same basic functionality but with detail differences, such as additional parameters relating to newer features. The different versions are indicated by "[v1]", etc. where necessary; if no version number is given, a reference to the command or event applies to all versions.

The specification version information gives the version number of the specification which first specified this command or event or, where more than one specification version number is shown, each version of this command or event.

Table 3.1 lists the requirements for a Controller to support each command or event or version thereof. Subject to Section 3.2, a Controller shall support the command or event if it is shown as mandatory for at least one of the transports (i.e., BR/EDR or LE) that the Controller supports, otherwise the Controller may support the command or event if it is shown as optional for at least one of the transports that the Controller supports, otherwise it shall not support the command or event. If the command or event has more than one version, then this determination is made for each version separately using the requirements listed in the table for that version. The LMP features mentioned in the conditions are defined in [Vol 2] Part C, Section 3.2 and the Link Layer features in [Vol 6] Part B, Section 4.6.

Name	Vers.	Summary Description	BR/EDR	LE
Accept Connection Request command	1.1	The HCI_Accept_Connection_Request command is used to accept a new incoming BR/EDR connection request.	M	E
Accept Synchronous Connection Request command	1.2	The HCI_Accept_Synchronous_Connection_Request command is used to accept an incoming request for a synchronous connection and to inform the local Link Manager about the acceptable parameter values for the synchronous connection.	C.134	E
Authenticated Payload Timeout Expired event	4.1	The HCI_Authenticated_Payload_Timeout_Expired event is used to indicate that a packet containing a valid MIC on the Handle was not received within the *authenticatedPayloadTO*.	C.155	C.155

Name	Vers.	Summary Description	BR/EDR	LE
Authentication Complete event	1.1	The HCI_Authentication_Complete event occurs when authentication has been completed for the specified connection.	C.101	E
Authentication Requested command	1.1	The HCI_Authentication_Requested command is used to establish authentication between the two devices associated with the specified Connection_Handle.	O	E
Change Connection Link Key command	1.1	The HCI_Change_Connection_Link_Key command is used to force both devices of a connection associated to the Connection_Handle, to generate a new link key.	O	E
Change Connection Link Key Complete event	1.1	The HCI_Change_Connection_Link_Key_Complete event is used to indicate that the change in the Link Key for the Connection_Handle specified by the Connection_Handle parameter had been completed.	C.102	E
Change Connection Packet Type command	1.1	The HCI_Change_Connection_Packet_Type command is used to change which packet types can be used for a connection that is currently established.	C.133	E
Command Complete event	1.1	The HCI_Command_Complete event is used by the Controller to pass the return status of a command and the other parameters for each HCI command.	M	M
Command Status event	1.1	The HCI_Command_Status event is used to indicate that the command described by the Command_Opcode parameter has been received and the Controller is currently performing the task for this command.	M	M
Configure Data Path command	5.2	The HCI_Configure_Data_Path command is used by a Host to configure a data path to enable codec operation in the Controller.	C.156	C.156
Connection Complete event	1.1	The HCI_Connection_Complete event indicates to both of the Hosts forming the connection that a new BR/EDR connection has been established.	M	E
Connection Packet Type Changed event	1.1	The HCI_Connection_Packet_Type_Changed event is used to indicate the completion of the process of the Link Manager changing the packet type mask used for the specified Connection_Handle.	C.133	E
Connection Request event	1.1	The HCI_Connection_Request event is used to indicate that a new incoming BR/EDR connection is trying to be established.	M	E

Name	Vers.	Summary Description	BR/EDR	LE
Connectionless Peripheral Broadcast Channel Map Change event	CSA4	The HCI_Connectionless_Peripheral_Broadcast_Channel_Map_Change event indicates to the Host that the BR/EDR Controller has moved to a new AFH channel map for the PBD logical link.	C.201	E
Connectionless Peripheral Broadcast Receive event	CSA4	The HCI_Connectionless_Peripheral_Broadcast_Receive event provides the Host with the data received from a Connectionless Peripheral Broadcast packet.	C.202	E
Connectionless Peripheral Broadcast Timeout event	CSA4	On the Connectionless Peripheral Broadcast Receiver, the HCI_Connectionless_Peripheral_Broadcast_Timeout event indicates to the Host that the BR/EDR Controller has lost synchronization with the Connectionless Peripheral Broadcast Transmitter. On the Connectionless Peripheral Broadcast Transmitter, the HCI_Connectionless_Peripheral_Broadcast_Timeout event indicates to the Host that the BR/EDR Controller has been unable to transmit a Connectionless Peripheral Broadcast packet for the timeout interval specified in the HCI_Set_Connectionless_Peripheral_Broadcast command.	C.202	E
Create Connection Cancel command	1.2	The HCI_Create_Connection_Cancel command is used to cancel an ongoing Create Connection.	M	E
Create Connection command	1.1	The HCI_Create_Connection command will cause the BR/EDR Link Manager to create an ACL connection to the BR/EDR Controller with the BD_ADDR specified by the parameters.	M	E
Data Buffer Overflow event	1.1	The HCI_Data_Buffer_Overflow event is used to indicate that the Controller's data buffers have overflowed, because the Host has sent more packets than allowed.	O	O
Delete Reserved LT_ADDR command	CSA4	The HCI_Delete_Reserved_LT_ADDR command requests that the BR/EDR Controller cancel the reservation of a specific LT_ADDR reserved for the purposes of Connectionless Peripheral Broadcast.	C.201	E
Delete Stored Link Key command	1.1	The HCI_Delete_Stored_Link_Key command provides the ability to remove one or more of the link keys stored in the Controller.	C.121	E
Disconnect command	1.1	The HCI_Disconnect command is used to terminate an existing BR/EDR or LE connection.	M	C.3

Name	Vers.	Summary Description	BR/EDR	LE
Disconnection Complete event	1.1	The HCI_Disconnection_Complete event occurs when a connection has been terminated.	M	C.3
Enable Implementation Under Test Mode command	1.1	The HCI_Enable_Implementation_Under_Test_Mode command will allow the local Controller to enter test mode via LMP test commands. The Host issues this command when it wants the local device to be the IUT for the Testing scenarios as described in the Bluetooth Test Mode document.	C.123	E
Encryption Change event	1.1 5.3	The HCI_Encryption_Change event is used to indicate that the change in encryption has been completed for the specified Connection_Handle.	[v1] M [v2] C.158	[v1] C.4 [v2] C.56
Encryption Key Refresh Complete event	2.1 + EDR	The HCI_Encryption_Key_Refresh_Complete event is used to indicate to the Host that the encryption key was refreshed on the given Connection_Handle any time encryption is paused and then resumed.	M	C.4
Enhanced Accept Synchronous Connection Request command	CSA2	The HCI_Enhanced_Accept_Synchronous_Connection_Request command is used to accept an incoming request for a synchronous connection and to inform the local Link Manager about the acceptable parameter values for the synchronous connection.	C.135	E
Enhanced Flush command	2.1 + EDR	The HCI_Enhanced_Flush command is used to discard specific packets currently pending for transmission in the Controller for the specified Handle. This command takes a parameter specifying the type of packets to be flushed.	M	E
Enhanced Flush Complete event	2.1 + EDR	The HCI_Enhanced_Flush_Complete event is used to indicate that an Enhanced Flush is complete.	M	E
Enhanced Setup Synchronous Connection command	CSA2	The HCI_Enhanced_Setup_Synchronous_Connection command adds a new or modifies an existing synchronous logical transport (SCO or eSCO) on a physical link depending on the Connection_Handle parameter specified.	C.135	E
Exit Periodic Inquiry Mode command	1.1	The HCI_Exit_Periodic_Inquiry_Mode command is used to end the Periodic Inquiry mode when the local device is in Periodic Inquiry Mode.	C.103	E
Exit Sniff Mode command	1.1	The HCI_Exit_Sniff_Mode command is used to end Sniff mode for a Connection_Handle which is currently in Sniff mode.	C.214	E

Name	Vers.	Summary Description	BR/EDR	LE
Extended Inquiry Result event	2.1 + EDR	The HCI_Extended_Inquiry_Result event indicates that a BR/EDR Controller has responded with an extended inquiry response during the current Inquiry process.	C.147	E
Flow Specification command	1.2	The HCI_Flow_Specification command is used to specify the flow parameters for the traffic carried over the ACL connection identified by the Connection_Handle.	M	E
Flow Specification Complete event	1.2	The HCI_Flow_Specification_Complete event is used to inform the Host about the Quality of Service for the ACL connection the Controller is able to support.	M	E
Flush command	1.1	The HCI_Flush command is used to discard all data that is currently pending for transmission in the Controller for the specified Connection_Handle.	M	E
Flush Occurred event	1.1	The HCI_Flush_Occurred event is used to indicate that, for the specified Handle, the data to be transmitted has been discarded.	M	E
Get MWS Transport Layer Configuration command	CSA3	The HCI_Get_MWS_Transport_Layer_Configuration command reads the supported baud rates from the Controller.	C.109	C.109
Hardware Error event	1.1	The HCI_Hardware_Error event is used to indicate some type of hardware failure for the Controller.	O	O
Hold Mode command	1.1	The HCI_Hold_Mode command is used to initiate Hold mode.	C.213	E
Host Buffer Size command	1.1	The HCI_Host_Buffer_Size command is used by the Host to notify the Controller about its buffer sizes for ACL and synchronous data. The Controller will fragment the data to be transmitted from the Controller to the Host, so that data contained in HCI Data packets will not exceed these sizes.	C.107	C.107
Host Number Of Completed Packets command	1.1	The HCI_Host_Number_Of_Completed_Packets command is used by the Host to indicate to the Controller when the Host is ready to receive more HCI packets for any Connection_Handle.	C.107	C.107
Inquiry Cancel command	1.1	The HCI_Inquiry_Cancel command will cause the BR/EDR Controller to stop the current Inquiry if the BR/EDR Controller is in Inquiry Mode.	C.127	E

Name	Vers.	Summary Description	BR/EDR	LE
Inquiry command	1.1	The HCI_Inquiry command will cause the BR/EDR Controller to enter Inquiry Mode. Inquiry Mode is used to discovery other nearby BR/EDR Controllers.	C.127	E
Inquiry Complete event	1.1	The HCI_Inquiry_Complete event indicates that the Inquiry is finished.	C.127	E
Inquiry Response Notification event	CSA4	The HCI_Inquiry_Response_Notification event indicates to the Host that the BR/EDR Controller responded to an inquiry message.	C.126	E
Inquiry Result event	1.1	The HCI_Inquiry_Result event indicates that a BR/EDR Controller or multiple BR/EDR Controllers have responded so far during the current Inquiry process.	C.127	E
Inquiry Result with RSSI event	1.2	The HCI_Inquiry_Result_with_RSSI event indicates that a BR/EDR Controller or multiple BR/EDR Controllers have responded so far during the current Inquiry process.	C.128	E
IO Capability Request event	2.1 + EDR	The HCI_IO_Capability_Request event is used to indicate that the IO capabilities of the Host are required for a Secure Simple Pairing process.	M	E
IO Capability Request Negative Reply command	2.1 + EDR	The HCI_IO_Capability_Request_Negative_Reply command is used to reject a pairing attempt after an HCI_IO_Capability_Request event has been received by the Host.	M	E
IO Capability Request Reply command	2.1 + EDR	The HCI_IO_Capability_Request_Reply command is used to reply to an HCI_IO_Capability_Request event from the Controller, and specifies the current IO capabilities of the Host.	M	E
IO Capability Response event	2.1 + EDR	The HCI_IO_Capability_Response event is used to indicate to the Host that IO capabilities from a remote device specified by BD_ADDR have been received during a Secure Simple Pairing process.	M	E
Keypress Notification event	2.1 + EDR	The HCI_Keypress_Notification event is sent to the Host after a passkey notification has been received by the Link Manager on the given BD_ADDR.	M	E
LE Accept CIS Request command	5.2	The HCI_LE_Accept_CIS_Request command is used by the Peripheral's Host to inform the Controller to accept the request for creating the CIS.	E	C.40

Name	Vers.	Summary Description	BR/EDR	LE
LE Add Device To Filter Accept List command	4.0	The HCI_LE_Add_Device_To_Filter_Accept_List command will add a device to the Filter Accept List.	E	M
LE Add Device To Monitored Advertisers List command	6.0	The HCI_LE_Add_Device_To_Monitored_Advertisers_List command will add a device to the Monitored Advertisers List.	E	C.78
LE Add Device To Periodic Advertiser List command	5.0	The HCI_LE_Add_Device_To_Periodic_Advertiser_List command will add a device to the Periodic Advertiser List.	E	C.21
LE Add Device To Resolving List command	4.2	The HCI_LE_Add_Device_To_Resolving_List command is used to add one device to the resolving list used to resolve Resolvable Private Addresses in the Controller.	E	C.9
LE Advertising Report event	4.0	The HCI_LE_Advertising_Report event indicates that an advertising or scan response packet has been received.	E	C.98
LE Advertising Set Terminated event	5.0	The HCI_LE_Advertising_Set_Terminated event indicates that advertising in a given advertising set has stopped.	E	C.17
LE BIG Create Sync command	5.2	The HCI_LE_BIG_Create_Sync synchronizes and receives PDUs from one or more BISes.	E	C.42
LE BIG Sync Established event	5.2	The HCI_LE_BIG_Sync_Established event indicates that the Controller has completed an attempt to synchronize with the requested BISes.	E	C.42
LE BIG Sync Lost event	5.2	The HCI_LE_BIG_Sync_Lost event indicates that the Controller stopped synchronizing with a BIG.	E	C.42
LE BIG Terminate Sync command	5.2	The HCI_LE_BIG_Terminate_Sync command stops or cancels synchronizing with a BIG.	E	C.42
LE BIGInfo Advertising Report event	5.2	The HCI_LE_BIGInfo_Advertising_Report event indicates that the Controller has received an Advertising PDU that contained a BIGInfo field.	E	C.54
LE Channel Selection Algorithm event	5.0	The HCI_LE_Channel_Selection_Algorithm event indicates the channel selection algorithm used on a connection.	E	C.23
LE CIS Established event	5.2 Erratum 18552	The HCI_LE_CIS_Established event indicates that the Controller established a CIS.	E	[v1] C.38 [v2] C.159

Name	Vers.	Summary Description	BR/EDR	LE
LE CIS Request event	5.2	The HCI_LE_CIS_Request event indicates that the Peripheral's Controller received a request from the Central to create a CIS.	E	C.40
LE Clear Advertising Sets command	5.0	The HCI_LE_Clear_Advertising_Sets command will remove all existing advertising sets from the Controller.	E	C.17
LE Clear Filter Accept List command	4.0	The HCI_LE_Clear_Filter_Accept_List command will clear the Filter Accept List.	E	M
LE Clear Monitored Advertisers List command	6.0	The HCI_LE_Clear_Monitored_Advertisers_List command will clear the Monitored Advertisers List.	E	C.78
LE Clear Periodic Advertiser List command	5.0	The HCI_LE_Clear_Periodic_Advertiser_List command will clear the Periodic Advertiser List.	E	C.21
LE Clear Resolving List command	4.2	The HCI_LE_Clear_Resolving_List command is used to remove all devices from the resolving list used to resolve Resolvable Private Addresses in the Controller.	E	C.9
LE Connection Complete event	4.0	The HCI_LE_Connection_Complete event indicates to the Host that a new connection has been created.	E	C.3
LE Connection CTE Request Enable command	5.1	The HCI_LE_Connection_CTE_Request_Enable command will request the Controller to start or stop sending of LL_CTE_REQ PDUs on a connection.	E	C.25
LE Connection CTE Response Enable command	5.1	The HCI_LE_Connection_CTE_Response_Enable command will command the Controller to respond to LL_CTE_REQ PDUs with LL_CTE_RSP PDUs.	E	C.26
LE Connection IQ Report event	5.1	The HCI_LE_Connection_IQ_Report event is used to report IQ samples from the Constant Tone Extension field of a received packet containing an LL_CTE_RSP PDU.	E	C.25
LE Connection Update command	4.0	The HCI_LE_Connection_Update command will be used to change the connection parameters of an existing connection.	E	C.62
LE Connection Update Complete event	4.0	The HCI_LE_Connection_Update_Complete event indicates the completion of the process to change the connection parameters.	E	C.3
LE Connectionless IQ Report event	5.1	The HCI_LE_Connectionless_IQ_Report event reports IQ information from the Constant Tone Extension of a received advertising packet.	E	C.28

Name	Vers.	Summary Description	BR/EDR	LE
LE Create BIG command	5.2	The HCI_LE_Create_BIG command creates one or more BISes of a BIG.	E	C.41
LE Create BIG Complete event	5.2	The HCI_LE_Create_BIG_Complete event indicates that the Controller completed an attempt to create the BISes that were requested by the Host.	E	C.41
LE Create BIG Test command	5.2	The HCI_LE_Create_BIG_Test command is used to create one or more BISes of a BIG for testing purposes.	E	C.41
LE Create CIS command	5.2	The HCI_LE_Create_CIS command is used by the Central's Host to create one or more CISes.	E	C.39
LE Create Connection Cancel command	4.0	The HCI_LE_Create_Connection_Cancel command is used to cancel an ongoing HCI_LE_Create_Connection command.	E	C.94
LE Create Connection command	4.0	The HCI_LE_Create_Connection command is used to create a new connection.	E	C.59
LE CS Config Complete event	6.0	The HCI_LE_CS_Config_Complete event is used to report the status of a CS configuration initiated by either a local or remote Controller.	E	C.75
LE CS Create Config command	6.0	The HCI_LE_CS_Create_Config command is used by a Host to create a CS configuration.	E	C.75
LE CS Procedure Enable command	6.0	The HCI_LE_CS_Procedure_Enable command is used by a Host to enable the Controller to initiate the CS start procedure.	E	C.75
LE CS Procedure Enable Complete event	6.0	The HCI_LE_CS_Procedure_Enable_Complete event is used to report the status after enabling a new CS procedure or disabling an ongoing CS procedure.	E	C.75
LE CS Read Local Supported Capabilities command	6.0	The HCI_LE_CS_Read_Local_Supported_Capabilities command is used by a Host to query CS capabilities.	E	C.75
LE CS Read Remote FAE Table command	6.0	The HCI_LE_CS_Read_Remote_FAE_Table command is used by a Host to read the per-channel mode-0 Frequency Actuation Error table of the remote Controller.	E	C.75
LE CS Read Remote FAE Table Complete event	6.0	The HCI_LE_CS_Read_Remote_FAE_Table_Complete event is used to report the completion of a locally initiated Channel Sounding mode-0 FAE Table Request procedure.	E	C.75

Name	Vers.	Summary Description	BR/EDR	LE
LE CS Read Remote Supported Capabilities command	6.0	The HCI_LE_CS_Read_Remote_Supported_Capabilities command is used by a Host to query the CS capabilities of a remote device.	E	C.75
LE CS Read Remote Supported Capabilities Complete event	6.0	The HCI_LE_CS_Read_Remote_Supported_Capabilities_Complete event is used to report the CS capabilities of a remote device.	E	C.75
LE CS Remove Config command	6.0	The HCI_LE_CS_Remove_Config command is used by a Host to remove an active CS configuration.	E	C.75
LE CS Security Enable command	6.0	The HCI_LE_CS_Security_Enable command is used by a Host to start the CS Security procedure on the specified connection.	E	C.75
LE CS Security Enable Complete event	6.0	The HCI_LE_CS_Security_Enable_Complete event is used to report the completion of a CS Security Start procedure initiated by either a local or remote Controller.	E	C.75
LE CS Set Channel Classification command	6.0	The HCI_LE_CS_Set_Channel_Classification command is used by the Host to specify the channel classification to be used for CS procedures.	E	C.75
LE CS Set Default Settings command	6.0	The HCI_LE_CS_Set_Default_Settings command is used by a Host to set default CS settings in the local Controller.	E	C.75
LE CS Set Procedure Parameters command	6.0	The HCI_LE_CS_Set_Procedure_Parameters command is used by the Host to specify the parameters to be used for scheduling CS procedures.	E	C.75
LE CS Subevent Result Continue event	6.0	The HCI_LE_CS_Subevent_Result_Continue event is used to report any remaining results of a CS subevent in the initiator or reflector.	E	C.75
LE CS Subevent Result event	6.0	The HCI_LE_CS_Subevent_Result event is used to report the results of a CS subevent in the initiator or reflector.	E	C.75
LE CS Test command	6.0	The HCI_LE_CS_Test command runs the CS test.	E	C.75
LE CS Test End command	6.0	The HCI_LE_CS_Test_End command stops the CS test.	E	C.75
LE CS Test End Complete event	6.0	The HCI_LE_CS_Test_End_Complete event is used to report the termination of a CS test.	E	C.75

Name	Vers.	Summary Description	BR/EDR	LE
LE CS Write Cached Remote FAE Table command	6.0	The HCI_LE_CS_Write_Cached_Remote_-FAE_Table command is used by a Host to write the per-channel mode-0 Frequency Actuation Error table of the remote device in the local Controller.	E	C.76
LE CS Write Cached Remote Supported Capabilities command	6.0	The HCI_LE_CS_Write_Cached_Remote_-Supported_Capabilities command is used by a Host to write a cached copy of the remote CS capabilities in a local Controller.	E	C.75
LE CTE Request Failed event	5.1	The HCI_LE_CTE_Request_Failed event indicates a problem with a request generated by an HCI_LE_Connection_CTE_Request_Enable command for a peer device to send Constant Tone Extensions.	E	C.25
LE Data Length Change event	4.2	The HCI_LE_Data_Length_Change event is used to indicate a change in the maximum packet sizes by the Link Layer.	E	C.8
LE Directed Advertising Report event	4.2	The HCI_LE_Directed_Advertising_Report event indicates that directed advertisements have been received where the advertiser is using a resolvable private address for the TargetA field in the ADV_DIRECT_IND PDU and the scanning filter policy is set to send this event to the Host.	E	C.63
LE Enable Encryption command	4.0	The HCI_LE_Enable_Encryption command is used to enable link level encryption.	E	C.60
LE Enable Monitoring Advertisers command	6.0	The HCI_LE_Enable_Monitoring_Advertisers command will enable monitoring advertisers that are in the Monitored Advertisers List.	E	C.78
LE Encrypt command	4.0	The HCI_LE_Encrypt command will encrypt a block of unencrypted data against a key and generate a block of encrypted data.	E	C.4
LE Enhanced Connection Complete event	4.2 5.4	The HCI_LE_Enhanced_Connection_Complete event indicates to the Host that a new connection has been created. This event contains the additional parameters of the local and peer resolvable private addresses.	E	[v1] C.24 [v2] C.69
LE Enhanced Read Transmit Power Level command	5.2	The HCI_LE_Enhanced_Read_Transmit_Power_Level command is used to read the current and maximum transmit power levels used by the local Controller on a specified PHY on an ACL connection.	E	C.51

Name	Vers.	Summary Description	BR/EDR	LE
LE Extended Advertising Report event	5.0	The HCI_LE_Extended_Advertising_Report event indicates that an advertising packet has been received.	E	C.19
LE Extended Create Connection command	5.0 5.4	The HCI_LE_Extended_Create_Connection command is used to create a new connection supporting different initiating PHYs and to initiate a connection with a synchronized device.	E	[v1] C.20 [v2] C.67
LE Frame Space Update command	6.0	The HCI_LE_Frame_Space_Update command is used to initiate the Frame Space Update procedure.	E	C.79
LE Frame Space Update Complete event	6.0	The HCI_LE_Frame_Space_Update_Complete event is used to inform the Host of changes to the frame space values	E	C.79
LE Generate DHKey command	4.2 5.1	The HCI_LE_Generate_DHKey command is used to initiate generation of a Diffie-Hellman key in the Controller for use over the LE transport.	E	[v1] C.99 [v2] O
LE Generate DHKey Complete event	4.2	The HCI_LE_Generate_DHKey_Complete event indicates that LE Diffie-Hellman key generation has been completed by the Controller.	E	O
LE ISO Read Test Counters command	5.2	The HCI_LE_ISO_Read_Test_Counters command reads the test counters in the Controller which is configured in ISO Receive Test mode.	E	C.46
LE ISO Receive Test command	5.2	The HCI_LE_ISO_Receive_Test command configures a Link Layer to receive test payloads from an established CIS or a synchronized BIS.	E	C.46
LE ISO Test End command	5.2	The HCI_LE_ISO_Test_End command terminates the ISO Transmit and/or Receive Test mode.	E	C.47
LE ISO Transmit Test command	5.2	The HCI_LE_ISO_Transmit_Test command configures an established CIS or BIS to transmit test payloads that are generated by the Controller.	E	C.45
LE Long Term Key Request event	4.0	The HCI_LE_Long_Term_Key_Request event indicates that a Long Term Key is required for a connection.	E	C.61
LE Long Term Key Request Negative Reply command	4.0	The HCI_LE_Long_Term_Key_Request_Negative_Reply command is used to reply to an HCI_LE_Long_Term_Key_Request event and indicates that the Host does not have a Long Term Key for that connection.	E	C.61

Name	Vers.	Summary Description	BR/EDR	LE
LE Long Term Key Request Reply command	4.0	The HCI_LE_Long_Term_Key_Request_Reply command is used to reply to an HCI_LE_Long_Term_Key_Request event and includes the Long Term Key stored in the Host for that connection.	E	C.61
LE Modify Sleep Clock Accuracy command	5.1	The HCI_LE_Modify_Sleep_Clock_Accuracy command requests the Controller changes its sleep clock accuracy for testing purposes.	E	C.37
LE Monitored Advertisers Report event	6.0	The HCI_LE_Monitored_Advertisers_Report event is used by a Controller to send reports on advertising devices being monitored.	E	C.78
LE Path Loss Threshold event	5.2	The HCI_LE_Path_Loss_Threshold event is used to report a path loss threshold crossing on an ACL connection.	E	C.52
LE Periodic Advertising Create Sync Cancel command	5.0	The HCI_LE_Periodic_Advertising_Create_Sync_Cancel command is used to cancel a pending HCI_LE_Periodic_Advertising_Create_Sync command.	E	C.16
LE Periodic Advertising Create Sync command	5.0	The HCI_LE_Periodic_Advertising_Create_Sync command is used to start receiving periodic advertising packets from an advertiser.	E	C.16
LE Periodic Advertising Report event	5.0 5.4	The HCI_LE_Periodic_Advertising_Report event indicates that a periodic advertising packet has been received.	E	[v1] C.21 [v2] C.68
LE Periodic Advertising Set Info Transfer command	5.1	The HCI_LE_Periodic_Advertising_Set_Info_Transfer command is used to send periodic advertising synchronization information, describing periodic advertising events that the Controller is transmitting, to a connected Controller.	E	C.34
LE Periodic Advertising Response Report event	5.4	The HCI_LE_Periodic_Advertising_Response_Report event is used to report response data to a Host.	E	C.67
LE Periodic Advertising Subevent Data Request event	5.4	The HCI_LE_Periodic_Advertising_Subevent_Data_Request event is used to request subevent data from a Host.	E	C.67

Name	Vers.	Summary Description	BR/EDR	LE
LE Periodic Advertising Sync Established event	5.0 5.4	The HCI_LE_Periodic_Advertising_Sync_Established event indicates that the Controller has started receiving periodic advertising packets from an advertiser.	E	[v1] C.16 [v2] C.68
LE Periodic Advertising Sync Lost event	5.0	The HCI_LE_Periodic_Advertising_Sync_Lost event indicates the Controller has ended receiving a periodic advertising train.	E	C.21
LE Periodic Advertising Sync Transfer command	5.1	The HCI_LE_Periodic_Advertising_Sync_Transfer command is used to send periodic advertising synchronization information to a connected Controller.	E	C.33
LE Periodic Advertising Sync Transfer Received event	5.1 5.4	The HCI_LE_Periodic_Advertising_Sync_Transfer_Received event reports reception of periodic advertising synchronization information from a connected Controller.	E	[v1] C.35 [v2] C.68
LE Periodic Advertising Terminate Sync command	5.0	The HCI_LE_Periodic_Advertising_Terminate_Sync command is used to end receiving of a periodic advertising train.	E	C.21
LE PHY Update Complete event	5.0	The HCI_LE_PHY_Update_Complete event is used to inform the Host of the current PHY.	E	C.11
LE Rand command	4.0	The HCI_LE_Rand command will generate a random number.	E	C.4
LE Read Advertising Physical Channel Tx Power command	4.0	The HCI_LE_Read_Advertising_Physical_Channel_Tx_Power command will read the transmit power level that will be used for advertising.	E	C.97
LE Read All Local Supported Features command	6.0	The HCI_LE_Read_All_Local_Supported_Features command will read all the features supported by the local LE Controller.	E	C.70
LE Read All Remote Features command	6.0	The HCI_LE_Read_All_Remote_Features command is used to read all the features used on a connection and the features supported by a remote LE device.	E	C.71
LE Read All Remote Features Complete event	6.0	The HCI_LE_Read_All_Remote_Features_Complete event indicates the completion of the process to read all the features used on a connection and the features supported by a remote LE device.	E	C.72

Name	Vers.	Summary Description	BR/EDR	LE
LE Read Antenna Information command	5.1	The HCI_LE_Read_Antenna_Information command allows the Host to read the switching rates, the sampling rates, the number of antennae, and the maximum length of the Constant Tone Extension supported by the Controller.	E	C.31
LE Read Buffer Size command	4.0 5.2	The HCI_LE_Read_Buffer_Size command returns the size of the HCI buffers. These buffers are used by the LE Controller to buffer data that is to be transmitted.	E	[v1] C.3 [v2] C.55
LE Read Channel Map command	4.0	The HCI_LE_Read_Channel_Map command will read the current state of the channel map for a connection.	E	C.3
LE Read Filter Accept List Size command	4.0	The HCI_LE_Read_Filter_Accept_List_Size command will read the number of Filter Accept List entries that this Controller can store at the present time.	E	M
LE Read ISO Link Quality command	5.2	The HCI_LE_Read_ISO_Link_Quality command returns the value of various counters related to link quality on an isochronous stream.	E	C.50
LE Read ISO TX Sync command	5.2	The HCI_LE_Read_ISO_TX_Sync command is used to read the Time_Stamp and Time_Offset of a transmitted SDU.	E	C.45
LE Read Local P-256 Public Key command	4.2	The HCI_LE_Read_Local_P-256_Public_Key command is used to return the local P-256 public key from the Controller.	E	O
LE Read Local P-256 Public Key Complete event	4.2	The HCI_LE_Read_Local_P-256_Public_Key_Complete event is generated when local P-256 key generation is complete.	E	O
LE Read Local Resolvable Address command	4.2	The HCI_LE_Read_Local_Resolvable_Address command is used to get the current local Resolvable Private Address being used for the corresponding peer Identity Address.	E	C.10
LE Read Local Supported Features Page 0 command	4.0	The HCI_LE_Read_Local_Supported_Features_Page_0 command will read page 0 of the features supported by the local LE Controller.	E	M
LE Read Maximum Advertising Data Length command	5.0	The HCI_LE_Read_Maximum_Advertising_Data_Length command will read the maximum length of advertising data that the advertising Controller supports in a given advertising set.	E	C.17

Name	Vers.	Summary Description	BR/EDR	LE
LE Read Maximum Data Length command	4.2	The HCI_LE_Read_Maximum_Data_Length command allows the Host to read the Controller's supportedMaxTxOctets, supportedMaxTxTime, supportedMaxRxOctets, and supportedMaxRxTime parameters.	E	C.8
LE Read Monitored Advertisers List Size command	6.0	The HCI_LE_Read_Monitored_Advertisers_List_Size command will read the number of Monitored Advertisers List entries that the Controller supports.	E	C.78
LE Read Number of Supported Advertising Sets command	5.0	The HCI_LE_Read_Number_of_Supported_Advertising_Sets command will read the number of advertising sets that the advertising Controller can support at the present time.	E	C.17
LE Read Peer Resolvable Address command	4.2	The HCI_LE_Read_Peer_Resolvable_Address command is used to get the current peer Resolvable Private Address being used for the corresponding peer Public and Random (static) Identity Address.	E	C.10
LE Read Periodic Advertiser List Size command	5.0	The HCI_LE_Read_Periodic_Advertiser_List_Size command will read the number of Periodic Advertiser List entries that the Controller can store at the present time.	E	C.21
LE Read PHY command	5.0	The HCI_LE_Read_PHY command will read the current PHY.	E	C.11
LE Read Remote Features Page 0 command	4.0	The HCI_LE_Read_Remote_Features_Page_0 command is used to read page 0 of the features used on a connection and the features supported by a remote LE device.	E	C.3
LE Read Remote Features Page 0 Complete event	4.0	The HCI_LE_Read_Remote_Features_Page_0_Complete event indicates the completion of the process to read page 0 of the features used on a connection and the features supported by a remote LE device.	E	C.3
LE Read Remote Transmit Power Level command	5.2	The HCI_LE_Read_Remote_Transmit_Power_Level command is used to read the transmit power level used by the remote Controller on a specified PHY on an ACL connection.	E	C.51
LE Read Resolving List Size command	4.2	The HCI_LE_Read_Resolving_List_Size command is used to read the total number of entries in the resolving list that can be stored in the Controller.	E	C.9
LE Read RF Path Compensation command	5.0	The HCI_LE_Read_RF_Path_Compensation command is used to read the RF Path Compensation Value.	E	C.22

Name	Vers.	Summary Description	BR/EDR	LE
LE Read Suggested Default Data Length command	4.2	The HCI_LE_Read_Suggested_Default_Data_Length command allows the Host to read the initial MaxTxOctets and MaxTxTime values for new connections it suggested to the Controller.	E	C.8
LE Read Supported States command	4.0	The HCI_LE_Read_Supported_States command will read the current supported state and role combinations for the local LE Controllers.	E	M
LE Read Transmit Power command	5.0	The HCI_LE_Read_Transmit_Power command will read the minimum and maximum transmit powers supported by the Controller.	E	C.64
LE Receiver Test command	4.0 5.0 5.1	The HCI_LE_Receiver_Test command will run the LE receiver test.	E	[v1] C.2 [v2] C.13 [v3] C.30
LE Reject CIS Request command	5.2	The HCI_LE_Reject_CIS_Request command is used by the Peripheral's Host to inform the Controller to reject the request for creating the CIS.	E	C.40
LE Remote Connection Parameter Request event	4.1	The HCI_LE_Remote_Connection_Parameter_Request event is used to indicate to the Host that the remote device is requesting a change in the connection parameters.	E	C.6
LE Remote Connection Parameter Request Negative Reply command	4.1	The HCI_LE_Remote_Connection_Parameter_Request_Negative_Reply command is used to reject the remote device's request to change the connection parameters of the LE connection.	E	C.6
LE Remote Connection Parameter Request Reply command	4.1	The HCI_LE_Remote_Connection_Parameter_Request_Reply command is used to accept the remote device's request to change the connection parameters of the LE connection.	E	C.6
LE Remove Advertising Set command	5.0	The HCI_LE_Remove_Advertising_Set command will remove an advertising set from the Controller.	E	C.17
LE Remove CIG command	5.2	The HCI_LE_Remove_CIG command is used by the Central's Host to remove a CIG from the Controller.	E	C.39

Name	Vers.	Summary Description	BR/EDR	LE
LE Remove Device From Filter Accept List command	4.0	The HCI_LE_Remove_Device_From_Filter_Accept_List command will remove a single device from the Filter Accept List.	E	M
LE Remove Device From Monitored Advertisers List command	6.0	The HCI_LE_Remove_Device_From_Monitored_Advertisers_List command will remove a device from the Monitored Advertisers list.	E	C.78
LE Remove Device From Periodic Advertiser List command	5.0	The HCI_LE_Remove_Device_From_Periodic_Advertiser_List command will remove a single device from the Periodic Advertiser List.	E	C.21
LE Remove Device From Resolving List command	4.2	The HCI_LE_Remove_Device_From_Resolving_List command is used to remove one device from the resolving list used to resolve Resolvable Private Addresses in the Controller.	E	C.9
LE Remove ISO Data Path command	5.2	The HCI_LE_Remove_ISO_Data_Path command removes an isochronous data path between the Host and the Controller.	E	C.47
LE Request Peer SCA command	5.2	The HCI_LE_Request_Peer_SCA command requests the Sleep Clock Accuracy of the peer device.	E	C.44
LE Request Peer SCA Complete event	5.2	The HCI_LE_Request_Peer_SCA_Complete event indicates that the Controller completed the attempt to read the Sleep Clock Accuracy (SCA) of the peer device.	E	C.95
LE Scan Request Received event	5.0	The HCI_LE_Scan_Request_Received event indicates that a scan request has been received.	E	C.17
LE Scan Timeout event	5.0	The HCI_LE_Scan_Timeout event indicates that scanning has finished.	E	C.19
LE Set Address Resolution Enable command	4.2	The HCI_LE_Set_Address_Resolution_Enable command is used to enable resolution of Resolvable Private Addresses in the Controller.	E	C.9
LE Set Advertising Data command	4.0	The HCI_LE_Set_Advertising_Data command will set the data transmitted when advertising.	E	C.97
LE Set Advertising Enable command	4.0	The HCI_LE_Set_Advertising_Enable command will enable or disable advertising.	E	C.97
LE Set Advertising Parameters command	4.0	The HCI_LE_Set_Advertising_Parameters command will set the parameters used for advertising.	E	C.97

Name	Vers.	Summary Description	BR/EDR	LE
LE Set Advertising Set Random Address command	5.0	The HCI_LE_Set_Advertising_Set_Random_Address command will set the random address used in advertising.	E	C.17
LE Set CIG Parameters command	5.2	The HCI_LE_Set_CIG_Parameters command is used by a Central's Host to set the parameters of one or more Connected Isochronous Streams (CISes) that are associated with a CIG in the Controller.	E	C.39
LE Set CIG Parameters Test command	5.2	The HCI_LE_Set_CIG_Parameters_Test command is used by a Central's Host to set the parameters of one or more CISes that are associated with a CIG in the Controller for testing purposes.	E	C.39
LE Set Connection CTE Receive Parameters command	5.1	The HCI_LE_Set_Connection_CTE_Receive_Parameters command will set the antenna-switching pattern, switching and sampling slot durations for receiving the Constant Tone Extension on a connection.	E	C.25
LE Set Connection CTE Transmit Parameters command	5.1	The HCI_LE_Set_Connection_CTE_Transmit_Parameters command will set the antenna-switching pattern, switching and sampling slot durations for transmitting the Constant Tone Extension on a connection.	E	C.26
LE Set Connectionless CTE Transmit Enable command	5.1	The HCI_LE_Set_Connectionless_CTE_Transmit_Enable command will request the Controller to enable or disable sending packets containing a Constant Tone Extension.	E	C.27
LE Set Connectionless CTE Transmit Parameters command	5.1	The HCI_LE_Set_Connectionless_CTE_Transmit_Parameters command will set the antenna-switching pattern and switching and sampling slot durations for the transmission of Constant Tone Extensions.	E	C.27
LE Set Connectionless IQ Sampling Enable command	5.1	The HCI_LE_Set_Connectionless_IQ_Sampling_Enable command will request the Controller to enable or disable taking IQ samples from the Constant Tone Extension of advertising packets.	E	C.28
LE Set Data Length command	4.2	The HCI_LE_Set_Data_Length command is used to suggest maximum packet sizes to the Controller.	E	C.8

Name	Vers.	Summary Description	BR/EDR	LE
LE Set Data Related Address Changes command	5.3	The HCI_LE_Set_Data_Related_Address_Changes command specifies circumstances when the Controller shall refresh any Resolvable Private Address used by an advertising set, whether or not the address timeout period has been reached.	E	C.10
LE Set Decision Data command	6.0	The HCI_LE_Set_Decision_Data command will set the decision data transmitted when advertising.	E	C.73
LE Set Decision Instructions command	6.0	The HCI_LE_Set_Decision_Instructions command will set the decision instructions used when scanning for advertisements that include decision data.	E	C.74
LE Set Default Periodic Advertising Sync Transfer Parameters command	5.1	The HCI_LE_Set_Default_Periodic_Advertising_Sync_Transfer_Parameters command is used to specify the default behavior of the Controller when periodic advertising synchronization information is received from a connected Controller.	E	C.35
LE Set Default PHY command	5.0	The HCI_LE_Set_Default_PHY command is used to configure preferred PHYs for new connections for the local device.	E	C.11
LE Set Default Subrate command	5.3	The HCI_LE_Set_Default_Subrate command sets the range of the min and max subrates and other subrate parameters on a Central that may be requested by a Peripheral.	E	C.57
LE Set Event Mask command	4.0	The HCI_LE_Set_Event_Mask command is used to control which events are generated by the HCI for the Host.	E	M
LE Set Extended Advertising Data command	5.0	The HCI_LE_Set_Extended_Advertising_Data command will set the advertising data transmitted when advertising.	E	C.17
LE Set Extended Advertising Enable command	5.0	The HCI_LE_Set_Extended_Advertising_Enable command will enable or disable advertising.	E	C.17
LE Set Extended Advertising Parameters command	5.0 5.4	The HCI_LE_Set_Extended_Advertising_Parameters command will set the parameters used for advertising.	E	[v1] C.65 [v2] C.66
LE Set Extended Scan Enable command	5.0	The HCI_LE_Set_Extended_Scan_Enable command will enable or disable scanning on the primary advertising physical channels.	E	C.19

Name	Vers.	Summary Description	BR/EDR	LE
LE Set Extended Scan Parameters command	5.0	The HCI_LE_Set_Extended_Scan_Parameters command will set the parameters used for scanning on the primary advertising physical channel.	E	C.19
LE Set Extended Scan Response Data command	5.0	The HCI_LE_Set_Extended_Scan_Response_Data command will set the data transmitted in a scan response.	E	C.17
LE Set Host Channel Classification command	4.0	The HCI_LE_Set_Host_Channel_Classification command allows the Host to specify a channel classification based on its “local information”.	E	C.36
LE Set Host Feature command	5.2 6.0	The HCI_LE_Set_Host_Feature command is used to set or clear a bit controlled by the Host in the Link Layer FeatureSet stored in the Controller.	E	[v1] C.49 [v2] C.77
LE Set Path Loss Reporting Enable command	5.2	The HCI_LE_Set_Path_Loss_Reporting_Enable command is used to enable or disable path loss reporting events for an ACL connection.	E	C.52
LE Set Path Loss Reporting Parameters command	5.2	The HCI_LE_Set_Path_Loss_Reporting_Parameters command is used to set the path loss threshold and related parameters used to trigger reports for an ACL connection.	E	C.52
LE Set Periodic Advertising Data command	5.0	The HCI_LE_Set_Periodic_Advertising_Data command will set the periodic advertising data transmitted when advertising.	E	C.18
LE Set Periodic Advertising Enable command	5.0	The HCI_LE_Set_Periodic_Advertising_Enable command will enable or disable periodic advertising.	E	C.18
LE Set Periodic Advertising Parameters command	5.0 5.4	The HCI_LE_Set_Periodic_Advertising_Parameters command will set the parameters used for periodic advertising.	E	[v1] C.18 [v2] C.67
LE Set Periodic Advertising Receive Enable command	5.1	The HCI_LE_Set_Periodic_Advertising_Receive_Enable command will enable or disable periodic advertising reports once synchronized.	E	C.32
LE Set Periodic Advertising Response Data command	5.4	The HCI_LE_Set_Periodic_Advertising_Response_Data command is used to set the data for a response slot.	E	C.68

Name	Vers.	Summary Description	BR/EDR	LE
LE Set Periodic Advertising Subevent Data command	5.4	The HCI_LE_Set_Periodic_Advertising_Subevent_Data command is used to send subevent data for one or more subevents.	E	C.67
LE Set Periodic Sync Subevent command	5.4	The HCI_LE_Set_Periodic_Sync_Subevent command is used to configure the subset of subevents a device will synchronize with.	E	C.68
LE Set Periodic Advertising Sync Transfer Parameters command	5.1	The HCI_LE_Set_Periodic_Advertising_Sync_Transfer_Parameters command is used to allow the Host to specify the behavior of the Controller when periodic advertising synchronization information is received from a connected Controller.	E	C.35
LE Set PHY command	5.0	The HCI_LE_Set_PHY command is used to request a change of the PHY for a Connection_Handle.	E	C.11
LE Set Privacy Mode command	5.0	The HCI_LE_Set_Privacy_Mode command is used to allow the Host to specify the privacy mode for an entry on the resolving list.	E	C.9
LE Set Random Address command	4.0	The HCI_LE_Set_Random_Address command will set the Random Device Address that may be used in a packet sent on the advertising physical channel.	E	C.1
LE Set Resolvable Private Address Timeout command	4.2 6.1	The HCI_LE_Set_Resolvable_Private_Address_Timeout command sets the length of time the Controller uses a random private address before a new random private address is generated and starts being used. The [v2] version enables the timeout to be randomly varied within a specified range.	E	[v1] C.9 [v2] C.10
LE Set Scan Enable command	4.0	The HCI_LE_Set_Scan_Enable command will enable or disable scanning.	E	C.98
LE Set Scan Parameters command	4.0	The HCI_LE_Set_Scan_Parameters command will set the parameters used for scanning.	E	C.98
LE Set Scan Response Data command	4.0	The HCI_LE_Set_Scan_Response_Data command will set the data transmitted in a scan response.	E	C.15
LE Set Transmit Power Reporting Enable command	5.2	The HCI_LE_Set_Transmit_Power_Reporting_Enable command is used to enable or disable reporting to the local Host of transmit power level changes on an ACL connection.	E	C.51

Name	Vers.	Summary Description	BR/EDR	LE
LE Setup ISO Data Path command	5.2	The HCI_LE_Setup_ISO_Data_Path command identifies and creates the isochronous data path between the Host and the Controller and optionally configures the codec in the Controller.	E	C.47
LE Subrate Change event	5.3	The HCI_LE_Subrate_Change event indicates that a new subrate factor has been applied to an existing ACL connection.	E	C.57
LE Subrate Request command	5.3	The HCI_LE_Subrate_Request command modifies an existing ACL connection by applying a subrate factor.	E	C.57
LE Terminate BIG command	5.2	The HCI_LE_Terminate_BIG command terminates the transmission of all BISes of a BIG or cancels the process of creating a BIG.	E	C.41
LE Terminate BIG Complete event	5.2	The HCI_LE_Terminate_BIG_Complete event indicates that the transmission of all the BISes in the BIG have been terminated.	E	C.41
LE Test End command	4.0	The HCI_LE_Test_End command will end the current the receiver or transmitter test.	E	M
LE Transmit Power Reporting event	5.2	The HCI_LE_Transmit_Power_Reporting event is used to report the transmit power level on the ACL connection.	E	C.51
LE Transmitter Test command	4.0 5.0 5.1 5.2	The HCI_LE_Transmitter_Test command will run the LE transmitter test.	E	[v1] C.1 [v2] C.12 [v3] C.29 [v4] C.53
LE Write RF Path Compensation command	5.0	The HCI_LE_Write_RF_Path_Compensation command is used to indicate the RF path gain or loss from the RF transceiver output to the antenna output contributed by intermediate components.	E	C.22
LE Write Suggested Default Data Length command	4.2	The HCI_LE_Write_Suggested_Default_Data_Length command allows the Host to suggest initial MaxTxOctets and MaxTxTime values for new connections.	E	C.8
Link Key Notification event	1.1	The HCI_Link_Key_Notification event is used to indicate to the Host that a new Link Key has been created for the connection with the BR/EDR Controller specified in BD_ADDR.	M	E

Name	Vers.	Summary Description	BR/EDR	LE
Link Key Request event	1.1	The HCI_Link_Key_Request event is used to indicate that a Link Key is required for the connection with the device specified in BD_ADDR.	M	E
Link Key Request Negative Reply command	1.1	The HCI_Link_Key_Request_Negative_Reply command is used to reply to an HCI_Link_Key_Request event from the BR/EDR Controller if the Host does not have a stored Link Key for the connection with the other BR/EDR Controller specified by BD_ADDR.	M	E
Link Key Request Reply command	1.1	The HCI_Link_Key_Request_Reply command is used to reply to an HCI_Link_Key_Request event from the BR/EDR Controller, and specifies the Link Key stored on the Host to be used as the link key for the connection with the other BR/EDR Controller specified by BD_ADDR.	M	E
Link Key Selection command	1.1	The HCI_Link_Key_Selection command is used to force both BR/EDR Controllers of a connection associated to the Connection_Handle to use the temporary link key of the Central or the regular link keys.	C.215	E
Link Key Type Changed event	1.1	The HCI_Link_Key_Type_Changed event is used to indicate that the change in the temporary Link Key or in the semi-permanent link keys on the Bluetooth Central side has been completed.	C.215	E
Link Supervision Timeout Changed event	2.1 + EDR	The HCI_Link_Supervision_Timeout_Changed event indicates that the remote device changed the Link Supervision Timeout.	M	E
Loopback Command event	1.1	The HCI_Loopback_Command event is used to loop back all commands that the Host sends to the BR/EDR Controller with some exceptions.	C.123	E
Max Slots Change event	1.1	The HCI_Max_Slots_Change event is used to indicate a change in the max slots by the LM.	C.132	E
Mode Change event	1.1	The HCI_Mode_Change event is used to indicate that the current mode has changed.	C.144	E
Number Of Completed Data Blocks event	3.0 + HS	The HCI_Number_Of_Completed_Data_Blocks event is used by the Controller to indicate to the Host how many HCI ACL Data packets have been completed and how many data block buffers have been freed for each Handle since the previous HCI_Number_Of_Completed_Data_Blocks event was sent.	C.124	E

Name	Vers.	Summary Description	BR/EDR	LE
Number Of Completed Packets event	1.1	The HCI_Number_Of_Completed_Packets event is used by the Controller to indicate to the Host how many HCI Data packets have been completed for each Connection_Handle since the previous HCI_Number_Of_Completed_Packets event was sent.	M	C.3
Page Scan Repetition Mode Change event	1.1	The HCI_Page_Scan_Repetition_Mode_Change event indicates that the connected remote BR/EDR Controller with the specified Connection_Handle has successfully changed the Page Scan Repetition Mode (SR).	O	E
Periodic Inquiry Mode command	1.1	The HCI_Periodic_Inquiry_Mode command is used to configure the BR/EDR Controller to perform an automatic Inquiry based on a specified period range.	C.128	E
Peripheral Page Response Timeout event	CSA4	The HCI_Peripheral_Page_Response_Timeout event indicates to the Host that the *pageRespTO* has been exceeded on the BR/EDR Controller after the Controller responded to an ID packet.	O	E
PIN Code Request event	1.1	The HCI_PIN_Code_Request event is used to indicate that a PIN code is required to create a new link key for a connection.	M	E
PIN Code Request Negative Reply command	1.1	The HCI_PIN_Code_Request_Negative_Reply command is used to reply to an HCI_PIN_Code_Request event from the Controller when the Host cannot specify a PIN code to use for a connection.	M	E
PIN Code Request Reply command	1.1	The HCI_PIN_Code_Request_Reply command is used to reply to an HCI_PIN_Code_Request event from the Controller and specifies the PIN code to use for a connection.	M	E
QoS Setup command	1.1	The HCI_QoS_Setup command is used to specify Quality of Service parameters for a Connection_Handle.	M	E
QoS Setup Complete event	1.1	The HCI_QoS_Setup_Complete event is used to indicate that QoS is set up.	M	E
QoS Violation event	1.1	The HCI_QoS_Violation event is used to indicate the Controller's Link Manager is unable to provide the current QoS requirement for the Handle.	M	E

Name	Vers.	Summary Description	BR/EDR	LE
Read AFH Channel Assessment Mode command	1.2	The HCI_Read_AFH_Channel_Assessment_Mode command will read the value for the AFH Channel Classification Mode parameter. This value is used to enable or disable the Controller's channel assessment scheme.	C.140	C.58
Read AFH Channel Map command	1.2	The HCI_Read_AFH_Channel_Map command will read the current state of the channel map for a connection.	C.139	E
Read Authenticated Payload Timeout command	4.1	The HCI_Read_Authenticated_Payload_Timeout command is used to read the Authenticated Payload Timeout parameter, which is used to set the maximum time between packets being received from the remote device without a valid MIC.	C.155	C.155
Read Authentication Enable command	1.1	The HCI_Read_Authentication_Enable command will read the value for the Authentication Enable parameter, which controls whether the Bluetooth device will require authentication for each connection with other Bluetooth devices.	C.111	E
Read Automatic Flush Timeout command	1.1	The HCI_Read_Automatic_Flush_Timeout command will read the value for the Flush Timeout configuration parameter for the specified Connection_Handle. The Flush Timeout parameter is only used for ACL connections.	M	E
Read BD_ADDR command	1.1	The HCI_Read_BD_ADDR command will read the value for the BD_ADDR parameter.	M	M
Read Buffer Size command	1.1	The HCI_Read_Buffer_Size command returns the size of the HCI buffers. These buffers are used by the Controller to buffer data that is to be transmitted.	M	E
Read Class of Device command	1.1	The HCI_Read_Class_of_Device command will read the value for the Class of Device configuration parameter, which is used to indicate its capabilities to other devices.	M	E
Read Clock command	1.2	The HCI_Read_Clock command will read an estimate of a piconet or the local Bluetooth Clock.	O	E
Read Clock Offset command	1.1	The HCI_Read_Clock_Offset command allows the Host to read the clock offset of remote BR/EDR Controllers.	O	E
Read Clock Offset Complete event	1.1	The HCI_Read_Clock_Offset_Complete event is used to indicate the completion of the process of the LM obtaining the Clock offset information.	C.104	E

Name	Vers.	Summary Description	BR/EDR	LE
Read Connection Accept Timeout command	1.1	The HCI_Read_Connection_Accept_Timeout command will read the value for the Connection Accept Timeout configuration parameter, which allows the Controller to automatically deny a connection request after a specified period has occurred, and to refuse a new connection.	M	C.40
Read Current IAC LAP command	1.1	The HCI_Read_Current_IAC_LAP command will read the LAP(s) used to create the Inquiry Access Codes (IAC) that the local BR/EDR Controller is simultaneously scanning for during Inquiry Scans.	C.125	E
Read Data Block Size command	3.0 + HS	The HCI_Read_Data_Block_Size command returns the maximum size of the HCI buffers. These buffers are used by the Controller to buffer data that is to be transmitted.	C.124	E
Read Default Erroneous Data Reporting command	2.1 + EDR	The HCI_Read_Default_Erroneous_Data_Reporting command will read the value for the Erroneous Data Reporting configuration parameter, which controls whether the BR/EDR Controller will provide data for every (e)SCO interval, with the Packet_Status_Flag in HCI Synchronous Data packets set according to HCI Synchronous Data packets.	C.112	E
Read Default Link Policy Settings command	1.2	The HCI_Read_Default_Link_Policy_Settings command will read the Default Link Policy configuration parameter for all new connections.	C.141	E
Read Encryption Key Size command	3.0 + HS	The HCI_Read_Encryption_Key_Size command is used to read the encryption key size on a given Connection_Handle.	M	E
Read Enhanced Transmit Power Level command	3.0 + HS	The HCI_Read_Enhanced_Transmit_Power_Level command will read the values for the GFSK, π/4-DQPSK and 8DPSK Transmit Power Level parameters for the specified Connection_Handle.	C.217	E
Read Extended Inquiry Length command	4.1	The HCI_Read_Extended_Inquiry_Length command is used to read the Extended Inquiry Length parameter from the Controller.	C.113	E
Read Extended Inquiry Response command	2.1 + EDR	The HCI_Read_Extended_Inquiry_Response command will read the data that the BR/EDR Controller sends in the extended inquiry response packet during inquiry response.	C.205	E
Read Extended Page Timeout command	4.1	The HCI_Read_Extended_Page_Timeout command is used to read the Extended Page Timeout parameter from the Controller.	C.114	E

Name	Vers.	Summary Description	BR/EDR	LE
Read Failed Contact Counter command	1.1	The HCI_Read_Failed_Contact_Counter command will read the value for the Failed Contact Counter configuration parameter for a particular connection to another device.	M	E
Read Flow Control Mode command	3.0 + HS	The HCI_Read_Flow_Control_Mode command returns the value of the Flow_Control_Mode configuration parameter supported by this Controller.	C.124	E
Read Hold Mode Activity command	1.1	The HCI_Read_Hold_Mode_ Activity command is used to read which activities should be suspended when the BR/EDR Controller is in Hold mode.	C.213	E
Read Inquiry Mode command	1.2	The HCI_Read_Inquiry_Mode command is used to read the Inquiry Mode configuration parameter of the local BR/EDR Controller.	C.115	E
Read Inquiry Response Transmit Power Level command	2.1 + EDR	The HCI_Read_Inquiry_Response_Transmit_Power_Level command will read the inquiry response Transmit Power level used to transmit the FHS and EIR data packets. This can be used directly in the Tx Power Level EIR data type.	C.125	E
Read Inquiry Scan Activity command	1.1	The HCI_Read_Inquiry_Scan_Activity command will read the value for Inquiry Scan Interval and Inquiry Scan Window configuration parameters. Inquiry Scan Interval defines the amount of time between consecutive inquiry scans. Inquiry Scan Window defines the amount of time for the duration of the inquiry scan.	C.125	E
Read Inquiry Scan Type command	1.2	The HCI_Read_Inquiry_Scan_Type command is used to read the Inquiry Scan Type configuration parameter of the local BR/EDR Controller. The Inquiry Scan Type configuration parameter can set the inquiry scan to either normal or interlaced scan.	C.125	E
Read LE Host Support command	4.0	The HCI_Read_LE_Host_Support command reads the LE Supported Host setting from the BR/EDR Controller.	C.116	E
Read Link Policy Settings command	1.1	The HCI_Read_Link_Policy_Settings command will read the Link Policy configuration parameter for the specified Connection_Handle. The Link Policy settings allow the Host to specify which Link Modes the Link Manager can use for the specified Connection_Handle.	C.141	E

Name	Vers.	Summary Description	BR/EDR	LE
Read Link Quality command	1.1	The HCI_Read_Link_Quality command will read the value for the Link Quality for the specified Connection_Handle.	O	E
Read Link Supervision Timeout command	1.1	The HCI_Read_Link_Supervision_Timeout command will read the value for the Link Supervision Timeout configuration parameter for the device. This parameter is used by the Controller to determine link loss.	C.117	E
Read LMP Handle command	1.2	The HCI_Read_LMP_Handle command will read the current LMP Handle associated with the Connection_Handle.	C.134	E
Read Local Extended Features command	1.2	The HCI_Read_Local_Extended_Features command requests a list of the supported extended features for the local device.	C.220	E
Read Local Name command	1.1	The HCI_Read_Local_Name command provides the ability to read the stored user-friendly name for the BR/EDR Controller.	M	E
Read Local OOB Data command	2.1 + EDR	The HCI_Read_Local_OOB_Data command is used to obtain a Secure Simple Pairing Hash C and Randomizer R which are intended to be transferred to a remote device using an OOB mechanism.	M	E
Read Local OOB Extended Data command	4.1	The HCI_Read_Local_OOB_Extended_Data command is used to obtain a Secure Simple Pairing Hash C and Randomizer R associated with both P-192 and P-256 public keys, which are intended to be transferred to a remote device using an OOB mechanism.	C.142	E
Read Local Simple Pairing Options command	Erratum 10734	The HCI_Read_Local_Simple_Pairing_Options command is used to read the Secure Simple Pairing options and the maximum encryption key size supported.	O	E
Read Local Supported Codec Capabilities command	5.2	The HCI_Read_Local_Supported_Codec_Capabilities command is used by a Host to query codec capabilities.	C.156	C.156
Read Local Supported Codecs command	CSA2 5.2	The HCI_Read_Local_Supported_Codecs command is used by a Host to query a Controller's supported codecs.	[v1] C.157 [v2] O	[v1] E [v2] O
Read Local Supported Commands command	1.2	The HCI_Read_Local_Supported_Commands command requests a list of the supported HCI commands for the local device.	M	M

Name	Vers.	Summary Description	BR/EDR	LE
Read Local Supported Controller Delay command	5.2	The HCI_Read_Local_Supported_Controller_Delay command is used by a Host to query a range of supported Controller delays for a given codec configuration.	C.156	C.156
Read Local Supported Features command	1.1	The HCI_Read_Local_Supported_Features command requests a list of the supported features for the local device.	M	M
Read Local Version Information command	1.1	The HCI_Read_Local_Version_Information command will read the version information for the local Controller.	M	M
Read Loopback Mode command	1.1	The HCI_Read_Loopback_Mode command will read the value for the setting of the BR/EDR Controller's Loopback Mode. The setting of the Loopback Mode will determine the path of information.	C.123	E
Read Num Broadcast Retransmissions command	1.1	The HCI_Read_Num_Broadcast_Retransmissions command will read the parameter value for the Number of Broadcast Retransmissions for the BR/EDR Controller.	C.118	E
Read Number Of Supported IAC command	1.1	The HCI_Read_Number_Of_Supported_IAC command will read the value for the number of Inquiry Access Codes (IAC) that the local BR/EDR Controller can simultaneously listen for during an Inquiry Scan.	C.125	E
Read Page Scan Activity command	1.1	The HCI_Read_Page_Scan_Activity command will read the values for the Page Scan Interval and Page Scan Window configuration parameters. Page Scan Interval defines the amount of time between consecutive page scans. Page Scan Window defines the duration of the page scan.	M	E
Read Page Scan Type command	1.2	The HCI_Read_Page_Scan_Type command is used to read the page scan type of the local BR/EDR Controller. The Page Scan Type configuration parameter can set the page scan to either normal or interlaced scan.	C.119	E
Read Page Timeout command	1.1	The HCI_Read_Page_Timeout command will read the value for the Page Reply Timeout configuration parameter, which determines the time the BR/EDR Controller will wait for the remote device to respond to a connection request before the local device returns a connection failure.	M	E

Name	Vers.	Summary Description	BR/EDR	LE
Read PIN Type command	1.1	The HCI_Read_PIN_Type command is used for the Host to read the value that is specified to indicate whether the Host supports variable PINs or only fixed PINs.	C.120	E
Read Remote Extended Features command	1.2	The HCI_Read_Remote_Extended_Features command requests a list of the supported extended features of a remote device.	C.220	E
Read Remote Extended Features Complete event	1.2	The HCI_Read_Remote_Extended_Features_Complete event is used to indicate the completion of the process of the Link Manager obtaining the supported Extended features of the remote BR/EDR Controller specified by the Connection_Handle parameter.	C.220	E
Read Remote Supported Features command	1.1	The HCI_Read_Remote_Supported_Features command requests a list of the supported features of a remote device.	M	E
Read Remote Supported Features Complete event	1.1	The HCI_Read_Remote_Supported_Features_Complete event is used to indicate the completion of the process of the Link Manager obtaining the supported features of the remote BR/EDR Controller specified by the Connection_Handle parameter.	M	E
Read Remote Version Information command	1.1	The HCI_Read_Remote_Version_Information command will read the values for the version information for the remote device associated with the Connection_Handle.	O	C.3
Read Remote Version Information Complete event	1.1	The HCI_Read_Remote_Version_Information_Complete event is used to indicate the completion of the process of the Link Manager obtaining the version information of the remote device associated with the Connection_Handle parameter.	C.105	C.3
Read RSSI command	1.1	The HCI_Read_RSSI command will read the value for the Received Signal Strength Indication (RSSI) for a Connection_Handle to another Controller.	O	C.3
Read Scan Enable command	1.1	The HCI_Read_Scan_Enable command will read the value for the Scan Enable configuration parameter, which controls whether or not the BR/EDR Controller will periodically scan for page attempts and/or inquiry requests from other BR/EDR Controllers.	M	E

Name	Vers.	Summary Description	BR/EDR	LE
Read Secure Connections Host Support command	4.1	The HCI_Read_Secure_Connections_Host_Support command is used to read the Secure Connections Host Supports parameter from the Controller.	C.218	E
Read Simple Pairing Mode command	2.1 + EDR	The HCI_Read_Simple_Pairing_Mode command reads the Secure Simple Pairing mode setting in the BR/EDR Controller.	M	E
Read Stored Link Key command	1.1	The HCI_Read_Stored_Link_Key command provides the ability to read whether one or more link keys are stored in the Controller.	C.121	E
Read Synchronization Train Parameters command	CSA4	The HCI_Read_Synchronization_Train_Parameters command returns the currently configured values for the Synchronization Train functionality in the BR/EDR Controller.	C.201	E
Read Synchronous Flow Control Enable command	1.1	The HCI_Read_Synchronous_Flow_Control_Enable command provides the ability to read the Synchronous Flow Control Enable setting. By using this setting, the Host can decide if the Controller will send HCI_Number_Of_Completed_Packets events for synchronous Connection_Handles.	C.122	E
Read Transmit Power Level command	1.1	The HCI_Read_Transmit_Power_Level command will read the values for the Transmit Power Level parameter for the specified Connection_Handle.	C.152	C.3
Read Voice Setting command	1.1	The HCI_Read_Voice_Setting command will read the values for the Voice Setting configuration parameter, which controls all the various settings for the voice connections.	C.134	E
Receive Synchronization Train command	CSA4	The HCI_Receive_Synchronization_Train command requests synchronization with the specified Connectionless Peripheral Broadcast transmitter.	C.202	E
Refresh Encryption Key command	2.1 + EDR	The HCI_Refresh_Encryption_Key command is used by the Host to cause the Controller to refresh the encryption key by pausing and resuming encryption	M	E
Reject Connection Request command	1.1	The HCI_Reject_Connection_Request command is used to decline a new incoming BR/EDR connection request.	M	E

Name	Vers.	Summary Description	BR/EDR	LE
Reject Synchronous Connection Request command	1.2	The HCI_Reject_Synchronous_Connection_Request command is used to decline an incoming request for a synchronous link.	C.134	E
Remote Host Supported Features Notification event	2.1 + EDR	The HCI_Remote_Host_Supported_Features_Notification event is used to return the LMP extended features page containing the Host features.	C.106	E
Remote Name Request Cancel command	1.2	The HCI_Remote_Name_Request_Cancel command is used to cancel an ongoing Remote Name Request.	C.106	E
Remote Name Request command	1.1	The HCI_Remote_Name_Request command is used to obtain the user-friendly name of another BR/EDR Controller.	O	E
Remote Name Request Complete event	1.1	The HCI_Remote_Name_Request_Complete event is used to indicate a remote name request has been completed.	C.106	E
Remote OOB Data Request event	2.1 + EDR	The HCI_Remote_OOB_Data_Request event is used to indicate that the Secure Simple Pairing Hash C and Randomizer R is required for the Secure Simple Pairing process involving the device identified by BD_ADDR.	M	E
Remote OOB Data Request Negative Reply command	2.1 + EDR	The HCI_Remote_OOB_Data_Request_Negative_Reply command is used to reply to an HCI_Remote_OOB_Data_Request event that the Host does not have the C and R	M	E
Remote OOB Data Request Reply command	2.1 + EDR	The HCI_Remote_OOB_Data_Request_Reply command is used to reply to an HCI_Remote_OOB_Data_Request event with the C and R values received via an OOB transfer from a remote BR/EDR Controller identified by BD_ADDR.	M	E
Remote OOB Extended Data Request Reply command	4.1	The HCI_Remote_OOB_Extended_Data_Request_Reply command is used to reply to an HCI_Remote_OOB_Data_Request event with the C and R values received via an OOB transfer from a remote BR/EDR Controller identified by the BD_ADDR.	C.142	E
Reset command	1.1	For a BR/EDR Controller, the HCI_Reset command resets HCI, the Link Manager, and the Bluetooth radio. For an LE Controller, the HCI_Reset command resets HCI, the Link Layer, and LE PHY.	M	M

Name	Vers.	Summary Description	BR/EDR	LE
Reset Failed Contact Counter command	1.1	The HCI_Reset_Failed_Contact_Counter command will reset the value for the Failed Contact Counter configuration parameter for a particular connection to another device.	M	E
Return Link Keys event	1.1	The HCI_Return_Link_Keys event is used to return stored link keys after an HCI_Read_Stored_Link_Key command is used.	C.121	E
Role Change event	1.1	The HCI_Role_Change event is used to indicate that the current BR/EDR Controller role related to the particular connection has been changed.	C.212	E
Role Discovery command	1.1	The HCI_Role_Discovery command is used for a BR/EDR Controller to determine which role the device is performing for a particular Connection_Handle.	O	E
SAM Status Change event	5.0	The HCI_SAM_Status_Change event is used to indicate that either the local or remote SAM slot map on a particular connection has been changed.	C.219	E
Send Keypress Notification command	2.1 + EDR	The HCI_Send_Keypress_Notification command is used during the Passkey Entry protocol by a device with KeyboardOnly IO capabilities. It is used by a Host to inform the remote device when keys have been entered or erased.	M	E
Set AFH Host Channel Classification command	1.2	The HCI_Set_AFH_Host_Channel_Classification command allows the Host to specify a channel classification based on its “local information”.	C.140	E
Set Connection Encryption command	1.1	The HCI_Set_Connection_Encryption command is used to enable and disable the link level encryption.	M	E
Set Connectionless Peripheral Broadcast command	CSA4	The HCI_Set_Connectionless_Peripheral_Broadcast command controls Connectionless Peripheral Broadcast functionality (for transmission) in the BR/EDR Controller including enabling and disabling the broadcast.	C.201	E
Set Connectionless Peripheral Broadcast Data command	CSA4	The HCI_Set_Connectionless_Peripheral_Broadcast_Data command is used by the Host to set Connectionless Peripheral Broadcast data in the BR/EDR Controller.	C.201	E
Set Connectionless Peripheral Broadcast Receive command	CSA4	The HCI_Set_Connectionless_Peripheral_Broadcast_Receive command enables and disables Connectionless Peripheral Broadcast reception in the BR/EDR Controller.	C.202	E

Name	Vers.	Summary Description	BR/EDR	LE
Set Controller To Host Flow Control command	1.1	The HCI_Set_Controller_To_Host_Flow_Control command is used by the Host to turn flow control on or off in the direction from the Controller to the Host.	O	C.96
Set Ecosystem Base Interval command	5.2	The HCI_Set_Ecosystem_Base_Interval command indicates to the Controller the base interval of the ecosystem.	O	O
Set Event Filter command	1.1	The HCI_Set_Event_Filter command is used by the Host to specify different event filters. The Host may issue this command multiple times to request various conditions for the same type of event filter and for different types of event filters.	C.148	E
Set Event Mask command	1.1	The HCI_Set_Event_Mask command is used to control which events are generated by the HCI for the Host.	M	M
Set Event Mask Page 2 command	3.0 + HS	The HCI_Set_Event_Mask_Page 2 command is used to control which events are generated by the HCI for the Host.	C.145	C.145
Set External Frame Configuration command	CSA3	The HCI_Set_External_Frame_Configuration command enables an external device to describe a frame structure to the Controller.	C.108	O
Set Min Encryption Key Size command	5.3	The HCI_Set_Min_Encryption_Key_Size command is used to modify the minimum encryption key size that may be negotiated by the Controller.	O	E
Set MWS Channel Parameters command	CSA3	The HCI_Set_MWS_Channel_Parameters command enables an MWS device to inform the Controller about the MWS channel configuration.	O	O
Set MWS Scan Frequency Table command	CSA3	The HCI_Set_MWS_Scan_Frequency_Table command specifies the frequencies represented by the frequency index supplied by the MWS_SCAN_FREQUENCY signal.	O	O
Set MWS Signaling command	CSA3	The HCI_Set_MWS_Signaling command enables an MWS device to inform the Controller about the timing parameters for the MWS coexistence interface.	O	O
Set MWS Transport Layer command	CSA3	The HCI_Set_MWS_Transport_Layer command selects the MWS coexistence signaling transport layer in the Controller.	C.109	C.109

Name	Vers.	Summary Description	BR/EDR	LE
Set MWS_PATTERN Configuration command	CSA3	The HCI_Set_MWS_PATTERN_Configuration command specifies the configuration of the pattern indicated over the MWS Coexistence Transport Layer.	C.136	E
Set Reserved LT_ADDR command	CSA4	The HCI_Set_Reserved_LT_ADDR command requests that the BR/EDR Controller reserve a specific LT_ADDR for the purposes of Connectionless Peripheral Broadcast.	C.201	E
Set Triggered Clock Capture command	CSA4	The HCI_Set_Triggered_Clock_Capture command is used to configure the Controller to return events containing an estimate of a piconet or the local Bluetooth clock.	O	E
Setup Synchronous Connection command	1.2	The HCI_Setup_Synchronous_Connection command adds a new or modifies an existing synchronous logical transport (SCO or eSCO) on a physical link depending on the Connection_Handle parameter specified.	C.134	E
Simple Pairing Complete event	2.1 + EDR	The HCI_Simple_Pairing_Complete event is used to indicate that the Secure Simple Pairing process has completed.	M	E
Sniff Mode command	1.1	The HCI_Sniff_Mode command is used to alter the behavior of the LM and have the LM place the local or remote device into Sniff mode.	C.214	E
Sniff Subrating command	2.1 + EDR	The HCI_Sniff_Subrating command is used to configure the sniff subrating parameters in the local device.	C.221	E
Sniff Subrating event	2.1 + EDR	The HCI_Sniff_Subrating event is used to inform the Host of the local and remote transmit and receive latencies.	C.221	E
Start Synchronization Train command	CSA4	The HCI_Start_Synchronization_Train command enables the Synchronization Train on the BR/EDR Controller using the currently configured Synchronization Train parameters.	C.201	E
Switch Role command	1.1	The HCI_Switch_Role command is used to switch Central and Peripheral roles of the devices on either side of a connection.	C.212	E
Synchronization Train Complete event	CSA4	The HCI_Synchronization_Train_Complete event indicates that the Synchronization Train has completed.	C.201	E
Synchronization Train Received event	CSA4	The HCI_Synchronization_Train_Received event provides the status of Synchronization Train packets received from the device with the given BD_ADDR.	C.202	E

Name	Vers.	Summary Description	BR/EDR	LE
Synchronous Connection Changed event	1.2	The HCI_Synchronous_Connection_Changed event indicates to the Host that an existing synchronous connection has been reconfigured.	C.134	E
Synchronous Connection Complete event	1.2	The HCI_Synchronous_Connection_Complete event indicates to both the Hosts that a new synchronous connection has been established.	C.134	E
Triggered Clock Capture event	CSA4	The HCI_Triggered_Clock_Capture event reports the Bluetooth clock when an external trigger occurred.	C.110	E
Truncated Page Cancel command	CSA4	The HCI_Truncated_Page_Cancel command is used to cancel an ongoing Truncated Page.	C.129	E
Truncated Page command	CSA4	The HCI_Truncated_Page command will cause the BR/EDR Controller to page the BR/EDR Controller with the BD_ADDR specified by the parameters and abort the page sequence after receiving the ID response packet.	C.129	E
Truncated Page Complete event	CSA4	The HCI_Truncated_Page_Complete event indicates to the Host that a Truncated Page has completed.	C.129	E
User Confirmation Request event	2.1 + EDR	The HCI_User_Confirmation_Request event is used to indicate that user confirmation of a numeric value is required.	M	E
User Confirmation Request Negative Reply command	2.1 + EDR	The HCI_User_Confirmation_Request_Negative_Reply command is used to reply to an HCI_User_Confirmation_Request event and indicates that the user selected “no”. This command will terminate Secure Simple Pairing.	M	E
User Confirmation Request Reply command	2.1 + EDR	The HCI_User_Confirmation_Request_Reply command is used to reply to an HCI_User_Confirmation_Request event and indicates that the user selected “yes”. It is also used when the Host has no input and no output capabilities.	M	E
User Passkey Notification event	2.1 + EDR	The HCI_User_Passkey_Notification event is used to provide a passkey for the Host to display to the user as required as part of a Secure Simple Pairing process.	M	E
User Passkey Request event	2.1 + EDR	The HCI_User_Passkey_Request event is used to indicate that a passkey is required as part of a Secure Simple Pairing process.	M	E

Name	Vers.	Summary Description	BR/EDR	LE
User Passkey Request Negative Reply command	2.1 + EDR	The HCI_User_Passkey_Request_Negative_Reply command is used to reply to an HCI_User_Passkey_Request event and indicates the Host could not provide a passkey. This command will terminate Secure Simple Pairing.	M	E
User Passkey Request Reply command	2.1 + EDR	The HCI_User_Passkey_Request_Reply command is used to reply to an HCI_User_Passkey_Request event and specifies the Numeric_Value (passkey) entered by the user to be used in the Secure Simple Pairing process.	M	E
Write AFH Channel Assessment Mode command	1.2	The HCI_Write_AFH_Channel_Assessment_Mode command will write the value for the Channel Classification Mode configuration parameter. This value is used to enable or disable the Controller's channel assessment scheme.	C.140	C.58
Write Authenticated Payload Timeout command	4.1	The HCI_Write_Authenticated_Payload_Timeout command is used to write the Authenticated Payload Timeout parameter, which is used to set the maximum time between packets being received from the remote device without a valid MIC.	C.151	C.7
Write Authentication Enable command	1.1	The HCI_Write_Authentication_Enable command will write the value for the Authentication Enable parameter, which controls whether the Bluetooth device will require authentication for each connection with other Bluetooth devices.	O	E
Write Automatic Flush Timeout command	1.1	The HCI_Write_Automatic_Flush_Timeout command will write the value for the Flush Timeout configuration parameter for the specified Connection_Handle. The Flush Timeout parameter is only used for ACL connections.	M	E
Write Class of Device command	1.1	The HCI_Write_Class_of_Device command will write the value for the Class_of_Device configuration parameter, which is used to indicate its capabilities to other devices.	M	E
Write Connection Accept Timeout command	1.1	The HCI_Write_Connection_Accept_Timeout command will write the value for the Connection Accept Timeout configuration parameter, which allows the Controller to automatically deny a connection request after a specified period has occurred, and to refuse a new connection.	M	C.40

Name	Vers.	Summary Description	BR/EDR	LE
Write Current IAC LAP command	1.1	The HCI_Write_Current_IAC_LAP command will write the LAP(s) used to create the Inquiry Access Codes (IAC) that the local BR/EDR Controller is simultaneously scanning for during Inquiry Scans.	C.125	E
Write Default Erroneous Data Reporting command	2.1 + EDR	The HCI_Write_Default_Erroneous_Data_Reporting command will write the value for the Erroneous Data Reporting configuration parameter, which controls whether the Bluetooth Controller will provide data for every (e)SCO interval, with the Packet_Status_Flag in HCI Synchronous Data packets set according to HCI Synchronous Data packets.	C.206	E
Write Default Link Policy Settings command	1.2	The HCI_Write_Default_Link_Policy_Settings command will write the Default Link Policy configuration parameter for all new connections.	C.141	E
Write Extended Inquiry Length command	4.1	The HCI_Write_Extended_Inquiry_Length command is used to write the Extended Inquiry Length parameter to the Controller.	C.128	E
Write Extended Inquiry Response command	2.1 + EDR	The HCI_Write_Extended_Inquiry_Response command will write the data that the BR/EDR Controller sends in the extended inquiry response packet during inquiry response.	C.205	E
Write Extended Page Timeout command	4.1	The HCI_Write_Extended_Page_Timeout command is used to write the Extended Page Timeout parameter to the Controller.	O	E
Write Flow Control Mode command	3.0 + HS	The HCI_Write_Flow_Control_Mode command sets the value of the Flow_Control_Mode configuration parameter for this Controller.	C.124	E
Write Hold Mode Activity command	1.1	The HCI_Write_Hold_Mode_Activity command is used to write which activities should be suspended when the BR/EDR Controller is in Hold mode.	C.213	E
Write Inquiry Mode command	1.2	The HCI_Write_Inquiry_Mode command is used to write the Inquiry Mode configuration parameter of the local BR/EDR Controller.	C.146	E
Write Inquiry Scan Activity command	1.1	The HCI_Write_Inquiry_Scan_Activity command will write the value for Inquiry Scan Interval and Inquiry Scan Window configuration parameters. Inquiry Scan Interval defines the amount of time between consecutive inquiry scans. Inquiry Scan Window defines the amount of time for the duration of the inquiry scan.	C.125	E

Name	Vers.	Summary Description	BR/EDR	LE
Write Inquiry Scan Type command	1.2	The HCI_Write_Inquiry_Scan_Type command is used to write the Inquiry Scan Type configuration parameter of the local BR/EDR Controller. The Inquiry Scan Type configuration parameter can set the inquiry scan to either normal or interlaced scan.	C.125	E
Write Inquiry Transmit Power Level command	2.1 + EDR	The HCI_Write_Inquiry_Transmit_Power_Level command is used to write the transmit power level used to transmit the inquiry (ID) data packets.	C.127	E
Write LE Host Support command	4.0	The HCI_Write_LE_Host_Support command writes the LE Supported Host setting to the BR/EDR Controller.	C.153	E
Write Link Policy Settings command	1.1	The HCI_Write_Link_Policy_Settings command will write the Link Policy configuration parameter for the specified Connection_Handle. The Link Policy settings allow the Host to specify which Link Modes the Link Manager can use for the specified Connection_Handle.	C.141	E
Write Link Supervision Timeout command	1.1	The HCI_Write_Link_Supervision_Timeout command will write the value for the Link Supervision Timeout configuration parameter for the device. This parameter is used by the Controller to determine link loss.	O	E
Write Local Name command	1.1	The HCI_Write_Local_Name command provides the ability to modify the user-friendly name for the BR/EDR Controller.	M	E
Write Loopback Mode command	1.1	The HCI_Write_Loopback_Mode command will write the value for the setting of the BR/EDR Controllers Loopback Mode. The setting of the Loopback Mode will determine the path of information.	C.123	E
Write Num Broadcast Retransmissions command	1.1	The HCI_Write_Num_Broadcast_Retransmissions command will write the parameter value for the Number of Broadcast Retransmissions for the BR/EDR Controller.	O	E
Write Page Scan Activity command	1.1	The HCI_Write_Page_Scan_Activity command will write the value for Page Scan Interval and Page Scan Window configuration parameters. Page Scan Interval defines the amount of time between consecutive page scans. Page Scan Window defines the duration of the page scan.	M	E

Name	Vers.	Summary Description	BR/EDR	LE
Write Page Scan Type command	1.2	The HCI_Write_Page_Scan_Type command is used to write the page scan type of the local BR/EDR Controller. The Page Scan Type configuration parameter can set the page scan to either normal or interlaced scan.	C.154	E
Write Page Timeout command	1.1	The HCI_Write_Page_Timeout command will write the value for the Page Reply Timeout configuration parameter, which allows the BR/EDR Controller to define the amount of time a connection request will wait for the remote device to respond before the local device returns a connection failure.	M	E
Write PIN Type command	1.1	The HCI_Write_PIN_Type command is used for the Host to specify whether the Host supports variable PIN or only fixed PINs.	O	E
Write Scan Enable command	1.1	The HCI_Write_Scan_Enable command will write the value for the Scan Enable configuration parameter, which controls whether or not the BR/EDR Controller will periodically scan for page attempts and/or inquiry requests from other BR/EDR Controllers.	M	E
Write Secure Connections Host Support command	4.1	The HCI_Write_Secure_Connections_Host_Support command is used to write the Secure Connections Host Supports parameter to the Controller.	C.218	E
Write Secure Connections Test Mode command	4.1	The HCI_Write_Secure_Connections_Test_Mode command is used to put the Controller in a test mode where DM1 packets are not allowed to be used for ACL-U traffic and/or the contents of eSCO payloads can be looped back.	C.138	E
Write Simple Pairing Debug Mode command	2.1 + EDR	The HCI_Write_Simple_Pairing_Debug_Mode command configures the BR/EDR Controller to use a predefined Diffie Hellman private key for Secure Simple Pairing to enable debug equipment to monitor the encrypted connection.	M	E
Write Simple Pairing Mode command	2.1 + EDR	The HCI_Write_Simple_Pairing_Mode command writes the Secure Simple Pairing mode setting in the BR/EDR Controller.	M	E
Write Stored Link Key command	1.1	The HCI_Write_Stored_Link_Key command provides the ability to write one or more link keys to be stored in the Controller.	O	E

Name	Vers.	Summary Description	BR/EDR	LE
Write Synchronization Train Parameters command	CSA4	The HCI_Write_Synchronization_Train_Parameters command configures the Synchronization Train functionality in the BR/EDR Controller.	C.201	E
Write Synchronous Flow Control Enable command	1.1	The HCI_Write_Synchronous_Flow_Control_Enable command provides the ability to write the Synchronous Flow Control Enable setting. By using this setting, the Host can decide if the Controller will send HCI_Number_Of_Completed_Packets events for synchronous Connection_Handles.	C.135	E
Write Voice Setting command	1.1	The HCI_Write_Voice_Setting command will write the values for the Voice Setting configuration parameter, which controls all the various settings for the voice connections.	C.134	E

Table 3.1: Alphabetical list of commands and events

C.1: Mandatory if the LE Controller supports transmitting packets, otherwise excluded.

C.2: Mandatory if the LE Controller supports receiving packets, otherwise excluded.

C.3: Mandatory if the LE Controller supports Connection State, otherwise excluded.

C.4: Mandatory if LE Feature (LE Encryption) is supported, otherwise excluded.

C.6: Mandatory if LE Feature (Connection Parameters Request procedure) is supported, otherwise excluded.

C.7: Mandatory if LE Feature (LE Encryption) and LE Feature (LE Ping) are supported, otherwise excluded.

C.8: Mandatory if LE Feature (LE Data Packet Length Extension) is supported, otherwise optional.

C.9: Mandatory if LE Feature (LL Privacy) is supported, otherwise excluded.

C.10: Optional if LE Feature (LL Privacy) is supported, otherwise excluded.

C.11: Mandatory if LE Feature (LE 2M PHY) or LE Feature (LE Coded PHY) is supported, otherwise optional.

C.12: Mandatory if LE Feature (LE 2M PHY) or LE Feature (LE Coded PHY) or LE Feature (Stable Modulation Index - Transmitter) is supported, otherwise optional if the LE Controller supports transmitting packets, otherwise excluded.

C.13: Mandatory if LE Feature (LE 2M PHY) or LE Feature (LE Coded PHY) or LE Feature (Stable Modulation Index - Receiver) is supported, otherwise optional if the LE Controller supports receiving packets, otherwise excluded.

C.15: Mandatory if LE Controller supports transmitting scannable advertisements, otherwise excluded.

C.16: Mandatory if LE Feature (Periodic Advertising) is supported and the LE Controller supports both Scanning State and Synchronization State, otherwise excluded.

C.17: Mandatory if LE Feature (Extended Advertising) is supported and the LE Controller supports Advertising State, otherwise excluded.

C.18: Mandatory if LE Feature (Periodic Advertising) is supported and the LE Controller supports Advertising State, otherwise excluded.

C.19: Mandatory if LE Feature (Extended Advertising) is supported and the LE Controller supports Scanning State, otherwise excluded.

C.20: Mandatory if LE Feature (Extended Advertising) is supported and the LE Controller supports Initiating State, otherwise excluded.

C.21: Mandatory if LE Feature (Periodic Advertising) is supported and the LE Controller supports Synchronization State, otherwise excluded.

C.22: Mandatory if the LE Controller supports sending Transmit Power in advertisements or if LE Feature (LE Power Control Request) is supported, otherwise optional.

C.23: Mandatory if LE Feature (LE Channel Selection Algorithm #2) is supported, otherwise excluded.

C.24: Mandatory if the LE Controller supports Connection State and either LE Feature (LL Privacy) or LE Feature (Extended Advertising) is supported, otherwise optional if the LE Controller supports Connection State, otherwise excluded.

C.25: Mandatory if LE Feature (Connection CTE Request) is supported, otherwise excluded.

C.26: Mandatory if LE Feature (Connection CTE Response) is supported, otherwise excluded.

C.27: Mandatory if LE Feature (Connectionless CTE Transmitter) is supported, otherwise excluded.

C.28: Mandatory if LE Feature (Connectionless CTE Receiver) is supported, otherwise excluded.

C.29: Mandatory if LE Feature (Connection CTE Response) or LE Feature (Connectionless CTE Transmitter) is supported, otherwise optional if the LE Controller supports transmitting packets, otherwise excluded.

C.30: Mandatory if LE Feature (Connection CTE Request) or LE Feature (Connectionless CTE Receiver) is supported, otherwise optional if the LE Controller supports receiving packets, otherwise excluded.

C.31: Mandatory if LE Feature (Connection CTE Request) or LE Feature (Connection CTE Response) or LE Feature (Connectionless CTE Transmitter) or LE Feature (Connectionless CTE Receiver) is supported, otherwise excluded.

C.32: Mandatory if LE Feature (Periodic Advertising Sync Transfer – Recipient) is supported, otherwise optional if LE Feature (Periodic Advertising) is supported and the LE Controller supports Synchronization State, otherwise excluded.

C.33: Mandatory if LE Feature (Periodic Advertising Sync Transfer – Sender) is supported and the LE Controller supports Scanning State, otherwise excluded.

C.34: Mandatory if LE Feature (Periodic Advertising Sync Transfer – Sender) is supported and the LE Controller supports Advertising State, otherwise excluded.

C.35: Mandatory if LE Feature (Periodic Advertising Sync Transfer – Recipient) is supported, otherwise excluded.

C.36: Mandatory if the LE Controller supports Central role or supports both Peripheral role and LE Feature (Channel Classification), otherwise optional if LE Feature (Extended Advertising) is supported and the LE Controller supports Advertising State or if LE Feature (Isochronous Broadcaster) is supported, otherwise excluded.

C.37: Mandatory if the LE Controller can change its sleep clock accuracy, otherwise excluded.

C.38: Mandatory if LE Feature (Connected Isochronous Stream - Central) or LE Feature (Connected Isochronous Stream - Peripheral) is supported, otherwise excluded.

C.39: Mandatory if LE Feature (Connected Isochronous Stream - Central) is supported, otherwise excluded.

C.40: Mandatory if LE Feature (Connected Isochronous Stream - Peripheral) is supported, otherwise excluded.

C.41: Mandatory if LE Feature (Isochronous Broadcaster) is supported, otherwise excluded.

C.42: Mandatory if LE Feature (Synchronized Receiver role) is supported, otherwise excluded.

C.44: Mandatory if LE Feature (Sleep Clock Accuracy Updates) and either LE Feature (Connected Isochronous Stream - Central) or LE Feature

(Connected Isochronous Stream - Peripheral) are supported, otherwise optional if LE Feature (Sleep Clock Accuracy Updates) is supported, otherwise excluded.

C.45: Mandatory if LE Feature (Connected Isochronous Stream - Central), or LE Feature (Connected Isochronous Stream - Peripheral), or LE Feature (Isochronous Broadcaster) is supported, otherwise excluded.

C.46: Mandatory if LE Feature (Connected Isochronous Stream - Central), or LE Feature (Connected Isochronous Stream - Peripheral), or LE Feature (Synchronized Receiver role) is supported, otherwise excluded.

C.47: Mandatory if LE Feature (Connected Isochronous Stream - Central), or LE Feature (Connected Isochronous Stream - Peripheral), or LE Feature (Isochronous Broadcaster), or LE Feature (Synchronized Receiver role) is supported, otherwise excluded.

C.49: Mandatory if LE Feature (Connected Isochronous Stream - Central), or LE Feature (Connected Isochronous Stream - Peripheral), or LE Feature (Connection Subrating), or LE Feature (Advertising Coding Selection), or LE Feature (Channel Sounding) is supported, otherwise optional.

C.50: Optional if LE Feature (Connected Isochronous Stream - Central), or LE Feature (Connected Isochronous Stream - Peripheral), or LE Feature (Synchronized Receiver role) is supported, otherwise excluded.

C.51: Mandatory if LE Feature (LE Power Control Request) is supported, otherwise excluded.

C.52: Mandatory if LE Feature (LE Path Loss Monitoring) is supported, otherwise excluded.

C.53: Mandatory if LE Feature (LE Power Control Request) is supported, otherwise optional if the LE Controller supports transmitting packets, otherwise excluded.

C.54: Mandatory if LE Feature (Synchronized Receiver) is supported, otherwise optional.

C.55: Mandatory if LE Feature (Connected Isochronous Stream - Central), or LE Feature (Connected Isochronous Stream - Peripheral), or LE Feature (Isochronous Broadcaster) is supported, otherwise optional if the LE Controller supports Connection State, otherwise excluded.

C.56: Optional if LE Feature (LE Encryption) is supported, otherwise excluded.

C.57: Mandatory if LE Feature (Connection Subrating) is supported, otherwise excluded.

C.58: Mandatory if LE Feature (Channel Classification) is supported, otherwise excluded.

C.59: Mandatory if the LE Controller supports Central role, otherwise excluded.

C.60: Mandatory if the LE Controller supports Central role and LE Feature (LE Encryption), otherwise excluded.

C.61: Mandatory if the LE Controller supports Peripheral role and LE Feature (LE Encryption), otherwise excluded.

C.62: Mandatory if the LE Controller supports Central role or supports both Peripheral role and LE Feature (Connection Parameters Request Procedure), otherwise excluded.

C.63: Mandatory if the LE Controller supports Scanning state and LE Feature (LL Privacy), otherwise excluded.

C.64: Optional if the Controller supports transmitting packets, otherwise excluded.

C.65: Mandatory if LE Set Extended Advertising Parameters command [v2] is supported, otherwise mandatory if LE Feature (Extended Advertising) is supported and the LE Controller supports Advertising State, otherwise excluded.

C.66: Mandatory if LE Feature (Advertising Coding Selection) is supported, otherwise optional if LE Feature (Extended Advertising) is supported and the LE Controller supports Advertising state, otherwise excluded.

C.67: Mandatory if LE Feature (Periodic Advertising with Responses - Advertiser) is supported, otherwise excluded.

C.68: Mandatory if LE Feature (Periodic Advertising with Responses - Scanner) is supported, otherwise excluded.

C.69: Mandatory if LE Feature (Periodic Advertising with Responses - Advertiser) or LE Feature (Periodic Advertising with Responses - Scanner) is supported, otherwise excluded.

C.70: Mandatory if the LE Controller supports LE Feature (LL Extended Feature Set), otherwise optional.

C.71: Mandatory if the LE Controller supports Connection State and LE Feature (LL Extended Feature Set), otherwise optional if the LE Controller supports Connection State, otherwise excluded.

C.72: Mandatory if the LE Controller supports the LE Read All Remote Features command, otherwise excluded.

C.73: Mandatory if LE Feature (Decision-Based Advertising Filtering) is supported and the LE Controller supports Advertising State, otherwise excluded.

C.74: Mandatory if LE Feature (Decision-Based Advertising Filtering) is supported and the LE Controller supports Scanning State, otherwise excluded.

C.75: Mandatory if LE Feature (Channel Sounding) is supported, otherwise excluded.

C.76: Mandatory if LE Feature (Channel Sounding) and initiator role are supported, otherwise excluded.

C.77: Optional if the LE Set Host Feature command [v1] is supported, otherwise excluded.

C.78: Mandatory if LE Feature (Monitoring Advertisers) is supported, otherwise excluded.

C.79: Mandatory if LE Feature (Frame Space Update) is supported, otherwise excluded.

C.94: Mandatory if the LE Create Connection or LE Extended Create Connection command is supported, otherwise excluded.

C.95: Mandatory if the LE Request Peer SCA command is supported, otherwise excluded.

C.96: Optional if the LE Controller supports Connection State, otherwise excluded.

C.97: Mandatory if Advertising State is supported, otherwise excluded.

C.98: Mandatory if Scanning State is supported, otherwise excluded.

C.99: Mandatory if LE Generate DHKey command [v2] is supported, otherwise optional.

C.101: Mandatory if the Authentication Requested command is supported, otherwise excluded.

C.102: Mandatory if the Change Connection Link Key command is supported, otherwise excluded.

C.103: Mandatory if the Periodic Inquiry Mode command is supported, otherwise excluded.

C.104: Mandatory if the Read Clock Offset command is supported, otherwise excluded.

C.105: Mandatory if the Read Remote Version Information command is supported, otherwise excluded.

C.106: Mandatory if the Remote Name Request command is supported, otherwise excluded.

C.107: Mandatory if the Set Controller To Host Flow Control command is supported, otherwise excluded.

C.108: Mandatory if the Set MWS_PATTERN Configuration command is supported, otherwise optional.

C.109: Mandatory if the Set MWS Signaling command is supported, otherwise excluded.

C.110: Mandatory if the Set Triggered Clock Capture command is supported, otherwise excluded.

C.111: Mandatory if the Write Authentication Enable command is supported, otherwise excluded.

C.112: Mandatory if the Write Default Erroneous Data Reporting command is supported, otherwise excluded.

C.113: Mandatory if the Write Extended Inquiry Length command is supported, otherwise excluded.

C.114: Mandatory if the Write Extended Page Timeout command is supported, otherwise excluded.

C.115: Mandatory if the Write Inquiry Mode command is supported, otherwise excluded.

C.116: Mandatory if the Write LE Host Support command is supported, otherwise excluded.

C.117: Mandatory if the Write Link Supervision Timeout command is supported, otherwise excluded.

C.118: Mandatory if the Write Num Broadcast Retransmissions command is supported, otherwise excluded.

C.119: Mandatory if the Write Page Scan Type command is supported, otherwise excluded.

C.120: Mandatory if the Write PIN Type command is supported, otherwise excluded.

C.121: Mandatory if the Write Stored Link Key command is supported, otherwise excluded.

C.122: Mandatory if the Write Synchronous Flow Control Enable command is supported, otherwise excluded.

C.123: Mandatory if BR/EDR test mode is supported, otherwise excluded.

C.124: Mandatory if Data block based flow control is supported, otherwise excluded.

C.125: Mandatory if Inquiry Scan is supported, otherwise excluded.

C.126: Optional if Inquiry Scan is supported, otherwise excluded.

C.127: Mandatory if Inquiry is supported, otherwise excluded.

C.128: Optional if Inquiry is supported, otherwise excluded.

C.129: Mandatory if Truncated page state is supported, otherwise excluded.

C.130: *Previously used*

C.131: *Previously used*

C.132: Mandatory if multi-slot ACL packets are is supported, otherwise excluded.

C.133: Mandatory if HV2, HV3, or multi-slot or EDR ACL packets are is supported, otherwise excluded.

C.134: Mandatory if SCO or eSCO is supported, otherwise excluded.

C.135: Optional if SCO or eSCO is supported, otherwise excluded.

C.136: Optional if Slot Availability Mask is supported, otherwise excluded.

C.138: Mandatory if Secure Connections (Controller) is supported, otherwise optional if eSCO is supported, otherwise excluded.

C.139: Mandatory if the Controller is AFH capable in either role, otherwise excluded.

C.140: Mandatory if the Controller supports AFH classification in either role or is an AFH capable Central, otherwise excluded.

C.141: Mandatory if Role Switch, Hold mode, or Sniff mode is supported, otherwise excluded.

C.142: Mandatory if Secure Connections (Controller) or Secure Simple Pairing (Controller) is supported, otherwise excluded.

C.143: *Previously used*

C.144: Mandatory if Hold Mode or Sniff Mode is supported, otherwise excluded.

C.145: Mandatory if any event in event mask page 2 is supported, otherwise optional.

C.146: Mandatory if the Extended Inquiry Result event or the IO Capability Request event is supported, otherwise optional if Inquiry is supported, otherwise excluded.

C.147: Optional if the Inquiry Result with RSSI event is supported, otherwise excluded.

C.148: Optional if any of the Connection Complete, Connection Request, Extended Inquiry Result, Inquiry Result with RSSI, IO Capability Request, or Synchronous Connection Complete events is supported, otherwise excluded.

C.149: *Previously used*

C.150: *Previously used*

C.151: Mandatory if Secure Connections (Controller) and Ping are supported, otherwise excluded.

C.152: Mandatory if Power Control is supported, otherwise optional.

C.153: Mandatory if LE supported in the Controller, otherwise optional.

C.154: Mandatory if Interlaced Page Scan is supported, otherwise optional.

C.155: Mandatory if the Write Authenticated Payload Timeout command is supported, otherwise excluded.

C.156: Mandatory if the Read Local Supported Codecs command [v2] is supported, otherwise excluded.

C.157: Mandatory if the Read Local Supported Codecs command [v2] is supported, otherwise optional.

C.158: Mandatory if the Set Min Encryption Key Size command is supported, otherwise optional.

C.159: Optional if the LE CIS Established event [v1] is supported, otherwise excluded.

C.201: Mandatory if Connectionless Peripheral Broadcast - Transmitter is supported, otherwise excluded.

C.202: Mandatory if Connectionless Peripheral Broadcast - Receiver is supported, otherwise excluded.

C.203: *Previously used*

C.204: *Previously used*

C.205: Mandatory if Extended Inquiry Response is supported, otherwise excluded.

C.206: Mandatory if Erroneous Synchronous Data Reporting is supported, otherwise excluded.

C.212: Mandatory if Role Switch is supported, otherwise excluded.

C.213: Mandatory if Hold mode is supported, otherwise excluded.

C.214: Mandatory if Sniff mode is supported, otherwise excluded.

C.215: Mandatory if Broadcast Encryption is supported, otherwise excluded.

C.217: Mandatory if BR/EDR Enhanced Power Control is supported, otherwise excluded.

C.218: Mandatory if Secure Connections (Controller) is supported, otherwise excluded.

C.219: Mandatory if Slot Availability Mask is supported, otherwise excluded.

C.220: Mandatory if LMP Extended Features mask is supported, otherwise excluded.

C.221: Mandatory if Sniff subrating is supported, otherwise excluded.

3.1 LE Controller requirements

3.1.1 Legacy and extended advertising

Table 3.2 lists the legacy and extended advertising commands and events.

If a Controller supports any legacy advertising command or event listed in the table and also supports the LE Feature (Extended Advertising), it shall support the corresponding extended advertising command or event in the same row of the table.

If, since the last power-on or reset, the Host has ever issued a legacy advertising command and then issues an extended advertising command, or has ever issued an extended advertising command and then issues a legacy advertising command, the Controller shall return the error code *Command Disallowed* (0x0C).

A Host should not issue legacy commands to a Controller that supports the LE Feature (Extended Advertising).

Legacy advertising command or event	Extended advertising command or event
HCI_LE_Advertising_Report event	HCI_LE_Extended_Advertising_Report event
HCI_LE_Directed_Advertising_Report event	HCI_LE_Extended_Advertising_Report event
HCI_LE_Set_Advertising_Parameters command	HCI_LE_Set_Extended_Advertising_Parameters command
HCI_LE_Read_Advertising_Physical_Channel_-Tx_Power command	*none*
HCI_LE_Set_Advertising_Data command	HCI_LE_Set_Extended_Advertising_Data command
HCI_LE_Set_Scan_Response_Data command	HCI_LE_Set_Extended_Scan_Response_Data command
HCI_LE_Set_Advertising_Enable command	HCI_LE_Set_Extended_Advertising_Enable command
none	HCI_LE_Read_Maximum_Advertising_Data_-Length command
none	HCI_LE_Read_Number_of_Supported_-Advertising_Sets command
none	HCI_LE_Remove_Advertising_Set command
none	HCI_LE_Clear_Advertising_Sets command
none	HCI_LE_Set_Periodic_Advertising_Parameters command
none	HCI_LE_Set_Periodic_Advertising_Data command

Legacy advertising command or event	Extended advertising command or event
none	HCI_LE_Set_Periodic_Advertising_Enable command
HCI_LE_Set_Scan_Parameters command	HCI_LE_Set_Extended_Scan_Parameters command
HCI_LE_Set_Scan_Enable command	HCI_LE_Set_Extended_Scan_Enable command
HCI_LE_Create_Connection command	HCI_LE_Extended_Create_Connection command
none	HCI_LE_Periodic_Advertising_Create_Sync command
none	HCI_LE_Periodic_Advertising_Create_Sync_Cancel command
none	HCI_LE_Periodic_Advertising_Terminate_Sync command
none	HCI_LE_Add_Device_To_Periodic_Advertiser_List command
none	HCI_LE_Remove_Device_From_Periodic_Advertiser_List command
none	HCI_LE_Clear_Periodic_Advertiser_List command
none	HCI_LE_Read_Periodic_Advertiser_List_Size command
none	HCI_LE_Set_Periodic_Advertising_Sync_Transfer_Parameters command
none	HCI_LE_Set_Default_Periodic_Advertising_Sync_Transfer_Parameters command
none	HCI_LE_Periodic_Advertising_Sync_Transfer_Received event

Table 3.2: Legacy and extended advertising commands and events

3.2 Underlying Support

Except as stated in this section, if a command or event is supported by a Controller then the feature underlying the command or event shall also be fully supported. If the feature applies to more than one transport, it shall be supported on all supported transports.

If the Controller supports ACL connections on BR/EDR but does not support Connection State on LE then, for each command or event that it supports that has a handle parameter, it shall only support the underlying functionality on BR/EDR (such Controllers will not support the commands or events that create LE connections and therefore all valid handles will represent BR/EDR connections).

For each of the commands and events in Table 3.3, the requirements in Table 3.1 shall be evaluated separately for each supported transport. If the requirement for a given supported transport evaluates to Mandatory, or evaluates to Optional and the Controller supports the command or event on that transport, then the underlying feature shall be fully supported on that transport. Otherwise the Controller shall not support the underlying feature on that transport and:

- For a command, if the Host issues the command with the Handle or Connection_Handle parameter referring to a connection on that transport, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).
- For an event, the Controller shall not generate that event with the Connection_Handle parameter referring to a connection on that transport.

HCI_Authenticated_Payload_Timeout_Expired event
HCI_Encryption_Change event
HCI_Encryption_Key_Refresh_Complete event
HCI_Read_Authenticated_Payload_Timeout command
HCI_Read_Remote_Version_Information command
HCI_Read_Remote_Version_Information_Complete event
HCI_Read_RSSI command
HCI_Read_Transmit_Power_Level command
HCI_Write_Authenticated_Payload_Timeout command

Table 3.3: Commands and events that have separate requirements for each transport

3.3 Feature Exchange

If a command has a Connection_Handle parameter, returns an HCI_Command_Status event followed by a completion event (see Section 4.4), and the specification of that command does not refer to feature exchange, then the command may perform feature exchange on the specified connection before any other procedure in order to determine whether the peer device supports a necessary feature.

4 HCI FLOW CONTROL

Flow control for data shall be used in the direction from the Host to the Controller to avoid overflowing the Controller data buffers with data destined for a remote device (using a Connection_Handle) that is not responding. The Host manages the data buffers of the Controller. Packet based flow control is the default for BR/EDR traffic and the only option for LE traffic. Flow control for data moving from the Controller to the Host may be in accordance with Section 4.2.

Command flow control is covered in Section 4.4 and Section 4.5.

4.1 Host to Controller data flow control

Two methods of data flow control are defined: 'packet-based' flow control and 'data-block-based' flow control, known as buffer management. Selection of the data flow control mechanism is performed with the HCI_Write_Flow_Control_Mode command (see Section 7.3.73).

If a BR/EDR/LE Controller implements separate buffers for ACL Data:

1. The Host shall use the HCI_LE_Read_Buffer_Size command to determine the buffers that are used for ACL Data on an LE-U logical link.
2. The Host shall use separate packet based flow control for each set of buffers.
3. The Connection_Handle contained in the ACL Data packet shall be used by the Controller to determine which set of buffers to use and the logical link (ACL-U, APB-U, or LE-U) over which the data is to be sent.

If a BR/EDR/LE Controller does not implement separate buffers, then all ACL Data shall use the BR/EDR buffer management as described below, and only the logical link (ACL-U, APB-U, or LE-U) shall be determined by the Connection_Handle.

A packet is said to have completed when the Controller no longer needs the buffer space to store the data from the packet and has freed the corresponding buffer for re-use. This nominally happens when the data is transmitted or flushed, but can be delayed for implementation reasons or can happen early if the implementation transfers the data to other storage.

For each individual Connection_Handle, the data shall be sent to the Controller in HCI Data packets in the order in which it was provided by the Host and shall arrive at the Controller in that order.

4.1.1 Packet-based data flow control

When the packet based flow control mechanism is enabled, on initialization, a Host that supports LE shall issue the HCI_LE_Read_Buffer_Size command (see Section 7.8.2). Two of the return parameters of this command determine the maximum size of HCI ACL (excluding header) Data packets that can be used to transmit ACL data for an LE transport sent from the Host to the Controller. There is an additional return parameter that specifies the total number of HCI ACL Data packets that the Controller may have waiting for transmission in those buffers. A Controller that supports BR/EDR and LE may return zero for the total number of HCI ACL packets used to transmit ACL data for an LE transport. In this case the Host shall then send all BR/EDR and LE data using the HCI ACL Data packets into the buffers identified using the HCI_Read_Buffer_Size command. A Controller that does not support BR/EDR shall not return zero for the total number of HCI ACL packets used to transmit ACL data for an LE transport.

When the packet-based flow control mechanism is enabled, on initialization, a Host that supports isochronous data over HCI in either the Connected Isochronous Stream Central role, Connected Isochronous Stream Peripheral role, or Isochronous Broadcaster role shall issue the HCI_LE_Read_Buffer_Size command.

An HCI ISO Data packet is used to transfer isochronous data between the Host and Controller for transmission of isochronous data on an isochronous transport. The ISO_Data_Packet_Length parameter of this command specifies the maximum buffer size for each HCI ISO Data packet (excluding the header but including optional fields such as ISO_SDU_Length). The return parameter Total_Num_ISO_Data_Packets of this command specifies the maximum number of HCI ISO Data packets that the Controller can have waiting for transmission in its buffers.

Note: The ISO_Data_Packet_Length and Total_Num_ISO_Data_Packets return parameters are only available when using v2 or above of the HCI_LE_Read_Buffer_Size command (see Section 7.8.2).

In a BR/EDR Controller, when the packet based flow control mechanism is enabled, on initialization, the Host shall issue the HCI_Read_Buffer_Size command. Two of the return parameters of this command determine the maximum size of HCI ACL and Synchronous Data packets (excluding header) sent from the Host to the Controller. There are also two additional return parameters that specify the total number of HCI ACL and Synchronous Data packets that the Controller may have waiting for transmission in its buffers. A Controller that supports BR/EDR shall not return zero for the total number of HCI ACL Data packets or their maximum size. A Controller that supports SCO or eSCO over HCI shall not return zero for the total number of HCI Synchronous Data packets or their maximum size.

When there is at least one connection to another device, the Controller is broadcasting a BIG, or when in local loopback mode on a BR/EDR Controller, the Controller shall

use the HCI_Number_Of_Completed_Packets event to control the flow of data from the Host. This event contains a list of Connection_Handles and a corresponding number of HCI Data packets and/or HCI ISO Data packets that have been completed since the previous time the event was returned (or since the connection was established, if the event has not been returned before for a particular Connection_Handle).

The Host chooses the Connection_Handles for the following HCI Data packets and/or HCI ISO Data packets based on the information returned in this event, and/or the HCI_LE_Read_Buffer_Size commands.

Every time it has sent an HCI Data packet, the Host shall reduce its count of the free buffer space for the corresponding link type (ACL, SCO, or eSCO) in the Controller by one HCI Data packet.

Every time the Host sends an HCI ISO Data packet, the Host shall reduce its count of the free buffer space for the corresponding logical link type (LE-S or LE-F) in the Controller by one HCI ISO Data packet.

Each HCI_Number_Of_Completed_Packets event received by the Host provides information about how many HCI Data packets and/or HCI ISO Data packets have been completed for each Connection_Handle since the previous HCI_Number_Of_Completed_Packets event was sent to the Host. It can then calculate the actual current buffer usage.

The Host shall not send an HCI Data packet or HCI ISO Data packet to the Controller when its count of the free buffer space for the corresponding link type is zero.

When the Controller has completed one or more HCI Data packet(s) and/or HCI ISO Data packet(s) it shall send an HCI_Number_Of_Completed_Packets event to the Host, until it finally reports that all the pending HCI Data packets have been completed. The frequency at which this event is sent is manufacturer specific.

Note: The HCI_Number_Of_Completed_Packets events will not report on synchronous Connection_Handles if Synchronous Flow Control is disabled. (See Section 7.3.36 and Section 7.3.37.)

4.1.2 Data-block-based data flow control

When the data-block-based flow control mechanism is enabled, on initialization the Host shall issue the Read Data Block Size command. Two of the return parameters of this command determine the maximum size of HCI ACL Data packets (excluding header) sent from the Host to the Controller. A further return parameter specifies the total number of HCI ACL Data packets that the Controller may have waiting for transmission in its buffers.

The Controller shall use the HCI_Number_Of_Completed_Data_Blocks event to control the flow of data from the Host. This event contains a list of Handles and a corresponding number of HCI Data packets that have been completed since the previous time the event was returned (or since the link was established, if the event has not been returned before for a particular Handle).

Based on the information returned in this event, and the return parameters of the HCI_Read_Data_Block_Size command that specify the total number of HCI ACL Data packets that can be stored in the Controller, the Host decides for which Handles the following HCI Data packets should be sent.

Every time it has sent an HCI Data packet, the Host shall reduce its count of the free buffer space for the corresponding ACL link type in the Controller by one HCI Data packet.

Each HCI_Number_Of_Completed_Data_Blocks event received by the Host provides information about how many HCI Data packets have been completed for each Handle since the previous HCI_Number_Of_Completed_Data_Blocks event was sent to the Host. It can then calculate the actual current buffer usage.

The Host shall not send an HCI Data packet to the Controller when its count of the free buffer space for the corresponding link type is zero.

When the Controller has completed one or more HCI Data packet(s) it shall send an HCI_Number_Of_Completed_Data_Blocks event to the Host until it finally reports that all the pending HCI Data packets have been completed. The frequency at which this event is sent is manufacturer specific.

4.2 Controller to Host data flow control

In some implementations, flow control may also be necessary in the direction from the Controller to the Host. The HCI_Set_Controller_To_Host_Flow_Control command can be used to turn flow control on or off in that direction.

On initialization, the Host uses the HCI_Host_Buffer_Size command to notify the Controller about the maximum size of HCI ACL and Synchronous Data packets sent from the Controller to the Host. The command also contains two additional command parameters to notify the Controller about the total number of ACL and Synchronous Data packets that can be stored in the data buffers of the Host.

The Host uses the HCI_Host_Number_Of_Completed_Packets command in exactly the same way as the Controller uses the HCI_Number_Of_Completed_Packets event as was previously described in this section, but a packet is completed when the Host is ready to free the corresponding buffer.

The Controller shall not send an HCI Data packet to the Host when its count of the free buffer space for the corresponding link type is zero.

The HCI_Host_Number_Of_Completed_Packets command is a special command for which no command flow control is used, and which can be sent anytime there is a connection or when in local loopback mode. The command also has no event after the command has completed. This makes it possible for the flow control to work in exactly the same way in both directions, and the flow of normal commands will not be disturbed.

For each individual Connection_Handle, the data shall be sent to the Host in HCI Data packets in the order in which it was provided by the Controller and shall arrive at the Host in that order.

4.3 Disconnection behavior

When the Host receives an HCI_Disconnection_Complete event, the Host shall assume that all unacknowledged HCI Data packets that have been sent to the Controller for the returned Handle have been flushed, and that the corresponding data buffers have been freed. A Controller does not have to notify the Host about this in an HCI_Number_Of_Completed_Packets or an HCI_Number_Of_Completed_Data_Blocks event before the disconnection event.

If flow control is also enabled in the direction from the Controller to the Host, the Controller may, after it has sent an HCI_Disconnection_Complete event, assume that the Host will flush its data buffers for the sent Handle when it receives the HCI_Disconnection_Complete event. The Host does not have to notify the Controller about this in an HCI_Host_Number_Of_Completed_Packets command.

4.4 Command flow control

On initial power-on, and after a reset, the Host shall send a maximum of one outstanding HCI Command packet until an HCI_Command_Complete or HCI_Command_Status event has been received.

The HCI_Command_Complete and HCI_Command_Status events contain a parameter called Num_HCI_Command_Packets, which indicates the number of HCI Command packets the Host is currently allowed to send to the Controller. The Controller may buffer one or more HCI Command packets, but the Controller shall start performing the commands in the order in which they are received. The Controller can start performing a command before it completes previous commands. Therefore, the commands do not always complete in the order they are started.

To indicate to the Host that the Controller is ready to receive HCI command packets, the Controller may generate an HCI_Command_Complete or HCI_Command_Status event with the Command Opcode set to 0x0000 and the Num_HCI_Command_Packets

parameter set to 1 or more. Command Opcode 0x0000 is a special value indicating that this event is not associated with a command sent by the Host. The Controller can send an HCI_Command_Complete or HCI_Command_Status event with Command Opcode 0x0000 at any time to change the number of outstanding HCI Command packets that the Host can send before waiting. If the Controller generates an HCI_Command_Complete or HCI_Command_Status event with Num_HCI_Command_Packets set to zero, then the Host shall stop sending commands.

HCI commands may take different amounts of time to be completed. Therefore, the results of commands will be reported back to the Host in the form of an event. For example, for most HCI commands the Controller will generate the HCI_Command_Complete event when a command is completed. This event contains the return parameters for the completed HCI command. For enabling the Host to detect errors on the HCI-Transport Layer, there needs to be a timeout between the transmission of the Host's command and the reception of the Controller's response (e.g. an HCI_Command_Complete or HCI_Command_Status event). Since the maximum response timeout is strongly dependent on the HCI-Transport Layer used, it is recommended to use a default value of one second for this timer. This amount of time is also dependent on the number of commands unprocessed in the command queue.

There are two separate patterns of command execution. For the first type (used by those commands which are expected to complete quickly and are carried out entirely in the local Controller), the Controller shall send the Host an HCI_Command_Complete event when it has completed the command. For the second type (used by those commands that are expected to take a significant length of time, usually because they involve interaction with a peer device), the Controller shall send the Host an HCI_Command_Status event when it has received the command and checked the parameters. When the actions associated with the command have finished, a separate event that is associated with the command (the "completion event") shall be sent by the Controller to the Host. Between the times that these two events are generated (even if they have not yet been received by the Host), this type of command is described as "pending".

If a command of the second type does not begin to execute (for example, if there was a parameter error or the command is currently not allowed), the HCI_Command_Status event shall be returned with the appropriate error code in the Status parameter and no completion event is generated.

When a Connection_Handle is deleted and there are pending commands relating to that Connection_Handle, the Controller may return the completion event for each command to the Host. Each such event shall have a non-zero status and shall precede the event indicating the deletion of the Connection_Handle. No events for that Connection_Handle shall be sent after the event indicating the deletion of the Connection_Handle.

4.5 Command error handling

4.5.1 Generic error handling

Unless explicitly stated otherwise in the description of a command, any error in any parameter means that the command will not begin to execute; it will only return an error code. If more than one error code is applicable, the implementation shall choose one of them.

If an error occurs for a command for which an HCI_Command_Complete event is returned, the error shall be reported in the Status parameter.

If an error occurs for a command for which an HCI_Command_Status event and a completion event are returned, there are two possibilities; which happens will depend on the specific error. If the error is one which means the command will not begin to execute (including any errors in parameters), the error shall be returned as a non-zero Status parameter in the HCI_Command_Status event and no completion event will be returned. If the error is not detected until after the HCI_Command_Status event has been generated, the HCI_Command_Status event shall have the Status parameter set to zero and the error shall be returned in the Status parameter of the completion event.

If the Controller does not support an issued command, it shall return the error code *Unknown HCI command* (0x01) in the Status parameter of either an HCI_Command_Complete event or an HCI_Command_Status event; which event is used is vendor-specific.

If an error occurs for a command for which an HCI_Command_Complete event is returned, the Return Parameters field may only contain some of the return parameters specified for the command. The Status parameter, which explains the error reason and which is the first return parameter, shall always be returned. If there is a Handle parameter or a BD_ADDR parameter right after the Status parameter, this parameter shall also be returned so that the Host can identify to which instance of a command the HCI_Command_Complete event belongs. In this case, the Handle or BD_ADDR parameter shall have exactly the same value as that in the corresponding command parameter. It is implementation specific whether more parameters will be returned in case of an error; if they are not, the event will be shorter than if they were.

The above also applies to commands that have associated command specific completion events with a Status parameter in their completion event, with the exceptions shown in Table 4.1, which indicates the only parameters (other than Status) that are valid. The validity of other parameters is likewise implementation specific for failed commands in this group, but they shall be sent in any case.

Event	Valid parameters
Connection_Complete	BD_ADDR
Synchronous_Connection_Complete	BD_ADDR
LE_Connection_Complete	*none*
LE_Enhanced_Connection_Complete	*none*
LE_Periodic_Advertising_Sync_Established	*none*
LE_CIS_Established	Connection_Handle
LE_CIS_Request	*none*
LE_Create_BIG_Complete	BIG_Handle
LE_Terminate_BIG_Complete	BIG_Handle
LE_BIG_Sync_Established	BIG_Handle
LE_Request_Peer_SCA_Complete	Connection_Handle

Table 4.1: Valid parameters for command completion events reporting an error

For the purposes of this section, the Subevent_Code parameter of the HCI_LE_Meta event (see Section 7.7.65) is not treated as a parameter and is always valid.

Note: The BD_ADDR return parameter of the command HCI_Read_BD_ADDR is not used to identify to which instance of the HCI_Read_BD_ADDR command the HCI_Command_Complete event belongs. It is optional for the Controller to return this parameter in case of an error.

4.5.2 Error handling specific to a command

Some controller command descriptions in Section 7 include a table describing error conditions and error handling specific to that command in addition to the command error handling described in Section 4.5.1. Table 4.2 describes the four types of command error handling used in the command-specific error conditions and error handling tables.

Type	Error Condition	Command Rejected with Error Code	Return Specified Error Code
MC	The Controller shall return the specified error code and not execute the command.	Mandatory	Mandatory
M	The Controller shall return an error code and not execute the command. The error code returned should be the one specified.	Mandatory	Recommended
RC	The Controller should return an error code and not execute the command. If it does return an error code, it shall be the one specified.	Recommended	Mandatory

Type	Error Condition	Command Rejected with Error Code	Return Specified Error Code
R	The Controller should return an error code and not execute the command. If it does return an error code, it should be the one specified.	Recommended	Recommended

Table 4.2: Types of error handling

An error situation occurs if any of the conditions in the table apply at the moment the Controller starts to process the command parameters (if any) and before the Controller starts to execute the command. For example, an error condition because a conflicting mode was enabled would not apply if that mode is disabled between the Host sending the command to the HCI transport and the Controller starting to check the command parameters.

4.6 LMP transaction and LL procedure collisions

If the Host issues a command that returns a successful HCI_Command_Status event but then triggers an LMP transaction or Link Layer procedure that terminates with the error code *LMP Error Transaction Collision / LL Procedure Collision* (0x23) because the peer has also initiated the same transaction or procedure, then the Controller shall take one of the following actions:

- The Controller shall wait until the peer-initiated transaction or procedure has completed and use the result to generate the command-specific completion event. In this case, the collision is not reported to the Host.
- The Controller shall generate the command-specific completion event with the error code *LMP Error Transaction Collision / LL Procedure Collision* (0x23).

4.7 LE Host and Controller synchronization

To synchronize the timing of isochronous data received in the Host with the timing of the isochronous data received in the Controller from the isochronous physical channel, the Controller can include a time stamp (see [Vol 6] Part G, Section 1) in each HCI ISO Data packet. Similarly, the Host can include a time stamp in each SDU (see [Vol 6] Part G, Section 1) sent to the Controller.

A Host can use the HCI_LE_Read_ISO_TX_Sync command at any time to read the time stamp and packet sequence number of the last SDU scheduled for transmission.

4.8 Versioned events

If an event has more than one version and the event is generated, the Controller shall use the latest version that is both supported and enabled (“unmasked”) in the relevant event mask (see Section 7.3.1, Section 7.3.69, and Section 7.8.1).

5 HCI DATA FORMATS

5.1 Correctness

The Controller shall set the value of return and event parameters so as to correctly represent the data or circumstances being reported. For example, in the HCI_Connection_Complete event (see Section 7.7.3), the value of the Link_Type parameter must correctly indicate the type of connection being reported.

5.2 Data and parameter formats

- All values are in binary and hexadecimal little-endian formats unless otherwise noted.
- Unless noted otherwise, the order of parameters in an HCI Command packet or HCI Event packet is the order the parameters are listed in the command or event.
- Arrayed parameters are specified using the following notation: ParameterA[i]. If more than one set of arrayed parameters are specified (e.g. ParameterA[i], ParameterB[i]), then, unless noted otherwise, the order of the parameters are as follows: ParameterA[0], ParameterB[0], ParameterA[1], ParameterB[1], ParameterA[2], ParameterB[2], ... ParameterA[n], ParameterB[n]. The description of an arrayed parameter will actually describe a single element of the array.
- Unless noted otherwise, all parameter values are sent and received in little-endian format (i.e. for multi-octet parameters the rightmost (Least Significant Octet) is transmitted first).
- Most command and event parameters that are not-arrayed and all elements in an arrayed parameter have fixed sizes (an integer number of octets). Where a parameter, or an element of an arrayed parameter, has a variable length, this will be noted in the specific command; the length will then be specified in another parameter.The parameters and the size of each not-arrayed parameter (or of each element in an arrayed parameter) contained in a command or an event is specified for each command or event. The number of elements in an arrayed parameter is not fixed.
  - Where a command or event has one or more arrayed parameters or parameters with variable length, the maximum value specified for the parameter that determines the size can result in an array or parameter that is too big to fit in the HCI command or event packet. When this happens, the effective maximum size will be less than the specified maximum and can depend on the size or value of other parameters.
- Where bit strings are specified, the low order bit is the right hand bit, e.g. 0 is the low order bit in 0b10.

- Where a parameter value is described as "0xXX" or "N = 0xXX" (with an appropriate number of "X"s), then the description applies to all possible values other than any for which a separate description is given. Where the description specifies a range, values outside that range (if any) are reserved for future use.
- Parameter values or opcodes that an implementation does not know how to interpret shall be ignored and the operation that is being attempted shall be completed with the correct signaling. The Host or Controller shall not stop functioning because of receiving a reserved value.
- Unless noted otherwise, such as in a "Mandatory Range" statement or because a value relates to an optional feature that is not supported, the Controller shall support all valid values of all parameters (values reserved for future use are not valid).

5.3 IDs and Handles

Two types of identifiers are used in HCI commands and events.

IDs, assigned by the Host, are identifiers used between two peer devices and sent over the air in PDUs. Each different type of ID has a separate number space. The CIS_ID has a separate number space for each CIG_ID.

Handles, assigned by either the Host in a command or by the Controller in an event, are identifiers used between the Host and the Controller but not sent over the air. Some handles share the same number spaces and others have separate number spaces.

When a device allocates an ID or Handle for a new object (e.g. when the Controller allocates a Connection_Handle for a new ACL connection), it shall not use a handle that is currently allocated to another object in the same number space.

After a device deletes an ID or Handle (e.g. after the Controller deletes a Connection_Handle for a disconnected ACL connection), it may reuse the ID or Handle.

5.3.1 Controller handles

Connection_Handles, Sync_Handles, Advertising_Handles, and BIG_Handles are Controller Handles used to identify logical channels between the Host and the Controller.

Connection_Handles are assigned by the Controller when a new logical transport is created or reserved and reported to the Host in one of the following events: HCI_Connection_Complete, HCI_Synchronous_Connection_Complete, HCI_LE_Connection_Complete, HCI_LE_Enhanced_Connection_Complete, HCI_LE_CIS_Request, HCI_LE_Create_BIG_Complete, HCI_LE_BIG_Sync_Established, or HCI_Command_Complete events following the HCI_LE_Set_CIG_Parameters

command. Broadcast Connection_Handles that use the BR/EDR transport are handled differently, and are described in Section 5.3.1.1.

Sync_Handles are assigned by the Controller when a new logical transport is created and reported to the Host in the HCI_LE_Periodic_Advertising_Sync_Established event.

Advertising_Handles are assigned by the Host when a new advertising set is created by using the HCI_LE_Set_Extended_Advertising_Parameters command.

BIG_Handles are assigned by the Host when a new BIG is created using one of the following commands: HCI_LE_Create_BIG, HCI_LE_Create_BIG_Test, and LE_BIG_Create_Sync.

All connection handles that are assigned by the Controller shall be derived from the same number space. Sync handles shall be assigned by the Controller from a separate number space.

Advertising handles and BIG handles are assigned by the Host from separate number spaces.

5.3.1.1 Broadcast Connection_Handles

The first time the Host sends an HCI ACL Data packet with Broadcast_Flag set to 0b01 (active Peripheral broadcast) after a power-on or a reset, the value of the Connection_Handle parameter shall be a value which is not currently assigned by the Controller.

The BR/EDR Controller shall then continue to use the same Connection_Handle for broadcast until a reset is made. The Controller shall not re-allocate a Connection_Handle that it knows is used for broadcast.

In some situations, it may happen that the Controller sends a Connection Complete event before having interpreted a Broadcast packet received from the Host, and that the Connection_Handles of both Connection Complete event and HCI ACL Data packet are the same. This conflict is avoided as follows:

If a Connection Complete event is received containing the Connection_Handle used for broadcast, the Host shall wait before sending any packets for the new connection until it receives a Number Of Completed Packets event indicating that there are no pending broadcast packets belonging to the Connection_Handle. The Host shall also change the Connection_Handle used for broadcast to a Connection_Handle which is currently not assigned by the Controller. This Connection_Handle shall then be used for all following broadcasts of until a reset is performed or the same conflict situation happens again. However, this will occur very rarely.

By following this procedure, the Controller can distinguish between the Broadcast message sent by the Host and the new connection made (this could be even a new synchronous link) even though the Connection_Handles are the same.

For an HCI ACL Data packet sent from the Controller to the Host where the Broadcast_Flag is 01, the Connection_Handle parameter should contain the Connection_Handle for the ACL connection to the Central that sent the broadcast.

For Connectionless Peripheral Broadcast, no Connection_Handle is assigned.

5.3.2 [This section is no longer used]

5.4 Exchange of HCI-specific information

The Host Controller Transport Layer provides transparent exchange of HCI specific information. These transporting mechanisms provide the ability for the Host to send HCI commands, receive HCI events, and send and receive data to the Controller. Since the Host Controller Transport Layer provides transparent exchange of HCI-specific information, the HCI specification specifies the format of the commands, events, and data exchange between the Host and the Controller(s). The next sections specify the HCI packet formats.

5.4.1 HCI Command packet

The HCI Command packet is used to send commands to the Controller from the Host. The format of the HCI Command packet is shown in Figure 5.1, and the definition of each field is explained below.

Controllers shall be able to accept HCI Command packets with up to 255 bytes of data excluding the HCI Command packet header. The HCI Command packet header is the first 3 octets of the packet.

Each command is assigned a 2 byte Opcode used to uniquely identify different types of commands. The Opcode parameter is divided into two fields, called the Opcode Group Field (OGF) and Opcode Command Field (OCF). The OGF occupies the upper 6 bits of the Opcode, while the OCF occupies the remaining 10 bits. Any opcode not mentioned in this Part is reserved for future use.

The OGF value 0x3E is reserved for specification development purposes.

The OGF of 0x3F is reserved for vendor-specific debug commands.

The organization of the opcodes allows additional information to be inferred without fully decoding the entire Opcode.

Note: The OGF composed of all ‘ones’ has been reserved for vendor-specific debug commands. These commands are vendor-specific and are used during manufacturing, for a possible method for updating firmware, and for debugging.

On receipt of a Vendor Specific Debug command the Controller should respond with either:

1. An HCI_Command_Status event. If the status indicates success (Section 7.7.15) then this event shall be followed by an HCI event with Event Code field of 0xFF (Section 5.4.4).
2. An HCI_Command_Complete event specifying the corresponding Vendor Specific Debug command opcode.

The Host shall assume that sending of an HCI_Vendor_Specific_Debug command will consume an HCI command credit.

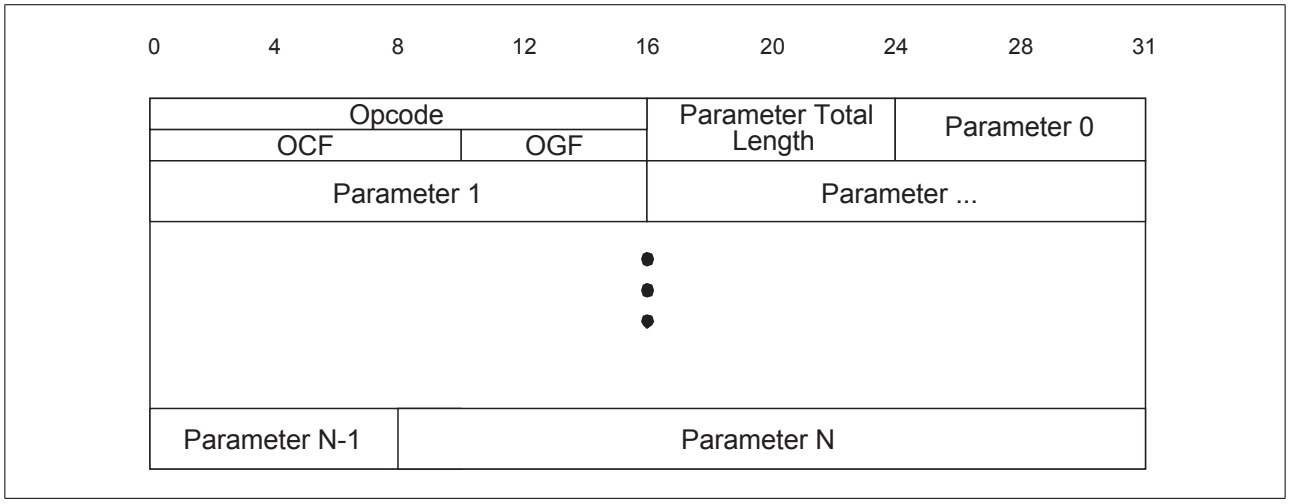

Figure 5.1: HCI Command packet

Opcode: *Size: 2 octets*

Value	Parameter Description
0xXXXX	OGF Range (6 bits): 0x00 to 0x3F (0x3F reserved for vendor-specific debug commands) OCF Range (10 bits): 0x0000 to 0x03FF

Parameter_Total_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Lengths of all of the parameters contained in this packet measured in octets. (N.B.: total length of parameters, not number of parameters)

Parameter 0 - N: *Size: Parameter_Total_Length*

Value	Parameter Description
0xXX	Each command has a specific number of parameters associated with it. These parameters and the size of each of the parameters are defined for each command. Each parameter is an integer number of octets in size.

5.4.2 HCI ACL Data packets

HCI ACL Data packets are used to exchange data between the Host and Controller. There are two types of HCI ACL Data packets:

- Automatically-Flushable
- Non-Automatically-Flushable

Automatically-Flushable HCI ACL Data packets are flushed based on the setting of an automatic flush timer (see Section 7.3.29). Non-Automatically-Flushable HCI ACL Data packets are not controlled by the automatic flush timeout and shall not be automatically flushed. The format of the HCI ACL Data packet is shown in Figure 5.2. The definition for each of the fields in the data packets is explained below.

Hosts and Controllers shall be able to accept HCI ACL Data packets with up to 27 bytes of data excluding the HCI ACL Data packet header on Connection_Handles associated with an LE-U logical link.The HCI ACL Data packet header is the first 4 octets of the packet.

Note: HCI ACL Data packets with a Connection_Handle associated with an LE-U logical link will not be affected by the automatic flush timer because only non-flushable packet boundary flags are allowed.

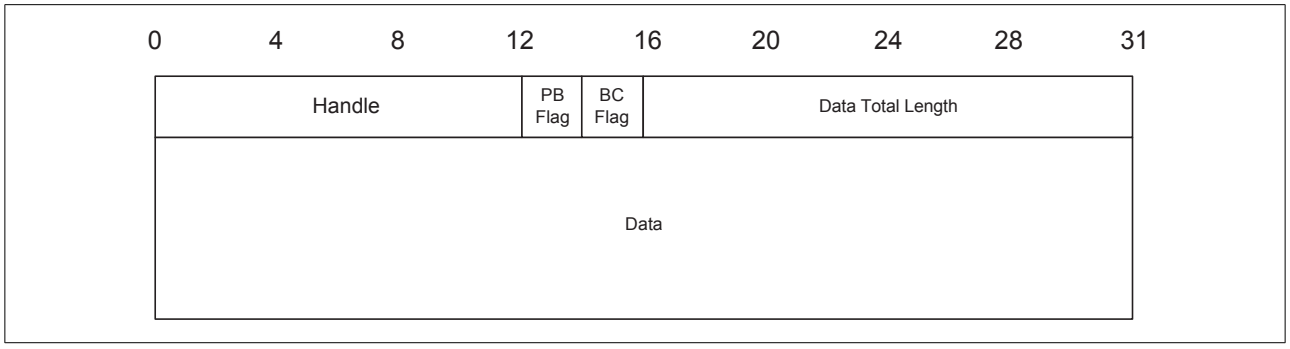

Figure 5.2: HCI ACL Data packet

Handle: *Size: 12 Bits*

Value	Parameter Description
0xXXX	Connection_Handle to be used for transmitting a data packet over a Controller. Range: 0x000 to 0xEFF (all other values reserved for future use)

The Flag Bits consist of the Packet_Boundary_Flag and Broadcast_Flag. The Packet_Boundary_Flag is located in bit 4 and bit 5, and the Broadcast_Flag is located in bit 6 and bit 7 in the second octet of the HCI ACL Data packet.

Packet_Boundary_Flag: *Size: 2 Bits*

Value	Parameter Description		APB-U	ACL-U	LE-U
0b00	First non-automatically-flushable packet of a higher layer message (start of a non-automatically-flushable L2CAP PDU) from Host to Controller.	Host to Controller	Not allowed	Allowed	Allowed
		Controller to Host	Not allowed	Not allowed (except during loopback)	Not allowed
0b01	Continuing fragment of a higher layer message	Host to Controller	Allowed	Allowed	Allowed
		Controller to Host	Allowed	Allowed	Allowed
0b10	First automatically flushable packet of a higher layer message (start of an automatically-flushable L2CAP PDU).	Host to Controller	Allowed	Allowed	Not Allowed
		Controller to Host	Allowed	Allowed	Allowed
0b11	Previously used				

The start of a non-flushable packet of a higher layer message (start of a non-automatically-flushable L2CAP PDU) with the PBF of 0b00 shall be transmitted with an LLID of 0b10. All continuing fragment packets of a higher layer message shall be transmitted with an LLID of 0b01.

Broadcast_Flag: *Size: 2 Bits*

Value	Parameter Description
0b00	Point-to-point (ACL-U or LE-U)
0b01	BR/EDR broadcast (APB-U)
0b10	Reserved for future use.
0b11	Reserved for future use.

Note: The Broadcast_Flag value 0b01 may only be used in packets from Host to Controller on the Central of a piconet and from Controller to Host on the Peripheral of a piconet. Peripherals in Sniff mode will only receive a broadcast packet if it happens to be sent in a sniff slot when the Peripheral is listening.

Data_Total_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Length of data measured in octets.

5.4.3 HCI Synchronous Data packets

HCI Synchronous Data packets are used to exchange synchronous data (SCO and eSCO) between the Host and Controller. The format of the HCI Synchronous Data packet is shown in Figure 5.3. The definition for each of the fields in the data packets is explained below. The HCI Synchronous Data packet header is the first 3 octets of the packet.

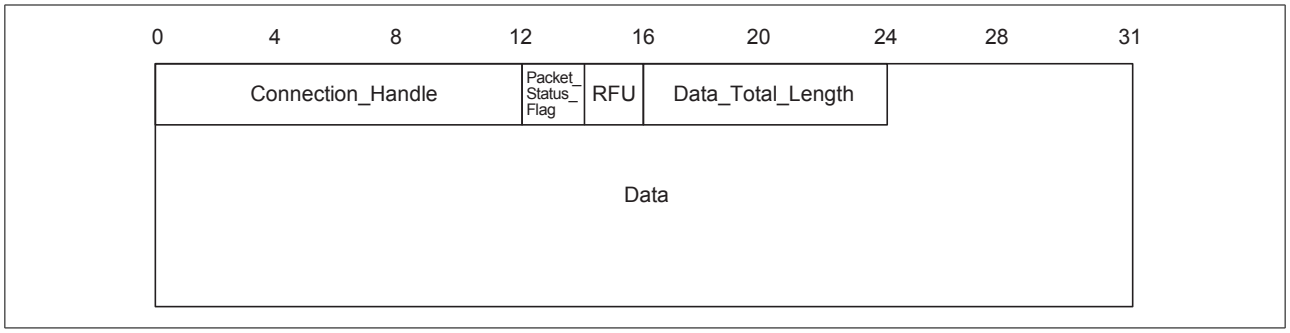

Figure 5.3: HCI Synchronous Data packet

Connection_Handle: *Size: 12 Bits*

Value	Parameter Description
0xXXX	Connection_Handle to be used to for transmitting a synchronous data packet. Range: 0x0000 to 0x0EFF

The Packet_Status_Flag bits consist of two bits, which are located from bit 4 to 5 in the second octet of the HCI Synchronous Data packet.

The Host shall set the Packet_Status_Flag bits to 0b00.

If the Erroneous_Data_Reporting parameter was set to disabled when the synchronous connection was created, the Controller shall set the Packet_Status_Flag bits to 0b00 and whether or not data is provided for cases when a valid (e)SCO packet was not received is unspecified.

If the Erroneous_Data_Reporting parameter was set to enabled when the synchronous connection was created, the Controller shall set the Packet_Status_Flag according to the following table.

Packet_Status_Flag (in packets sent by the Controller): *Size: 2 Bits*

Value	Parameter Description
0b00	Correctly received data. The payload data belongs to received eSCO or SCO packets that the Baseband marked as “good data”.
0b01	Possibly invalid data. At least one eSCO packet has been marked by the Baseband as “data with possible errors” and all others have been marked as “good data” in the eSCO interval(s) corresponding to the HCI Synchronous Data packet.
0b10	No data received. All data from the Baseband received during the (e)SCO interval(s) corresponding to the HCI Synchronous Data packet have been marked as "lost data" by the Baseband. The Payload data octets shall be set to 0.
0b11	Data partially lost. Not all, but at least one (e)SCO packet has been marked as “lost data” by the Baseband in the (e)SCO intervals corresponding to the HCI Synchronous Data packet. The payload data octets corresponding to the missing (e)SCO packets shall be set to 0.

Note: Some HCI transports and/or Controller implementations will align the HCI Synchronous Data packets with the (e)SCO Baseband packets such that data integrity can be explicitly marked in the Packet_Status_Flag. For HCI transports or Controller implementations that do not preserve this alignment, information in the Packet_Status_Flag may be ambiguous.

Data_Total_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Length of synchronous data measured in octets

5.4.4 HCI Event packet

The HCI Event packet is used by the Controller to notify the Host when events occur. If the Controller sends an HCI Event Packet containing an Event Code or an LE subevent code that the Host has not masked out and does not support, the Host shall ignore that packet. Any event code or LE subevent code not mentioned in this Part is reserved for future use. The Host shall be able to accept HCI Event packets with up to 255 octets of data excluding the HCI Event packet header. The format of the HCI Event packet is shown in Figure 5.4, and the definition of each field is explained below. The HCI Event packet header is the first 2 octets of the packet.

The event code 0xFE is reserved for specification development purposes. The event code 0xFF is reserved for vendor-specific debugging events.

Note: An LE Controller uses a single Event Code (see Section 7.7.65) to transmit all LE specific events from the Controller to the Host. The first Event Parameter is always a subevent code identifying the specific event.

Controllers should use subevent codes with Event Codes 0xFE and 0xFF.

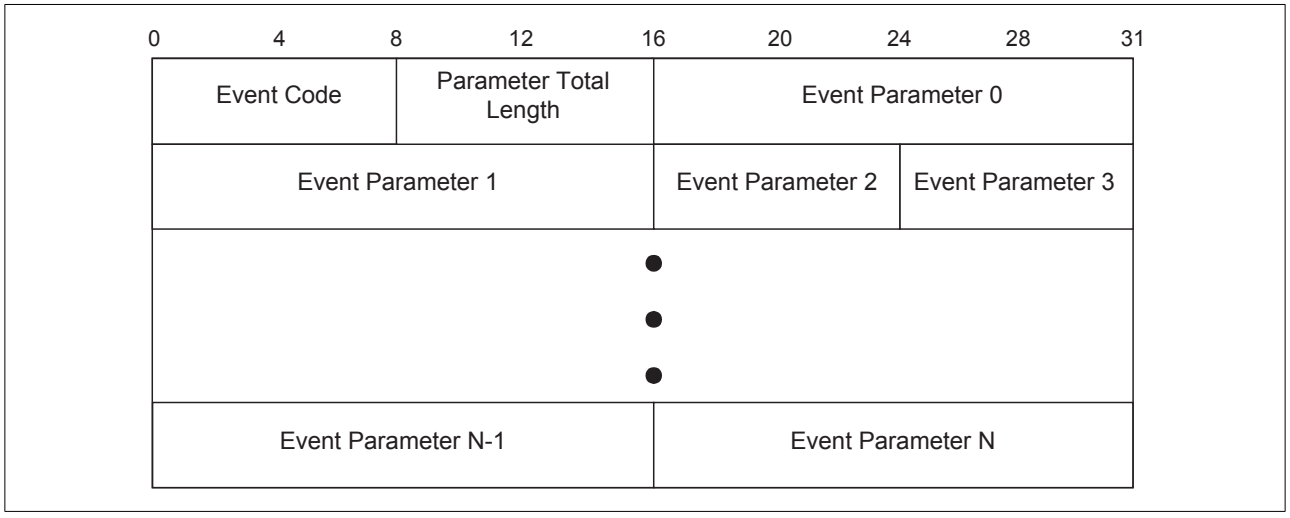

Figure 5.4: HCI Event packet

Event_Code: *Size: 1 octet*

Value	Parameter Description
0xXX	Each event is assigned a 1-Octet event code used to uniquely identify different types of events.

Parameter_Total_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Length of all of the parameters contained in this packet, measured in octets

Event_Parameter 0 - N: *Size: Parameter_Total_Length*

Value	Parameter Description
0xXX	Each event has a specific number of parameters associated with it. These parameters and the size of each of the parameters are defined for each event. Each parameter is an integer number of octets in size.

5.4.5 HCI ISO Data packets

HCI ISO Data packets are used to exchange isochronous data between the Host and Controller. An HCI ISO Data packet holds either an SDU or part of an SDU. In the Host to Controller direction, it cannot contain more data than the size of the buffer supported

by the Controller. If the length of an SDU is greater than the Controller's buffer size, the Host may need to fragment that SDU. The Controller shall not start sending an SDU or fragments of an SDU to the Host until all the PDUs containing data from that SDU have either been received or can no longer be received because the last opportunity for them to be transmitted has passed. SDU fragments generated over HCI are unrelated to the SDU fragments generated by ISOAL.

The format of the HCI ISO Data packet is shown in Figure 5.5. The definition of each field in the packet is given below. The HCI ISO Data packet header is the first 4 octets of the packet.

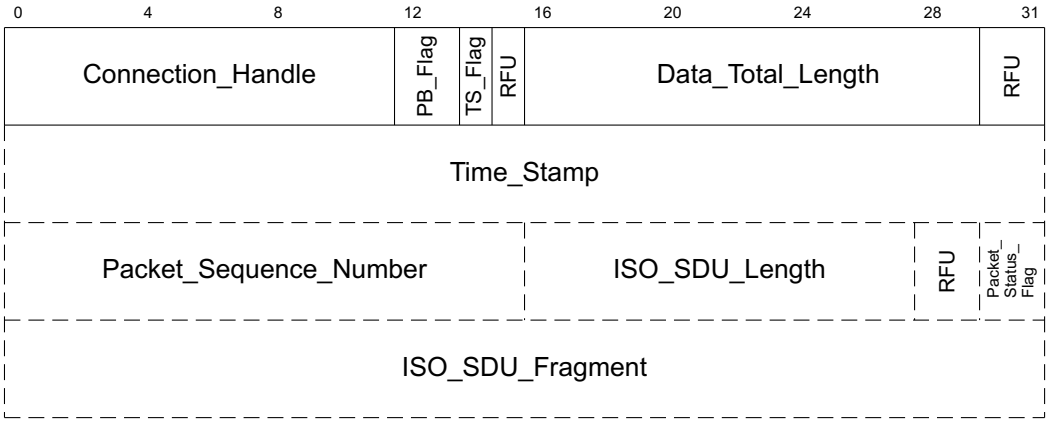

Figure 5.5: Format of an HCI ISO Data packet

If PB_Flag equals 0b00 or 0b10, then the Packet_Sequence_Number, ISO_SDU_Length, and Packet_Status_Flag fields (plus the intermediate RFU field) shall all be present in the packet and the Time_Stamp field may be present. If PB_Flag equals 0b01 or 0b11, then none of these fields shall be included in the packet.

Connection_Handle: *Size: 12 bits*

Value	Parameter Description
0xXXX	Connection_Handle to be used for transmitting an ISO SDU or fragment. Range: 0x000 to 0xEFF

PB_Flag: *Size: 2 bits*

Value	Parameter Description
0b00	The ISO_SDU_Fragment field contains the first fragment of a fragmented SDU.
0b01	The ISO_SDU_Fragment field contains an intermediate fragment of an SDU.

Value	Parameter Description
0b10	The ISO_SDU_Fragment field contains a complete SDU.
0b11	The ISO_SDU_Fragment field contains the last fragment of an SDU.

TS_Flag: *Size: 1 bit*

Value	Parameter Description
0	The Time_Stamp field is not present in the packet.
1	The Time_Stamp field is present in the packet.

Data_Total_Length: *Size: 14 bits*

Value	Parameter Description
0xXXXX	Length of the packet, excluding the packet header, in octets.

In the Host to Controller direction, Data_Total_Length shall be less than or equal to the size of the buffer supported by the Controller (which is returned using the ISO_Data_Packet_Length return parameter of the LE Read Buffer Size command).

If PB_Flag is 0b01 or 0b11, then Data_Total_Length may be zero. Otherwise Data_Total_Length is at least 4 if TS_Flag is 0 and at least 8 if TS_Flag is 1.

Time_Stamp: *Size: 32 bits*

Value	Parameter Description
0xXXXXXXXX	A time, in microseconds (see [Vol 6] Part G, Section 3).

Packet_Sequence_Number: *Size: 16 bits*

Value	Parameter Description
0xXXXX	The sequence number of the SDU (see [Vol 6] Part G, Section 2).

ISO_SDU_Length: *Size: 12 bits*

Value	Parameter Description
0xXXXX	The total length of the SDU (and not of any individual fragments), in octets.

The Packet_Status_Flag field indicates the status of the packet that the Controller receives over the isochronous physical channel. The Packet_Status_Flag field is only valid in HCI ISO Data packets sent by the Controller and is reserved for future use in packets sent by the Host.

Packet_Status_Flag (in packets sent by the Controller) *Size: 2 bits*

Value	Parameter Description
0b00	Valid data. The complete SDU was received correctly.
0b01	Possibly invalid data. The contents of the ISO_SDU_Fragment may contain errors or part of the SDU may be missing. This is reported as "data with possible errors".
0b10	Part(s) of the SDU were not received correctly. This is reported as "lost data".
All other values	Reserved for future use

The ISO_SDU_Fragment field shall contain the isochronous data (the SDU or fragment of the SDU). This field may be empty. When Packet_Status_Flag is set to 0b10 in packets from the Controller to the Host, there is no data, PB_Flag shall be set to 0b10, and ISO_SDU_Length shall be set to zero.

5.5 Ignored parameters

When a parameter of a command or event is described as “ignored” (this is usually only in a specific circumstance), then the value of this parameter shall not affect the behavior of the recipient (whether Controller or Host) in any way. In particular, the Controller shall not report an error because the value is out of range, reserved for future use, or represents an inappropriate entity (e.g. a Connection_Handle may be unassigned or for the wrong logical channel), or because two related values have the wrong relationship (e.g. minimum > maximum).

6 HCI CONFIGURATION PARAMETERS

6.1 Scan Enable

The Scan_Enable parameter controls whether or not the BR/EDR Controller will periodically scan for page attempts and/or inquiry requests from other BR/EDR Controllers. If Page Scan is enabled, then the device will enter page scan mode based on the value of the Page_Scan_Interval and Page_Scan_Window parameters. If Inquiry Scan is enabled, then the BR/EDR Controller will enter Inquiry Scan mode based on the value of the Inquiry_Scan_Interval and Inquiry_Scan_Window parameters.

Scan_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	No Scans enabled.
0x01	Inquiry Scan enabled. Page Scan always disabled.
0x02	Inquiry Scan disabled. Page Scan enabled.
0x03	Inquiry Scan enabled. Page Scan enabled.
All other values	Reserved for future use

6.2 Inquiry Scan Interval

The Inquiry_Scan_Interval configuration parameter defines the amount of time between consecutive inquiry scans. This is defined as the time interval from when the BR/EDR Controller started its last inquiry scan until it begins the next inquiry scan.

Inquiry_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0012 to 0x1000; only even values are valid Default: 0x1000 Time = N × 0.625 ms Time Range: 11.25 to 2560 ms Time Default: 2.56 s

6.3 Inquiry Scan Window

The Inquiry_Scan_Window configuration parameter defines the amount of time for the duration of the inquiry scan. The Inquiry_Scan_Window can only be less than or equal to the Inquiry_Scan_Interval.

Inquiry_Scan_Window: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0011 to 0x1000 Default: 0x0012 Mandatory Range: 0x0011 to Inquiry Scan Interval Time = N × 0.625 ms Time Range: 10.625 ms to 2560 ms Time Default: 11.25 ms

6.4 Inquiry Scan Type

The Inquiry_Scan_Type configuration parameter indicates whether inquiry scanning will be done using non-interlaced scan or interlaced scan. Currently, one mandatory inquiry scan type and one optional inquiry scan type are defined. For details, see [Vol 2] Part B, Section 8.4.1.

Inquiry_Scan_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Mandatory: Standard Scan (default)
0x01	Optional: Interlaced Scan
All other values	Reserved for future use

6.5 Inquiry mode

The Inquiry_Mode configuration parameter indicates whether inquiry returns Inquiry Result events in the standard format, with RSSI, or with RSSI and extended inquiry response information.

Inquiry_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Standard Inquiry Result event format
0x01	Inquiry Result format with RSSI

Value	Parameter Description
0x02	Inquiry Result with RSSI format or Extended Inquiry Result format
All other values	Reserved for future use

6.6 Page Timeout

The Page_Timeout configuration parameter together with Extended_Page_Timeout defines the maximum time the local Link Manager will wait for a Baseband page response from the remote device at a locally initiated connection attempt. If this time expires and the remote BR/EDR Controller has not responded to the page at Baseband level, the connection attempt will be considered to have failed.

Page_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0001 to 0xFFFF Default: 0x2000 Mandatory Range: 0x0016 to 0xFFFF Time = N × 0.625 ms Time Range: 0.625 ms to 40.9 s Time Default: 5.12 s

6.7 Connection Accept Timeout

The Connection_Accept_Timeout configuration parameter allows the BR/EDR or LE Controller to automatically deny a connection request after a specified time period has occurred and the new connection is not accepted. The parameter defines the time duration from when the BR/EDR Controller sends an HCI_Connection_Request event or the LE Controller sends an HCI_LE_CIS_Request event until the Controller will automatically reject an incoming connection.

Connection_Accept_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0001 to 0xB540 Default: 0x1F40 Mandatory Range: 0x00A0 to 0xB540 Time = N × 0.625 ms Time Range: 0.625 ms to 29 s Time Default: 5 s

6.8 Page Scan Interval

The Page_Scan_Interval configuration parameter defines the amount of time between consecutive page scans. This time interval is defined from when the Controller started its last page scan until it begins the next page scan.

Page_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0012 to 0x1000; only even values are valid Default: 0x0800 Time = N × 0.625 ms Time Range: 11.25 ms to 2560 ms Time Default: 1.28 s

6.9 Page Scan Window

The Page_Scan_Window configuration parameter defines the amount of time for the duration of the page scan. The Page_Scan_Window can only be less than or equal to the Page_Scan_Interval.

Page_Scan_Window: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0011 to 0x1000 Default: 0x0012 Mandatory Range: 0x0011 to Page Scan Interval Time = N × 0.625 ms Time Range: 10.625 ms to Page Scan Interval Time Default: 11.25 ms

6.10 [This section is no longer used]

6.11 Page Scan Type

The Page_Scan_Type parameter indicates whether page scanning will be done using non-interlaced scan or interlaced scan. For details, see [Vol 2] Part B, Section 8.3.1.

Page_Scan_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Mandatory: Standard Scan (default)
0x01	Optional: Interlaced Scan
All other values	Reserved for future use

6.12 Voice Setting

The Voice_Setting parameter controls all the various settings for voice connections. The Voice_Setting parameter controls the configuration for voice connections: Input Coding, Air coding format, input data format, Input sample size, and linear PCM parameter. The air coding format bits in the Voice_Setting command parameter specify which air coding format the local device requests. The air coding format bits do not specify which air coding format(s) the local device accepts when a remote device requests an air coding format. This is determined by the hardware capabilities of the local BR/EDR Controller.

Voice_Setting: *Size: 1 octet*

Bit Number	Parameter description	
0 – 1	Air coding format	0: CVSD 1: μ-law 2: A-law 3. transparent data
2 – 4	Linear PCM bit position - number of bit positions that the MSB of the sample is from the MSB of the value (only for linear PCM)	
5	Input sample size (only for linear PCM)	0: 8 bits 1: 16 bits
6 – 7	Input data format	0: one’s complement 1: two’s complement 2: sign and magnitude 3: unsigned
8 – 9	Input coding format	0: linear 1: μ-law 2: A-law 3: Reserved for future use
10 – 15	Reserved for future use	

6.13 PIN Type

The PIN_Type configuration parameter determines whether the Link Manager assumes that the Host supports variable PIN codes or a fixed PIN code. The Controller uses the PIN_Type information during pairing.

PIN_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Variable PIN.
0x01	Fixed PIN.

6.14 Link key

The Controller can store a limited number of link keys for other BR/EDR Controllers. Link keys are shared between two BR/EDR Controllers, and are used for all security transactions between the two BR/EDR Controllers. A Host device may have additional storage capabilities, which can be used to save additional link keys to be reloaded to the BR/EDR Controller when needed. A Link_Key is associated with a BD_ADDR.

Link_Key: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	Link Key for an associated BD_ADDR.

6.15 Failed Contact Counter

The Failed_Contact_Counter records the number of consecutive incidents in which either the local or remote device did not respond after the flush timeout had expired, and the L2CAP PDU that was currently being transmitted was automatically ‘flushed’. When this occurs, the Failed_Contact_Counter is incremented by 1.

The Failed_Contact_Counter is maintained for each Connection_Handle.

The Failed_Contact_Counter for a connection is reset to zero on the following conditions:

1. When a new connection is established
2. When the Failed_Contact_Counter is not zero and an L2CAP PDU is acknowledged for that connection
3. When the HCI_Reset_Failed_Contact_Counter command has been issued

Failed_Contact_Counter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of consecutive failed contacts for a connection corresponding to the Connection_-Handle

6.16 Authentication Enable

The Authentication_Enable parameter controls if the local device requires to authenticate the remote device at connection setup (between the HCI_Create_Connection command or acceptance of an incoming ACL connection and the corresponding Connection Complete event). At connection setup, only the device(s) with the Authentication_Enable parameter enabled will try to authenticate the other device.

Note: Changing this parameter does not affect existing connections.

Authentication_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Authentication not required.
0x01	Authentication required for all connections.
All other values	Reserved for future use

6.17 Hold Mode Activity

The Hold_Mode_Activity value is used to determine what activities should be suspended when the BR/EDR Controller is in Hold mode. After the hold period has expired, the device will return to the previous mode of operation. If no activities are suspended, then all of the current Periodic Inquiry, Inquiry Scan, and Page Scan settings remain valid during the Hold mode. If the Hold_Mode_Activity parameter is set to Suspend Page Scan, Suspend Inquiry Scan, and Suspend Periodic Inquiries, then the device can enter a low-power state during the Hold mode period and all activities are suspended. The Hold Mode Activity is only valid if all connections are in Hold mode.

Hold_Mode_Activity: *Size: 1 octet*

Bit	Parameter Description
0	Suspend Page Scan.
1	Suspend Inquiry Scan.
2	Suspend Periodic Inquiries.
All other bits	Reserved for future use.

6.18 Link Policy Settings

The Link_Policy_Settings parameter determines the behavior of the local Link Manager when it receives a request from a remote Link Manager or it determines itself to change role or to enter Hold or Sniff mode. The local Link Manager will automatically accept or reject such a request from the remote device, and may even autonomously request itself, depending on the value of the Link_Policy_Settings parameter for the corresponding Connection_Handle. When the value of the Link_Policy_Settings parameter is changed for a certain Connection_Handle, the new value will only be used for requests from a remote device or from the local Link Manager itself made after this command has been completed. By enabling each mode individually, the Host can choose any combination needed to support various modes of operation. Multiple LM policies may be specified for the Link_Policy_Settings parameter by performing a bitwise OR operation of the different activity types.

Note: The local BR/EDR Controller may be forced into Hold mode (regardless of whether the local device is Central or Peripheral) by the remote device regardless of the value of the Link_Policy_Settings parameter. The forcing of Hold mode can however only be done once the connection has already been placed into Hold mode through an LMP request (the Link_Policy_Settings determine if requests from a remote device should be accepted or rejected). The forcing of Hold mode can after that be done as long as the connection lasts regardless of the setting for Hold mode in the Link_Policy_Settings parameter.

Note: If the implementation in the remote device is a “polite” implementation that does not force another device into Hold mode via LMP PDUs, then the Link_Policy_Settings will never be overruled.

Link_Policy_Settings: *Size: 1 octet*

Bit Number	Parameter Description
0	Enable Role switch.
1	Enable Hold mode.
2	Enable Sniff mode.
All other bits	Reserved for future use.

6.19 Flush Timeout

The Flush_Timeout configuration parameter is used for ACL connections on a BR/EDR Controller only. The Flush Timeout is defined in [Vol 2] Part B, Section 7.6.3. This parameter allows automatically-flushable ACL packets to be automatically flushed without the Host device issuing an HCI_Flush command. This provides support for isochronous data, such as audio. Non-automatically-flushable ACL packets shall not be

affected by this parameter (see Section 5.4.2) providing support for both asynchronous and isochronous data on the same ACL connection. When the L2CAP packet that is currently being transmitted is automatically 'flushed', the Failed_Contact_Counter is incremented by one.

Flush_Timeout: *Size: 2 octets*

Value	Parameter Description
0x0000	Timeout = ∞; No Automatic Flush
N = 0xXXXX	Range: 0x0001 to 0x07FF Mandatory Range: 0x0002 to 0x07FF Time = N × 0.625 ms Time Range: 0.625 ms to 1279.375 ms

6.20 Num Broadcast Retransmissions

Broadcast packets are not acknowledged and are unreliable. The Num_Broadcast_Retransmissions parameter, N, is used to increase the reliability of a broadcast message by retransmitting the broadcast message multiple times. This sets the value N_{BC} in the Baseband to one greater than the Num_Broadcast_Retransmissions value. (See [Vol 2] Part B, Section 7.6.5) This parameter should be adjusted as the link quality measurement changes.

Num_Broadcast_Retransmissions: *Size: 1 octet*

Value	Parameter Description
N = 0xXX	N_{BC} = N + 1 Range: 0x00 to 0xFE

6.21 Link Supervision Timeout

The Link_Supervision_Timeout parameter is used by the BR/EDR Controller to monitor link loss. If, for any reason, no packets are received from that Connection_Handle for a duration longer than the Link_Supervision_Timeout, the connection shall be disconnected. The same timeout value is used for both synchronous and ACL connections for the device specified by the Connection_Handle.

Note: Setting the Link_Supervision_Timeout to No link supervision timeout (0x0000) will disable the Link_Supervision_Timeout check for the specified Connection_Handle.

Link_Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
0x0000	No link supervision timeout.
N = 0xXXXX	Range: 0x0001 to 0xFFFF Default: 0x7D00 Mandatory Range: 0x0190 to 0xFFFF Time = N × 0.625 ms Time Range: 0.625 ms to 40.9 s Time Default: 20 s

6.22 Synchronous Flow Control Enable

The Synchronous_Flow_Control_Enable configuration parameter allows the Host to decide if the BR/EDR Controller will send HCI_Number_Of_Completed_Packets events for synchronous Connection_Handles. This setting allows the Host to enable and disable synchronous flow control.

Synchronous_Flow_Control_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Synchronous Flow Control is disabled. No HCI_Number_Of_Completed_Packets events will be sent from the BR/EDR Controller for synchronous Connection_Handles.
0x01	Synchronous Flow Control is enabled. HCI_Number_Of_Completed_Packets events will be sent from the BR/EDR Controller for synchronous Connection_Handles.

6.23 Local Name

The user-friendly Local_Name provides the user the ability to distinguish one BR/EDR Controller from another. The Local_Name configuration parameter is a UTF-8 encoded string with the type utf8s{248} defined in [Vol 1] Part E, Section 2.9.3.

Note: The Local_Name configuration parameter is a string parameter. Endianness does therefore not apply to the Local_Name configuration parameter. The first octet of the name is received first.

Local_Name: *Size: 248 octets*

Value	Parameter Description
	A UTF-8 encoded User Friendly Descriptive Name for the device with type utf8s{248}.

6.24 Extended Inquiry response

The Extended_Inquiry_Response provides information about the local device in response to inquiry from remote devices. The configuration parameter has two parts, a significant part followed by a non-significant part. The non-significant part contains only all-zero octets. The data format of the significant part is defined in [Vol 3] Part C, Section 8.

Extended_Inquiry_Response: *Size: 240 octets*

Value	Parameter Description
	Information about the local device that will be sent in an extended inquiry response packet to remote devices during inquiry response.

6.25 Erroneous Data Reporting

The Erroneous_Data_Reporting configuration parameter shall be used for SCO and eSCO connections only. This parameter determines if the BR/EDR Controller is required to provide data to the Host for every (e)SCO interval, with the Packet_Status_Flag in HCI Synchronous Data packets set according to Section 5.4.3.

Erroneous_Data_Reporting: *Size: 1 octet*

Value	Parameter Description
0x00	Erroneous data reporting disabled
0x01	Erroneous data reporting enabled.
All other values	Reserved for future use

6.26 Class of Device

The Class_Of_Device parameter is used to indicate the capabilities of the local device to other devices.

Class_Of_Device: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Class of Device for the device.

6.27 Supported commands

The Supported_Commands configuration parameter lists which HCI commands the local Controller supports.

The Supported_Commands is a 64 octet bit field. If a bit is set to 1, then this command is supported.

Supported_Commands: *Size: 64 octets*

Octet	Bit	Command Supported
0	0	HCI_Inquiry
	1	HCI_Inquiry_Cancel
	2	HCI_Periodic_Inquiry_Mode
	3	HCI_Exit_Periodic_Inquiry_Mode
	4	HCI_Create_Connection
	5	HCI_Disconnect

6.28 [This section is no longer used]

6.29 [This section is no longer used]

6.30 [This section is no longer used]

6.31 [This section is no longer used]

6.32 [This section is no longer used]

6.33 Flow Control mode

The Flow_Control_Mode configuration parameter allows the Host to select the HCI Data flow control mode used by the Controller for ACL Data traffic other than LE traffic, which shall always use packet-based data flow control mode.

Flow_Control_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Packet based data flow control mode (default)
0x01	Data block based data flow control mode
All other values	Reserved for future use

6.34 LE Supported Host

The LE_Supported_Host parameter allows the Host to read and set the Link Manager Protocol feature bit LE Supported (Host). See [Vol 2] Part C, Section 3.2.

LE_Supported_Host: *Size: 1 octet*

Value	Parameter Description
0x00	LE Supported (Host) disabled (**default**)
0x01	LE Supported (Host) enabled
All other values	Reserved for future use

6.35 [This section is no longer used]

6.36 Sync Train Interval

The Sync_Train_Interval configuration parameter defines the time between Synchronization Train transmit events on a single transmit RF channel.

Sync_Train_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0020 to 0xFFFE; only even values are valid Default: 0x0080 Mandatory Range: 0x0020 to 0x1000 Time = N × 0.625 ms Time Range: 20 ms to 40.9 s Time Default: 80 ms

6.37 Sync Train Timeout

The Sync_Train_Timeout configuration parameter is used by the Controller to terminate the Synchronization Train after it has been started via the HCI_Start_Synchronization_Train command.

Sync_Train_Timeout: *Size: 4 octets*

Value	Parameter Description
N = 0xXXXXXXXX	Range: 0x00000002 to 0x07FFFFFE; only even values are valid Default: 0x0002EE00 Time = N × 0.625 ms Time Range: 1.25 ms to 23.3 hours Time Default: 120 s

6.38 Service Data

The Service_Data configuration parameter defines the value of the service data field in the Synchronization Train.

Service_Data: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: 0x00 to 0xFF Default: 0x00

6.39 Secure Connections Host Support

The Secure_Connections_Host_Support configuration parameter allows the Host to indicate whether it supports Secure Connections or not. When Secure Connections Host Support is set to 'enabled' the Controller shall use the enhanced reporting mechanisms for the Encryption_Enabled parameter in the

HCI_Encryption_Change event (see Section 7.7.8) and the Key_Type parameter in the HCI_Link_Key_Notification event (see Section 7.7.24).

Secure_Connections_Host_Support: *Size: 1 octet*

Value	Parameter Description
0x00	Secure_Conections_Host_Support is ‘disabled’. Host does not support Secure Connections (default)
0x01	Secure_Connections_Host_Support is ‘enabled’. Host supports Secure Connections
All other values	Reserved for future use

6.40 Authenticated Payload Timeout

The Authenticated_Payload_Timeout configuration parameter allows the Host to configure the maximum interval between packets containing a MIC received from the remote device when AES-CCM encryption is enabled.

Authenticated_Payload_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum amount of time specified between packets authenticated by a MIC. Range: 0x0001 to 0xFFFF Time = N × 10 ms Time Range: 10 ms to 655,350 ms

6.41 Extended Page Timeout

The Extended_Page_Timeout configuration parameter together with Page_Timeout defines the maximum time the local Link Manager will wait for a Baseband page response from the remote device at a locally initiated connection attempt. If this time expires and the remote device has not responded to the page at Baseband level, the connection attempt will be considered to have failed.

Extended_Page_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0000 to 0xFFFF Default: 0x0000 Time = N × 0.625 ms Time Range: 0 to 40.9 s Time Default: 0 s

6.42 Extended Inquiry Length

The Extended_Inquiry_Length configuration parameter together with Inquiry_Length defines the maximum time the local Link Manager will wait for a Baseband inquiry response messages from the remote device at a locally initiated inquiry or periodic inquiry.

Extended_Inquiry_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0000 to 0xFFFF Default: 0x0000 Time = N × 0.625 ms Time Range: 0 to 40.9 s Time Default: 0 s

7 HCI COMMANDS AND EVENTS

7.1 Link Control commands

The Link Control commands allow a Controller to control connections to other BR/EDR Controllers. Some Link Control commands are used only with a BR/EDR Controller whereas other Link Control commands are also used with an LE Controller.

In the BR/EDR Controller, when the Link Control commands are used, the Link Manager (LM) controls how the Bluetooth piconets and scatternets are established and maintained. These commands instruct the LM to create and modify Link Layer connections with Bluetooth remote devices, perform Inquiries of other BR/EDR Controllers in range, and other LMP commands.

In the LE Controller, Link Control commands are used to disconnect physical links.

For the Link Control commands, the OGF is defined as 0x01.

7.1.1 Inquiry command

Command	OCF	Command Parameters	Return Parameters
HCI_Inquiry	0x0001	LAP, Inquiry_Length, Num_Responses	*none*

Description:

This command causes the BR/EDR Controller to enter Inquiry Mode. Inquiry Mode is used to discover other nearby BR/EDR Controllers. The LAP parameter contains the LAP from which the inquiry access code shall be derived when the inquiry procedure is made. The Inquiry_Length parameter, added to Extended_Inquiry_Length (see Section 6.42), specifies the total duration of the Inquiry Mode and, when this time expires, Inquiry will be halted. The Num_Responses parameter specifies the number of responses that can be received before the Inquiry is halted. HCI_Inquiry_Result, HCI_Inquiry_Result_with_RSSI, or HCI_Extended_Inquiry_Result events will be sent to report the details of nearby BR/EDR Controllers that have responded to this inquiry. The HCI_Inquiry_Complete event is sent to report that Inquiry Mode has ended.

A device which responds during an inquiry or inquiry period should always be reported to the Host in an HCI_Inquiry_Result, HCI_Inquiry_Result_with_RSSI, or HCI_Extended_Inquiry_Result event if the device has not been reported earlier during the current inquiry or inquiry period and the device has not been filtered out using

the command HCI_Set_Event_Filter. If the device has been reported earlier during the current inquiry or inquiry period, whether it is reported again will depend on the implementation (e.g. whether earlier results have been saved in the BR/EDR Controller and in that case how many responses have been saved). It is recommended that the BR/EDR Controller tries to report a particular device only once during an inquiry or inquiry period.

Command parameters:

LAP: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	The LAP from which the inquiry access code should be derived when the inquiry procedure is made; see Assigned Numbers. Range: 0x9E8B00 to 0x9E8B3F

Inquiry_Length: *Size: 1 octet*

Value	Parameter Description
N = 0xXX	Maximum amount of time (added to Extended_Inquiry_Length) specified before the Inquiry is halted. Range: 0x01 to 0x30 Time = N × 1.28 s Range: 1.28 to 61.44 s

Num_Responses: *Size: 1 octet*

Value	Parameter Description
0x00	Unlimited number of responses.
0xXX	Maximum number of responses from the Inquiry before the Inquiry is halted. Range: 0x01 to 0xFF

Return parameters:

None.

Event(s) generated (unless masked away):

An HCI_Command_Status event shall be sent from the BR/EDR Controller to the Host when the BR/EDR Controller has started the Inquiry process. Unless filtered, an HCI_Inquiry_Result, HCI_Inquiry_Result_with_RSSI, or HCI_Extended_Inquiry_Result event shall be created for each BR/EDR Controller which responds to the Inquiry message. In addition, multiple BR/EDR Controllers which respond to the Inquire

message may be combined into the same event. An HCI_Inquiry_Complete event shall be generated when the Inquiry process has completed.

7.1.2 Inquiry Cancel command

Command	OCF	Command Parameters	Return Parameters
HCI_Inquiry_Cancel	0x0002	*none*	Status

Description:

This command shall cause the BR/EDR Controller to stop the current Inquiry if the BR/EDR Controller is in Inquiry Mode. This command allows the Host to interrupt the BR/EDR Controller and request the BR/EDR Controller to perform a different task. The command should only be issued after the HCI_Inquiry command has been issued, an HCI_Command_Status event has been received for the Inquiry command, and before the HCI_Inquiry_Complete event occurs.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Inquiry_Cancel command succeeded.
0x01 to 0xFF	HCI_Inquiry_Cancel command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Inquiry_Cancel command has completed, an HCI_Command_Complete event shall be generated. No HCI_Inquiry_Complete event will be generated for the cancelled Inquiry process.

7.1.3 Periodic Inquiry Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Periodic_Inquiry_Mode	0x0003	Max_Period_Length, Min_Period_Length, LAP, Inquiry_Length, Num_Responses	Status

Description:

This command is used to configure the BR/EDR Controller to enter the Periodic Inquiry Mode that performs an automatic Inquiry. Max_Period_Length and Min_Period_Length define the time range between two consecutive inquiries, from the beginning of an inquiry until the start of the next inquiry. The BR/EDR Controller shall use this range to determine a new random time between two consecutive inquiries for each Inquiry. The LAP parameter contains the LAP from which the inquiry access code shall be derived when the inquiry procedure is made. The Inquiry_Length parameter, added to Extended_Inquiry_Length (see Section 6.42), specifies the total duration of the Inquiry Mode and, when time expires, Inquiry will be halted. The Num_Responses parameter specifies the number of responses that can be received before the Inquiry is halted. This command is completed when the Inquiry process has been started by the BR/EDR Controller, and an HCI_Command_Complete event is sent from the Controller to the Host. When each of the periodic Inquiry processes are completed, the Controller will send an HCI_Inquiry_Complete event to the Host indicating that the latest periodic Inquiry process has finished. When a BR/EDR Controller responds to the Inquiry message, an HCI_Inquiry_Result, HCI_Inquiry_Result_with_RSSI, or HCI_Extended_Inquiry_Result event will occur to notify the Host of the discovery.

Max_Period_Length shall be greater than Min_Period_Length. Min_Period_Length shall be greater than (Inquiry_Length + Extended Inquiry_Length).

A device which responds during an inquiry or inquiry period should always be reported to the Host in an HCI_Inquiry_Result, HCI_Inquiry_Result_with_RSSI, or HCI_Extended_Inquiry_Result event if the device has not been reported earlier during the current inquiry or inquiry period and the device has not been filtered out using the command HCI_Set_Event_Filter. If the device has been reported earlier during the current inquiry or inquiry period, whether it is reported again will depend on the implementation (e.g. whether earlier results have been saved in the BR/EDR Controller and in that case how many responses have been saved). It is recommended that the BR/EDR Controller tries to report a particular device only once during an inquiry or inquiry period.

Command parameters:

Max_Period_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum amount of time specified between consecutive inquiries. Range: 0x0003 to 0xFFFF Time = N × 1.28 s Range: 3.84 to 83884.8 s 0.0 to 23.3 hours

Min_Period_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum amount of time specified between consecutive inquiries. Range: 0x0002 to 0xFFFE Time = N × 1.28 s Range: 2.56 to 83883.52 s 0.0 to 23.3 hours

LAP: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	The LAP from which the inquiry access code should be derived when the inquiry procedure is made; see Assigned Numbers. Range: 0x9E8B00 to 0x9E8B3F

Inquiry_Length: *Size: 1 octet*

Value	Parameter Description
N = 0xXX	Maximum amount of time (added to Extended_Inquiry_Length) specified before the Inquiry is halted. Range: 0x01 to 0x30 Time = N × 1.28 s Range: 1.28 to 61.44 s

Num_Responses: *Size: 1 octet*

Value	Parameter Description
0x00	Unlimited number of responses.
0xXX	Maximum number of responses from the Inquiry before the Inquiry is halted. Range: 0x01 to 0xFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Periodic_Inquiry_Mode command succeeded.
0x01 to 0xFF	HCI_Periodic_Inquiry_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

The HCI Periodic Inquiry Mode begins when the BR/EDR Controller sends the HCI_Command_Complete event for this command to the Host. Unless filtered, an HCI_Inquiry_Result, HCI_Inquiry_Result_with_RSSI, or HCI_Extended_Inquiry_Result event shall be created for each remote device that has responded to the Inquiry message. In addition, responses to the Inquiry message from multiple BR/EDR Controllers may be combined into the same event. An HCI_Inquiry_Complete event shall be generated when each of the periodic Inquiry processes has completed. No HCI_Inquiry_Complete event will be generated for the cancelled Inquiry process.

7.1.4 Exit Periodic Inquiry Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Exit_Periodic_Inquiry_Mode	0x0004	*none*	Status

Description:

This command is used to end the Periodic Inquiry mode when the local device is in Periodic Inquiry Mode. If the BR/EDR Controller is currently in an Inquiry process, the Inquiry process shall be stopped directly and the BR/EDR Controller shall no longer perform periodic inquiries until the HCI_Periodic_Inquiry_Mode command is reissued.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Exit_Periodic_Inquiry_Mode command succeeded.
0x01 to 0xFF	HCI_Exit_Periodic_Inquiry_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

An HCI_Command_Complete event for this command shall occur when the local device is no longer in Periodic Inquiry Mode. No HCI_Inquiry_Complete event will be generated for the cancelled Inquiry process.

7.1.5 Create Connection command

Command	OCF	Command Parameters	Return Parameters
HCI_Create_Connection	0x0005	BD_ADDR, Packet_Type, Page_Scan_Repetition_Mode, Reserved, Clock_Offset, Allow_Role_Switch	*none*

Description:

This command causes the Link Manager to create a connection to the remote device with the BD_ADDR specified by the command parameters. This command causes the local BR/EDR Controller to begin the Page process to create a link level connection. The Link Manager will determine how the new ACL connection is established. This ACL connection is determined by the current state of the device, its piconet, and the state of the device to be connected. The Packet_Type parameter specifies which packet types the Link Manager shall use for the ACL connection; the Host shall not specify packet types that the local Controller does not support. When sending HCI ACL Data packets the Link Manager shall only use the packet type(s) specified by Packet_Type or the always-allowed DM1 packet type. Multiple packet types may be specified for the Packet Type parameter by performing a bit-wise OR operation of the different packet types. The Link Manager may choose which packet type to be used from the list of acceptable packet types. The Page_Scan_Repetition_Mode parameter specifies the Page Scan Repetition mode supported by the remote device with the BD_ADDR. This is the most recent version of the information that was acquired either during the inquiry process or from an HCI_Page_Scan_Repetition_Mode_Change event (see Section 7.7.31). The Clock_Offset parameter is the difference between its own clock and the clock of the remote device with BD_ADDR. Only bits 2 to 16 of the difference are used, and they are mapped to this parameter as bits 0 to 14 respectively. A Clock_Offset_Valid_Flag, located in bit 15 of the Clock_Offset parameter, is used to indicate if the Clock Offset is valid or not. A Connection_Handle for this connection is returned in the HCI_Connection_Complete event (see below). The Allow_Role_Switch parameter specifies if the local device accepts or rejects the request from the remote device to switch roles at connection setup (in the Role parameter of the HCI_Accept_Connection_Request command) (before the local Controller returns an HCI_Connection_Complete event). For a definition of the different packet types see [Vol 2] Part B, Section 6.5.

Note: The Host should enable as many packet types as possible for the Link Manager to perform efficiently.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device to be connected.

Packet_Type: *Size: 2 octets*

Bit Number	Parameter Description
1	2-DH1 shall not be used.
2	3-DH1 shall not be used.
3	Ignored; DM1 may be used whether or not this bit is set.
4	DH1 may be used.
8	2-DH3 shall not be used.
9	3-DH3 shall not be used.
10	DM3 may be used.
11	DH3 may be used.
12	2-DH5 shall not be used.
13	3-DH5 shall not be used.
14	DM5 may be used.
15	DH5 may be used.
All other bits	Reserved for future use.

Page_Scan_Repetition_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	R0
0x01	R1
0x02	R2
All other values	Reserved for future use.

Reserved: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved, shall be set to 0x00.

Clock_Offset: *Size: 2 octets*

Bit Number	Parameter Description
0-14	Bits 16-2 of CLKNPeripheral - CLK
15	Clock_Offset_Valid_Flag Invalid Clock Offset = 0 Valid Clock Offset = 1

Allow_Role_Switch: *Size: 1 octet*

Value	Parameter Description
0x00	The local device will be a Central, and will not accept a role switch requested by the remote device at the connection setup.
0x01	The local device may be a Central, or may become a Peripheral after accepting a role switch requested by the remote device at the connection setup.
All other values	Reserved for future use.

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Create_Connection command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. In addition, when the Link Manager determines the connection is established, the BR/EDR Controller, on both BR/EDR Controllers that form the connection, shall send an HCI_Connection_Complete event to each Host. The HCI_Connection_Complete event contains the Connection_Handle if this command is successful.

7.1.6 Disconnect command

Command	OCF	Command Parameters	Return Parameters
HCI_Disconnect	0x0006	Connection_Handle, Reason	*none*

Description:

This command is used to terminate an existing connection. The Connection_Handle parameter indicates which connection is to be disconnected. The Reason parameter indicates the reason for ending the connection and is copied into the error code field of the LMP_DETACH PDU on a BR/EDR connection or the error code field of the LL_TERMINATE_IND or LL_CIS_TERMINATE_IND PDU on an LE connection. All SCO, eSCO, and CIS connections on a physical link should be disconnected before the ACL connection on the same physical connection is disconnected. If it does not, they will be implicitly disconnected as part of the ACL disconnection.

If the Host issues this command when there is a pending HCI_LE_Create_CIS command for the same CIS but before the CIS is created, then this command shall be successful and the CIS shall not be created.

Note: The CIS is created when the Central sends an LL_CIS_IND PDU to the Peripheral for that CIS (see [Vol 6] Part B, Section 5.1.15).

Note: If the Controller follows the requirements of version v5.4 of this specification or lower, it can return an error if this command is issued before the CIS is created.

Note: As specified in Section 7.7.5, on the Central, the handle for a CIS remains valid even after disconnection and, therefore, the Host can recreate a disconnected CIS at a later point in time using the same connection handle.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	On the Central, the Controller has not received the HCI_LE_Create_CIS command for the same CIS (a previous CIS with the same CIS_ID in the same CIG that has been terminated or considered lost is not the same CIS for this purpose).	*Command Disallowed* (0x0C)
MC	On the Peripheral, the Controller has not generated the HCI_LE_CIS_Established event for that CIS.	*Command Disallowed* (0x0C)

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Reason: *Size: 1 octet*

Value	Parameter Description
0x05, 0x13 to 0x15, 0x1A, 0x29, 0x3B	*Authentication Failure* error code (0x05), *Other End Terminated Connection* error codes (0x13 to 0x15), *Unsupported Remote Feature* error code (0x1A), *Pairing with Unit Key Not Supported* error code (0x29) and *Unacceptable Connection Parameters* error code (0x3B), see [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_Disconnect command, it shall send the HCI_Command_Status event to the Host. The HCI_Disconnection_Complete event will occur at each Host when the termination of the connection has completed, and on the local Host also indicates that this command has been completed. The Reason parameter in the event on the local Host shall be set to the value *Connection Terminated by Local Host* (0x16), while that on the remote Host shall be set to the value of Reason. However, if the termination procedure completes because a timer expires and, therefore, the local Controller cannot determine whether or not Reason was received by the remote Controller, the Reason parameter on the local Host should instead be set to the value *LMP Response Timeout / LL Response Timeout* (0x22).

If this command is issued for a CIS on the Central and the CIS is successfully terminated before being created, or after being created but before being established, then an HCI_LE_CIS_Established event shall also be sent for this CIS with the Status *Operation Cancelled by Host* (0x44).

7.1.7 Create Connection Cancel command

Command	OCF	Command Parameters	Return Parameters
HCI_Create_Connection_Cancel	0x0008	BD_ADDR	Status, BD_ADDR

Description:

This command is used to request cancellation of the ongoing connection creation process, which was started by an HCI_Create_Connection command of the local BR/EDR Controller.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	The connection is already established and the Controller has sent the HCI_Connection_Complete event.	*Connection Already Exists* (0x0B)
MC	The Controller has not received an HCI_Create_Connection command for the same BD_ADDR.	*Unknown Connection Identifier* (0x02)

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the HCI_Create_Connection command that was issued before and is the subject of this cancellation request.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Create_Connection_Cancel command succeeded
0x01 to 0xFF	HCI_Create_Connection_Cancel command failed. See [Vol 1] Part F, Controller Error Codes for list of error codes

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the HCI_Create_Connection command that was issued before and is the subject of this cancellation request.

Event(s) generated (unless masked away):

When the HCI_Create_Connection_Cancel command has completed, an HCI_Command_Complete event shall be generated.

If the connection is already established by the Baseband, but the BR/EDR Controller has not yet sent the HCI_Connection_Complete event, then the local device shall detach the link and return an HCI_Command_Complete event with the status “Success”.

The HCI_Connection_Complete event for the corresponding HCI_Create_Connection command shall always be sent. The HCI_Connection_Complete event shall be sent after the HCI_Command_Complete event for the HCI_Create_Connection_Cancel command. If the cancellation was successful, the HCI_Connection_Complete event will be generated with the error code *Unknown Connection Identifier* (0x02).

7.1.8 Accept Connection Request command

Command	OCF	Command Parameters	Return Parameters
HCI_Accept_Connection_Request	0x0009	BD_ADDR, Role	*none*

Description:

This command is used to accept a new incoming connection request.
The HCI_Accept_Connection_Request command shall only be issued after an HCI_Connection_Request event has occurred. The HCI_Connection_Request event will return the BD_ADDR of the device which is requesting the connection. This command will cause the Link Manager to create a connection to the BR/EDR Controller, with the BD_ADDR specified by the command parameters. The Link Manager will determine how the new connection will be established. This will be determined by the current state of the device, its piconet, and the state of the device to be connected. The Role parameter allows the Host to specify if the Link Manager shall request a role switch and become the Central for this connection. This is a preference and not a requirement. If the Role Switch fails then the connection will still be accepted, and the HCI_Role_Discovery command will reflect the current role.

The Link Manager may terminate the connection if it would be low on resources if the role switch fails. The decision to accept a connection should be completed before the connection accept timeout expires on the local Bluetooth Module.

Note: When accepting a synchronous connection request, the Role parameter is not used and will be ignored by the BR/EDR Controller.

Note: See Section 7.3.3 for the behavior when the HCI_Connection_Request event is masked or the connection is auto accepted.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device to be connected

Role: *Size: 1 octet*

Value	Parameter Description
0x00	Become the Central for this connection. The LM will perform the role switch.
0x01	Remain the Peripheral for this connection. The LM will **NOT** perform the role switch.

Return parameters:

None.

Event(s) generated (unless masked away):

The HCI_Accept_Connection_Request command shall cause the HCI_Command_Status event to be sent from the BR/EDR Controller when the BR/EDR Controller begins setting up the connection. In addition, when the Link Manager determines the connection is established, the local BR/EDR Controller shall send an HCI_Connection_Complete event to its Host, and the remote Controller will send an HCI_Connection_Complete event or an HCI_Synchronous_Connection_Complete event to the Host. The HCI_Connection_Complete event contains the Connection_Handle if this command is successful.

7.1.9 Reject Connection Request command

Command	OCF	Command Parameters	Return Parameters
HCI_Reject_Connection_Request	0x000A	BD_ADDR, Reason	*none*

Description:

This command is used to decline a new incoming connection request.
The HCI_Reject_Connection_Request command shall only be called after an HCI_Connection_Request event has occurred. The HCI_Connection_Request event will return the BD_ADDR of the device that is requesting the connection. The Reason parameter will be returned to the connecting device in the Status parameter of the HCI_Connection_Complete event returned to the Host of the connection device, to indicate why the connection was declined.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device to reject the connection from.

Reason: *Size: 1 octet*

Value	Parameter Description
0x0D to 0x0F	Host Reject error code. See [Vol 1] Part F, Controller Error Codes for list of error codes and descriptions.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_Reject_Connection_Request command, the Controller shall send the HCI_Command_Status event to the Host. Then, the local BR/EDR Controller will send an HCI_Connection_Complete event to its Host, and the remote device shall send an HCI_Connection_Complete event or an HCI_Synchronous_Connection_Complete event to the Host. The Status parameter of the HCI_Connection_Complete event, which is sent to the Host of the device attempting to make the connection, will contain the Reason parameter from this command.

7.1.10 Link Key Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_Link_Key_Request_Reply	0x000B	BD_ADDR, Link_Key	Status, BD_ADDR

Description:

This command is used to reply to an HCI_Link_Key_Request event from the Controller, and specifies the Link Key stored on the Host to be used as the link key for the connection with the other BR/EDR Controller specified by BD_ADDR. The HCI_Link_Key_Request event will be generated when the BR/EDR Controller needs a Link Key for a connection.

When the BR/EDR Controller generates an HCI_Link_Key_Request event in order for the local Link Manager to respond to the request from the remote Link Manager (as a result of an HCI_Create_Connection or HCI_Authentication_Requested command from the remote Host), the local Host shall respond with either an HCI_Link_Key_Request_-Reply or HCI_Link_Key_Request_Negative_Reply command before the remote Link Manager detects LMP response timeout. (See [Vol 2] Part C.)

When the BR/EDR Controller supports the Secure Connections (Controller Support) feature, it shall discard the Link Key once the connection has been disconnected.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device of which the Link Key is for.

Link_Key: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	Link Key for the associated BD_ADDR.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Link_Key_Request_Reply command succeeded.
0x01 to 0xFF	HCI_Link_Key_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device of which the Link Key request reply has completed.

Event(s) generated (unless masked away):

When the HCI_Link_Key_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.11 Link Key Request Negative Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_Link_Key_Request_Negative_Reply	0x000C	BD_ADDR	Status, BD_ADDR

Description:

This command is used to reply to an HCI_Link_Key_Request event from the BR/EDR Controller if the Host does not have a stored Link Key for the connection with the other BR/EDR Controller specified by BD_ADDR. The HCI_Link_Key_Request event will be generated when the BR/EDR Controller needs a Link Key for a connection.

When the Controller generates an HCI_Link_Key_Request event in order for the local Link Manager to respond to the request from the remote Link Manager (as a result of an HCI_Create_Connection or HCI_Authentication_Requested command from the remote Host), the local Host shall respond with either an HCI_Link_Key_Request_Reply or HCI_Link_Key_Request_Negative_Reply command before the remote Link Manager detects LMP response timeout. (See [Vol 2] Part C, Link Manager Protocol Specification.)

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device which the Link Key is for.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Link_Key_Request_Negative_Reply command succeeded.
0x01 to 0xFF	HCI_Link_Key_Request_Negative_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device for which the HCI_Link_Key_Request_Negative_Reply command has completed.

Event(s) generated (unless masked away):

When the HCI_Link_Key_Request_Negative_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.12 PIN Code Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_PIN_Code_Request_Reply	0x000D	BD_ADDR, PIN_Code_Length, PIN_Code	Status, BD_ADDR

Description:

This command is used to reply to an HCI_PIN_Code_Request event from the BR/EDR Controller, and specifies the PIN code to use for a connection. The HCI_PIN_Code_Request event will be generated when a connection with remote initiating device has requested pairing.

When the BR/EDR Controller generates an HCI_PIN_Code_Request event in order for the local Link Manager to respond to the request from the remote Link Manager (as a result of an HCI_Create_Connection or HCI_Authentication_Requested command from the remote Host), the local Host shall respond with either an HCI_PIN_Code_Request_Reply or HCI_PIN_Code_Request_Negative_Reply command before the remote Link Manager detects LMP response timeout. (See [Vol 2] Part C, Link Manager Protocol Specification.)

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device which the PIN code is for.

PIN_Code_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	The PIN code length specifics the length, in octets, of the PIN code to be used. Range: 0x01 to 0x10

PIN_Code: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	PIN code for the device that is to be connected. Note: The PIN_Code parameter is a string parameter. Endianness does therefore not apply to the PIN_Code parameter.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_PIN_Code_Request_Reply command succeeded.
0x01 to 0xFF	HCI_PIN_Code_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device for which the HCI_PIN_Code_Request_Reply command has completed.

Event(s) generated (unless masked away):

When the HCI_PIN_Code_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.13 PIN Code Request Negative Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_PIN_Code_Request_Negative_Reply	0x000E	BD_ADDR	Status, BD_ADDR

Description:

This command is used to reply to a PIN Code request event from the BR/EDR Controller when the Host cannot specify a PIN code to use for a connection. This command will cause the pair request with remote device to fail.

When the BR/EDR Controller generates an HCI_PIN_Code_Request event in order for the local Link Manager to respond to the request from the remote Link Manager (as a result of an HCI_Create_Connection or HCI_Authentication_Requested command from the remote Host), the local Host shall respond with either an HCI_PIN_Code_Request_Reply or HCI_PIN_Code_Request_Negative_Reply command before the remote Link Manager detects LMP response timeout. (See [Vol 2] Part C, Link Manager Protocol Specification.)

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device which this command is responding to.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_PIN_Code_Request_Negative_Reply command succeeded.
0x01 to 0xFF	HCI_PIN_Code_Request_Negative_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device for which the HCI_PIN_Code_Request_Negative_Reply command has completed.

Event(s) generated (unless masked away):

When the HCI_PIN_Code_Request_Negative_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.14 Change Connection Packet Type command

Command	OCF	Command Parameters	Return Parameters
HCI_Change_Connection_Packet_Type	0x000F	Connection_Handle, Packet_Type	*none*

Description:

This command is used to change which packet types can be used for a connection that is currently established. This allows current connections to be dynamically modified to support different types of user data. The Packet_Type parameter specifies which packet types the Link Manager can use for the connection; the Host shall not specify packet types that the local Controller does not support. When sending HCI ACL Data packets the Link Manager shall only use the packet type(s) specified by Packet_Type or the always-allowed DM1 packet type. The interpretation of the value of Packet_Type will depend on the Link_Type parameter returned in the HCI_Connection_Complete event at the connection setup. Multiple packet types may be specified for Packet_Type by bitwise OR operation of the different packet types. For a definition of the different packet types see [Vol 2] Part B, Section 6.5.

Note: The Host should enable as many packet types as possible for the Link Manager to perform efficiently.

Note: Use the HCI_Setup_Synchronous_Connection command to change an eSCO connection.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Packet_Type: *Size: 2 octets*

For ACL Link_Type

Bit Number	Parameter Description
1	2-DH1 shall not be used.
2	3-DH1 shall not be used.
3	Ignored; DM1 may be used whether or not this bit is set.
4	DH1 may be used.

Bit Number	Parameter Description
8	2-DH3 shall not be used.
9	3-DH3 shall not be used.
10	DM3 may be used.
11	DH3 may be used.
12	2-DH5 shall not be used.
13	3-DH5 shall not be used.
14	DM5 may be used.
15	DH5 may be used.
All other bits	Reserved for future use.

For SCO Link_Type

Bit Number	Parameter Description
5	HV1 may be used.
6	HV2 may be used.
7	HV3 may be used.
All other bits	Reserved for future use.

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Change_Connection_Packet_Type command, the Controller shall send the HCI_Command_Status event to the Host. In addition, when the Link Manager determines the packet type has been changed for the connection, the Controller on the local device will send an HCI_Connection_Packet_Type_Changed event to the Host. This will be done at the local side only.

7.1.15 Authentication Requested command

Command	OCF	Command Parameters	Return Parameters
HCI_Authentication_Requested	0x0011	Connection_Handle	*none*

Description:

This command is used to try to authenticate the remote device associated with the specified Connection_Handle. On an authentication failure, the BR/EDR Controller or Link Manager shall not automatically detach the link. The Host is responsible for issuing an HCI_Disconnect command to terminate the link if the action is appropriate.

The Controller shall always perform the authentication with the remote device even if the link has already been authenticated or the Controller already has a stored link key.

Note: The Connection_Handle parameter is used to identify the other BR/EDR Controller which forms the connection. The Connection_Handle should be a Connection_Handle for an ACL connection. The authentication will apply to all Connection_Handles with the same remote BR/EDR Controller.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_Authentication_Requested command, it shall send the HCI_Command_Status event to the Host.

If Secure Simple Pairing Mode is enabled, the HCI_Link_Key_Request event shall be generated, and Secure Simple Pairing shall be started only if the Host replies to it with the HCI_Link_Key_Request_Negative_Reply command; if the Host replies to it with the HCI_Link_Key_Request_Reply command, only the authentication procedure (see [Vol 2] Part C, Section 4.2.1) shall be performed and no Secure Simple Pairing shall be started.

If Secure Simple Pairing Mode is not enabled, then the BR/EDR Controller may, but should not, use an existing stored link key. If authentication fails, the HCI_PIN_Code_Request event may be generated.

Using an existing stored link key when Secure Simple Pairing mode is disabled is discouraged because it does not offer the Host a method for enhancing the security of an existing link (e.g., in the case where a profile mandating a minimum passkey length is started over a link that is already authenticated with shorter passkey than the new service requires).

The HCI_Authentication_Complete event is generated when the authentication has been completed for the connection and is the indication that this command has been completed.

7.1.16 Set Connection Encryption command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Connection_Encryption	0x0013	Connection_Handle, Encryption_Enable	*none*

Description:

This command is used to enable and disable the link level encryption. The Connection_Handle parameter is used to identify the other BR/EDR Controller which forms the connection. The Connection_Handle should be a Connection_Handle for an ACL connection. The encryption setting will apply to all Connection_Handles with the same remote BR/EDR Controller. While the encryption is being changed, the Link Manager will suspend all ACL-U traffic on the connection.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	Both devices support both the Secure Connections (Controller Support) and Secure Connections (Host Support) features, Encryption_Enable is set to “Turn Link Level Encryption OFF”, and encryption is currently enabled on the specified Connection_Handle.	*Encryption Mode Not Acceptable* (0x25)

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Encryption_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Turn Link Level Encryption OFF.
0x01	Turn Link Level Encryption ON.

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Set_Connection_Encryption command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. When the Link Manager has completed enabling/disabling encryption for the connection, the local BR/EDR Controller shall send an HCI_Encryption_Change event to the Host, and the BR/EDR Controller on the remote device will also generate an HCI_Encryption_Change event.

7.1.17 Change Connection Link Key command

Command	OCF	Command Parameters	Return Parameters
HCI_Change_Connection_Link_Key	0x0015	Connection_Handle	*none*

Description:

This command is used to force both devices of a connection associated with the Connection_Handle to generate a new link key. The link key is used for authentication and encryption of connections.

Note: The Connection_Handle parameter is used to identify the other BR/EDR Controller forming the connection. The Connection_Handle should be a Connection_Handle for an ACL connection.

Note: The resulting link key, generated as a result of HCI_Change_Connection_Link_Key command, will be of equal link key strength to the previously used link key.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_Change_Connection_Link_Key command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. When the Link Manager has changed the Link Key for the connection, the local BR/EDR Controller shall send an HCI_Link_Key_Notification event and an HCI_Change_Connection_Link_Key_Complete event to the Host, and the remote BR/EDR Controller will also generate an HCI_Link_Key_Notification event. The HCI_Link_Key_Notification event indicates that a new connection link key is valid for the connection.

7.1.18 Link Key Selection command

Command	OCF	Command Parameters	Return Parameters
HCI_Link_Key_Selection	0x0017	Key_Flag	*none*

Description:

This command is used to force the device that is Central of the piconet to use the temporary link key or the semi-permanent link keys. The temporary link key is used for encryption of broadcast messages within a piconet, and the semi-permanent link keys are used for private encrypted point-to-point communication. The Key_Flag parameter is used to indicate which Link Key (temporary link key or the semi-permanent link keys) shall be used.

Note: When at least one Peripheral in the piconet cannot support AES-CCM encryption, encrypted broadcast packets will not be received by Peripherals where both the Controller and Host support Secure Connections. When all Peripherals in the piconet support AES-CCM encryption, broadcast packets will not be encrypted and may be received by Peripherals that have AES-CCM encryption enabled.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	All Peripherals in the piconet support AES-CCM encryption and Key_Flag is set to “Use Temporary Link Key”.	*Command Disallowed* (0x0C)

Command parameters:

Key_Flag: *Size: 1 octet*

Value	Parameter Description
0x00	Use semi-permanent Link Keys.
0x01	Use Temporary Link Key.

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Link_Key_Selection command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. When

the Link Manager has changed link key, the BR/EDR Controller on both the local and the remote device shall send an HCI_Link_Key_Type_Changed event to the Host. If no change is required or the command fails, only the Controller on the local device shall send the event. The Connection_Handle on the Central side shall be a Connection_Handle for one of the existing connections to a Peripheral. On the Peripheral side, the Connection_Handle shall be a Connection_Handle to the initiating Central.

The HCI_Link_Key_Type_Changed event contains the status of this command.

7.1.19 Remote Name Request command

Command	OCF	Command Parameters	Return Parameters
HCI_Remote_Name_Request	0x0019	BD_ADDR, Page_Scan_Repetition_Mode, Reserved, Clock_Offset	*none*

Description:

This command is used to obtain the user-friendly name of another BR/EDR Controller. The user-friendly name is used to enable the user to distinguish one BR/EDR Controller from another. The BD_ADDR parameter is used to identify the device for which the user-friendly name is to be obtained. The Page_Scan_Repetition_Mode parameter specifies the Page Scan Repetition mode supported by the remote device with the BD_ADDR. This is the most recent version of the information that was acquired either during the inquiry process or from an HCI_Page_Scan_Repetition_Mode_Change event (see Section 7.7.31). The Clock_Offset parameter is the difference between its own clock and the clock of the remote device with BD_ADDR. Only bits 2 to 16 of the difference are used and they are mapped to this parameter as bits 0 to 14 respectively. A Clock_Offset_Valid_Flag, located in bit 15 of Clock_Offset, is used to indicate if Clock Offset is valid or not.

When the HCI_Remote_Supported_Host_Features_Notification event is unmasked and when the HCI_Remote_Name_Request command initiates a connection, the Link Manager shall read the remote LMP features mask pages 0 and 1.

Note: If no connection exists between the local device and the device corresponding to the BD_ADDR, a temporary Link Layer connection will be established to obtain the LMP features and name of the remote device.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for the device whose name is requested.

Page_Scan_Repetition_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	R0
0x01	R1
0x02	R2
All other values	Reserved for future use.

Reserved: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved, shall be set to 0x00.

Clock_Offset: *Size: 2 octets*

Bit Number	Parameter Description
0 to 14	Bits 2 to 16 of CLKNPeripheral - CLK
15	Clock_Offset_Valid_Flag Invalid Clock Offset = 0 Valid Clock Offset = 1

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Remote_Name_Request command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. If a temporary Link Layer connection was established, then when the Link Manager has completed the LMP sequence to obtain the remote Host supported features, if present, the BR/EDR Controller on the local device shall send an HCI_Remote_Host_Supported_Features_Notification event. When the Link Manager has completed the LMP messages to obtain the remote name, the local BR/EDR Controller shall send an HCI_Remote_Name_Request_Complete event to the Host. If the remote Host supported features page is present, the HCI_Remote_Host_Supported_Features_Notification event shall be sent before the HCI_Remote_Name_Request_Complete event. If not, only the HCI_Remote_Name_Request_Complete event shall be sent.

7.1.20 Remote Name Request Cancel command

Command	OCF	Command Parameters	Return Parameters
HCI_Remote_Name_Request_Cancel	0x001A	BD_ADDR	Status, BD_ADDR

Description:

This command is used to request cancellation of the ongoing remote name request process, which was started by the HCI_Remote_Name_Request command.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the HCI_Remote_Name_Request command that was issued before and that is subject of this cancellation request

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Remote_Name_Request_Cancel command succeeded
0x01 to 0xFF	HCI_Remote_Name_Request_Cancel command failed. See [Vol 1] Part F, Controller Error Codes for list of error codes

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the HCI_Remote_Name_Request_Cancel command that was issued before and that was subject of this cancellation request

Event(s) generated (unless masked away):

When the HCI_Remote_Name_Request_Cancel command has completed, an HCI_Command_Complete event shall be generated.

If the HCI_Remote_Name_Request_Cancel command is sent to the BR/EDR Controller without a preceding HCI_Remote_Name_Request command to the same device, the Controller shall return an HCI_Command_Complete event with the error code *Invalid HCI Command Parameters* (0x12).

The HCI_Remote_Name_Request_Complete event for the corresponding HCI_Remote_Name_Request command shall always be sent. The HCI_Remote_-Name_Request_Complete event shall be sent after the HCI_Command_Complete event for the HCI_Remote_Name_Request_Cancel command. If the cancellation was successful, the HCI_Remote_Name_Request_Complete event shall be generated with the error code *Unknown Connection Identifier* (0x02).

7.1.21 Read Remote Supported Features command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Remote_Supported_Features	0x001B	Connection_Handle	*none*

Description:

This command requests a list of the supported features for the remote device identified by the Connection_Handle parameter. The Connection_Handle shall be a Connection_Handle for an ACL-U logical link. The HCI_Read_Remote_Supported_Features_Complete event will return a list of the LMP features. For details see [Vol 2] Part C, Link Manager Protocol Specification.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Read_Remote_Supported_Features command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. When the Link Manager has completed the LMP sequence to determine the remote features or has determined that it will be using a cached copy, the BR/EDR Controller on the local device shall send an HCI_Read_Remote_Supported_Features_Complete event to the Host. The HCI_Read_Remote_Supported_Features_Complete event contains the status of this command, and parameters describing the supported features of the remote device.

7.1.22 Read Remote Extended Features command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Remote_Extended_Features	0x001C	Connection_Handle, Page_Number	*none*

Description:

This command returns the requested page of the extended LMP features for the remote device identified by the specified Connection_Handle. The Connection_Handle shall be the Connection_Handle for an ACL-U logical link. This command is only available if the extended features feature is implemented by the remote device. The HCI_Read_Remote_Extended_Features_Complete event will return the requested information. For details see [Vol 2] Part C, Link Manager Protocol Specification.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Page_Number: *Size: 1 octet*

Value	Parameter Description
0x00	Requests the normal LMP features as returned by the HCI_Read_Remote_Supported_Features command
0x01 to 0xFF	Return the corresponding page of features

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Read_Remote_Extended_Features command the BR/EDR Controller shall send the HCI_Command_Status event to the Host. When the Link Manager has completed the LMP sequence to determine the remote extended features or has determined that it will be using a cached copy, the Controller on the local device shall generate an HCI_Read_Remote_Extended_Features_Complete event to the Host. The

HCI_Read_Remote_Extended_Features_Complete event contains the page number and the remote features returned by the remote device.

7.1.23 Read Remote Version Information command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Remote_Version_Information	0x001D	Connection_Handle	*none*

Description:

This command will obtain the values for the version information for the remote device identified by the Connection_Handle parameter. The Connection_Handle shall be a Connection_Handle for an ACL-U or LE-U logical link.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_Read_Remote_Version_Information command, the Controller shall send the HCI_Command_Status event to the Host. When the Link Manager or Link Layer has completed the sequence to determine the remote version information, the local Controller shall send an HCI_Read_Remote_Version_Information_Complete event to the Host. The HCI_Read_Remote_Version_Information_Complete event contains the status of this command, and parameters describing the version and subversion of the LMP or Link Layer used by the remote device.

7.1.24 Read Clock Offset command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Clock_Offset	0x001F	Connection_Handle	*none*

Description:

Both the System Clock and the clock offset to a remote device are used to determine what hopping frequency is used by a remote device for page scan. This command allows the Host to read the clock offset of remote devices. The clock offset can be used to speed up the paging procedure when the local device tries to establish a connection to a remote device, for example, when the local Host has issued an HCI_Create_Connection or HCI_Remote_Name_Request command. The Connection_Handle shall be a Connection_Handle for an ACL-U logical link.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Read_Clock_Offset command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. If this command is requested at the Central then, when the Link Manager has completed the LMP messages to obtain the Clock Offset information, the BR/EDR Controller on the local BR/EDR Controller shall send an HCI_Read_Clock_Offset_Complete event to the Host. If this command is requested at the Peripheral, the LM shall immediately send an HCI_Read_Clock_Offset_Complete event to the Host, without an exchange of LMP PDUs.

7.1.25 Read LMP Handle command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_LMP_Handle	0x0020	Connection_Handle	Status, Connection_Handle, LMP_Handle, Reserved

Description:

This command reads the current LMP Handle associated with the Connection_Handle. The Connection_Handle shall identify a SCO or eSCO connection. If the Connection_Handle is a SCO Connection_Handle, then this command shall read the LMP SCO Handle for this connection. If the Connection_Handle is an eSCO Connection_Handle, then this command shall read the LMP eSCO Handle for this connection.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_LMP_Handle command succeeded.
0x01 to 0xFF	HCI_Read_LMP_Handle command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

LMP_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	The LMP Handle is the LMP Handle that is associated with this Connection_Handle. For a synchronous handle, this would be the LMP Synchronous Handle used when negotiating the synchronous connection in the link manager.

Reserved: *Size: 4 octets*

Value	Parameter Description
0x00000000	This parameter is reserved and shall be set to zero.

Event(s) generated (unless masked away):

When the HCI_Read_LMP_Handle command has completed, an HCI_Command_Complete event shall be generated.

7.1.26 Setup Synchronous Connection command

Command	OCF	Command Parameters	Return Parameters
HCI_Setup_Synchronous_Connection	0x0028	Connection_Handle, Transmit_Bandwidth, Receive_Bandwidth, Max_Latency, Voice_Setting, Retransmission_Effort, Packet_Type	*none*

Description:

This command adds a new or modifies an existing synchronous logical transport (SCO or eSCO) on a physical link depending on the Connection_Handle parameter specified. If the Connection_Handle refers to an ACL link a new synchronous logical transport will be added. If the Connection_Handle refers to an already existing synchronous logical transport (eSCO only) this link will be modified. The parameters are specified per connection. This synchronous connection can be used to transfer synchronous voice at 64 kb/s or transparent synchronous data.

When used to setup a new synchronous logical transport, the Connection_Handle parameter shall specify an ACL connection with which the new synchronous connection will be associated. The other parameters relate to the negotiation of the link, and may be reconfigured during the lifetime of the link. The transmit and receive bandwidth specify how much bandwidth shall be available for transmitting and for receiving data. While in many cases the receive and transmit bandwidth parameters may be equal, they may be different. The latency specifies an upper limit to the time between the eSCO (or SCO) instants, plus the size of the retransmission window, plus the length of the reserved synchronous slots for this logical transport. The content format specifies the settings for voice or transparent data on this connection. The retransmission effort specifies the extra resources that are allocated to this connection if a packet may need to be retransmitted. The Retransmission_Effort parameter shall be set to indicate the required behavior, or to don't care.

When used to modify an existing synchronous logical transport, the Transmit_Bandwidth, Receive_Bandwidth and Voice_Setting shall be set to the same values as were used during the initial setup. The Packet_Type, Retransmission_Effort and Max_Latency parameters may be modified.

The Packet_Type field is a bitmap specifying which packet types the LM shall accept in the negotiation of the link parameters. Multiple packet types are specified by bitwise OR of the packet type codes in the table. At least one packet type shall be specified for

each negotiation. It is recommended to enable as many packet types as possible. The Host may enable packet types that are not supported by the local Controller.

A Connection_Handle for the new synchronous connection will be returned in an HCI_Synchronous_Connection_Complete event.

Note: The link manager may choose any combination of packet types, timing, and retransmission window sizes that satisfy the parameters given. This may be achieved by using more frequent transmissions of smaller packets. The link manager may choose to set up either a SCO or an eSCO connection, if the parameters allow, using the corresponding LMP sequences.

Note: To modify a SCO connection, use the HCI_Change_Connection_Packet_Type command.

If the lower layers cannot achieve the exact transmit and receive bandwidth requested subject to the other parameters, then the link shall be rejected.

A synchronous connection may only be created when an ACL connection already exists.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	The ACL link has encryption enabled using AES-CCM and the Controller cannot establish an eSCO transport (e.g., Packet_Type only allows SCO packet types).	*Connection Rejected Due to Security Reasons* (0x0E)

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Transmit_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Transmit bandwidth in octets per second.

Receive_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Receive bandwidth in octets per second.

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0x0000 to 0x0003	Reserved for future use
0x0004 to 0xFFFE	This is a value, in milliseconds, representing the upper limit of the sum of the synchronous interval and the size of the eSCO window, where the eSCO window is the reserved slots plus the retransmission window. (See [Vol 2] Part B, Figure 8.9)
0xFFFF	Don't care.

Voice_Setting: *Size: 2 octets (10 bits meaningful)*

Value	Parameter Description
See Section 6.12.	

Retransmission_Effort: *Size: 1 octet*

Value	Parameter Description
0x00	No retransmissions (SCO or eSCO connection allowed)
0x01	At least one retransmission, optimize for power consumption (eSCO connection required).
0x02	At least one retransmission, optimize for link quality (eSCO connection required)
0xFF	Don’t care (SCO or eSCO connection allowed)
All other values	Reserved for future use

Packet_Type: *Size: 2 octets*

Bit Number	Parameter Description
0	HV1 may be used.
1	HV2 may be used.
2	HV3 may be used.
3	EV3 may be used.
4	EV4 may be used.
5	EV5 may be used.

Bit Number	Parameter Description
6	2-EV3 shall not be used.
7	3-EV3 shall not be used.
8	2-EV5 shall not be used.
9	3-EV5 shall not be used.
All other bits	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Setup_Synchronous_Connection command, it shall send the HCI_Command_Status event to the Host. In addition, when the LM determines the connection is established, the local BR/EDR Controller shall send an HCI_Synchronous_Connection_Complete event to the local Host, and the remote Controller will send an HCI_Synchronous_Connection_Complete event or an HCI_Connection_Complete event to the remote Host. The HCI_Synchronous_Connection_Complete event contains the Connection_Handle if this command is successful.

If this command is used to change the parameters of an existing eSCO link, the HCI_Synchronous_Connection_Changed event is sent to both Hosts. In this case no HCI_Synchronous_Connection_Complete event, HCI_Connection_Request event, or HCI_Connection_Complete event will be sent to either Host. This command cannot be used to change the parameters of a SCO link.

7.1.27 Accept Synchronous Connection Request command

Command	OCF	Command Parameters	Return Parameters
HCI_Accept_-Synchronous_Connection_Request	0x0029	BD_ADDR, Transmit_Bandwidth, Receive_Bandwidth, Max_Latency, Voice_Setting, Retransmission_Effort, Packet_Type	*none*

Description:

This command is used to accept an incoming request for a synchronous connection and to inform the local Link Manager about the acceptable parameter values for the synchronous connection.

The command shall only be issued after an HCI_Connection_Request event with link type SCO or eSCO has occurred. The HCI_Connection_Request event contains the BD_ADDR of the device requesting the connection. The decision to accept a connection should be taken before the timer Connection_Accept_Timeout expires on the local device.

The Host shall include in the Packet_Type parameter at least one packet type for the transport (SCO or eSCO) specified in the incoming request. The Controller shall ignore any packet types in the Packet_Type parameter for the other transport.

If the ACL link has encryption enabled using AES-CCM then the Host shall not accept a request where the link type is SCO.

The parameter set of the HCI_Accept_Synchronous_Connection_Request command is the same as for the HCI_Setup_Synchronous_Connection command. The Transmit_Bandwidth and Receive_Bandwidth values are required values for the new link and shall be met. The Max_Latency is an upper bound to the acceptable latency for the Link, as defined in the HCI_Setup_Synchronous_Connection command (see Section 7.1.26) and shall not be exceeded. Voice_Setting specifies the encoding in the same way as in the HCI_Setup_Synchronous_Connection command and shall be met. The Retransmission_Effort parameter shall be set to indicate the required behavior, or to don't care. The Packet_Type parameter is a bit mask specifying the synchronous packet types that are allowed on the link.

If the Link Type of the incoming request is SCO, then the Controller shall ignore the Transmit_Bandwidth, Receive_Bandwidth, and Retransmission_Effort parameters.

Note: See Section 7.3.3 for the behavior when the HCI_Connection_Request event is masked or the connection is auto accepted.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device requesting the connection

Transmit_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0xFFFFFFFE	Transmit bandwidth in octets per second.
0xFFFFFFFF	Don’t care (default)

Receive_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0xFFFFFFFE	Receive bandwidth in octets per second.
0xFFFFFFFF	Don’t care (default)

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0x0000 to 0x0003	Reserved for future use
0x0004 to 0xFFFE	This is a value in milliseconds representing the upper limit of the sum of the synchronous interval and the size of the eSCO window, where the eSCO window is the reserved slots plus the retransmission window. (See [Vol 2] Part B, Figure 8.9)
0xFFFF	Don't care (default)

Voice_Setting: *Size: 2 octets (10 bits meaningful)*

Value	Parameter Description
See Section 6.12. When links are auto-accepted, the default is to use the values written by the HCI_Write_Voice_Setting command.	

Retransmission_Effort: *Size: 1 octet*

Value	Parameter Description
0x00	No retransmissions
0x01	At least one retransmission, optimize for power consumption
0x02	At least one retransmission, optimize for link quality
0xFF	Don't care (default)
All other values	Reserved for future use

Packet_Type: *Size: 2 octets*

Bit Number	Parameter Description
0	HV1 may be used.
1	HV2 may be used.
2	HV3 may be used.
3	EV3 may be used.
4	EV4 may be used.
5	EV5 may be used.
6	2-EV3 shall not be used.
7	3-EV3 shall not be used
8	2-EV5 shall not be used.
9	3-EV5 shall not be used.
All other bits	Reserved for future use

Default: 0x003F - means all defined packet types may be used.

Return parameters:

None.

Event(s) generated (unless masked away):

The HCI_Accept_Synchronous_Request command shall cause the HCI_Command_-Status event to be sent from the BR/EDR Controller when the BR/EDR Controller starts setting up the connection. When the link setup is complete, the local BR/EDR Controller shall send an HCI_Synchronous_Connection_Complete event to its Host, and the remote BR/EDR Controller will send an HCI_Synchronous_Connection_-Complete event to the Host. The HCI_Synchronous_Connection_Complete will contain the Connection_Handle and the link parameters if the setup is successful.

7.1.28 Reject Synchronous Connection Request command

Command	OCF	Command Parameters	Return Parameters
HCI_Reject_-Synchronous_Connection_Request	0x002A	BD_ADDR, Reason	*none*

Description:

This command is used to decline an incoming request for a synchronous link. It shall only be issued after an HCI_Connection_Request event with Link Type equal to SCO or eSCO has occurred. The HCI_Connection_Request event contains the BD_ADDR of the device requesting the connection. The Reason parameter will be returned to the initiating Host in the Status parameter of the HCI_Synchronous_Connection_Complete event on the remote side.

If the ACL link has encryption enabled using AES-CCM and the requested link type was SCO, the Host shall reject the request using this command with the Reason parameter set to *Rejected Due to Security Reasons* (0x0E).

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device requesting the connection

Reason: *Size: 1 octet*

Value	Parameter Description
0x0D to 0x0F	Host Reject error code. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_Reject_Synchronous_Connection_Request, it shall send an HCI_Command_Status event to the Host. When the setup is terminated, the local Controller shall send an HCI_Synchronous_Connection_Complete event to its Host, and the remote Controller will send an HCI_Synchronous_Connection_Complete event to the Host with the Reason code from this command.

7.1.29 IO Capability Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_IO_Capability_Request_Reply	0x002B	BD_ADDR, IO_Capability, OOB_Data_Present, Authentication_Requirements	Status, BD_ADDR

Description:

This command is used to reply to an HCI_IO_Capability_Request event from the Controller, and specifies the current IO capabilities of the Host. This includes the Host input, output and out-of-band (OOB) capabilities.

If an authenticated link key is not required by the Host, the Authentication Requirements parameter may be set to one of the following:

- MITM Protection Not Required – No Bonding
- MITM Protection Not Required – Dedicated Bonding
- MITM Protection Not Required – General Bonding

If both Hosts set the Authentication_Requirements parameter to one of the above values, the Link Managers shall use the numeric comparison authentication procedure and the Hosts shall use the Just Works association model.

If an authenticated link key is required by the Host, the Authentication Requirements parameter shall be set to one of the following:

- MITM Protection Required – No Bonding
- MITM Protection Required – Dedicated Bonding
- MITM Protection Required – General Bonding

In addition, the following requirements apply:

- If one or both Hosts set the Authentication Requirements parameter to one of the above values, the Link Managers shall use the IO_Capability parameter to determine the authentication procedure.
- A Host that sets the Authentication_Requirements parameter to one of the above values shall verify that the resulting Link Key type meets the security requirements requested.

If the Host has received OOB authentication data from a device with the same BD_ADDR sent in the HCI_IO_Capabilty_Request event, then the OOB_Data_Present parameter shall be set to:

- "P-192 OOB authentication data from remote device present" when the Host has received only P-192 OOB data,
- "P-256 OOB authentication data from remote device present" when the Host has received only P-256 OOB data, or
- "P-192 and P-256 OOB authentication data from remote device present" when the Host has received both P-192 and P-256 OOB data.

Otherwise OOB_Data_Present shall be set to "OOB authentication data not present".

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

IO_Capability: *Size: 1 octet*

Value	Parameter Description
0x00	DisplayOnly
0x01	DisplayYesNo
0x02	KeyboardOnly
0x03	NoInputNoOutput
All other values	Reserved for future use

OOB_Data_Present: *Size: 1 octet*

Value	Parameter Description
0x00	OOB authentication data not present
0x01	P-192 OOB authentication data from remote device present
0x02	P-256 OOB authentication data from remote device present
0x03	P-192 and P-256 OOB authentication data from remote device present
All other values	Reserved for future use

Authentication_Requirements: *Size: 1 octet*

Value	Parameter Description
0x00	MITM Protection Not Required – No Bonding. Numeric comparison with automatic accept allowed.
0x01	MITM Protection Required – No Bonding. Use IO Capabilities to determine authentication procedure
0x02	MITM Protection Not Required – Dedicated Bonding. Numeric comparison with automatic accept allowed.
0x03	MITM Protection Required – Dedicated Bonding. Use IO Capabilities to determine authentication procedure
0x04	MITM Protection Not Required – General Bonding. Numeric Comparison with automatic accept allowed.
0x05	MITM Protection Required – General Bonding. Use IO capabilities to determine authentication procedure.
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_IO_Capability_Request_Reply command succeeded
0x01 to 0xFF	HCI_IO_Capability_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_IO_Capability_Request_Reply command has completed, an HCI_Command_Complete event shall be generated. When the device is the initiator of Secure Simple Pairing, an HCI_IO_Capability_Response event shall be generated. Additionally, when the OOB_Data_Present parameter indicates that OOB authentication data from the remote device is present, the HCI_Remote_OOB_Data_Request event shall be generated.

7.1.30 User Confirmation Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_User_Confirmation_Request_Reply	0x002C	BD_ADDR	Status, BD_ADDR

Description:

This command is used to reply to an HCI_User_Confirmation_Request event and indicates that the user selected "yes". It is also used when the Host has no input and no output capabilities.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_User_Confirmation_Request_Reply command succeeded
0x01 to 0xFF	HCI_User_Confirmation_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_User_Confirmation_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.31 User Confirmation Request Negative Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_User_Confirmation_Request_-Negative_Reply	0x002D	BD_ADDR	Status, BD_ADDR

Description:

This command is used to reply to an HCI_User_Confirmation_Request event and indicates that the user selected "no". This command shall cause the initiating Link Manager to transmit an LMP_NUMERIC_COMPARISON_FAILED PDU and terminate Secure Simple Pairing.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_User_Confirmation_Request_Negative_Reply command succeeded
0x01 to 0xFF	HCI_User_Confirmation_Request_Negative_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_User_Confirmation_Request_Negative_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.32 User Passkey Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_User_Passkey_Request_Reply	0x002E	BD_ADDR, Numeric_Value	Status, BD_ADDR

Description:

This command is used to reply to an HCI_User_Passkey_Request event and specifies the Numeric_Value (passkey) entered by the user to be used in the Secure Simple Pairing process.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Numeric_Value: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0x000F423F	Numeric value (passkey) entered by user. Valid values are decimal 000000 to 999999.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_User_Passkey_Request_Reply command succeeded
0x01 to 0xFF	HCI_User_Passkey_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_User_Passkey_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.33 User Passkey Request Negative Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_User_Passkey_Request_Negative_-Reply	0x002F	BD_ADDR	Status, BD_ADDR

Description:

This command is used to reply to an HCI_User_Passkey_Request event and indicates the Host could not provide a passkey. This command shall cause the initiating Link Manager to transmit an LMP_PASSKEY_ENTRY_FAILED PDU and terminate Secure Simple Pairing.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_User_Passkey_Request_Negative_Reply command succeeded
0x01 to 0xFF	HCI_User_Passkey_Request_Negative_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_User_Passkey_Negative_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.34 Remote OOB Data Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_Remote_OOB_Data_Request_Reply	0x0030	BD_ADDR, C, R	Status, BD_ADDR

Description:

This command is used to reply to an HCI_Remote_OOB_Data_Request event with the C and R values received via an OOB transfer from a remote device identified by BD_ADDR. If the R value is not present in the received OOB data from the remote device, the Host shall set R to zeros.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device from which the C and R values were received

C: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	Secure Simple Pairing Hash C

R: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	Secure Simple Pairing Randomizer R

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Remote_OOB_Data_Request_Reply command succeeded
0x01to 0xFF	HCI_Remote_OOB_Data_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_Remote_OOB_Data_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.35 Remote OOB Data Request Negative Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_Remote_-OOB_Data_Request_Negative_Reply	0x0033	BD_ADDR	Status, BD_ADDR

Description:

This command is used to reply to an HCI_Remote_OOB_Data_Request event that the Host does not have the C and R values associated with the remote device identified by BD_ADDR.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Remote_OOB_Data_Request_Negative_Reply command succeeded
0x01 to 0xFF	HCI_Remote_OOB_Data_Request_Negative_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_Remote_OOB_Data_Request_Negative_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.36 IO Capability Request Negative Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_IO_Capability_Request_Negative_-Reply	0x0034	BD_ADDR, Reason	Status, BD_ADDR

Description:

This command shall be used to reject a pairing attempt after an HCI_IO_Capability_Request event has been received by the Host. The reason for the rejection is given in the Reason parameter. The error code *Secure Simple Pairing not Supported by Host* (0x37) shall not be used in the Reason parameter.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Reason: *Size: 1 octet*

Value	Parameter Description
0xXX	Reason that Secure Simple Pairing rejected. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_IO_Capability_Request_Negative_Reply command succeeded.
0x01 to 0xFF	HCI_IO_Capability_Request_Negative_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_IO_Capability_Request_Negative_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.1.45 Enhanced Setup Synchronous Connection command

Command	OCF	Command Parameters	Return Parameters
HCI_Enhanced_-Setup_Synchronous_-Connection	0x003D	Connection_Handle, Transmit_Bandwidth, Receive_Bandwidth, Transmit_Coding_Format, Receive_Coding_Format, Transmit_Codec_Frame_Size, Receive_Codec_Frame_Size, Input_Bandwidth, Output_Bandwidth, Input_Coding_Format, Output_Coding_Format, Input_Coded_Data_Size, Output_Coded_Data_Size, Input_PCM_Data_Format, Output_PCM_Data_Format, Input_PCM_Sample_Payload_MSB_Position, Output_PCM_Sample_Payload_MSB_Position, Input_Data_Path, Output_Data_Path, Input_Transport_Unit_Size, Output_Transport_Unit_Size, Max_Latency, Packet_Type, Retransmission_Effort	*none*

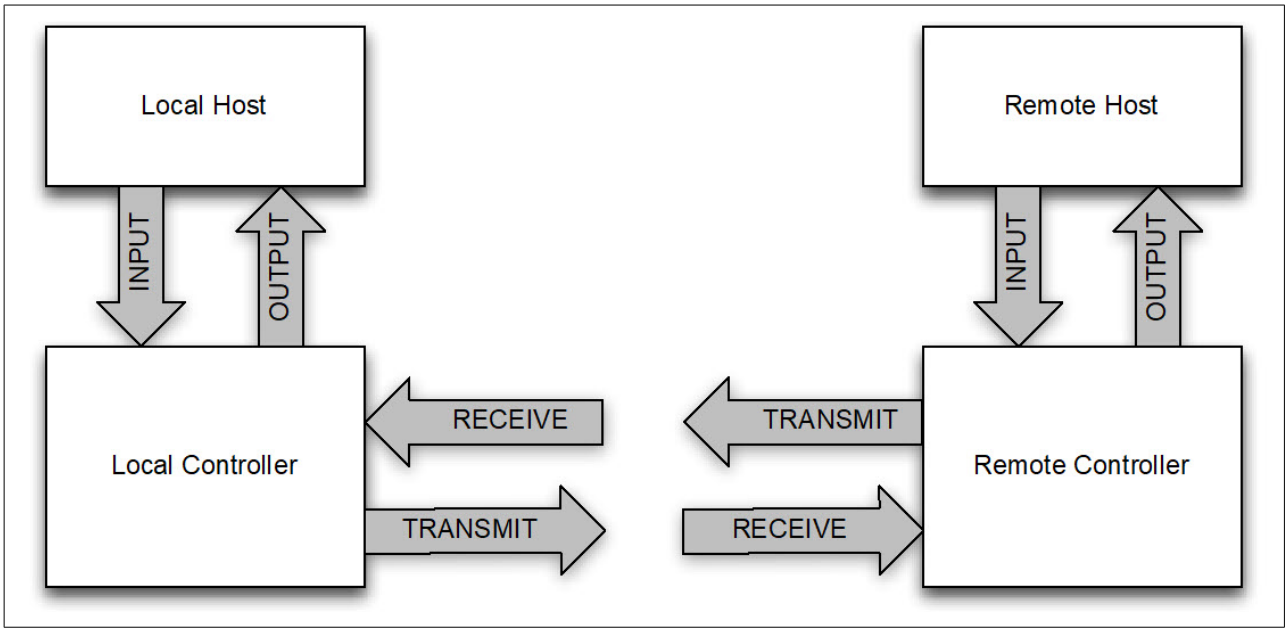
Description:

This command adds a new, or modifies an existing, synchronous logical transport (SCO or eSCO) on a physical link depending on the Connection_Handle parameter specified. If the Connection_Handle refers to an ACL link, then a new synchronous logical transport shall be added. If the Connection_Handle refers to an existing synchronous logical transport (eSCO only), then this link shall be modified. The parameters are specified per connection. This synchronous connection can be used to transfer synchronous voice data or transparent synchronous data. If the ACL link has encryption enabled using AES-CCM and the Controller cannot establish an eSCO transport (e.g. the Host parameters restricting the packet types to SCO packet types),

the Controller shall return the error code *Rejected Due to Security Reasons* (0x0E) and a SCO transport will not be established.

When used to setup a new synchronous logical transport, the Connection_Handle parameter shall specify an ACL connection with which the new synchronous connection shall be associated. The other parameters relate to the negotiation of the link, and may be reconfigured during the lifetime of the link.

The following terms are used to describe the four different audio paths: Transmit, Receive, Input and Output. The Transmit and Receive paths are from the perspective of the local Controller's radio. The Input and Output paths are from the perspective of the Controller.



The following parameters are used to describe the transmit and receive paths over the air:

- The Transmit_Bandwidth and Receive_Bandwidth parameters specify how much bandwidth shall be available for transmitting and for receiving data. The Host shall set the Transmit_Bandwidth and Receive_Bandwidth parameters to be equal or shall set one of them to be zero and the other non-zero.
- The Transmit_Coding_Format and Receive_Coding_Format parameters specify the coding format used for transmitted or received data. The Host shall set the Transmit_Coding_Format and Receive_Coding_Formats to be equal. When the Transmit_Coding_Format and Receive_Coding_Format parameters are not equal to CVSD, A-law or μ-law, the Link Manager shall map these to Transparent air mode.
- The Transmit_Codec_Frame_Size and Receive_Codec_Frame_Size parameters specify the frame size produced by the codecs in the context of over-the-air coding.

The over-the-air packet size should have the following relationship with the codec frame size:

Packet_Size = Frame_Size × N, or

Packet_Size = Frame_Size ÷ N

where N is an integer.

The following parameters are used to describe the coding format used prior to encapsulating over the audio data transport path:

- The Input_Bandwidth and Output_Bandwidth specify the nominal rate at which the Host or Controller transfers data (for HCI transports this excludes the HCI header). The Host shall either set the Input_Bandwidth and Output_Bandwidth to be equal, or shall set one of them to be zero and the other non-zero.
- The Input_Coding_Format and Output_Coding_Format parameters specify the coding format used over the transport. The Host shall set the Input_Coding_Format and Output_Coding_Format to be equal.
- The Input_Coded_Data_Size and Output_Coded_Data_Size specify the number of bits in each sample or frame of data. For CVSD, a frame of data shall be 8 bits.
- The Input_PCM_Data_Format and Output_PCM_Data_Format parameters specify the data format over the transport for linear samples. They shall be ignored when the data is encoded in any other way.
- The Input_PCM_Sample_Payload_MSB_Position and Output_PCM_Sample_Payload_MSB_Position parameters indicate, for linear samples, how many bit positions that the MSB of the sample is away from starting at the MSB of the data. They shall be ignored when the data is encoded in any other way. For example, if Input_Coded_Data_Size =16 and Input_PCM_Sample_Payload_MSB_Position = 3, then each sample is actually only 13 bits, the MSB (which is the sign bit for signed formats) is bit 12 (counting from the LSB at bit 0), and the contents of bits 13, 14, and 15 of each sample shall be ignored.

The following parameters describe the audio data transport path characteristics:

- The Input_Data_Path and Output_Data_Path parameters specify the audio data transport path. When set to 0x00, the audio data path shall be over the HCI transport. When set to 0xFF, audio test mode (see Section 7.6.2) is selected (this is only applicable during test mode). When set to 0x01 to 0xFE, the audio data path shall use non-HCI transport data paths (e.g. PCM interface) with logical transport channel numbers. The meanings of these logical transport channel numbers are vendor specific.
- The Input_Transport_Unit_Size and Output_Transport_Unit_Size indicate how many bits are in each unit of data delivered by the audio data transport. Except for HCI,

the meaning of “unit” depends on the Host transport used and, therefore, is vendor specific (for example, on a PCM transport this should indicate the number of bits transported per sync pulse, and would normally be 8 or 16). The Host shall set the Input_Transport_Unit_Size and Output_Transport_Unit_Size to be equal. For HCI Host transport the Host shall set them to 0.

The following parameters are used by the Link Manager to negotiate the synchronous transport:

- The Max_Latency parameter specifies an upper limit to the time between the eSCO (or SCO) instants, plus the size of the retransmission window, plus the length of the reserved synchronous slots for this logical transport.
- The Packet_Type parameter is a bitmap specifying which synchronous packet types may be used by the Link Manager in the negotiation of the link parameters. Multiple packet types are specified by bitwise OR of the packet type codes in the table. At least one packet type shall be specified for each negotiation. It is recommended to enable as many packet types as possible. The Host may enable packet types that are not supported by the local Controller.
- The Retransmission_Effort parameter specifies the extra resources that are allocated to this connection if a packet may need to be retransmitted. The Retransmission_Effort parameter shall be set to indicate the required behavior, or to “Don’t care”.

The following restrictions shall apply:

- Either both the Transmit_Coding_Format and Input_Coding_Format shall be “transparent” or neither shall be. If both are “transparent”, the Transmit_Bandwidth and the Input_Bandwidth shall be the same and the Controller shall not modify the data sent to the remote device.
- Either both the Receive_Coding_Format and Output_Coding_Format shall be “transparent” or neither shall be. If both are “transparent”, the Receive_Bandwidth and the Output_Bandwidth shall be the same and the Controller shall not modify the data sent to the Host.

A Connection_Handle for the new synchronous connection will be returned in the HCI_Synchronous_Connection_Complete event if the command is used to set up a new synchronous connection.

When used to modify an existing synchronous logical transport, only the Packet_Type, Retransmission_Effort and Max_Latency parameters may be modified.

Note: The Link Manager may choose any combination of packet types, timing, and retransmission window sizes that satisfy the parameters given. This may be achieved by using more frequent transmissions of smaller packets. The link manager may choose to set up either a SCO or an eSCO connection, if the parameters allow, using the corresponding LMP sequences.

Note: To modify a SCO connection, use the HCI_Change_Connection_Packet_Type command.

If the lower layers cannot achieve the exact transmit and receive bandwidth requested subject to the other parameters, or cannot achieve the transcoding or resampling implied by the parameters, then the link creation or link modification shall be rejected. A synchronous connection may only be created when an ACL connection already exists.

The data at the audio data transport interface shall be treated as a stream of bits. The bits in each unit of data delivered by the transport shall be taken LSB first, and the units shall be taken in the order of delivery. The samples, encoded samples, frames, or other entity to be transcoded for transmission, or that has been transcoded after reception, shall be taken in the order of transmission or reception, with each entity taken LSB first.

For example, if the audio data transport uses 16 bit units and the Input or Output coding format is A-law, each unit represents two samples with the first in the 8 least significant bits and the second in the 8 most significant bits. Similarly, if the audio data transport uses 8 bit units and the Input or Output coding format is linear PCM with a size of 16 bits, the 8 least significant bits of each sample are transmitted first.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Transmit_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0xFFFFFFFE	Transmit bandwidth in octets per second.
0xFFFFFFFF	Don’t care

Receive_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0xFFFFFFFE	Receive bandwidth in octets per second.
0xFFFFFFFF	Don't care

Transmit_Coding_Format: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding_Format
Octets 1 to 4	Octet 1 to 2: Company ID, see Assigned Numbers for Company Identifier Octet 3 to 4: Vendor specific codec ID. Shall be ignored if octet 0 of Transmit_Coding_Format is not 0xFF.

Receive_Coding_Format: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding_Format
Octets 1 to 4	Octet 1 to 2: Company ID, see Assigned Numbers for Company Identifier. Octet 3 to 4: Vendor specific codec ID. Shall be ignored if octet 0 of Receive_Coding_Format is not 0xFF.

Transmit_Codec_Frame_Size: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Range: 0x0001 to 0xFFFF, the actual size of the over-the-air encoded frame in octets.

Receive_Codec_Frame_Size: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Range: 0x0001 to 0xFFFF, the actual size of the over-the-air encoded frame in octets.

Input_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Host to Controller nominal data rate in octets per second.

Output_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Controller to Host nominal data rate in octets per second.

Input_Coding_Format: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding_Format
Octets 1 to 4	Octet 1 to 2: Company ID, see Assigned Numbers for Company Identifier. Octet 3 to 4: Vendor specific codec ID. Shall be ignored if octet 0 of Input_Coding_Format is not 0xFF.

Output_Coding_Format: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding_Format
Octets 1 to 4	Octet 1 to 2: Company ID, see Assigned Numbers for Company Identifier. Octet 3 to 4: Vendor specific codec ID. Shall be ignored if octet 0 of Output_Coding_Format is not 0xFF.

Input_Coded_Data_Size: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Size, in bits, of the sample or framed data

Output_Coded_Data_Size: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Size, in bits, of the sample or framed data

Input_PCM_Data_Format: *Size: 1 octet*

Value	Parameter Description
0xXX	See Assigned Numbers for PCM_Data_Format

Output_PCM_Data_Format: *Size: 1 octet*

Value	Parameter Description
0xXX	See Assigned Numbers for PCM_Data_Format

Input_PCM_Sample_Payload_MSB_Position: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of bit positions within an audio sample that the MSB of the sample is away from starting at the MSB of the data.

Output_PCM_Sample_Payload_MSB_Position: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of bit positions within an audio sample that the MSB of the sample is away from starting at the MSB of the data.

Input_Data_Path: *Size: 1 octet*

Value	Parameter Description
0x00	HCI
0x01 to 0xFE	Logical_Channel_Number. The meaning of the logical channels will be vendor specific.
0xFF	Audio test mode

Output_Data_Path: *Size: 1 octet*

Value	Parameter Description
0x00	HCI
0x01 to 0xFE	Logical_Channel_Number. The meaning of the logical channels will be vendor specific.
0xFF	Audio test mode

Input_Transport_Unit_Size: *Size: 1 octet*

Value	Parameter Description
1 to 255	The number of bits in each unit of data received from the Host over the audio data transport.
0	Not applicable (implied by the choice of audio data transport)

Output_Transport_Unit_Size: *Size: 1 octet*

Value	Parameter Description
1 to 255	The number of bits in each unit of data sent to the Host over the audio data transport.
0	Not applicable (implied by the choice of audio data transport)

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0x0000 to 0x0003	Reserved for future use
0x0004 to 0xFFFE	The value, in milliseconds, representing the upper limit of the sum of the synchronous interval and the size of the eSCO window, where the eSCO window is the reserved slots plus the retransmission window. (See [Vol 2] Part B, Figure 8.9)
0xFFFF	Don't care.

Packet_Type: *Size: 2 octets*

Bit Number	Parameter Description
0	HV1 may be used
1	HV2 may be used
2	HV3 may be used
3	EV3 may be used
4	EV4 may be used
5	EV5 may be used
6	2-EV3 shall not be used
7	3-EV3 shall not be used
8	2-EV5 shall not be used
9	3-EV5 shall not be used
All other bits	Reserved for future use

Note: 0x003F means all packet types may be used.

Retransmission_Effort: *Size: 1 octet*

Value	Parameter Description
0x00	No retransmission (SCO or eSCO connection allowed)
0x01	At least one retransmission, optimize for power consumption (eSCO connection required)
0x02	At least one retransmission, optimize for link quality (eSCO connection required)
0xFF	Don't care (SCO or eSCO connection allowed)
All other values	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Enhanced_Setup_Synchronous_Connection command, it shall send the HCI_Command_Status event to the Host. In addition, when the LM determines that the connection is established, the local BR/EDR Controller shall send an HCI_Synchronous_Connection_Complete event to the local Host, and the remote Controller will send an HCI_Synchronous_Connection_Complete event or an HCI_Connection_Complete event to the remote Host. The HCI_Synchronous_Connection_Complete event contains the Connection_Handle if this command is successful.

This command cannot be used to change the parameters of a SCO link.

7.1.46 Enhanced Accept Synchronous Connection Request command

Command	OCF	Command Parameters	Return Parameters
HCI_Enhanced_-Accept_Synchronous_-Connection_Request	0x003E	BD_ADDR, Transmit_Bandwidth, Receive_Bandwidth, Transmit_Coding_Format, Receive_Coding_Format, Transmit_Codec_Frame_Size, Receive_Codec_Frame_Size, Input_Bandwidth, Output_Bandwidth, Input_Coding_Format, Output_Coding_Format, Input_Coded_Data_Size, Output_Coded_Data_Size, Input_PCM_Data_Format, Output_PCM_Data_Format, Input_PCM_Sample_Payload_MSB_Position, Output_PCM_Sample_Payload_MSB_Position, Input_Data_Path, Output_Data_Path, Input_Transport_Unit_Size, Output_Transport_Unit_Size, Max_Latency, Packet_Type, Retransmission_Effort	*none*

Description:

This command is used to accept an incoming request for a synchronous connection and to present the local Link Manager with the acceptable parameter values for the synchronous connection. This command shall only be issued after an HCI_Connection_Request event, with link type SCO or eSCO, has occurred. An HCI_Connection_Request event contains the BD_ADDR of the device requesting the connection. The command to accept a connection must be received by the Controller before the timer Connection_Accept_Timeout expires on the local device.

The parameter set of the HCI_Enhanced_Accept_Synchronous_Connection_Request command is the same as for the HCI_Enhanced_Setup_Synchronous_Connection command except for the Connection_Handle in the HCI_Enhanced_Setup_-Synchronous_Connection command, which is replaced by the BD_ADDR in the HCI_Enhanced_Accept_Synchronous_Connection_Request command. See Section 7.1.45 for the descriptions of these parameters.

The Host shall include in the Packet_Type parameter at least one packet type for the transport (SCO or eSCO) specified in the incoming request. The Controller shall ignore any packet types in the Packet_Type parameter for the other transport.

If the Link Type of the incoming request is SCO, then the Controller shall ignore the Transmit_Bandwidth, Receive_Bandwidth, and Retransmission_Effort parameters.

Note: See Section 7.3.3 for the behavior when the HCI_Connection_Request event is masked or the connection is auto accepted.

If the ACL link has encryption enabled using AES-CCM then the Host shall not accept a request where the link type is SCO.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device requesting the connection

Transmit_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0xFFFFFFFE	Transmit bandwidth in octets per second.
0xFFFFFFFF	Don’t care

Receive_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0xFFFFFFFE	Receive bandwidth in octets per second.
0xFFFFFFFF	Don’t care

Transmit_Coding_Format: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding_Format
Octets 1 to 4	Octet 1 to 2: Company ID, see Assigned Numbers for Company Identifier. Octet 3 to 4: Vendor specific codec ID. Shall be ignored if octet 0 of Transmit_Coding_Format is not 0xFF.

Receive_Coding_Format: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding_Format
Octets 1 to 4	Octet 1 to 2: Company ID, see Assigned Numbers for Company Identifier. Octet 3 to 4: Vendor specific codec ID. Shall be ignored if octet 0 of Receive_Coding_Format is not 0xFF.

Transmit_Codec_Frame_Size: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Range: 0x0001 to 0xFFFF, the actual size of the over-the-air encoded frame in octets.

Receive_Codec_Frame_Size: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Range: 0x0001 to 0xFFFF, the actual size of the over-the-air encoded frame in octets.

Input_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Host to Controller nominal data rate in octets per second.

Output_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Controller to Host nominal data rate in octets per second.

Input_Coding_Format: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding_Format
Octets 1 to 4	Octet 1 to 2: Company ID, see Assigned Numbers for Company Identifier. Octet 3 to 4: Vendor specific codec ID. Shall be ignored if octet 0 of Input_Coding_Format is not 0xFF.

Output_Coding_Format: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding_Format
Octets 1 to 4	Octet 1 to 2: Company ID, see Assigned Numbers for Company Identifier. Octet 3 to 4: Vendor specific codec ID. Shall be ignored if octet 0 of Output_Coding_Format is not 0xFF.

Input_Coded_Data_Size: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Size, in bits, of the sample or framed data

Output_Coded_Data_Size: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Size, in bits, of the sample or framed data

Input_PCM_Data_Format: *Size: 1 octet*

Value	Parameter Description
0xXX	See Assigned Numbers for PCM_Data_Format

Output_PCM_Data_Format: *Size: 1 octet*

Value	Parameter Description
0xXX	See Assigned Numbers for PCM_Data_Format

Input_PCM_Sample_Payload_MSB_Position: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of bit positions within an audio sample that the MSB of the sample is away from starting at the MSB of the data.

Output_PCM_Sample_Payload_MSB_Position: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of bit positions within an audio sample that the MSB of the sample is away from starting at the MSB of the data.

Input_Data_Path: *Size: 1 octet*

Value	Parameter Description
0x00	HCI
0x01 to 0xFE	Logical_Channel_Number. The meaning of the logical channels will be vendor specific.
0xFF	Audio test mode

Output_Data_Path: *Size: 1 octet*

Value	Parameter Description
0x00	HCI
0x01 to 0xFE	Logical_Channel_Number. The meaning of the logical channels will be vendor specific.
0xFF	Audio test mode

Input_Transport_Unit_Size: *Size: 1 octet*

Value	Parameter Description
1 to 255	The number of bits in each unit of data received from the Host over the audio data transport.
0	Not applicable (implied by the choice of audio data transport)

Output_Transport_Unit_Size: *Size: 1 octet*

Value	Parameter Description
1 to 255	The number of bits in each unit of data sent to the Host over the audio data transport.
0	Not applicable (implied by the choice of audio data transport)

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0x0000 to 0x0003	Reserved for future use
0x0004 to 0xFFFE	The value in milliseconds representing the upper limit of the sum of the synchronous interval, and the size of the eSCO window, where the eSCO window is the reserved slots plus the retransmission window. (See [Vol 2] Part B, Figure 8.9)
0xFFFF	Don't care.

Packet_Type: *Size: 2 octets*

Bit Number	Parameter Description
0	HV1 may be used
1	HV2 may be used
2	HV3 may be used
3	EV3 may be used
4	EV4 may be used
5	EV5 may be used
6	2-EV3 shall not be used
7	3-EV3 shall not be used
8	2-EV5 shall not be used
9	3-EV5 shall not be used
All other bits	Reserved for future use

Note: 0x003F means all packet types may be used.

Retransmission_Effort: *Size: 1 octet*

Value	Parameter Description
0x00	No retransmission
0x01	At least one retransmission, optimize for power consumption
0x02	At least one retransmission, optimize for link quality
0xFF	Don't care
All other values	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

The HCI_Enhanced_Accept_Synchronous_Request command requests the local BR/EDR Controller to start setting up the connection. When this action commences, the HCI_Command_Status event shall be sent by the BR/EDR Controller. When the link setup is complete, the BR/EDR Controller shall send an HCI_Synchronous_Connection_Complete event to its Host, and the remote BR/EDR Controller will send an HCI_Synchronous_Connection_Complete event to its Host. The HCI_Synchronous_Connection_Complete will contain the Connection_Handle and the link parameters if the setup is successful.

7.1.47 Truncated Page command

Command	OCF	Command Parameters	Return Parameters
HCI_Truncated_Page	0x003F	BD_ADDR, Page_Scan_Repetition_Mode, Clock_Offset	*none*

Description:

This command is used to page the BR/EDR Controller with the specified BD_ADDR and then abort the paging sequence after an ID response has been received. See [Vol 2] Part B, Section 8.3.3 for additional information.

The Page_Scan_Repetition_Mode parameter specifies the Page Scan Repetition mode supported by the remote BR/EDR Controller with the BD_ADDR. This is the most recent version of the information that was acquired either during the inquiry process or from an HCI_Page_Scan_Repetition_Mode_Change event (see Section 7.7.31).

The Clock_Offset parameter is the difference between the local BR/EDR Controller's own clock and the clock of the remote BR/EDR Controller with BD_ADDR. Only bits 2 to 16 of the difference are used, and they are mapped to this parameter as bits 0 to 14 respectively. A Clock_Offset_Valid_Flag, located in bit 15 of the Clock_Offset parameter, indicates if the Clock Offset is valid or not.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device to page

Page_Scan_Repetition_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	R0
0x01	R1
0x02	R2
All other values	Reserved for future use.

Clock_Offset: *Size: 2 octets*

Bit Number	Parameter Description
0 to 14	Bits 2 to 16 of CLKNPeripheral - CLK
15	Clock Offset is valid

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Truncated_Page command the BR/EDR Controller shall send the HCI_Command_Status event to the Host. In addition, when the Truncated Page procedure has completed, the BR/EDR Controller shall send an HCI_Truncated_Page_Complete event to the Host.

7.1.48 Truncated Page Cancel command

Command	OCF	Command Parameters	Return Parameters
HCI_Truncated_Page_Cancel	0x0040	BD_ADDR	Status, BD_ADDR

Description:

This command is used to request cancellation of an ongoing Truncated_Page process previously started by an HCI_Truncated_Page command.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device to which the HCI_Truncated_Page command was previously issued and that is the subject of the cancellation request.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Truncated_Page_Cancel command succeeded.
0x01 to 0xFF	HCI_Truncated_Page_Cancel command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device to which the HCI_Truncated_Page command was previously issued before and that is the subject of the cancellation request.

Event(s) generated (unless masked away):

When the HCI_Truncated_Page_Cancel command has completed, an HCI_Command_Complete event shall be generated.

If the truncated page procedure has already completed, but the BR/EDR Controller has not yet sent the HCI_Truncated_Page_Complete event, then the local device shall return an HCI_Command_Complete event with status “Success”.

If the HCI_Truncated_Page_Cancel command is sent to the BR/EDR Controller without a pending HCI_Truncated_Page command to the same device, the BR/EDR

Controller shall return an HCI_Command_Complete event with the error code *Unknown Connection Identifier* (0x02).

Note: From the BR/EDR Controller perspective this is identical to the situation where the HCI_Truncated_Page command has already completed and the HCI_Truncated_Page_Complete event already sent.

7.1.49 Set Connectionless Peripheral Broadcast command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Connectionless_Peripheral_-Broadcast	0x0041	Enable, LT_ADDR, LPO_Allowed, Packet_Type, Interval_Min, Interval_Max, Supervision_Timeout	Status, LT_ADDR, Interval

Description:

This command controls the Connectionless Peripheral Broadcast functionality in the BR/EDR Controller. Connectionless Peripheral Broadcast mode may be enabled or disabled by the Enable parameter. If Enable is set to 0x00 and the Synchronization Train substate is active, then the Controller shall also exit the Synchronization Train substate. If Enable is set to 0x00, the remaining parameters shall be ignored.

The LT_ADDR indicated in the Set_Connectionless_Peripheral_Broadcast shall be pre-allocated using the HCI_Set_Reserved_LT_ADDR command.

The LPO_Allowed parameter informs the BR/EDR Controller whether it is allowed to sleep.

The Packet_Type parameter specifies which packet types are allowed. The Host shall either enable BR packet types only, or shall enable EDR and DM1 packet types only.

The Interval_Min and Interval_Max parameters specify the range from which the BR/EDR Controller shall select the Connectionless Peripheral Broadcast Interval. The selected Interval is returned.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	The LT_ADDR has not been reserved.	*Unknown Connection Identifier* (0x02)
MC	The Controller is unable to reserve sufficient band-width for the requested activity.	*Connection Rejected Due to Limited Re-sources* (0x0D)

Command parameters:

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Disabled
0x01	Enabled
All other values	Reserved for future use

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR used for Connectionless Peripheral Broadcast
All other values	Reserved for future use

LPO_Allowed: *Size: 1 octet*

Value	Parameter Description
0x00	BR/EDR Controller shall not sleep (that is, clock accuracy shall be equal to or better than ± 20 ppm)
0x01	BR/EDR Controller may sleep (that is, clock accuracy shall be equal to or better than ± 250 ppm)
All other values	Reserved for future use

Packet_Type: *Size: 2 octets*

Bit Number	Parameter Description
1	2-DH1 shall not be used
2	3-DH1 shall not be used
3	DM1 may be used
4	DH1 may be used
8	2-DH3 shall not be used
9	3-DH3 shall not be used
10	DM3 may be used
11	DH3 may be used
12	2-DH5 shall not be used
13	3-DH5 shall not be used
14	DM5 may be used

Bit Number	Parameter Description
15	DH5 may be used
All other bits	Reserved for future use.

Interval_Min: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum interval between Connectionless Peripheral Broadcast packets in slots. Range: 0x0002 to 0xFFFE; only even values are valid

Interval_Max: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum interval between Connectionless Peripheral Broadcast packets in slots. Range: 0x0002 to 0xFFFE; only even values are valid

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Duration in slots after which the BR/EDR Controller reports an HCI_Connectionless_-Peripheral_Broadcast_Timeout event if it is unable to transmit a Connectionless Peripheral Broadcast packet. Range: 0x0002 to 0xFFFE; only even values are valid

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Connectionless_Peripheral_Broadcast command succeeded.
0x01 to 0xFF	HCI_Set_Connectionless_Peripheral_Broadcast command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR used for Connectionless Peripheral Broadcast
All other values	Reserved for future use

Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Actual interval between Connectionless Peripheral Broadcast packets in slots. Range: 0x0002 to 0xFFFE; only even values are valid

Event(s) generated (unless masked away):

When the HCI_Set_Connectionless_Peripheral_Broadcast command has completed, an HCI_Command_Complete event shall be generated.

If the BR/EDR Controller is unable to transmit a Connectionless Peripheral Broadcast packet for *Supervision_Timeout slots*, it shall generate an HCI_Connectionless_Peripheral_Broadcast_Timeout event.

7.1.50 Set Connectionless Peripheral Broadcast Receive command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_-Connectionless_-Peripheral_-Broadcast_Receive	0x0042	Enable, BD_ADDR, LT_ADDR, Interval, Clock_Offset, Next_Connectionless_Peripheral_Broadcast_Clock, Supervision_Timeout, Remote_Timing_Accuracy, Skip, Packet_Type, AFH_Channel_Map	Status, BD_ADDR, LT_ADDR

Description:

This command controls the reception of Connectionless Peripheral Broadcast packets in the BR/EDR Controller of a Connectionless Peripheral Broadcast Receiver. If the Enable parameter is set to Disabled, the BR/EDR Controller does not attempt to receive Connectionless Peripheral Broadcast packets and the remaining parameters shall be ignored. If the Enable parameter is set to Enabled, the BR/EDR Controller starts attempting to receive Connectionless Peripheral Broadcast packets on the specified LT_ADDR.

The Interval parameter specifies the interval of the Connectionless Peripheral Broadcast to be used by the BR/EDR Controller.

The Skip parameter specifies the number of consecutive Connectionless Peripheral Broadcast instants which the receiver may skip after successfully receiving a Connectionless Peripheral Broadcast packet.

The Packet_Type parameter specifies which packet types are allowed. The Host shall either enable BR packet types only or shall enable EDR and DM1 packet types only.

The AFH_Channel_Map parameter is the AFH channel map used by the Transmitter for the PBD logical link, and is obtained by the Receiver's Host from the HCI_Synchronization_Train_Received event.

Command parameters:

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Disabled
0x01	Enabled
All other values	Reserved for future use

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Connectionless Peripheral Broadcast transmitter

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR to use for receiving Connectionless Peripheral Broadcast messages
All other values	Reserved for future use

Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Interval between Connectionless Peripheral Broadcast packets instants in slots. Range: 0x0002 to 0xFFFE; only even values are valid

Clock_Offset: *Size: 4 octets (28 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX	(CLKNreceiver - CLKNtransmitter) *mod* 2^{28}

Next_Connectionless_Peripheral_Broadcast_Clock: *Size: 4 octets (28 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX	CLK for next Connectionless Peripheral Broadcast instant

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Duration in slots to continue listening for Connectionless Peripheral Broadcast packets after the last successfully received Connectionless Peripheral Broadcast packet. Range: 0x0002 to 0xFFFE; only even values are valid

Remote_Timing_Accuracy: *Size: 1 octet*

Value	Parameter Description
0xXX	Timing accuracy of the Transmitter in ppm. Typical values are 20 ppm and 250 ppm.

Skip: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of Connectionless Peripheral Broadcast instants to skip after successfully receiving a Broadcast packet.

Packet_Type: *Size: 2 octets*

Bit Number	Parameter Description
1	2-DH1 shall not be used
2	3-DH1 shall not be used
3	DM1 may be used
4	DH1 may be used
8	2-DH3 shall not be used
9	3-DH3 shall not be used
10	DM3 may be used
11	DH3 may be used
12	2-DH5 shall not be used
13	3-DH5 shall not be used
14	DM5 may be used
15	DH5 may be used
All other bits	Reserved for future use.

AFH_Channel_Map: *Size: 10 octets (79 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX XXXXXXXXXX XX	This parameter contains 80 1-bit fields. The n^{th} such field (in the range 0 to 78) contains the value for channel *n*: 0: channel *n* is unused 1: channel *n* is used The most significant bit (bit 79) is reserved for future use At least N_{min} channels shall be marked as used (see [Vol 2] Part B, Section 2.3.1)

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Connectionless_Peripheral_Broadcast_Receive command succeeded.
0x01 to 0xFF	HCI_Set_Connectionless_Peripheral_Broadcast_Receive command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Connectionless Peripheral Broadcast transmitter

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR used for receiving Connectionless Peripheral Broadcast messages
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Set_Connectionless_Peripheral_Broadcast_Receive command has been received, an HCI_Command_Complete event shall be generated. Completion of the HCI_Set_Connectionless_Peripheral_Broadcast_Receive command does not require reception of a Connectionless Peripheral Broadcast packet.
If the BR/EDR Controller does not receive a Connectionless Peripheral Broadcast packet for *CPB_supervisionTO* slots, it shall generate an HCI_Connectionless_Peripheral_Broadcast_Timeout event.

7.1.51 Start Synchronization Train command

Command	OCF	Command Parameters	Return Parameters
HCI_Start_Synchronization_Train	0x0043	*none*	*none*

Description:

This command controls the Synchronization Train functionality in the BR/EDR Controller. Connectionless Peripheral Broadcast mode shall be enabled on the BR/EDR Controller before this command may be used. After receiving this command and returning an HCI_Command_Status event, the Baseband starts attempting to send synchronization train packets containing information related to the enabled Connectionless Peripheral Broadcast packet timing.

Note: The AFH_Channel_Map used in the synchronization train packets is configured by the HCI_Set_AFH_Host_Channel_Classification command and the local channel classification in the BR/EDR Controller.

The synchronization train packets will be sent using the parameters specified by the latest HCI_Write_Synchronization_Train_Parameters command. The Synchronization Train will continue until *synchronization_trainTO* slots (as specified in the last HCI_Write_Synchronization_Train_Parameters command) have passed or until the Host disables the Connectionless Peripheral Broadcast logical transport.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	Connectionless Peripheral Broadcast mode is not enabled.	*Command Disallowed* (0x0C)

Command parameters:

None.

Return parameters:

None

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Start_Synchronization_Train command, it shall send an HCI_Command_Status event to the Host.

7.1.52 Receive Synchronization Train command

Command	OCF	Command Parameters	Return Parameters
HCI_Receive_Synchronization_Train	0x0044	BD_ADDR, Sync_Scan_Timeout, Sync_Scan_Window, Sync_Scan_Interval	*none*

Description:

This command requests synchronization with the specified Connectionless Peripheral Broadcast Transmitter. The Sync_Scan_Window parameter specifies the duration of each scan and the Sync_Scan_Interval parameter specifies the interval between the start of consecutive scan windows. An HCI_Synchronization_Train_Received event shall be sent if a synchronization train packet is received with a non-zero Connectionless Peripheral Broadcast LT_ADDR or if the BR/EDR Controller fails to receive a synchronization train packet for *synchronization_scanTO* slots.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Connectionless Peripheral Broadcast transmitter

Sync_Scan_Timeout: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Duration in slots to search for the synchronization train Shall be greater than or equal to Sync_Scan_Window; only even values are valid

Sync_Scan_Window: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Duration in slots to listen for a synchronization train packet on a single frequency Range: 0x0022 to 0xFFFC; only even values are valid

Sync_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Duration in slots between the start of consecutive scan windows Shall be greater than or equal to Sync_Scan_Window+0x0002; only even values are valid

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Receive_Synchronization_Train command, it shall send an HCI_Command_Status event to the Host. In addition, when the BR/EDR Controller receives, or fails to receive within the duration specified by *Sync_Scan_Timeout*, the synchronization train from the Connectionless Peripheral Broadcast transmitter, it shall send an HCI_Synchronization_Train_Received event to the Host.

7.1.53 Remote OOB Extended Data Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_Remote_- OOB_Extended_Data_Request_Reply	0x0045	BD_ADDR, C_192, R_192, C_256, R_256	Status, BD_ADDR

Description:

This command is used to reply to an HCI_Remote_OOB_Data_Request event with the C and R values derived with the P-192 public key and the C and R values associated with the P-256 public key received via an OOB transfer from a remote device identified by BD_ADDR. If the C_192 and R_192 values are not present in the received OOB data from the remote device, the Host shall set C_192 and R_192 to zeros. If the C_256 and R_256 values are not present in the received OOB data from the remote device, the Host shall set C_256 and R_256 to zeros.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	Neither Secure Connections (Host Support) nor Secure Simple Pairing (Host Support) has been enabled.	*Command Disallowed* (0x0C)

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device from which the C and R values were received

C_192: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXX XXXXXXXXXXX XXXXXXXXX	Secure Simple Pairing Hash C derived from the P-192 public key.

R_192: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXX XXXXXXXXXXX XXXXXXXXX	Secure Simple Pairing Randomizer associated with the P-192 public key.

C_256: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXX XXXXXXXXXXX XXXXXXXXX	Secure Simple Pairing Hash C derived from the P-256 public key.

R_256: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXX XXXXXXXXXXX XXXXXXXXX	Secure Simple Pairing Randomizer associated with the P-256 public key.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Remote_OOB_Extended_Data_Request_Reply command succeeded.
0x01 to 0xFF	HCI_Remote_OOB_Extended_Data_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXX	BD_ADDR of remote device from which the C and R values were received

Event(s) generated (unless masked away):

When the HCI_Remote_OOB_Extended_Data_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.2 Link Policy commands

The Link Policy commands provide methods for the Host to affect how the Link Manager manages the piconet. When Link Policy commands are used, the LM still controls how Bluetooth piconets and scatternets are established and maintained, depending on adjustable policy parameters. These policy commands modify the Link Manager behavior that can result in changes to the Link Layer connections with Bluetooth remote devices.

Note: Only one ACL connection can exist between two BR/EDR Controllers, and therefore there can only be one ACL HCI Connection_Handle for each physical Link Layer Connection. The BR/EDR Controller provides policy adjustment mechanisms to provide support for a number of different policies. This capability allows one Bluetooth module to be used to support many different usage models, and the same Bluetooth module can be incorporated in many different types of BR/EDR Controllers.

For the Link Policy commands, the OGF is defined as 0x02.

7.2.1 Hold Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Hold_Mode	0x0001	Connection_Handle, Hold_Mode_Max_Interval, Hold_Mode_Min_Interval	*none*

Description:

This command is used to alter the behavior of the Link Manager, and have it place the ACL Baseband connection associated by the specified Connection_Handle into the Hold mode. The Connection_Handle shall identify an ACL connection and not a SCO or eSCO connection. The Hold_Mode_Max_Interval and Hold_Mode_Min_Interval command parameters specify the length of time the Host wants to put the connection into the Hold mode. The local and remote devices will negotiate the length in the Hold mode. The Hold_Mode_Max_Interval parameter is used to specify the maximum length of the Hold interval for which the Host may actually enter into the Hold mode after negotiation with the remote device. The Hold interval defines the amount of time between when the Hold mode begins and when the Hold mode is completed. The Hold_Mode_Min_Interval parameter is used to specify the minimum length of the Hold interval for which the Host may actually enter into the Hold mode after the negotiation with the remote device. Therefore the Hold_Mode_Min_Interval shall not be greater than the Hold_Mode_Max_Interval. The BR/EDR Controller will return the actual Hold interval in the Interval parameter of the HCI_Mode_Change event, if the command is successful. This command enables the Host to support a low-power policy for itself or

several other BR/EDR Controllers, and allows the devices to enter Inquiry Scan, Page Scan, and a number of other possible actions.

Note: If the Host sends data to the BR/EDR Controller with a Connection_Handle corresponding to a connection in Hold mode, the BR/EDR Controller will keep the data in its buffers until either the data can be transmitted (the Hold mode has ended) or a flush, a flush timeout or a disconnection occurs. This is valid even if the Host has not yet been notified of the Hold mode through an HCI_Mode_Change event when it sends the data.

Note: The above is not valid for an HCI ACL Data packet sent from the Host to the BR/EDR Controller on the Central side where the Connection_Handle is a Connection_Handle used for broadcast and the Broadcast_Flag is set to Active Broadcast. The broadcast data will then never be received by Peripherals in Hold mode.

The Hold_Mode_Max_Interval shall be less than the Link Supervision Timeout configuration parameter.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Hold_Mode_Max_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum acceptable number of Baseband slots to wait in Hold mode. Time Length of the Hold = N × 0.625 ms (1 Baseband slot) Range: 0x0002 to 0xFFFE; only even values are valid. Time Range: 1.25 ms to 40.9 s Mandatory Range: 0x0014 to 0x8000

Hold_Mode_Min_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum acceptable number of Baseband slots to wait in Hold mode. Time Length of the Hold = N × 0.625 ms (1 Baseband slot) Range: 0x0002 to 0xFF00; only even values are valid Time Range: 1.25 ms to 40.9 s Mandatory Range: 0x0014 to 0x8000

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Hold_Mode command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. The HCI_Mode_Change event shall occur when the Hold mode has started and the HCI_Mode_Change event shall occur again when the Hold mode has completed for the specified Connection_Handle. The HCI_Mode_Change event signaling the end of the Hold mode is an estimation of the Hold mode ending if the event is for a remote BR/EDR Controller.

7.2.2 Sniff Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Sniff_Mode	0x0003	Connection_Handle, Sniff_Max_Interval, Sniff_Min_Interval, Sniff_Attempt, Sniff_Timeout	*none*

Description:

This command is used to alter the behavior of the Link Manager and have it place the ACL Baseband connection associated with the specified Connection_Handle into Sniff mode. The Connection_Handle parameter is used to identify which ACL link connection is to be placed in Sniff mode and shall identify an ACL connection, not a SCO or eSCO, connection. The Sniff_Max_Interval and Sniff_Min_Interval command parameters are used to specify the requested acceptable maximum and minimum periods in Sniff mode. The Sniff_Min_Interval shall not be greater than the Sniff_Max_Interval. The sniff interval defines the amount of time between each consecutive sniff period. The BR/EDR Controller will return the actual sniff interval in the Interval parameter of the HCI_Mode_Change event, if the command is successful. For a description of the meaning of the Sniff_Attempt and Sniff_Timeout parameters, see [Vol 2] Part B, Section 8.7. Sniff_Attempt is there called $N_{sniff\ attempt}$ and Sniff_Timeout is called $N_{sniff\ timeout}$. This command enables the Host to support a low-power policy for itself or several other BR/EDR Controllers, and allows the devices to enter Inquiry Scan, Page Scan, and a number of other possible actions.

Note: If the Host sends data to the BR/EDR Controller with a Connection_Handle corresponding to a connection in Sniff mode, the BR/EDR Controller will keep the data in its buffers until either the data can be transmitted or a flush, a flush timeout or a disconnection occurs. This is valid even if the Host has not yet been notified of Sniff mode through an HCI_Mode_Change event when it sends the data.

Note: It is possible for the Central to transmit data to a Peripheral without exiting Sniff mode (see description in [Vol 2] Part B, Section 8.7).

Note: The above is not valid for an HCI ACL Data packet sent from the Host to the BR/EDR Controller on the Central side where the Connection_Handle is a Connection_Handle used for broadcast and the Broadcast_Flag is set to Active Broadcast. In that case, the broadcast data will only be received by a Peripheral in Sniff mode if that Peripheral happens to listen to the Central when the broadcast is made.

The Sniff_Max_Interval shall be less than the Link Supervision Timeout configuration parameter.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Sniff_Max_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0002 to 0xFFFE; only even values are valid Mandatory Range: 0x0006 to 0x0540 Time = N × 0.625 ms Time Range: 1.25 ms to 40.9 s

Sniff_Min_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0002 to 0xFFFE; only even values are valid Mandatory Range: 0x0006 to 0x0540 Time = N × 0.625 ms Time Range: 1.25 ms to 40.9 s

Sniff_Attempt: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Number of Baseband receive slots for sniff attempt. Length = N × 1.25 ms Range: 0x0001 to 0x7FFF Time Range: 1.25 ms to 40.9 s Mandatory Range for Controller: 1 to T_{sniff}÷2

Sniff_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Number of Baseband receive slots for sniff timeout. Length = N × 1.25 ms Range: 0x0000 to 0x7FFF Time Range: 0 ms to 40.9 s Mandatory Range for Controller: 0 to 0x0028

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Sniff_Mode command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. The HCI_Mode_Change event shall occur when Sniff mode has started for the specified Connection_Handle.

7.2.3 Exit Sniff Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Exit_Sniff_Mode	0x0004	Connection_Handle	*none*

Description:

This command is used to end Sniff mode for a Connection_Handle, which is currently in Sniff mode. The Connection_Handle shall identify an ACL connection and not a SCO or eSCO connection. The Link Manager will determine and issue the appropriate LMP commands to remove Sniff mode for the associated Connection_Handle.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When BR/EDR Controller receives the HCI_Exit_Sniff_Mode command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. The HCI_Mode_Change event shall occur when Sniff mode has ended for the specified Connection_Handle.

7.2.4 [This section is no longer used]

7.2.5 [This section is no longer used]

7.2.6 QoS Setup command

Command	OCF	Command Parameters	Return Parameters
HCI_QoS_Setup	0x0007	Connection_Handle, Unused, Service_Type, Token_Rate, Peak_Bandwidth, Latency, Delay_Variation	*none*

Description:

This command is used to specify Quality of Service parameters for a Connection_Handle. The Connection_Handle shall be a Connection_Handle for an ACL connection. These QoS parameter are the same parameters as L2CAP QoS. For more detail see [Vol 3] Part A, Logical Link Control and Adaptation Protocol Specification. This allows the Link Manager to have all of the information about what the Host is requesting for each connection. The LM will determine if the QoS parameters can be met. BR/EDR Controllers that are both Peripherals and Centrals can use this command. When a device is a Peripheral, this command will trigger an LMP request to the Central to provide the Peripheral with the specified QoS as determined by the LM. When a device is a Central, this command is used to request a Peripheral to accept the specified QoS as determined by the LM of the Central. Connection_Handle is used to identify for which connection the QoS request is requested.

The Unused parameter is reserved for future use.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Unused: *Size: 1 octet*

Value	Parameter Description
0x00	This value shall be used by the Host.
All other values	Reserved for future use.

Service_Type: *Size: 1 octet*

Value	Parameter Description
0x00	No Traffic.
0x01	Best Effort.
0x02	Guaranteed.
All other values	Reserved for future use.

Token_Rate: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Token Rate in octets per second.

Peak_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Peak Bandwidth in octets per second.

Latency: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Latency in microseconds.

Delay_Variation: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Delay Variation in microseconds.

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_QoS_Setup command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. When the Link Manager has completed the LMP messages to establish the requested QoS parameters, the BR/EDR Controller shall send an HCI_QoS_Setup_Complete event to the Host, and the event may also be generated on the remote side if there was LMP negotiation. The values of the parameters of the HCI_QoS_Setup_Complete event may, however, be different on the initiating and the remote side. The HCI_QoS_Setup_Complete event returned by the BR/EDR Controller on the local side

contains the status of this command, and returned QoS parameters describing the supported QoS for the connection.

Note: If the Link Manager performs an LMP transaction that involves the flow parameter values on the remote side, the remote Controller can send an HCI_Flow_Specification_Complete event or HCI_QoS_Setup_Complete event to the remote Host.

7.2.7 Role Discovery command

Command	OCF	Command Parameters	Return Parameters
HCI_Role_Discovery	0x0009	Connection_Handle	Status, Connection_Handle, Current_Role

Description:

This command is used for a Host to determine which role the device is performing for a particular Connection_Handle. The Connection_Handle shall be a Connection_Handle for an ACL connection.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Role_Discovery command succeeded
0x01 to 0xFF	HCI_Role_Discovery command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Current_Role: *Size: 1 octet*

Value	Parameter Description
0x00	Current Role is Central for this Connection_Handle.
0x01	Current Role is Peripheral for this Connection_Handle.

Event(s) generated (unless masked away):

When the HCI_Role_Discovery command has completed, an HCI_Command_Complete event shall be generated.

7.2.8 Switch Role command

Command	OCF	Command Parameters	Return Parameters
HCI_Switch_Role	0x000B	BD_ADDR, Role	*none*

Description:

This command is used to switch the current BR/EDR role the device is performing for a particular connection with another specified BR/EDR Controller. The BD_ADDR parameter indicates for which connection the role switch is to be performed and shall specify a BR/EDR Controller for which a connection already exists. The Role parameter indicates the requested new role that the local device performs.

If there is an (e)SCO connection between the local device and the device identified by the BD_ADDR parameter, an attempt to perform a role switch shall be rejected by the local device.

If the connection between the local device and the device identified by the BD_ADDR parameter is placed in Sniff mode, an attempt to perform a role switch shall be rejected by the local device.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for the connected device with which a role switch is to be performed.

Role: *Size: 1 octet*

Value	Parameter Description
0x00	Change own Role to Central for this BD_ADDR.
0x01	Change own Role to Peripheral for this BD_ADDR.

Return parameters:

None.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Switch_Role command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host. When the role

switch is performed, an HCI_Role_Change event shall occur to indicate that the roles have been changed, and will be communicated to both Hosts. If no change is required, only the Controller on the local device shall send the event. If a Baseband role switch is attempted but fails, the local Controller shall send the event and the remote Controller may send it.

7.2.9 Read Link Policy Settings command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Link_Policy_Settings	0x000C	Connection_Handle	Status, Connection_Handle, Link_Policy_Settings

Description:

This command will read the Link Policy setting for the specified Connection_Handle. The Connection_Handle shall be a Connection_Handle for an ACL connection. Section 6.18.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Link_Policy_Settings command succeeded.
0x01 to 0xFF	HCI_Read_Link_Policy_Settings command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Link_Policy_Settings: *Size: 2 octets*

Bit Number	Parameter Description
0	Enable Role Switch.
1	Enable Hold mode.

Bit Number	Parameter Description
2	Enable Sniff mode.
All other bits	Reserved for future use.

Event(s) generated (unless masked away):

When the HCI_Read_Link_Policy_Settings command has completed, an HCI_Command_Complete event shall be generated.

7.2.10 Write Link Policy Settings command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Link_Policy_Settings	0x000D	Connection_Handle, Link_Policy_Settings	Status, Connection_Handle

Description:

This command writes the Link Policy setting for the specified Connection_Handle. The Connection_Handle shall be a Connection_Handle for an ACL connection. See Section 6.18.

The default value is the value set by the HCI_Write_Default_Link_Policy_Settings command.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Link_Policy_Settings: *Size: 2 octets*

Bit Number	Parameter Description
0	Enable Role Switch.
1	Enable Hold mode.
2	Enable Sniff mode.
All other bits	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Link_Policy_Settings command succeeded.
0x01 to 0xFF	HCI_Write_Link_Policy_Settings command failed. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_Write_Link_Policy_Settings command has completed, an HCI_Command_Complete event shall be generated.

7.2.11 Read Default Link Policy Settings command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Default_Link_Policy_-Settings	0x000E	*none*	Status, Default_Link_Policy_Settings

Description:

This command reads the Default Link Policy setting for all new BR/EDR connections.

Note: See the Link Policy Settings configuration parameter (Section 6.18) for more information.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Link_Policy_Settings command succeeded
0x01 to 0xFF	HCI_Read_Link_Policy_Settings command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Default_Link_Policy_Settings: *Size: 2 octets*

Bit Number	Parameter Description
0	Enable Role Switch
1	Enable Hold mode
2	Enable Sniff mode
All other bits	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Default_Link_Policy_Settings command has completed, an HCI_Command_Complete event shall be generated.

7.2.12 Write Default Link Policy Settings command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Default_Link_Policy_-Settings	0x000F	Default_Link_Policy_Settings	Status

Description:

This command writes the Default Link Policy configuration value. The Default_Link_Policy_Settings parameter determines the initial value of the Link_Policy_Settings for all new BR/EDR connections.

Note: See the Link Policy Settings configuration parameter (Section 6.18) for more information.

Command parameters:

Default_Link_Policy_Settings: *Size: 2 octets*

Bit Number	Parameter Description
0	Enable Role Switch
1	Enable Hold mode
2	Enable Sniff mode
All other bits	Reserved for future use

The default value is 0x0000.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Link_Policy_Settings command succeeded
0x01 to 0xFF	HCI_Write_Link_Policy_Settings command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Default_Link_Policy_Settings command has completed, an HCI_Command_Complete event will be generated.

7.2.13 Flow Specification command

Command	OCF	Command Parameters	Return Parameters
HCI_Flow_Specification	0x0010	Connection_Handle, Unused, Flow_Direction, Service_Type, Token_Rate, Token_Bucket_Size, Peak_Bandwidth, Access_Latency	*none*

Description:

This command is used to specify the flow parameters for the traffic carried over the ACL connection identified by the Connection_Handle. The Connection_Handle parameter shall be a Connection_Handle for an ACL connection and is used to identify for which connection the Flow Specification is requested. The flow parameters refer to the outgoing or incoming traffic of the ACL link, as indicated by the Flow_Direction field. The HCI_Flow_Specification command allows the Link Manager to have the parameters of the outgoing as well as the incoming flow for the ACL connection. The flow parameters are defined in the L2CAP specification [Vol 3] Part A, Section 5.3, Quality of Service (QoS) option. The Link Manager will determine if the flow parameters can be supported. BR/EDR Controllers that are both Central and Peripheral can use this command.

The Unused parameter is reserved for future use.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Unused: *Size: 1 octet*

Value	Parameter Description
0x00	This value shall be used by the Host.
All other values	Reserved for future use.

Flow_Direction: *Size: 1 octet*

Value	Parameter Description
0x00	Outgoing Flow i.e., traffic sent over the ACL connection
0x01	Incoming Flow i.e., traffic received over the ACL connection
All other values	Reserved for future use.

Service_Type: *Size: 1 octet*

Value	Parameter Description
0x00	No Traffic
0x01	Best Effort
0x02	Guaranteed
All other values	Reserved for future use

Token_Rate: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Token Rate in octets per second

Token_Bucket_Size: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Token Bucket Size in octets

Peak_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Peak Bandwidth in octets per second

Access_Latency: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Latency in microseconds

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_Flow_Specification command, the BR/EDR Controller shall send the HCI_Command_Status event to the Host.

When the Link Manager has determined if the Flow specification can be supported, the BR/EDR Controller on the local BR/EDR Controller shall send an HCI_Flow_Specification_Complete event to the Host. The HCI_Flow_Specification_Complete event returned by the Controller on the local side contains the status of this command, and returned Flow parameters describing the supported QoS for the ACL connection.

Note: If the Link Manager performs an LMP transaction that involves the flow parameter values on the remote side, the remote Controller can send an HCI_Flow_Specification_Complete event or HCI_QoS_Setup_Complete event to the remote Host.

7.2.14 Sniff Subrating command

Command	OCF	Command Parameters	Return Parameters
HCI_Sniff_Subrating	0x0011	Connection_Handle, Max_Latency, Min_Remote_Timeout, Min_Local_Timeout	Status, Connection_Handle

Description:

This command specifies the parameters for sniff subrating for a given link. The interval shall be determined from the sniff interval and the maximum subrate latency parameters from the command. The link may have smaller subrates and therefore lower latencies and longer timeouts than those specified. When the sniff subrate has been exchanged an HCI_Sniff_Subrating event shall be generated. If this command is used on a link in Sniff mode this shall cause sniff subrating to be negotiated at the Link Manager, otherwise sniff subrating shall be negotiated only after the device has entered Sniff mode.

The Connection_Handle shall be the primary Connection_Handle between the two devices.

The Maximum Latency parameter shall define the maximum allowed sniff subrate of the remote device.

If the Host does not write the sniff subrating parameters prior to sniff subrating being initiated by the Link Manager the default values shall be used.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Max_Latency: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The Maximum Latency parameter shall be used to calculate the maximum_sniff subrate that the remote device may use. Default: T_{sniff} Latency = N × 0.625 ms (1 Baseband slot) Range: 0x0002 to 0xFFFE Time Range: 1.25 ms to 40.9 s

Min_Remote_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum sniff mode timeout ($T_{sniff\_mode\_timeout}$) that the remote device may use Default: 0x0000 Timeout = N × 0.625 ms (1 Baseband slot) Range: 0x0000 to 0xFFFE Time Range: 0 s to 40.9 s

Min_Local_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum sniff mode timeout ($T_{sniff\_mode\_timeout}$) that the local device may use. Default: 0x0000 Timeout = N × 0.625 ms (1 Baseband slot) Range: 0x0000 to 0xFFFE Time Range: 0 s to 40.9 s

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_Sniff_Subrating command succeeded.
0x01 to 0xFF	HCI_Sniff_Subrating command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_Sniff_Subrating command has been received by the BR/EDR Controller, an HCI_Command_Complete event shall be generated.

An HCI_Sniff_Subrating event shall occur when the sniff subrating has been negotiated for the specified Connection_Handle.

7.3 Controller & Baseband commands

The Controller & Baseband commands provide access and control to various capabilities of the Bluetooth hardware. These parameters provide control of BR/EDR Controllers and of the capabilities of the Link Manager and Baseband in the BR/EDR Controller and the Link Layer in an LE Controller. The Host can use these commands to modify the behavior of the local Controller.

For the HCI Control and Baseband commands, the OGF is defined as 0x03.

7.3.1 Set Event Mask command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Event_Mask	0x0001	Event_Mask	Status

Description:

This command is used to control which events are generated by the HCI for the Host. If the bit in the Event_Mask is set to a one, then the event associated with that bit will be enabled. For an LE Controller, the “LE Meta event” bit in the event_Mask shall enable or disable all LE events in the LE Meta event (see Section 7.7.65). The event mask allows the Host to control how much it is interrupted.

The Controller shall ignore those bits which are reserved for future use or represent events which it does not support. If the Host sets any of these bits to 1, the Controller shall act as if they were set to 0.

Command parameters:

Event_Mask: *Size: 8 octets*

Bit	Parameter Description
0	Inquiry Complete event
1	Inquiry Result event
2	Connection Complete event
3	Connection Request event
4	Disconnection Complete event
5	Authentication Complete event
6	Remote Name Request Complete event
7	Encryption Change event [v1]
8	Change Connection Link Key Complete event

Bit	Parameter Description
9	Link Key Type Changed event
10	Read Remote Supported Features Complete event
11	Read Remote Version Information Complete event
12	QoS Setup Complete event
15	Hardware Error event
16	Flush Occurred event
17	Role Change event
19	Mode Change event
20	Return Link Keys event
21	PIN Code Request event
22	Link Key Request event
23	Link Key Notification event
24	Loopback Command event
25	Data Buffer Overflow event
26	Max Slots Change event
27	Read Clock Offset Complete event
28	Connection Packet Type Changed event
29	QoS Violation event
30	Previously used
31	Page Scan Repetition Mode Change event
32	Flow Specification Complete event
33	Inquiry Result with RSSI event
34	Read Remote Extended Features Complete event
43	Synchronous Connection Complete event
44	Synchronous Connection Changed event
45	Sniff Subrating event
46	Extended Inquiry Result event
47	Encryption Key Refresh Complete event
48	IO Capability Request event
49	IO Capability Response event
50	User Confirmation Request event
51	User Passkey Request event
52	Remote OOB Data Request event

Bit	Parameter Description
53	Simple Pairing Complete event
55	Link Supervision Timeout Changed event
56	Enhanced Flush Complete event
58	User Passkey Notification event
59	Keypress Notification event
60	Remote Host Supported Features Notification event
61	LE Meta event
All other bits	Reserved for future use

The value with all bits set to 0 indicates that no events are specified. The default is for bits 0 to 44 (the value 0x0000 1FFF FFFF FFFF) to be set.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Event_Mask command succeeded.
0x01 to 0xFF	HCI_Set_Event_Mask command failed. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Set_Event_Mask command has completed, an HCI_Command_Complete event shall be generated.

7.3.2 Reset command

Command	OCF	Command Parameters	Return Parameters
HCI_Reset	0x0003	*none*	Status

Description:

This command will reset the Controller and the Link Manager on the BR/EDR Controller or the Link Layer on an LE Controller. If the Controller supports both BR/EDR and LE then the HCI_Reset command shall reset the Link Manager, Baseband and Link Layer. The HCI_Reset command shall not affect the used HCI transport layer since the HCI transport layers may have reset mechanisms of their own. After the reset is completed, the current operational state will be lost, the Controller will enter standby mode and the Controller will automatically revert to the default values for the parameters for which default values are defined in the specification.

Note: The HCI_Reset command will not necessarily perform a hardware reset. This is implementation defined.

The Host shall not send additional HCI commands before the HCI_Command_Complete event related to the HCI_Reset command has been received.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Reset command succeeded, was received and will be executed.
0x01 to 0xFF	HCI_Reset command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the reset has been performed, an HCI_Command_Complete event shall be generated.

7.3.3 Set Event Filter command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Event_Filter	0x0005	Filter_Type, Filter_Condition_Type, Condition	Status

Description:

This command is used by the Host to specify different event filters. The Host may issue this command multiple times to request various conditions for the same type of event filter and for different types of event filters. The event filters are used by the Host to specify items of interest, which allow the BR/EDR Controller to send only events which interest the Host. Only some of the events have event filters. By default (before this command has been issued after power-on or Reset) no filters are set, and the Auto_Accept_Flag is off (incoming connections are not automatically accepted). An event filter is added each time this command is sent from the Host and the Filter_Condition_Type is not equal to 0x00. (The old event filters will not be overwritten). To clear all event filters, the Filter_Type = 0x00 is used. The Auto_Accept_Flag will then be set to off. To clear event filters for only a certain Filter_Type, the Filter_Condition_Type = 0x00 is used.

The Inquiry Result filter allows the BR/EDR Controller to filter out HCI_Inquiry_Result, HCI_Inquiry_Result_with_RSSI, or HCI_Extended_Inquiry_Result events. The Inquiry Result filter allows the Host to specify that the BR/EDR Controller only sends Inquiry Results to the Host if the report meets one of the specified conditions set by the Host. For the Inquiry Result filter, the Host can specify one or more of the following Filter Condition Types:

1. Return responses from all devices during the Inquiry process
2. A device with a specific Class of Device responded to the Inquiry process
3. A device with a specific BD_ADDR responded to the Inquiry process

The Inquiry Result filter is used in conjunction with the HCI_Inquiry and HCI_Periodic_Inquiry_Mode commands.

The Connection Setup filter allows the Host to specify that the Controller only sends an HCI_Connection_Complete, HCI_Synchronous_Connection_Complete, or HCI_Connection_Request event to the Host if the event meets one of the specified

conditions set by the Host. For the Connection Setup filter, the Host can specify one or more of the following Filter Condition Types:

1. Allow Connections from all devices
2. Allow Connections from a device with a specific Class of Device
3. Allow Connections from a device with a specific BD_ADDR

For each of these conditions, an Auto_Accept_Flag parameter allows the Host to specify what action should be done when the condition is met. The Auto_Accept_Flag allows the Host to specify if the incoming connection should be auto accepted (in which case the BR/EDR Controller will send a HCI_Connection_Complete event to the Host when an ACL or SCO connection is completed or an HCI_Synchronous_Connection_Complete event when an eSCO connection is completed) or if the Host should make the decision (in which case the BR/EDR Controller will send the HCI_Connection_Request event to the Host, to elicit a decision on the connection). If the Auto_Accept_Flag is off and the Host has masked the HCI_Connection_Request event, the Controller shall reject the connection attempt.

Note: Auto-accept does not override any requirement to reject a connection in this specification, such as the requirement in [Vol 2] Part C, Section 4.5.1 to reject a SCO connection when AES-CCM encryption is in use.

If a synchronous connection is auto-accepted, then the default parameter settings of the Accept_Synchronous_Connection_Request command (see Section 7.1.27) should be used by the local Link Manager when negotiating the SCO or eSCO link parameters.

The Connection Setup filter is used in conjunction with the HCI_Read/Write_Scan_-Enable commands. If the local device is in the process of a page scan, and is paged by another device which meets one on the conditions set by the Host, and the Auto_Accept_Flag is off for this device, then an HCI_Connection_Request event will be sent to the Host by the BR/EDR Controller. An HCI_Connection_Complete event will be sent later on after the Host has responded to the incoming connection attempt. In this same example, if the Auto_Accept_Flag is on, then an HCI_Connection_Complete event will be sent to the Host by the Controller. (No HCI_Connection_Request event will be sent in that case.)

The BR/EDR Controller will store these filters in volatile memory until the Host clears the event filters using the HCI_Set_Event_Filter command or until the HCI_Reset command is issued. The number of event filters the BR/EDR Controller can store is implementation dependent.

Note: The Clear All Filters has no Filter Condition Types or Conditions.

Note: In the condition that a connection is auto accepted, an HCI_Link_Key_Request event and possibly also an HCI_PIN_Code_Request event and an HCI_Link_-Key_Notification event could be sent to the Host by the Controller before the HCI_Connection_Complete event is sent.

If there is a contradiction between event filters, the latest set event filter will override older ones. An example is an incoming connection attempt where more than one Connection Setup filter matches the incoming connection attempt, but the Auto-Accept_Flag has different values in the different filters.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	The Host tries to set more filters than the BR/EDR Controller can store.	*Memory Capacity Exceeded* (0x07)

Command parameters:

Filter_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Clear All Filters Note: In this case, the Filter_Condition_Type and Condition parameters should not be given; they should have a length of zero octets. Filter_Type should be the only parameter.
0x01	Inquiry Result.
0x02	Connection Setup.
All other values	Reserved for future use.

Filter Condition Types: For each Filter Type one or more Filter Condition types exists.

Inquiry_Result_Filter_Condition_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Return responses from all devices during the Inquiry process. Note: A device may be reported to the Host in an HCI_Inquiry_Result, HCI_Inquiry_-Result_with_RSSI, or HCI_Extended_Inquiry_Result event more than once during an inquiry or inquiry period depending on the implementation; see description in Section 7.1.1 and Section 7.1.3.
0x01	A device with a specific Class of Device responded to the Inquiry process.

Value	Parameter Description
0x02	A device with a specific BD_ADDR responded to the Inquiry process.
All other values	Reserved for future use

Connection_Setup_Filter_Condition_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Allow Connections from all devices.
0x01	Allow Connections from a device with a specific Class of Device.
0x02	Allow Connections from a device with a specific BD_ADDR.
All other values	Reserved for future use.

Condition: For each Filter Condition Type defined for the Inquiry Result Filter and the Connection Setup Filter, zero or more Condition parameters are required – depending on the filter condition type and filter type.

Condition for Inquiry_Result_Filter_Condition_Type = 0x00

Condition: *Size: 0 octets*

Value	Parameter Description
	The Condition parameter is not used.

Condition for Inquiry_Result_Filter_Condition_Type = 0x01

Condition: *Size: 6 octets*

Class_Of_Device: *Size: 3 octets*

Value	Parameter Description
0x000000	Return All Devices (default).
0xXXXXXX	*Class of Device* of Interest.

Class_Of_Device_Mask: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Bit Mask used to determine which bits of the Class of Device parameter are ‘don’t care’. Zero-value bits in the mask indicate the ‘don’t care’ bits of the Class of Device.

Condition for Inquiry_Result_Filter_Condition_Type = 0x02

Condition: *Size: 6 octets*

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device of Interest

Condition for Connection_Setup_Filter_Condition_Type = 0x00

Condition: *Size: 1 octet*

Auto_Accept_Flag: *Size: 1 octet*

Value	Parameter Description
0x01	Do NOT Auto accept the connection. (Auto accept is off)
0x02	Do Auto accept the connection with role switch disabled. (Auto accept is on).
0x03	Do Auto accept the connection with role switch enabled. (Auto accept is on). Note: When auto accepting an incoming synchronous connection, no role switch will be performed. The value 0x03 of the Auto_Accept_Flag will then get the same effect as if the value had been 0x02.
All other values	Reserved for future use.

Condition for Connection_Setup_Filter_Condition_Type = 0x01

Condition: *Size: 7 octets*

Class_Of_Device: *Size: 3 octets*

Value	Parameter Description
0x000000	Return All Devices (default).
0xXXXXXX	*Class of Device* of Interest.

Class_Of_Device_Mask: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Bit Mask used to determine which bits of the Class of Device parameter are ‘don’t care’. Zero-value bits in the mask indicate the ‘don’t care’ bits of the Class of Device. Note: For an incoming SCO connection, if the Class of Device is unknown then the connection will be accepted.

Auto_Accept_Flag: *Size: 1 octet*

Value	Parameter Description
0x01	Do NOT Auto accept the connection. (Auto accept is off)
0x02	Do Auto accept the connection with role switch disabled. (Auto accept is on).
0x03	Do Auto accept the connection with role switch enabled. (Auto accept is on). Note: When auto accepting an incoming synchronous connection, no role switch will be performed. The value 0x03 of the Auto_Accept_Flag will then get the same effect as if the value had been 0x02.
All other values	Reserved for future use.

Condition for Connection_Setup_Filter_Condition_Type = 0x02

Condition: *Size: 7 octets*

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device of Interest.

Auto_Accept_Flag: *Size: 1 octet*

Value	Parameter Description
0x01	Do NOT Auto accept the connection. (Auto accept is off)
0x02	Do Auto accept the connection with role switch disabled. (Auto accept is on).
0x03	Do Auto accept the connection with role switch enabled. (Auto accept is on). Note: When auto accepting an incoming synchronous connection, no role switch will be performed. The value 0x03 of the Auto_Accept_Flag will then get the same effect as if the value had been 0x02.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Event_Filter command succeeded.
0x01 to 0xFF	HCI_Set_Event_Filter command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

An HCI_Command_Complete event for this command shall occur when the Controller has enabled the filtering of events. When one of the conditions are met, a specific event shall occur.

7.3.4 Flush command

Command	OCF	Command Parameters	Return Parameters
HCI_Flush	0x0008	Connection_Handle	Status, Connection_Handle

Description:

This command is used to discard all data that is currently pending for transmission in the Controller for the specified Connection_Handle, even if there currently are chunks of data that belong to more than one L2CAP packet in the Controller. Both automatically-flushable and non-automatically-flushable packets shall be discarded (see Section 5.4.2). After this, all data that is sent to the Controller for the same Connection_Handle will be discarded by the Controller until an HCI ACL Data packet with one of the start Packet_Boundary_Flag values (0x00 or 0x02) is received. When this happens, a new transmission attempt can be made.

This command, when used on a BR/EDR Controller, will allow higher-level software to control how long the Baseband should try to retransmit a Baseband packet for a Connection_Handle before all data that is currently pending for transmission in the Controller should be flushed.

Note: The HCI_Flush command is used for ACL connections only. In addition to the HCI_Flush command, the automatic flush timers (see Section 7.3.29) can be used to automatically flush an automatically-flushable L2CAP packet that is currently being transmitted after the specified flush timer has expired.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Flush command succeeded.
0x01 to 0xFF	HCI_Flush command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

The HCI_Flush_Occurred event shall occur once the flush is completed. An HCI_Flush_Occurred event could be from an automatic Flush or could be caused by the Host issuing the HCI_Flush command. When the HCI_Flush command has completed, an HCI_Command_Complete event shall be generated, to indicate that the Host caused the Flush.

7.3.5 Read PIN Type command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_PIN_Type	0x0009	*none*	Status, PIN_Type

Description:

This command is used to read the PIN_Type configuration parameter. See Section 6.13.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_PIN_Type command succeeded.
0x01 to 0xFF	HCI_Read_PIN_Type command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

PIN_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Variable PIN.
0x01	Fixed PIN.

Event(s) generated (unless masked away):

When the HCI_Read_PIN_Type command has completed, an HCI_Command_Complete event will be generated.

7.3.6 Write PIN Type command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_PIN_Type	0x000A	PIN_Type	Status

Description:

This command is used to write the PIN Type configuration parameter. See Section 6.13.

Command parameters:

PIN_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Variable PIN.
0x01	Fixed PIN.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_PIN_Type command succeeded.
0x01 to 0xFF	HCI_Write_PIN_Type command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_PIN_Type command has completed, an HCI_Command_Complete event shall be generated.

7.3.7 [This section is no longer used]

7.3.8 Read Stored Link Key command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Stored_Link_Key	0x000D	BD_ADDR, Read_All	Status, Max_Num_Keys, Num_Keys_Read

Description:

This command provides the ability to read whether one or more link keys are stored in the BR/EDR Controller. The BR/EDR Controller can store a limited number of link keys for other BR/EDR Controllers. Link keys are shared between two BR/EDR Controllers, and are used for all security transactions between the two devices. The HCI_Read_Stored_Link_Key command shall not return the link key's value. A Host device may have additional storage capabilities, which can be used to save additional link keys to be reloaded to the BR/EDR Controller when needed. The Read_All parameter is used to indicate if all of the stored Link Keys should be returned. If Read_All indicates that all Link Keys are to be returned, then the BD_ADDR parameter shall be ignored. Otherwise, BD_ADDR is used to identify which link key to read. The stored Link Keys are returned by one or more HCI_Return_Link_Keys events. See Section 6.14.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for the stored link key to be read.

Read_All: *Size: 1 octet*

Value	Parameter Description
0x00	Return Link Key for specified BD_ADDR.
0x01	Return all stored Link Keys.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Stored_Link_Key command succeeded.
0x01 to 0xFF	HCI_Read_Stored_Link_Key command failed. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Max_Num_Keys: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Total Number of Link Keys that the Controller can store. Range: 0x0000 to 0xFFFF

Num_Keys_Read: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of Link Keys Read. Range: 0x0000 to 0xFFFF

Event(s) generated (unless masked away):

Zero or more instances of the HCI_Return_Link_Keys event shall occur after the command is issued. When there are no link keys stored, no HCI_Return_Link_Keys events will be returned. When there are link keys stored, the number of link keys returned in each HCI_Return_Link_Keys event is implementation specific. When the HCI_Read_Stored_Link_Key command has completed an HCI_Command_Complete event shall be generated.

7.3.9 Write Stored Link Key command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Stored_Link_Key	0x0011	Num_Keys_To_Write, BD_ADDR[i], Link_Key[i]	Status, Num_Keys_Written

Description:

This command provides the ability to write one or more link keys to be stored in the BR/EDR Controller. The BR/EDR Controller can store a limited number of link keys for other BR/EDR Controllers. If no additional space is available in the BR/EDR Controller then no additional link keys will be stored. If space is limited and if all the link keys to be stored will not fit in the limited space, then the order of the list of link keys without any error will determine which link keys are stored. Link keys at the beginning of the list will be stored first. The Num_Keys_Written parameter will return the number of link keys that were successfully stored. If no additional space is available, then the Host must delete one or more stored link keys before any additional link keys are stored. The link key replacement algorithm is implemented by the Host and not the BR/EDR Controller. Link keys are shared between two BR/EDR Controllers and are used for all security transactions between the two devices. A Host device may have additional storage capabilities, which can be used to save additional link keys to be reloaded to the BR/EDR Controller when needed. See Section 6.14.

Note: Link Keys are only stored by issuing this command.

A Host in Secure Connections Only Mode should not store link keys in the Controller.

Command parameters:

Num_Keys_To_Write: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of Link Keys to Write. Range: 0x01 to 0x0B

BD_ADDR[i]: *Size: Num_Keys_To_Write × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for the associated Link Key.

Link_Key[i]: *Size: Num_Keys_To_Write × 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	Link Key for an associated BD_ADDR.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Stored_Link_Key command succeeded.
0x01 to 0xFF	HCI_Write_Stored_Link_Key command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_Keys_Written: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of Link Keys successfully written. Range: 0x00 to 0x0B

Event(s) generated (unless masked away):

When the HCI_Write_Stored_Link_Key command has completed, an HCI_Command_Complete event shall be generated.

7.3.10 Delete Stored Link Key command

Command	OCF	Command Parameters	Return Parameters
HCI_Delete_Stored_Link_Key	0x0012	BD_ADDR, Delete_All	Status, Num_Keys_Deleted

Description:

This command provides the ability to remove one or more of the link keys stored in the BR/EDR Controller. The BR/EDR Controller can store a limited number of link keys for other BR/EDR devices.

The Delete_All parameter indicates whether one or all of the stored Link Keys are to be deleted. If Delete_All indicates that all Link Keys are to be deleted, then the BD_ADDR parameter shall be ignored. Otherwise, BD_ADDR identifies which link key to delete.

If a link key to be deleted is currently in use for a connection, then the link key shall be deleted immediately from the store but only completely deleted when all of the connections using it are disconnected. Otherwise the link key shall be deleted immediately. In either case, the command is completed when the key has (or all the keys have) been deleted from the store and, therefore, the key(s) cannot subsequently be read using the HCI_Read_Stored_Link_Key command. See Section 6.14.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for the link key to be deleted.

Delete_All: *Size: 1 octet*

Value	Parameter Description
0x00	Delete only the Link Key for specified BD_ADDR.
0x01	Delete all stored Link Keys.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Delete_Stored_Link_Key command succeeded.
0x01 to 0xFF	HCI_Delete_Stored_Link_Key command failed. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Num_Keys_Deleted: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of Link Keys deleted from the store

Event(s) generated (unless masked away):

When the HCI_Delete_Stored_Link_Key command has completed, an HCI_Command_Complete event shall be generated.

7.3.11 Write Local Name command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Local_Name	0x0013	Local_Name	Status

Description:

This command provides the ability to modify the user-friendly name for the BR/EDR Controller. See Section 6.23.

Command parameters:

Local_Name: *Size: 248 octets*

Value	Parameter Description
	A UTF-8 encoded User-Friendly Descriptive Name for the device with type utf8s{248} (see [Vol 1] Part E, Section 2.9.3).

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Local_Name command succeeded.
0x01 to 0xFF	HCI_Write_Local_Name command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Local_Name command has completed, an HCI_Command_Complete event shall be generated.

7.3.12 Read Local Name command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_Name	0x0014	*none*	Status, Local_Name

Description:

This command provides the ability to read the stored user-friendly name for the BR/EDR Controller. See Section 6.23.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_Name command succeeded
0x01 to 0xFF	HCI_Read_Local_Name command failed (see [Vol 1] Part F, Controller Error Codes for list of error codes).

Local_Name: *Size: 248 octets*

Parameter Description
A UTF-8 encoded User Friendly Descriptive Name for the device with type utf8s{248} (see [Vol 1] Part E, Section 2.9.3)

Event(s) generated (unless masked away):

When the HCI_Read_Local_Name command has completed an HCI_Command_Complete event shall be generated.

7.3.13 Read Connection Accept Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Connection_Accept_-Timeout	0x0015	*none*	Status, Connection_Accept_Timeout

Description:

This command reads the value for the Connection_Accept_Timeout configuration parameter. See Section 6.7.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Connection_Accept_Timeout command succeeded.
0x01 to 0xFF	HCI_Read_Connection_Accept_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Accept_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Connection Accept Timeout measured in number of BR/EDR Baseband slots. Interval Length = N × 0.625 ms (1 Baseband slot) Range: 0x0001 to 0xB540 Time Range: 0.625 ms to 29 s

Event(s) generated (unless masked away):

When the HCI_Read_Connection_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.14 Write Connection Accept Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Connection_Accept_-Timeout	0x0016	Connection_Accept_Timeout	Status

Description:

This command writes the value for the Connection_Accept_Timeout configuration parameter. See Section 6.7.

Command parameters:

Connection_Accept_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Connection Accept Timeout measured in number of BR/EDR Baseband slots. Interval Length = N × 0.625 ms (1 Baseband slot) Range: 0x0001 to 0xB540 Time Range: 0.625 ms to 29 s Default: 0x1FA0 (5.06 s) Mandatory Range for Controller: 0x00A0 to 0xB540

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Connection_Accept_Timeout command succeeded.
0x01 to 0xFF	HCI_Write_Connection_Accept_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Connection_Accept_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.15 Read Page Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Page_Timeout	0x0017	*none*	Status, Page_Timeout

Description:

This command reads the value for the Page_Timeout configuration parameter. See Section 6.6.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Page_Timeout command succeeded.
0x01 to 0xFF	HCI_Read_Page_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Page_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Page Timeout measured in number of Baseband slots. Interval Length = N × 0.625 ms (1 Baseband slot) Range: 0x0001 to 0xFFFF Time Range: 0.625 ms to 40.9 s

Event(s) generated (unless masked away):

When the HCI_Read_Page_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.16 Write Page Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Page_Timeout	0x0018	Page_Timeout	Status

Description:

This command writes the value for the Page_Timeout configuration parameter. See Section 6.6.

Command parameters:

Page_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Page Timeout measured in number of Baseband slots. Interval Length = N × 0.625 ms (1 Baseband slot) Range: 0x0001 to 0xFFFF Time Range: 0.625 ms to 40.9 s Default: 0x2000 (5.12 s) Mandatory Range for Controller: 0x0016 to 0xFFFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Page_Timeout command succeeded.
0x01 to 0xFF	HCI_Write_Page_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Page_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.17 Read Scan Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Scan_Enable	0x0019	*none*	Status, Scan_Enable

Description:

This command reads the value for the Scan_Enable parameter configuration parameter. See Section 6.1.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Scan_Enable command succeeded.
0x01 to 0xFF	HCI_Read_Scan_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Scan_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	No Scans enabled.
0x01	Inquiry Scan enabled. Page Scan disabled.
0x02	Inquiry Scan disabled. Page Scan enabled.
0x03	Inquiry Scan enabled. Page Scan enabled.
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Scan_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.3.18 Write Scan Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Scan_Enable	0x001A	Scan_Enable	Status

Description:

This command writes the value for the Scan_Enable configuration parameter. See Section 6.1.

Command parameters:

Scan_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	No Scans enabled (default)
0x01	Inquiry Scan enabled. Page Scan disabled.
0x02	Inquiry Scan disabled. Page Scan enabled.
0x03	Inquiry Scan enabled. Page Scan enabled.
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Scan_Enable command succeeded.
0x01 to 0xFF	HCI_Write_Scan_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Scan_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.3.19 Read Page Scan Activity command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Page_Scan_Activity	0x001B	*none*	Status, Page_Scan_Interval, Page_Scan_Window

Description:

This command reads the value for Page_Scan_Interval and Page_Scan_Window configuration parameters. See Section 6.8 and Section 6.9.

Note: Page Scan is only performed when Page_Scan is enabled (see Section 6.1, Section 7.3.17, and Section 7.3.18). A changed Page_Scan_Interval could change the local Page Scan Repetition Mode (see [Vol 2] Part B, Section 8.3.1).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Page_Scan_Activity command succeeded.
0x01 to 0xFF	HCI_Read_Page_Scan_Activity command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Page_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0012 to 0x1000 Time = N × 0.625 ms Range: 11.25 ms to 2560 ms; only even values are valid

Page_Scan_Window: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0011 to 0x1000 Time = N × 0.625 ms Range: 10.625 ms to 2560 ms

Event(s) generated (unless masked away):

When the HCI_Read_Page_Scan_Activity command has completed, an HCI_Command_Complete event shall be generated.

7.3.20 Write Page Scan Activity command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Page_Scan_Activity	0x001C	Page_Scan_Interval, Page_Scan_Window	Status

Description:

This command writes the values for the Page_Scan_Interval and Page_Scan_Window configuration parameters. The Page_Scan_Window shall be less than or equal to the Page_Scan_Interval. See Section 6.8 and Section 6.9.

Note: Page Scan is only performed when Page_Scan is enabled (see Section 6.1, Section 7.3.17, and Section 7.3.18). A changed Page_Scan_Interval could change the local Page Scan Repetition Mode (see [Vol 2] Part B, Section 8.3.1).

Command parameters:

Page_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
See Section 6.8	

Page_Scan_Window: *Size: 2 octets*

Value	Parameter Description
See Section 6.9	

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Page_Scan_Activity command succeeded.
0x01 to 0xFF	HCI_Write_Page_Scan_Activity command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Page_Scan_Activity command has completed, an HCI_Command_Complete event shall be generated.

7.3.21 Read Inquiry Scan Activity command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Inquiry_Scan_Activity	0x001D	*none*	Status, Inquiry_Scan_Interval, Inquiry_Scan_Window

Description:

This command reads the value for Inquiry_Scan_Interval and Inquiry_Scan_Window configuration parameter. See Section 6.2 and Section 6.3.

Note: Inquiry Scan is only performed when Inquiry_Scan is enabled see Section 6.1, Section 7.3.17, and Section 7.3.18).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Inquiry_Scan_Activity command succeeded.
0x01 to 0xFF	HCI_Read_Inquiry_Scan_Activity command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Inquiry_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0012 to 0x1000 Time = N × 0.625 ms Range: 11.25 to 2560 ms; only even values are valid

Inquiry_Scan_Window: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Range: 0x0011 to 0x1000 Time = N × 0.625 ms Range: 10.625 ms to 2560 ms

Event(s) generated (unless masked away):

When the HCI_Read_Inquiry_Scan_Activity command has completed, an HCI_Command_Complete event shall be generated.

7.3.22 Write Inquiry Scan Activity command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Inquiry_Scan_Activity	0x001E	Inquiry_Scan_Interval, Inquiry_Scan_Window	Status

Description:

This command writes the values for the Inquiry_Scan_Interval and Inquiry_Scan_Window configuration parameters. The Inquiry_Scan_Window shall be less than or equal to the Inquiry_Scan_Interval. See Section 6.2 and Section 6.3.

Note: Inquiry Scan is only performed when Inquiry_Scan is enabled (see Section 6.1, Section 7.3.17, and Section 7.3.18).

Command parameters:

Inquiry_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
See Section 6.2.	

Inquiry_Scan_Window: *Size: 2 octets*

Value	Parameter Description
See Section 6.3.	

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Inquiry_Scan_Activity command succeeded.
0x01 to 0xFF	HCI_Write_Inquiry_Scan_Activity command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Inquiry_Scan_Activity command has completed, an HCI_Command_Complete event shall be generated.

7.3.23 Read Authentication Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Authentication_Enable	0x001F	*none*	Status, Authentication_Enable

Description:

This command reads the value for the Authentication_Enable configuration parameter. See Section 6.16 Authentication Enable.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Authentication_Enable command succeeded.
0x01 to 0xFF	HCI_Read_Authentication_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Authentication_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Authentication not required.
0x01	Authentication required for all connections.
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Authentication_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.3.24 Write Authentication Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Authentication_Enable	0x0020	Authentication_Enable	Status

Description:

This command writes the value for the Authentication_Enable configuration parameter. See Section 6.16 Authentication Enable.

The Authentication_Enable configuration parameter shall only apply to connections (e.g. send an LMP_IN_RAND or LMP_AU_RAND) when the remote device's Host or BR/EDR Controller does not support Secure Simple Pairing or when the local Host does not support Secure Simple Pairing.

Command parameters:

Authentication_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Authentication not required (default)
0x01	Authentication required for all connections.
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Authentication_Enable command succeeded.
0x01 to 0xFF	HCI_Write_Authentication_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Authentication_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.3.25 Read Class of Device command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Class_Of_Device	0x0023	*none*	Status, Class_Of_Device

Description:

This command reads the value for the Class_Of_Device parameter. See Section 6.26.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Class_Of_Device command succeeded.
0x01 to 0xFF	HCI_Read_Class_Of_Device command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Class_Of_Device: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Class of Device for the device.

Event(s) generated (unless masked away):

When the HCI_Read_Class_Of_Device command has completed, an HCI_Command_Complete event shall be generated.

7.3.26 Write Class of Device command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Class_Of_Device	0x0024	Class_Of_Device	Status

Description:

This command writes the value for the Class_Of_Device parameter.

See Section 6.26.

Command parameters:

Class_Of_Device: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Class of Device for the device.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Class_Of_Device command succeeded.
0x01 to 0xFF	HCI_Write_Class_Of_Device command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Class_Of_Device command has completed, an HCI_Command_Complete event shall be generated.

7.3.27 Read Voice Setting command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Voice_Setting	0x0025	*none*	Status, Voice_Setting

Description:

This command reads the values for the Voice_Setting configuration parameter. See Section 6.12.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Voice_Setting command succeeded.
0x01 to 0xFF	HCI_Read_Voice_Setting command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Voice_Setting: *Size: 2 octets (10 bits meaningful)*

Value	Parameter Description
See Section 6.12.	

Event(s) generated (unless masked away):

When the HCI_Read_Voice_Setting command has completed, an HCI_Command_Complete event shall be generated.

7.3.28 Write Voice Setting command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Voice_Setting	0x0026	Voice_Setting	Status

Description:

This command writes the values for the Voice_Setting configuration parameter. See Section 6.12.

Command parameters:

Voice_Setting: *Size: 2 octets (10 bits meaningful)*

Value	Parameter Description
See Section 6.12.	

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Voice_Setting command succeeded.
0x01 to 0xFF	HCI_Write_Voice_Setting command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Voice_Setting command has completed, an HCI_Command_Complete event shall be generated.

7.3.29 Read Automatic Flush Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Automatic_Flush_Timeout	0x0027	Connection_Handle	Status, Connection_Handle, Flush_Timeout

Description:

This command reads the value for the Flush_Timeout parameter for the specified Connection_Handle. See Section 6.19.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Automatic_Flush_Timeout command succeeded.
0x01 to 0xFF	HCI_Read_Automatic_Flush_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Flush_Timeout: *Size: 2 octets*

Value	Parameter Description
0x0000	Timeout = ∞; No Automatic Flush
N = 0xXXXX	Flush Timeout = N × 0.625 ms Range: 0x0001 to 0x07FF

Event(s) generated (unless masked away):

When the HCI_Read_Automatic_Flush_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.30 Write Automatic Flush Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Automatic_Flush_Timeout	0x0028	Connection_Handle, Flush_Timeout	Status, Connection_Handle

Description:

This command writes the value for the Flush_Timeout parameter for the specified Connection_Handle. See Section 6.19.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Flush_Timeout: *Size: 2 octets*

Value	Parameter Description
0x0000	Timeout = ∞; No Automatic Flush (default)
N = 0xXXXX	Flush Timeout = N × 0.625 ms Range: 0x0001 to 0x07FF Mandatory Range for Controller: 0x0002 to 0x07FF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Automatic_Flush_Timeout command succeeded.
0x01 to 0xFF	HCI_Write_Automatic_Flush_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_Write_Automatic_Flush_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.31 Read Num Broadcast Retransmissions command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Num_Broadcast_-Retransmissions	0x0029	*none*	Status, Num_Broadcast_Retransmissions

Description:

This command reads the device's parameter value for the Number of Broadcast Retransmissions. See Section 6.20

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Num_Broadcast_Retransmissions command succeeded.
0x01 to 0xFF	HCI_Read_Num_Broadcast_Retransmissions command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_Broadcast_Retransmissions: *Size: 1 octet*

Value	Parameter Description
See Section 6.20.	

Event(s) generated (unless masked away):

When the HCI_Read_Num_Broadcast_Retransmission command has completed, an HCI_Command_Complete event shall be generated.

7.3.32 Write Num Broadcast Retransmissions command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Num_Broadcast_-Retransmissions	0x002A	Num_Broadcast_Retransmissions	Status

Description:

This command writes the device's parameter value for the Number of Broadcast Retransmissions. See Section 6.20.

Command parameters:

Num_Broadcast_Retransmissions: *Size: 1 octet*

Value	Parameter Description
See Section 6.20.	

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Num_Broadcast_Retransmissions command succeeded.
0x01 to 0xFF	HCI_Write_Num_Broadcast_Retransmissions command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Num_Broadcast_Retransmissions command has completed, an HCI_Command_Complete event shall be generated.

7.3.33 Read Hold Mode Activity command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Hold_Mode_Activity	0x002B	*none*	Status, Hold_Mode_Activity

Description:

This command reads the value for the Hold_Mode_Activity parameter.

See Section 6.16.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Hold_Mode_Activity command succeeded.
0x01 to 0xFF	HCI_Read_Hold_Mode_Activity command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Hold_Mode_Activity: *Size: 1 octet*

Value	Parameter Description
0x00	Maintain current Power State.
0x01	Suspend Page Scan.
0x02	Suspend Inquiry Scan.
0x04	Suspend Periodic Inquiries.
All other values	Reserved for future use.

Event(s) generated (unless masked away):

When the HCI_Read_Hold_Mode_Activity command has completed, an HCI_Command_Complete event shall be generated.

7.3.34 Write Hold Mode Activity command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Hold_Mode_Activity	0x002C	Hold_Mode_Activity	Status

Description:

This command writes the value for the Hold_Mode_Activity parameter.

See Section 6.16.

Command parameters:

Hold_Mode_Activity: *Size: 1 octet*

Value	Parameter Description
0x00	Maintain current Power State (default)
0x01	Suspend Page Scan.
0x02	Suspend Inquiry Scan.
0x04	Suspend Periodic Inquiries.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Hold_Mode_Activity command succeeded.
0x01 to 0xFF	HCI_Write_Hold_Mode_Activity command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Hold_Mode_Activity command has completed, an HCI_Command_Complete event shall be generated.

7.3.35 Read Transmit Power Level command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Transmit_Power_Level	0x002D	Connection_Handle, Type	Status, Connection_Handle, TX_Power_Level

Description:

This command reads the values for the TX_Power_Level parameter for the specified Connection_Handle. The Connection_Handle shall be a Connection_Handle for an ACL connection.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Type: *Size: 1 octet*

Value	Parameter Description
0x00	Read Current Transmit Power Level.
0x01	Read Maximum Transmit Power Level.
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Transmit_Power_Level command succeeded.
0x01 to 0xFF	HCI_Read_Transmit_Power_Level command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

TX_Power_Level: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -30 to 20 Units: dBm

Event(s) generated (unless masked away):

When the HCI_Read_Transmit_Power_Level command has completed, an HCI_Command_Complete event shall be generated.

7.3.36 Read Synchronous Flow Control Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Synchronous_-Flow_Control_Enable	0x002E	*none*	Status, Synchronous_Flow_Control_Enable

Description:

This command provides the ability to read the Synchronous_Flow_Control_Enable parameter. See Section 6.22.

The Synchronous_Flow_Control_Enable parameter shall only be changed if no connection exists.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Synchronous_Flow_Control_Enable command succeeded
0x01 to 0xFF	HCI_Read_Synchronous_Flow_Control_Enable command failed (see [Vol 1] Part F, Controller Error Codes for list of error codes).

Synchronous_Flow_Control_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Synchronous Flow Control is disabled. No HCI_Number_Of_Completed_Packets events will be sent from the Controller for synchronous Connection_Handles.
0x01	Synchronous Flow Control is enabled. HCI_Number_Of_Completed_Packets events will be sent from the Controller for synchronous Connection_Handles.

Event(s) generated (unless masked away):

When the HCI_Read_Synchronous_Flow_Control_Enable command has completed an HCI_Command_Complete event shall be generated.

7.3.37 Write Synchronous Flow Control Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Synchronous_-Flow_Control_Enable	0x002F	Synchronous_Flow_-Control_Enable	Status

Description:

This command provides the ability to write the Synchronous_Flow_Control_Enable parameter. See Section 6.22.

The Synchronous_Flow_Control_Enable parameter can only be changed if no connections exist.

Command parameters:

Synchronous_Flow_Control_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Synchronous Flow Control is disabled. No HCI_Number_Of_Completed_Packets events shall be sent from the Controller for synchronous Connection_Handles. **Default**
0x01	Synchronous Flow Control is enabled. HCI_Number_Of_Completed_Packets events shall be sent from the Controller for synchronous Connection_Handles.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Synchronous_Flow_Control_Enable command succeeded
0x01 to 0xFF	HCI_Write_Synchronous_Flow_Control_Enable command failed (see [Vol 1] Part F, Controller Error Codes for list of error codes.)

Event(s) generated (unless masked away):

When the HCI_Write_Synchronous_Flow_Control_Enable command has completed an HCI_Command_Complete event shall be generated.

7.3.38 Set Controller To Host Flow Control command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Controller_To_Host_Flow_-Control	0x0031	Flow_Control_Enable	Status

Description:

This command is used by the Host to turn flow control on or off for data and/or voice sent in the direction from the Controller to the Host. If flow control is turned off, the Host should not send the HCI_Host_Number_Of_Completed_Packets command. That command will be ignored by the Controller if it is sent by the Host and flow control is off. If flow control is turned on for HCI ACL Data packets and off for HCI Synchronous Data packets, HCI_Host_Number_Of_Completed_Packets commands sent by the Host should only contain Connection_Handles for ACL connections. If flow control is turned off for HCI ACL Data packets and on for HCI Synchronous Data packets, HCI_Host_Number_Of_Completed_Packets commands sent by the Host should only contain Connection_Handles for synchronous connections. If flow control is turned on for HCI ACL Data packets and HCI Synchronous Data packets, the Host will send HCI_Host_Number_Of_Completed_Packets commands both for ACL connections and synchronous connections.

The Flow_Control_Enable parameter shall only be changed if no connections exist.

Command parameters:

Flow_Control_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Flow control **off** in direction from Controller to Host (default)
0x01	Flow control **on** for HCI ACL Data packets and **off** for HCI Synchronous Data packets in direction from Controller to Host.
0x02	Flow control **off** for HCI ACL Data packets and **on** for HCI Synchronous Data packets in direction from Controller to Host.
0x03	Flow control **on** both for HCI ACL Data packets and HCI Synchronous Data packets in direction from Controller to Host.
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Controller_To_Host_Flow_Control command succeeded.
0x01 to 0xFF	HCI_Set_Controller_To_Host_Flow_Control command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Set_Controller_To_Host_Flow_Control command has completed, an HCI_Command_Complete event shall be generated.

7.3.39 Host Buffer Size command

Command	OCF	Command Parameters	Return Parameters
HCI_Host_Buffer_-Size	0x0033	Host_ACL_Data_Packet_Length, Host_Synchronous_Data_Packet_Length, Host_Total_Num_ACL_Data_Packets, Host_Total_Num_Synchronous_Data_Packets	Status

Description:

This command is used by the Host to notify the Controller about the maximum size of the data portion of HCI ACL and Synchronous Data packets sent from the Controller to the Host. The Controller shall fragment the data to be transmitted from the Controller to the Host according to these sizes, so that the HCI Data packets will contain data with up to these sizes. The HCI_Host_Buffer_Size command also notifies the Controller about the total number of HCI ACL and Synchronous Data packets that can be stored in the data buffers of the Host. If flow control from the Controller to the Host is turned off, and the HCI_Host_Buffer_Size command has not been issued by the Host, this means that the Controller will send HCI Data packets to the Host with any lengths the Controller wants to use, and it is assumed that the data buffer sizes of the Host are unlimited.
If flow control from the Controller to the Host is turned on, the HCI_Host_Buffer_Size command shall after a power-on or a reset always be sent by the Host before the first HCI_Host_Number_Of_Completed_Packets command is sent.

The HCI_Set_Controller_To_Host_Flow_Control command is used to turn flow control on or off. The Host_ACL_Data_Packet_Length parameter will be used to determine the size of the L2CAP fragments contained in ACL Data packets, which are transferred from the Controller to the Host. The Host_Synchronous_Data_Packet_Length parameter is used to determine the maximum size of HCI Synchronous Data packets. Both the Host and the Controller shall support command and event packets, where the data portion (excluding header) contained in the packets is 255 octets in size.

The Host_Total_Num_ACL_Data_Packets parameter contains the total number of HCI ACL Data packets that can be stored in the data buffers of the Host. The Controller will determine how the buffers are to be divided between different Connection_Handles. The Host_Total_Num_Synchronous_Data_Packets parameter gives the same information for HCI Synchronous Data packets. If the Host does not support SCO or eSCO over HCI, then it shall set Host_Total_Num_Synchronous_Data_Packets to zero, in which case the Controller shall ignore the Host_Synchronous_Data_Packet_Length parameter.

Note: The Host_ACL_Data_Packet_Length and Host_Synchronous_Data_Packet_Length command parameters do not include the length of the HCI ACL Data packet header or the HCI Synchronous Data packet header respectively.

Command parameters:

Host_ACL_Data_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum length (in octets) of the data portion of each HCI ACL Data packet that the Host is able to accept. Range: 0x0001 to 0xFFFF

Host_Synchronous_Data_Packet_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Maximum length (in octets) of the data portion of each HCI Synchronous Data packet that the Host is able to accept. Range: 0x01 to 0xFF

Host_Total_Num_ACL_Data_Packets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Total number of HCI ACL Data packets that can be stored in the data buffers of the Host. Range: 0x0001 to 0xFFFF

Host_Total_Num_Synchronous_Data_Packets: *Size: 2 octets*

Value	Parameter Description
0x0000	The Host does not support SCO or eSCO over HCI.
0xXXXX	Total number of HCI Synchronous Data packets that can be stored in the data buffers of the Host.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Host_Buffer_Size command succeeded.
0x01 to 0xFF	HCI_Host_Buffer_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Host_Buffer_Size command has completed, an HCI_Command_Complete event shall be generated.

7.3.40 Host Number Of Completed Packets command

Command	OCF	Command Parameters	Return Parameters
HCI_Host_Number_Of_-Completed_Packets	0x0035	Num_Handles, Connection_Handle[i], Host_Num_Completed_Packets[i]	*none*

Description:

This command is used by the Host to indicate to the Controller the number of HCI Data packets that have been completed for each Connection_Handle since the previous HCI_Host_Number_Of_Completed_Packets command was sent to the Controller. This means that the corresponding buffer space has been freed in the Host and is available for new packets to be sent. Based on this information, and the Host_Total_Num_ACL_Data_Packets and Host_Total_Num_Synchronous_Data_Packets command parameters of the HCI_Host_Buffer_Size command, the Controller can determine for which Connection_Handles the following HCI Data packets should be sent to the Host. When the Host has completed one or more HCI Data packet(s) it shall send an HCI_Host_Number_Of_Completed_Packets command to the Controller, until it finally reports that all pending HCI Data packets have been completed. The frequency at which this command is sent is manufacturer specific.

The HCI_Set_Controller_To_Host_Flow_Control command is used to turn flow control on or off. If flow control from the Controller to the Host is turned on, the HCI_Host_Buffer_Size command shall always be sent by the Host after a power-on or a reset before the first HCI_Host_Number_Of_Completed_Packets command is sent.

The HCI_Host_Number_Of_Completed_Packets command may be sent at any time by the Host when there is at least one connection, or if the Controller is in local loopback mode, independent of other commands. If the Host issues this command when neither of these cases applies, the Controller shall ignore it.

Command parameters:

Num_Handles: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of Connection_Handles and Host_Num_Completed_Packets parameters pairs contained in this command. Range: 0 to 255

Connection_Handle[i]: *Size: Num_Handles × 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Host_Num_Completed_Packets[i]: *Size: Num_Handles × 2 octets*

Value	Parameter Description
0xXXXX	The number of HCI Data packets that have been completed for the associated Connection_Handle since the previous time the event was returned. Range: 0x0000 to 0xFFFF

Return parameters:

None.

Event(s) generated (unless masked away):

Normally, no event is generated after the HCI_Host_Number_Of_Completed_Packets command has completed. However, if the HCI_Host_Number_Of_Completed_Packets command contains one or more invalid parameters, the Controller shall return an HCI_Command_Complete event containing the error code *Invalid HCI Command Parameters* (0x12). The normal flow control for commands is not used for this command.

7.3.41 Read Link Supervision Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Link_Supervision_-Timeout	0x0036	Handle	Status, Handle, Link_Supervision_Timeout

Description:

This command reads the value for the Link_Supervision_Timeout parameter for the Controller.

The Handle used for this command shall be the ACL connection to the appropriate device. See Section 6.21.

Command parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Specifies which Connection_Handle's Link Supervision Timeout value is to be read. The Handle is a Connection_Handle for a BR/EDR Controller. Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Link_Supervision_Timeout command succeeded.
0x01 to 0xFF	HCI_Read_Link_Supervision_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Specifies which Connection_Handle's Link Supervision Timeout value was read. The Handle is a Connection_Handle for a BR/EDR Controller. Range: 0x0000 to 0x0EFF

Link_Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
0x0000	No Link_Supervision_Timeout.
N = 0xXXXX	Measured in number of BR/EDR Baseband slots Link_Supervision_Timeout = N × 0.625 ms (1 Baseband slot) Range: 0x0001 to 0xFFFF Time Range: 0.625 ms to 40.9 s

Event(s) generated (unless masked away):

When the HCI_Read_Link_Supervision_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.42 Write Link Supervision Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Link_Supervision_Timeout	0x0037	Handle, Link_Supervision_Timeout	Status, Handle

Description:

This command writes the value for the Link_Supervision_Timeout parameter for a BR/EDR Controller.

The Handle used for this command shall be the ACL connection to the appropriate device. This command will set the Link_Supervision_Timeout values for other Synchronous Handles to that device. See Section 6.21.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	The Controller is the Peripheral on the ACL connection.	*Command Disallowed* (0x0C)

Command parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Specifies which Handle's Link Supervision Timeout value is to be written. The Handle is a Connection_Handle for a BR/EDR Controller. Range: 0x0000 to 0x0EFF

Link_Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
0x0000	No Link_Supervision_Timeout.
N = 0xXXXX	Measured in number of BR/EDR Baseband slots Link_Supervision_Timeout = N × 0.625 ms (1 Baseband slot) Range: 0x0001 to 0xFFFF Time Range: 0.625 ms to 40.9 s Default: 0x7D00 (20 s) Mandatory Range for Controller: 0x0190 to 0xFFFF; plus 0 for infinite timeout

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Link_Supervision_Timeout command succeeded.
0x01 to 0xFF	HCI_Write_Link_Supervision_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Specifies which Handle's Link Supervision Timeout value was written. The Handle is a Connection_Handle for a BR/EDR Controller. Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_Write_Link_Supervision_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.43 Read Number Of Supported IAC command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Number_Of_Supported_IAC	0x0038	*none*	Status, Num_Supported_IAC

Description:

This command reads the value for the number of Inquiry Access Codes (IAC) that the local BR/EDR Controller can simultaneous listen for during an Inquiry Scan. All BR/EDR Controllers are required to support at least one IAC, the General Inquiry Access Code (the GIAC). Some BR/EDR Controllers support additional IACs.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Number_Of_Supported_IAC command succeeded.
0x01 to 0xFF	HCI_Read_Number_Of_Supported_IAC command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_Supported_IAC: *Size: 1 octet*

Value	Parameter Description
0xXX	Specifies the number of Supported IAC that the local BR/EDR Controller can simultaneous listen for during an Inquiry Scan. Range: 0x01 to 0x40

Event(s) generated (unless masked away):

When the HCI_Read_Number_Of_Supported_IAC command has completed, an HCI_Command_Complete event shall be generated.

7.3.44 Read Current IAC LAP command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Current_IAC_LAP	0x0039	*none*	Status, Num_Current_IAC, IAC_LAP[i]

Description:

This command reads the LAP(s) used to create the Inquiry Access Codes (IAC) that the local BR/EDR Controller is simultaneously scanning for during Inquiry Scans. All BR/EDR Controllers shall support at least one IAC, the General Inquiry Access Code (the GIAC). Some BR/EDR Controllers support additional IACs.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Current_IAC_LAP command succeeded.
0x01 to 0xFF	HCI_Read_Current_IAC_LAP command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_Current_IAC: *Size: 1 octet*

Value	Parameter Description
0xXX	Specifies the number of IACs which are currently in use by the local BR/EDR Controller to simultaneously listen for during an Inquiry Scan. Range: 0x01 to 0x40

IAC_LAP[i]: *Size: Num_Current_IAC × 3 octets*

Value	Parameter Description
0xXXXXXX	LAP used to create the IAC which is currently in use by the local BR/EDR Controller to simultaneously listen for during an Inquiry Scan. Range: 0x9E8B00 to 0x9E8B3F

Event(s) generated (unless masked away):

When the HCI_Read_Current_IAC_LAP command has completed, an HCI_Command_Complete event shall be generated.

7.3.45 Write Current IAC LAP command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Current_IAC_LAP	0x003A	Num_Current_IAC, IAC_LAP[i]	Status

Description:

This command writes the LAP(s) used to create the Inquiry Access Codes (IAC) that the local BR/EDR Controller is simultaneously scanning for during Inquiry Scans. All BR/EDR Controller shall support at least one IAC, the General Inquiry Access Code (the GIAC). Some BR/EDR Controllers support additional IACs.

This command shall clear any existing IACs and stores Num_Current_IAC and the IAC_LAPs in to the Controller. If Num_Current_IAC is greater than Num_Supported_IAC then only the first Num_Supported_IAC shall be stored in the Controller, and an HCI_Command_Complete event with error code *Success* (0x00) shall be generated.

Command parameters:

Num_Current_IAC: *Size: 1 octet*

Value	Parameter Description
0xXX	Specifies the number of IACs that will be used by the local BR/EDR Controller to simultaneously listen for during an Inquiry Scan. Range: 0x01 to 0x40

IAC_LAP[i]: *Size: Num_Current_IAC × 3 octets*

Value	Parameter Description
0xXXXXXX	LAP that will be used to create the IACs that will be used by the local BR/EDR Controller to simultaneously listen for during an Inquiry Scan. Range: 0x9E8B00 to 0x9E8B3F. The default IAC(s) to be used shall be the GIAC and zero or more other IACs specified by the manufacturer.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Current_IAC_LAP command succeeded.
0x01 to 0xFF	HCI_Write_Current_IAC_LAP command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Current_IAC_LAP command has completed, an HCI_Command_Complete event shall be generated.

7.3.46 Set AFH Host Channel Classification command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_AFH_Host_Channel_-Classification	0x003F	AFH_Host_Channel_-Classification	Status

Description:

This command allows the Host to specify a channel classification based on its "local information". This classification persists until overwritten with a subsequent HCI_Set_AFH_Host_Channel_Classification command or until the BR/EDR Controller is reset.

If this command is used, updates should be sent within 10 seconds of the Host knowing that the channel classification has changed. The interval between two successive commands sent shall be at least 1 second.

Command parameters:

AFH_Host_Channel_Classification: *Size: 10 octets (79 bits meaningful)*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXX	This parameter contains 80 1-bit fields. The n^{th} such field (in the range 0 to 78) contains the value for channel *n*: 0: channel *n* is bad 1: channel *n* is unknown The most significant bit (bit 79) is reserved for future use At least N_{min} channels shall be marked as unknown. (See [Vol 2] Part B, Section 2.3.1). If the device supports Synchronizable mode, then the synchronization train channels (see [Vol 2] Part B, Section 2.6.4.8) shall be excluded when checking this requirement.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_AFH_Host_Channel_Classification command succeeded.
0x01 to 0xFF	HCI_Set_AFH_Host_Channel_Classification command failed. [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Set_AFH_Host_Channel_Classification command has completed, an HCI_Command_Complete event shall be generated.

7.3.47 Read Inquiry Scan Type command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Inquiry_Scan_Type	0x0042	*none*	Status, Inquiry_Scan_Type

Description:

This command reads the Inquiry_Scan_Type configuration parameter from the local BR/EDR Controller. See Section 6.4.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Inquiry_Scan_Type command succeeded
0x01 to 0xFF	HCI_Read_Inquiry_Scan_Type command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Inquiry_Scan_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Standard Scan (default)
0x01	Interlaced Scan
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Inquiry_Scan_Type command has completed, an HCI_Command_Complete event shall be generated.

7.3.48 Write Inquiry Scan Type command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Inquiry_Scan_Type	0x0043	Scan_Type	Status

Description:

This command writes the Inquiry Scan Type configuration parameter of the local BR/EDR Controller. See Section 6.4.

Command parameters:

Scan_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Standard Scan (default)
0x01	Interlaced Scan
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Inquiry_Scan_Type command succeeded
0x01 to 0xFF	HCI_Write_Inquiry_Scan_Type command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Inquiry_Scan_Type command has completed, an HCI_Command_Complete event shall be generated.

7.3.49 Read Inquiry Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Inquiry_Mode	0x0044	*none*	Status, Inquiry_Mode

Description:

This command reads the Inquiry_Mode configuration parameter of the local BR/EDR Controller. See Section 6.5.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Inquiry_Mode command succeeded.
0x01 to 0xFF	HCI_Read_Inquiry_Mode command failed. See [Vol 1] Part F, Controller Error Codes for list of error codes.

Inquiry_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Standard Inquiry Result event format
0x01	Inquiry Result format with RSSI
0x02	Inquiry Result with RSSI format or Extended Inquiry Result format
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Inquiry_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.3.50 Write Inquiry Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Inquiry_Mode	0x0045	Inquiry_Mode	Status

Description:

This command writes the Inquiry_Mode configuration parameter of the local BR/EDR Controller. See Section 6.5.

Command parameters:

Inquiry_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Standard Inquiry Result event format (default)
0x01	Inquiry Result format with RSSI
0x02	Inquiry Result with RSSI format or Extended Inquiry Result format
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Inquiry_Mode command succeeded.
0x01 to 0xFF	HCI_Write_Inquiry_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Inquiry_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.3.51 Read Page Scan Type command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Page_Scan_Type	0x0046	*none*	Status, Page_Scan_Type

Description:

This command reads the Page Scan Type configuration parameter of the local BR/EDR Controller. See Section 6.11.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Page_Scan_Type command succeeded.
0x01 to 0xFF	HCI_Read_Page_Scan_Type command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Page_Scan_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Mandatory: Standard Scan (default)
0x01	Optional: Interlaced Scan
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Page_Scan_Type command has completed, an HCI_Command_Complete event shall be generated.

7.3.52 Write Page Scan Type command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Page_Scan_Type	0x0047	Page_Scan_Type	Status

Description:

This command writes the Page Scan Type configuration parameter of the local BR/EDR Controller. See Section 6.11.

Command parameters:

Page_Scan_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Mandatory: Standard Scan (default)
0x01	Optional: Interlaced Scan
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Page_Scan_Type command succeeded.
0x01 to 0xFF	HCI_Write_Page_Scan_Type command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Page_Scan_Type command has completed, an HCI_Command_Complete event shall be generated.

7.3.53 Read AFH Channel Assessment Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_AFH_Channel_-Assessment_Mode	0x0048	*none*	Status, AFH_Channel_Assessment_Mode

Description:

This command reads the value for the AFH_Channel_Assessment_Mode parameter. The AFH_Channel_Assessment_Mode parameter controls whether the Controller's channel assessment scheme is enabled or disabled.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_AFH_Channel_Assessment_Mode command succeeded.
0x01 to 0xFF	HCI_Read_AFH_Channel_Assessment_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

AFH_Channel_Assessment_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Controller channel assessment disabled.
0x01	Controller channel assessment enabled.
All other values	Reserved for future use.

Event(s) generated (unless masked away):

When the HCI_Read_AFH_Channel_Assessment_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.3.54 Write AFH Channel Assessment Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_AFH_Channel_-Assessment_Mode	0x0049	AFH_Channel_-Assessment_Mode	Status

Description:

This command writes the value for the AFH_Channel_Assessment_Mode parameter. The AFH_Channel_Assessment_Mode parameter controls whether the Controller's channel assessment scheme is enabled or disabled.

Disabling channel assessment forces all channels to be unknown in the local classification for the BR/EDR physical transport, but does not affect the AFH_reporting_mode or support for the HCI_Set_AFH_Host_Channel_Classification command. A BR/EDR Peripheral in the AFH_reporting_enabled state shall continue to send LMP channel classification messages for any changes to the channel classification caused by either this command (altering the AFH_Channel_Assessment_Mode) or HCI_Set_AFH_Host_Channel_Classification command (providing a new channel classification from the Host).

Disabling channel assessment also forces all channels to be unknown in the local classification for the LE physical transport. If channel classification reporting is enabled by the Central, then the following rules apply to the Peripheral:

- Irrespective of whether channel assessment is enabled or disabled by the Host, the Controller shall continue to send LL_CHANNEL_STATUS_IND PDUs for any changes to the channel classification caused by the HCI_LE_Set_Host_Channel_Classification command.
- If channel assessment has been enabled by the Host, the Controller shall send LL_CHANNEL_STATUS_IND PDUs for any changes to the channel classification caused by the HCI_LE_Set_Host_Channel_Classification command and for any changes reported by the channel assessment scheme.
- The Controller shall send an LL_CHANNEL_STATUS_IND PDU whenever the channel classification changes because this command changes the channel assessment mode.

If the AFH_Channel_Assessment_Mode parameter is enabled and the Controller does not support a channel assessment scheme, other than via the HCI_Set_AFH_Host_Channel_Classification command (for BR/EDR) or via the HCI_LE_Set_Host_Channel_Classification command (for LE), then a Status parameter of 'Channel Assessment Not Supported' should be returned. See [Vol1] Part F, Controller Error Codes for a list of error codes and descriptions.

If the Controller supports a channel assessment scheme then the default AFH_Channel_Assessment_Mode is enabled, otherwise the default is disabled.

Command parameters:

AFH_Channel_Assessment_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Controller channel assessment disabled.
0x01	Controller channel assessment enabled.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_AFH_Channel_Assessment_Mode command succeeded.
0x01 to 0xFF	HCI_Write_AFH_Channel_Assessment_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_AFH_Channel_Assessment_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.3.55 Read Extended Inquiry Response command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Extended_Inquiry_-Response	0x0051	*none*	Status, FEC_Required, Extended_Inquiry_Response

Description:

This command reads the extended inquiry response to be sent during the extended inquiry response procedure. The FEC_Required parameter states if FEC encoding is required.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Extended_Inquiry_Response command succeeded.
0x01 to 0xFF	HCI_Read_Extended_Inquiry_Response command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

FEC_Required: *Size: 1 octet*

Value	Parameter Description
0x00	FEC is not required
0x01	FEC is required
All other values	Reserved for future use

Extended_Inquiry_Response: *Size: 240 octets*

Value	Parameter Description
	Extended inquiry response data as defined in [Vol 3] Part C, Section 8.

Event(s) generated (unless masked away):

When the HCI_Read_Extended_Inquiry_Response command has completed, an HCI_Command_Complete event shall be generated.

7.3.56 Write Extended Inquiry Response command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Extended_Inquiry_-Response	0x0052	FEC_Required, Extended_Inquiry_Response	Status

Description:

This command writes the extended inquiry response to be sent during the extended inquiry response procedure. The Controller shall not modify or use the extended inquiry response data for any other purpose except removing some or all of the non-significant part. The FEC_Required parameter states if FEC encoding is required. The extended inquiry response data is not preserved over a reset. The initial value of the inquiry response data is all all-zero octets.

Command parameters:

FEC_Required: *Size: 1 octet*

Value	Parameter Description
0x00	FEC is not required
0x01	FEC is required
All other values	Reserved for future use

Extended_Inquiry_Response: *Size: 240 octets*

Value	Parameter Description
	Extended inquiry response data as defined in [Vol 3] Part C, Section 8.
	All octets zero (default).

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Extended_Inquiry_Response command succeeded
0x01 to 0xFF	HCI_Write_Extended_Inquiry_Response command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Extended_Inquiry_Response command has completed, an HCI_Command_Complete event shall be generated.

7.3.57 Refresh Encryption Key command

Command	OCF	Command Parameters	Return Parameters
HCI_Refresh_Encryption_Key	0x0053	Connection_Handle	*none*

Description:

This command is used by the Host to cause the BR/EDR Controller to refresh the encryption key on an ACL connection identified by a Connection_Handle by pausing and resuming encryption.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

An HCI_Command_Status event is sent from the BR/EDR Controller to the Host when the Controller has started the Refresh Encryption Key procedure. An HCI_Encryption_Key_Refresh_Complete event shall be generated when the Refresh Encryption Key procedure has completed.

7.3.58 Read Simple Pairing Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Simple_Pairing_Mode	0x0055	*none*	Status, Simple_Pairing_Mode

Description:

This command reads the Simple_Pairing_Mode parameter in the BR/EDR Controller.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Simple_Pairing_Mode command succeeded.
0x01 to 0xFF	HCI_Read_Simple_Pairing_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Simple_Pairing_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Secure Simple Pairing not set (default)
0x01	Secure Simple Pairing enabled
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Simple_Pairing_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.3.59 Write Simple Pairing Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Simple_Pairing_Mode	0x0056	Simple_Pairing_Mode	Status

Description:

This command enables Secure Simple Pairing mode in the BR/EDR Controller. When Secure Simple Pairing Mode is set to 'enabled' the Link Manager shall respond to an LMP_IO_CAPABILITY_REQ PDU with an LMP_IO_CAPABILITY_RES PDU and continue with the subsequent pairing procedure. When Secure Simple Pairing mode is set to 'disabled', the Link Manager shall reject an IO capability request. A Host shall not set the Secure Simple Pairing Mode to ‘disabled.’

Until Write_Simple_Pairing_Mode is received by the BR/EDR Controller, it shall not support any Secure Simple Pairing sequences, and shall return the error code *Secure Simple Pairing not Supported by Host* (0x37). This command shall be written before initiating page scan or paging procedures.

The Link Manager Secure Simple Pairing (Host Support) feature bit shall be set to the Simple_Pairing_Mode parameter. The default value for Simple_Pairing_Mode shall be 'disabled.' When Simple_Pairing_Mode is set to 'enabled,' the bit in the LMP features mask indicating support for Secure Simple Pairing (Host Support) shall be set to enabled in subsequent responses to an LMP_FEATURES_REQ from a remote device.

Command parameters:

Simple_Pairing_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Secure Simple Pairing disabled (default)
0x01	Secure Simple Pairing enabled
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Simple_Pairing_Mode command succeeded.
0x01 to 0xFF	HCI_Write_Simple_Pairing_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Simple_Pairing_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.3.60 Read Local OOB Data command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_OOB_Data	0x0057	*none*	Status, C, R

Description:

This command obtains a Secure Simple Pairing Hash C and Randomizer R which are intended to be transferred to a remote device using an OOB mechanism. The BR/EDR Controller shall create new values for C and R for each invocation of this command. Each random number R shall be created according to [Vol 2] Part H, Section 2.

Note: Each OOB transfer will have unique C and R values.

After each OOB transfer this command shall be used to obtain a new set of values for the next OOB transfer.

Note: The Controller keeps information used to generate these values for later use in the Secure Simple Pairing process. If the BR/EDR Controller is powered off or reset then this information is lost and the values obtained before the power off or reset are invalid.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_OOB_Data command succeeded.
0x01 to 0xFF	HCI_Read_Local_OOB_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

C: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	Secure Simple Pairing Hash C

R: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	Secure Simple Pairing Randomizer R

Event(s) generated (unless masked away):

When the HCI_Read_Local_OOB_Data command has completed, an HCI_Command_Complete event shall be generated.

7.3.61 Read Inquiry Response Transmit Power Level command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Inquiry_Response_Transmit_-Power_Level	0x0058	*none*	Status, TX_Power

Description:

This command reads the power level used to transmit the FHS and EIR data packets. This can be used directly in the Tx Power Level EIR data type.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Inquiry_Response_Transmit_Power_Level command succeeded.
0x01 to 0xFF	HCI_Read_Inquiry_Response_Transmit_Power_Level command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -70 to 20 Units: dBm

Event(s) generated (unless masked away):

When the HCI_Read_Inquiry_Response_Transmit_Power_Level command has completed, an HCI_Command_Complete event shall be generated.

7.3.62 Write Inquiry Transmit Power Level command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Inquiry_Transmit_Power_Level	0x0059	TX_Power	Status

Description:

This command writes the inquiry transmit power level used to transmit the inquiry (ID) data packets. The Controller should use the supported TX power level closest to the TX_Power parameter.

Command parameters:

TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -70 to 20 Units: dBm

Return parameters:

Status: *Status:*

Size: 1 octet

Value	Parameter Description
0x00	HCI_Write_Inquiry_Transmit_Power_Level command succeeded
0x01 to 0xFF	HCI_Write_Inquiry_Transmit_Power_Level command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Inquiry_Transmit_Power_Level command has completed, an HCI_Command_Complete event shall be generated.

7.3.63 Send Keypress Notification command

Command	OCF	Command Parameters	Return Parameters
HCI_Send_Keypress_Notification	0x0060	BD_ADDR, Notification_Type	Status, BD_ADDR

Description:

This command is used during the Passkey Entry protocol by a device with KeyboardOnly IO capabilities. It is used by a Host to inform the remote device when keys have been entered or erased.

Command parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Notification_Type: *Size: 1 octet*

Value	Parameter Description
0	Passkey entry started
1	Passkey digit entered
2	Passkey digit erased
3	Passkey cleared
4	Passkey entry completed
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Send_Keypress_Notification command succeeded
0x01 to 0xFF	HCI_Send_Keypress_Notification command failed

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Event(s) generated (unless masked away):

When the HCI_Send_Keypress_Notification command has completed, an HCI_Command_Complete event shall be generated.

7.3.64 Read Default Erroneous Data Reporting command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Default_Erroneous_-Data_Reporting	0x005A	*none*	Status, Erroneous_Data_Reporting

Description:

This command reads the Erroneous_Data_Reporting parameter.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Default_Erroneous_Data_Reporting command succeeded.
0x01 to 0xFF	HCI_Read_Default_Erroneous_Data_Reporting command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Erroneous_Data_Reporting: *Size: 1 octet*

Value	Parameter Description
0x00	Erroneous data reporting disabled.
0x01	Erroneous data reporting enabled.
All other values	Reserved for future use.

Event(s) generated (unless masked away):

When the HCI_Read_Default_Erroneous_Data_Reporting command has completed, an HCI_Command_Complete event shall be generated.

7.3.65 Write Default Erroneous Data Reporting command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Default_Erroneous_Data_-Reporting	0x005B	Erroneous_Data_Reporting	Status

Description:

This command writes the Erroneous_Data_Reporting parameter. The BR/EDR Controller shall set the Packet_Status_Flag as defined in Section 5.4.3 HCI Synchronous Data packets, depending on the value of this parameter. The new value for the Erroneous_Data_Reporting parameter shall not apply to existing synchronous connections.

Command parameters:

Erroneous_Data_Reporting: *Size: 1 octet*

Value	Parameter Description
0x00	Erroneous Data reporting disabled (default).
0x01	Erroneous data reporting enabled.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Default_Erroneous_Data_Reporting command succeeded.
0x01 to 0xFF	HCI_Write_Default_Erroneous_Data_Reporting command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Default_Erroneous_Data_Reporting command has completed, an HCI_Command_Complete event shall be generated.

7.3.66 Enhanced Flush command

Command	OCF	Command Parameters	Return Parameters
HCI_Enhanced_Flush	0x005F	Handle, Packet_Type	*none*

Description:

This command is used to discard all L2CAP packets identified by Packet_Type that are currently pending for transmission in the Controller for the specified Handle, even if there currently are chunks of data that belong to more than one L2CAP packet of the same type in the Controller. The only packet type defined is automatically-flushable. Packets not identified by Packet_Type will not be flushed and will be processed normally by the Controller.

After flushing the packets, all data that is sent to the BR/EDR Controller for the same Handle and packet type shall be discarded by the Controller until an HCI ACL Data packet with the start Packet_Boundary_Flag (0x00 or 0x02) is received. This command allows higher-level software to control how long the Baseband should try to retransmit a Baseband packet of a specific type for a Handle before all data of that type currently pending for transmission in the Controller should be flushed. The HCI_Enhanced_Flush command shall be used for ACL-U connections only. On the BR/EDR Controller, the HCI_Flush command can be used to flush all packets (see Section 7.3.4). In addition to the HCI_Enhanced_Flush and HCI_Flush commands, the automatic flush timers (see Section 7.3.29) can be used to automatically flush an automatically-flushable L2CAP packet that is currently being transmitted after the specified flush timer has expired.

Command parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Handle to be used to identify a connection. Range: 0x0000 to 0x0EFF

Packet_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Automatically flushable only.
All other values	Reserved for future use.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_Enhanced_Flush command, the Controller shall send the HCI_Command_Status event to the Host. In addition, when all the packets identified by Packet_Type have been flushed for the specified Handle, the Controller shall send an HCI_Enhanced_Flush_Complete event to the Host. The Controller may send the HCI_Enhanced_Flush_Complete event immediately after flushing all the packets of type Packet_Type for the specified Handle, or it may wait until all packets for the specified Handle, independent of Packet_Type, buffered in the Controller at the time of the receipt of the HCI_Enhanced_Flush command, have been either flushed or transmitted.

7.3.67 [This section is no longer used]

7.3.68 [This section is no longer used]

7.3.69 Set Event Mask Page 2 command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Event_Mask_Page_2	0x0063	Event_Mask_Page_2	Status

Description:

This command is used to control which events are generated by the HCI for the Host. The Event_Mask_Page_2 is a logical extension to the Event_Mask parameter of the HCI_Set_Event_Mask command. If the bit in the Event_Mask_Page_2 is set to a one, then the event associated with that bit shall be enabled. The event mask allows the Host to control how much it is interrupted.

The Controller shall ignore those bits which are reserved for future use or represent events which it does not support. If the Host sets any of these bits to 1, the Controller shall act as if they were set to 0.

Command parameters:

Event_Mask_Page_2: *Size: 8 octets*

Bit	Parameter Description
0	Previously used
1	Previously used
2	Previously used
3	Previously used
4	Previously used
5	Previously used
6	Previously used
7	Previously used
8	Number Of Completed Data Blocks event
9	Previously used
10	Previously used
11	Previously used
12	Previously used
13	Previously used
14	Triggered Clock Capture event
15	Synchronization Train Complete event
16	Synchronization Train Received event

Bit	Parameter Description
17	Connectionless Peripheral Broadcast Receive event
18	Connectionless Peripheral Broadcast Timeout event
19	Truncated Page Complete event
20	Peripheral Page Response Timeout event
21	Connectionless Peripheral Broadcast Channel Map Change event
22	Inquiry Response Notification event
23	Authenticated Payload Timeout Expired event
24	SAM Status Change event
25	Encryption Change event [v2]
60 to 63	Reserved for specification development purposes

The value with all bits set to 0 (which is the default) indicates that no events are specified.

All bits not listed in this table are reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Event_Mask_Page_2 command succeeded.
0x01 to 0xFF	HCI_Set_Event_Mask_Page_2 command failed. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Set_Event_Mask_Page_2 command has completed, an HCI_Command_Complete event shall be generated.

7.3.70 [This section is no longer used]

7.3.71 [This section is no longer used]

7.3.72 Read Flow Control Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Flow_Control_Mode	0x0066	*none*	Status, Flow_Control_Mode

Description:

This command reads the value for the Flow_Control_Mode configuration parameter. See Section 6.33.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Flow_Control_Mode command succeeded.
0x01 to 0xFF	HCI_Read_Flow_Control_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Flow_Control_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Packet based data flow control mode
0x01	Data block based data flow control mode
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Flow_Control_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.3.73 Write Flow Control Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Flow_Control_Mode	0x0067	Flow_Control_Mode	Status

Description:

This command writes the value for the Flow_Control_Mode configuration parameter. See Section 6.33.

Command parameters:

Flow_Control_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Packet based data flow control mode (default)
0x01	Data block based data flow control mode
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Flow_Control_Mode command succeeded.
0x01 to 0xFF	HCI_Write_Flow_Control_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Flow_Control_Mode command has completed, an HCI_Command_Complete event shall be generated. If the set fails then the Controller continues using its current mode.

7.3.74 Read Enhanced Transmit Power Level command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Enhanced_Transmit_-Power_Level	0x0068	Connection_Handle, Type	Status, Connection_Handle, TX_Power_Level_GFSK, TX_Power_Level_DQPSK, TX_Power_Level_8DPSK

Description:

This command reads the values for the Enhanced_Transmit_Power_Level parameters for the specified Connection_Handle. The Connection_Handle shall be a Connection_Handle for an ACL connection.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Type: *Size: 1 octet*

Value	Parameter Description
0x00	Read Current Transmit Power Level
0x01	Read Maximum Transmit Power Level
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Enhanced_Transmit_Power_Level command succeeded.
0x01 to 0xFF	HCI_Read_Enhanced_Transmit_Power_Level command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

TX_Power_Level_GFSK: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -100 to 20 Units: dBm

TX_Power_Level_DQPSK: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -100 to 20 Units: dBm

TX_Power_Level_8DPSK: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -100 to 20 Units: dBm

Event(s) generated (unless masked away):

When the HCI_Read_Enhanced_Transmit_Power_Level command has completed, an HCI_Command_Complete event shall be generated.

7.3.75 [This section is no longer used]

7.3.76 [This section is no longer used]

7.3.77 [This section is no longer used]

7.3.78 Read LE Host Support command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_LE_Host_Support	0x006C	*none*	Status, LE_Supported_Host, Unused

Description:

This command is used to read the LE Supported (Host) Link Manager Protocol feature bit. See [Vol 2] Part C, Section 3.2.

The Unused parameter was previously used.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_LE_Host_Support command succeeded.
0x01 to 0xFF	HCI_Read_LE_Host_Support command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

LE_Supported_Host: *Size: 1 octet*

Value	Parameter Description
0xXX	LE_Supported_Host parameter, see Section 6.34.

Unused: *Size: 1 octet*

Value	Parameter Description
0x00	This value shall be returned by the Controller.
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_LE_Host_Support command has completed, an HCI_Command_Complete event shall be generated.

7.3.79 Write LE Host Support command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_LE_Host_Support	0x006D	LE_Supported_Host, Unused	Status

Description:

This command is used to set the LE Supported (Host) Link Manager Protocol feature bit. See [Vol 2] Part C, Section 3.2.

The default value for this feature bit shall be disabled. When LE_Supported_Host is set to enabled the bit in LMP features mask indicating support for LE Support (Host) shall be set.

The Unused parameter was previously used.

Command parameters:

LE_Supported_Host: *Size: 1 octet*

Value	Parameter Description
0xXX	LE_Supported_Host parameter. See Section 6.34

Unused: *Size: 1 octet*

Value	Parameter Description
0xXX	This value shall be ignored by the Controller.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_LE_Host_Support command succeeded.
0x01 to 0xFF	HCI_Write_LE_Host_Support command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_LE_Host_Support command has completed, an HCI_Command_Complete event shall be generated.

7.3.80 Set MWS Channel Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_MWS_Channel_-Parameters	0x006E	MWS_Channel_Enable, MWS_RX_Center_Frequency, MWS_TX_Center_Frequency, MWS_RX_Channel_Bandwidth, MWS_TX_Channel_Bandwidth, MWS_Channel_Type	Status

Description:

This command is used to inform the Controller of the MWS channel parameters.

The MWS_Channel_Enable parameter is used to enable or disable the MWS channel. If it is set to 0x00, the remaining parameters shall be ignored.

The MWS_RX_Center_Frequency and MWS_TX_Center_Frequency parameters are used to indicate the center frequency of the MWS device's uplink (TX) and downlink (RX) channels. The uplink and downlink channel centers may be the same value or different values.

The MWS_RX_Channel_Bandwidth and MWS_TX_Channel_Bandwidth parameters are used to indicate the bandwidth, in kHz, of the MWS device's uplink and downlink channels.

The MWS_Channel_Type parameter describes the type of channel. The types are defined in Assigned Numbers.

Command parameters:

MWS_Channel_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	MWS channel is disabled.
0x01	MWS channel is enabled.
All other values	Reserved for future use.

MWS_RX_Center_Frequency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS RX center frequency in MHz.

MWS_TX_Center_Frequency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS TX center frequency in MHz

MWS_RX_Channel_Bandwidth: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS RX channel bandwidth in kHz.

MWS_TX_Channel_Bandwidth: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS TX channel bandwidth in kHz.

MWS_Channel_Type: *Size: 1 octet*

Value	Parameter Description
0xXX	See Assigned Numbers.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_MWS_Channel_Parameters command succeeded.
0x01 to 0xFF	HCI_Set_MWS_Channel_Parameters command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions

Event(s) generated (unless masked away):

When the HCI_Set_MWS_Channel_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.3.81 Set External Frame Configuration command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_External_Frame_-Configuration	0x006F	MWS_Frame_Duration, MWS_Frame_Sync_Assert_Offset, MWS_Frame_Sync_Assert_Jitter, MWS_Num_Periods, Period_Duration[i], Period_Type[i]	Status

Description:

This command allows the Host to specify a frame configuration for an external collocated MWS system. This frame configuration persists until overwritten with a subsequent Set_External_Frame_Configuration or until the Controller is reset.

This command can be used to allow the Controller to align the piconet clock with an external frame structure.

When the external frame structure is a multiple of 1.25 ms, it can be aligned in a stable manner with the piconet clock.

The start of the external frame structure is defined as an offset from an external frame synchronization signal. This offset is defined by the MWS_Frame_Sync_Assert_Offset parameter. The offset is represented as the time, in microseconds, from the start of the next MWS frame to the FRAME_SYNC signal.

An external frame consists of downlink periods, uplink periods and guard periods. Downlink means the collocated MWS system is receiving, thus may be interfered with by Bluetooth transmissions. Uplink means the collocated MWS system is transmitting, thus may cause interference to Bluetooth receptions. A guard period may be used by the MWS system to compensate for propagation delays; in this case it should be regarded as split equally between downlink and uplink durations.

The number of specified periods is given by MWS_Num_Periods.

The duration of each period, in microseconds, is defined by the Period_Duration[i] parameters.

The Period_Type[i] parameter indicates if the specified period is an uplink, downlink, bi-directional or guard period.

The sum of all Period_Duration[i] parameters shall be equal to the MWS_Frame_Duration parameter.

Upon reception of an HCI_Set_External_Frame_Configuration command and a FRAME_SYNC signal from the MWS Coexistence Logical Interface, the Controller may compute the type 0 submap for local SAM slot maps. The Controller may then initiate the SAM set type 0 and SAM define map LMP sequences with the remote device.

Command parameters:

MWS_Frame_Duration: *Size: 2 octets*

Value	Parameter Description
0xXXXX	External frame duration in microseconds

MWS_Frame_Sync_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	External frame offset, in microseconds (signed integer)

MWS_Frame_Sync_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	External frame sync jitter, in microseconds (unsigned integer)

MWS_Num_Periods: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of specified periods in an external frame. Valid range: 1 to 32

Period_Duration[i]: *Size: MWS_Num_Periods × 2 octets*

Value	Parameter Description
0xXXXX	Duration of the period, in microseconds

Period_Type[i]: *Size: MWS_Num_Periods × 1 octet*

Value	Parameter Description
0x00	Downlink
0x01	Uplink
0x02	Bi-Directional
0x03	Guard Period
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_External_Frame_Configuration command succeeded.
0x01 to 0xFF	HCI_Set_External_Frame_Configuration command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions

Event(s) generated (unless masked away):

When the HCI_Set_External_Frame_Configuration command has completed, an HCI_Command_Complete event shall be generated.

7.3.82 Set MWS Signaling command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_-MWS_-Signaling	0x0070	MWS_RX_Assert_Offset, MWS_RX_Assert_Jitter, MWS_RX_Deassert_Offset, MWS_RX_Deassert_Jitter, MWS_TX_Assert_Offset, MWS_TX_Assert_Jitter, MWS_TX_Deassert_Offset, MWS_TX_Deassert_Jitter, MWS_Pattern_Assert_Offset, MWS_Pattern_Assert_Jitter, MWS_Inactivity_-Duration_Assert_Offset, MWS_Inactivity_-Duration_Assert_Jitter, MWS_Scan_Frequency_Assert_-Offset, MWS_Scan_Frequency_Assert_-Jitter, MWS_Priority_-Assert_Offset_Request	Status, Bluetooth_RX_Priority_Assert_Offset, Bluetooth_RX_Priority_Assert_Jitter, Bluetooth_RX_-Priority_Deassert_Offset, Bluetooth_RX_-Priority_Deassert_Jitter, 802_RX_Priority_Assert_Offset, 802_RX_Priority_Assert_Jitter, 802_RX_Priority_Deassert_Offset, 802_RX_Priority_Deassert_Jitter, Bluetooth_TX_On_Assert_Offset, Bluetooth_TX_On_Assert_Jitter, Bluetooth_TX_On_Deassert_Offset, Bluetooth_TX_On_Deassert_Jitter, 802_TX_On_Assert_Offset, 802_TX_On_Assert_Jitter, 802_TX_On_Deassert_Offset, 802_TX_On_Deassert_Jitter

Description:

This command is used to inform the Bluetooth Controller of the MWS signaling interface logical layer parameters.

All signals are defined in [Vol 7] Part A.

Command parameters:

MWS_RX_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_RX signal assert offset in microseconds (signed integer).

MWS_RX_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_RX signal assert jitter in microseconds (unsigned integer).

MWS_RX_Deassert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_RX signal de-assert offset in microseconds (signed integer).

MWS_RX_Deassert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_RX signal de-assert jitter in microseconds (unsigned integer).

MWS_TX_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_TX signal assert offset in microseconds (signed integer).

MWS_TX_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_TX signal assert jitter in microseconds (unsigned integer).

MWS_TX_Deassert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_TX signal de-assert offset in microseconds (signed integer).

MWS_TX_Deassert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_TX signal de-assert jitter in microseconds (unsigned integer).

MWS_Pattern_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_PATTERN signal assert offset in microseconds (signed integer).

MWS_Pattern_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_PATTERN signal assert jitter in microseconds (unsigned integer).

MWS_Inactivity_Duration_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_INACTIVITY_DURATION signal assert offset in microseconds (signed integer).

MWS_Inactivity_Duration_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_INACTIVITY_DURATION signal assert jitter in microseconds (unsigned integer).

MWS_Scan_Frequency_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_SCAN_FREQUENCY signal assert offset in microseconds (signed integer).

MWS_Scan_Frequency_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	MWS_SCAN_FREQUENCY signal assert jitter in microseconds (unsigned integer).

MWS_Priority_Assert_Offset_Request: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum advance notification from the beginning of an MWS Uplink period in microseconds (unsigned integer) before which the BLUETOOTH_RX_PRI or 802_RX_PRI signal shall be asserted to be recognized by the MWS.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_MWS_Signaling command succeeded.
0x01 to 0xFF	HCI_Set_MWS_Signaling command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions

Bluetooth_RX_Priority_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	BLUETOOTH_RX_PRI signal assert offset in microseconds (signed integer).

Bluetooth_RX_Priority_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	BLUETOOTH_RX_PRI signal assert jitter in microseconds (unsigned integer).

Bluetooth_RX_Priority_Deassert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	BLUETOOTH_RX_PRI signal de-assert offset in microseconds (signed integer).

Bluetooth_RX_Priority_Deassert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	BLUETOOTH_RX_PRI signal de-assert jitter in microseconds (unsigned integer).

802_RX_Priority_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	802_RX_PRI signal assert offset in microseconds (signed integer).

802_RX_Priority_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	802_RX_PRI signal assert jitter in microseconds (unsigned integer).

802_RX_Priority_Deassert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	802_RX_PRI signal de-assert offset in microseconds (signed integer).

802_RX_Priority_Deassert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	802_RX_PRI signal de-assert jitter in microseconds (unsigned integer).

Bluetooth_TX_On_Assert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	BLUETOOTH_TX_ON signal assert offset in microseconds (signed integer).

Bluetooth_TX_On_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	BLUETOOTH_TX_ON signal assert jitter in microseconds (unsigned integer).

Bluetooth_TX_On_Deassert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	BLUETOOTH_TX_ON signal de-assert offset in microseconds (signed integer).

Bluetooth_TX_On_Deassert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	BLUETOOTH_TX_ON signal de-assert jitter in microseconds (unsigned integer).

802_TX_On_Assert_Offset: Size: 2 octets

Value	Parameter Description
0xXXXX	802_TX_ON signal assert offset in microseconds (signed integer).

802_TX_On_Assert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	802_TX_ON signal assert jitter in microseconds (unsigned integer).

802_TX_On_Deassert_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	802_TX_ON signal de-assert offset in microseconds (signed integer).

802_TX_On_Deassert_Jitter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	802_TX_ON signal de-assert jitter in microseconds (unsigned integer).

Event(s) generated (unless masked away):

When the HCI_Set_MWS_Signaling command has completed, an HCI_Command_Complete event shall be generated.

7.3.83 Set MWS Transport Layer command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_MWS_Transport_Layer	0x0071	Transport_Layer, To_MWS_Baud_Rate, From_MWS_Baud_Rate	Status

Description:

This command configures the transport layer between the Bluetooth Controller and MWS device.

Command parameters:

Transport_Layer: *Size: 1 octet*

Value	Parameter Description
0xXX	See Assigned Numbers.

To_MWS_Baud_Rate: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Baud rate in the Bluetooth to MWS direction in Baud.

From_MWS_Baud_Rate: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Baud rate in the MWS to Bluetooth direction in Baud.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_MWS_Transport_Layer command succeeded.
0x01 to 0xFF	HCI_Set_MWS_Transport_Layer command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions

Event(s) generated (unless masked away):

When the HCI_Set_MWS_Transport_Layer command has completed, an HCI_Command_Complete event shall be generated.

7.3.84 Set MWS Scan Frequency Table command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_MWS_Scan_Frequency_Table	0x0072	Num_Scan_Frequencies, Scan_Frequency_Low[i], Scan_Frequency_High[i]	Status

Description:

This command configures the MWS scan frequency table in the Controller.

The Num_Scan_Frequencies parameter indicates the number of MWS scan frequencies to be set. A Controller shall support at least 8 table entries.

The Scan_Frequency_Low[i] and Scan_Frequency_High[i] parameters indicate the lower and upper edges for each scan frequency. The parameters for a given value of i correspond to a MWS_SCAN_FREQUENCY value of i+1 (see [Vol 7] Part A, Section 2.1.10); e.g., the first value corresponds to MWS_SCAN_FREQUENCY = 1.

Command parameters:

Num_Scan_Frequencies: *Size: 1 octet*

Value	Parameter Description
N	Number of MWS scan frequencies to be set in the table.

Scan_Frequency_Low[i]: *Size: Num_Scan_Frequencies × 2 octets*

Value	Parameter Description
0xXXXX	Lower edge of the MWS scan frequency in MHz.

Scan_Frequency_High[i]: *Size: Num_Scan_Frequencies × 2 octets*

Value	Parameter Description
0xXXXX	Upper edge of the MWS scan frequency in MHz.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_MWS_Scan_Frequency_Table command succeeded.
0x01 to 0xFF	HCI_Set_MWS_Scan_Frequency_Table command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions

Event(s) generated (unless masked away):

When the HCI_Set_MWS_Scan_Frequency_Table command has completed, an HCI_Command_Complete event shall be generated.

7.3.85 Set MWS_PATTERN Configuration command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_MWS_PATTERN_-Configuration	0x0073	MWS_Pattern_Index, MWS_Pattern_Num_Intervals, MWS_Pattern_Interval_Duration[i], MWS_Pattern_Interval_Type[i]	Status

Description:

This command is used by the Host to specify, in conjunction with the HCI_Set_External_Frame_Configuration command, local MWS_PATTERN parameters for an external collocated system.

An MWS_PATTERN configuration shall persist until overwritten by a subsequent Set_MWS_PATTERN_Configuration. All MWS_PATTERN configurations are deleted when an HCI_Set_External_Frame_Configuration command is received or when the Controller is reset.

The sum of the MWS_Pattern_Interval_Duration parameters shall be an integer multiple of the length of a frame as defined by the most recent HCI_Set_External_Frame_Configuration command.

Upon reception of an HCI_Set_MWS_PATTERN_Configuration command, the Controller may compute the local SAM slot map with SAM_Index equal to MWS_Pattern_Index. If the SAM slot map does not exist, it should be created; if the SAM slot map already exists, its parameters should be replaced. The Controller may then initiate the SAM define map LMP sequence with the remote device.

Upon reception of an MWS_PATTERN signal, with a value other than 3, from the MWS Coexistence Logical Interface (see [Vol 7] Part A), the Controller should check the MWS_PATTERN value against the SAM_Index of those SAM slot maps that have been configured by previous HCI_Set_MWS_PATTERN_Configuration commands. It should then take the following course of action:

1. If MWS_PATTERN does not match any configured SAM slot map, it should take no further action.
2. If MWS_PATTERN matches an available SAM slot map that is already active or is being activated, it should take no further action (i.e. let the current or pending active SAM slot map continue).

3. If MWS_PATTERN matches an available SAM slot map that is neither active nor is being activated, then:
   a. If the SAM slot map has been activated previously using the LMP_SAM_SET_TYPE0 (if relevant) and LMP_SAM_DEFINE_MAP LMP sequences, the Controller should start the SAM switch LMP sequence to activate the matched SAM slot map;
   b. Otherwise the Controller should start or complete the SAM set type 0 (if relevant), SAM define map, and SAM switch LMP sequences to activate the matched SAM slot map.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	The MWS_Pattern_Interval_Duration for an interval with type 4 is greater than the length of a frame.	*Invalid HCI Command Parameters* (0x12)
MC	The sum of the MWS_Pattern_Interval_Duration parameters for the intervals that precede an interval with type 4 is not a multiple of the length of the frame.	*Invalid HCI Command Parameters* (0x12)

Command parameters:

MWS_Pattern_Index: *Size: 1 octet*

Value	Parameter Description
0xXX	Index of the MWS_PATTERN instance to be configured. Range: 0 to 2.

MWS_Pattern_Num_Intervals: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of intervals in the following arrays.

MWS_Pattern_Interval_Duration[i]: *Size: MWS_Pattern_Num_Intervals × 2 octets*

Value	Parameter Description
0xXXXX	The duration of this Bluetooth activity interval in microseconds.

MWS_Pattern_Interval_Type[i]: *Size: MWS_Pattern_Num_Intervals × 1 octet*

Value	Parameter Description
0x00	Neither transmission nor reception is allowed in this interval.
0x01	Transmission is allowed in this interval.
0x02	Reception is allowed in this interval.
0x03	Both transmission and reception are allowed in this interval.
0x04	Interval for the MWS frame as defined by the HCI_Set_External_Frame_Configuration command.
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_MWS_PATTERN_Configuration command succeeded
0x01 to 0xFF	HCI_Set_MWS_PATTERN_Configuration command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Set_MWS_PATTERN_Configuration command has completed, an HCI_Command_Complete event shall be generated.

7.3.86 Set Reserved LT_ADDR command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Reserved_LT_ADDR	0x0074	LT_ADDR	Status, LT_ADDR

Description:

This command allows the Host to request that the BR/EDR Controller reserve a specific LT_ADDR for Connectionless Peripheral Broadcast.

If the LT_ADDR indicated in the LT_ADDR parameter is already in use by the BR/EDR Controller, it shall return the *Connection Already Exists* (0x0B) error code. If the LT_ADDR indicated in the LT_ADDR parameter is out of range, the Controller shall return the *Invalid HCI Command Parameters* (0x12) error code. If the command succeeds, then the reserved LT_ADDR shall be used when issuing subsequent HCI_Set_Connectionless_Peripheral_Broadcast_Data and HCI_Set_Connectionless_Peripheral_Broadcast commands.

To ensure that the reserved LT_ADDR is not already allocated, it is recommended that this command be issued at some point after HCI_Reset is issued but before page scanning is enabled or paging is initiated.

Command parameters:

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR to reserve for Connectionless Peripheral Broadcast
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Reserved_LT_ADDR command succeeded.
0x01 to 0xFF	HCI_Set_Reserved_LT_ADDR command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR reserved for Connectionless Peripheral Broadcast. This parameter shall have the same value as the command parameter LT_ADDR.
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Set_Reserved_LT_ADDR command has completed, an HCI_Command_Complete event shall be generated.

7.3.87 Delete Reserved LT_ADDR command

Command	OCF	Command Parameters	Return Parameters
HCI_Delete_Reserved_LT_ADDR	0x0075	LT_ADDR	Status, LT_ADDR

Description:

This command requests that the BR/EDR Controller cancel the reservation for a specific LT_ADDR reserved for the purposes of Connectionless Peripheral Broadcast.

If the LT_ADDR indicated in the LT_ADDR parameter is not reserved by the BR/EDR Controller, it shall return the *Unknown Connection Identifier* (0x02) error code.

If Connectionless Peripheral Broadcast mode is still active, then the Controller shall return the *Command Disallowed* (0x0C) error code.

Command parameters:

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR currently reserved for Connectionless Peripheral Broadcast and for which reservation is to be cancelled
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Delete_Reserved_LT_ADDR command succeeded.
0x01 to 0xFF	HCI_Delete_Reserved_LT_ADDR command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR whose reservation the Host has requested to cancel.
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Delete_Reserved_LT_ADDR command has completed, an HCI_Command_Complete event shall be generated.

7.3.88 Set Connectionless Peripheral Broadcast Data command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Connectionless_Peripheral_-Broadcast_Data	0x0076	LT_ADDR, Fragment, Data_Length, Data	Status, LT_ADDR

Description:

This command provides the ability for the Host to set Connectionless Peripheral Broadcast data in the BR/EDR Controller. This command may be issued at any time after an LT_ADDR has been reserved regardless of whether Connectionless Peripheral Broadcast mode has been enabled or disabled by the Enable parameter in the HCI_Set_Connectionless_Peripheral_Broadcast command. If the command is issued without the LT_ADDR reserved, the *Unknown Connection Identifier* (0x02) error code shall be returned.

If Connectionless Peripheral Broadcast mode is disabled, this data shall be kept by the BR/EDR Controller and used once Connectionless Peripheral Broadcast mode is enabled. If Connectionless Peripheral Broadcast mode is enabled, and this command is successful, this data will be sent starting with the next Connectionless Peripheral Broadcast instant.

The Data_Length field may be zero, in which case no data needs to be provided.

The Host may fragment the data using the Fragment field in the command. If the combined length of the fragments exceeds the capacity of the largest allowed packet size specified in the HCI_Set_Connectionless_Peripheral_Broadcast command, all fragments associated with the data being assembled shall be discarded and the *Invalid HCI Command Parameters* error code (0x12) shall be returned.

Command parameters:

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR on which to send Connectionless Peripheral Broadcast data
All other values	Reserved for future use

Fragment: *Size: 1 octet*

Value	Parameter Description
0x00	Continuation fragment
0x01	Starting fragment
0x02	Ending fragment
0x03	No fragmentation (single fragment)
All other values	Reserved for future use

Data_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Length of the Data field

Data: Size: *Data_Length octets*

Value	Parameter Description
Variable	Data to send in future Connectionless Peripheral Broadcast packets. This data will be repeated in future Connectionless Peripheral Broadcast instants until new data is provided

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Connectionless_Peripheral_Broadcast_Data command succeeded.
0x01 to 0xFF	HCI_Set_Connectionless_Peripheral_Broadcast_Data command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR on which Connectionless Peripheral Broadcast data will be sent
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Set_Connectionless_Peripheral_Broadcast_Data command has completed, an HCI_Command_Complete event shall be generated.

7.3.89 Read Synchronization Train Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Synchronization_Train_-Parameters	0x0077	*none*	Status, Sync_Train_Interval, Sync_Train_Timeout, Service_Data

Description:

This command returns the currently configured values for the Synchronization Train functionality in the Central's BR/EDR Controller. This command may be issued at any time.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Synchronization_Train_Parameters command succeeded.
0x01 to 0xFF	HCI_Read_Synchronization_Train_Parameters command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

Sync_Train_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Interval in slots between consecutive Synchronization Train events on the same channel. Range: 0x0020 to 0xFFFE; only even values are valid

Sync_Train_Timeout: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Duration in slots to continue sending the synchronization train Range: 0x00000002 to 0x07FFFFFE; only even values are valid

Service_Data: *Size: 1 octet*

Value	Parameter Description
0xXX	Host provided value included in Synchronization Train packet, octet 27; see [Vol 2] Part B, Table 8.11.

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Read_Synchronization_Train_Parameters command, it shall send an HCI_Command_Complete event to the Host.

7.3.90 Write Synchronization Train Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Synchronization_Train_-Parameters	0x0078	Interval_Min, Interval_Max, Sync_Train_Timeout, Service_Data	Status, Sync_Train_Interval

Description:

This command configures the Synchronization Train functionality in the BR/EDR Controller. This command may be issued at any time.

Note: The AFH_Channel_Map used in the Synchronization Train packets is configured by the HCI_Set_AFH_Host_Channel_Classification command and the local channel classification in the BR/EDR Controller.

Interval_Min and Interval_Max specify the allowed range of Sync_Train_Interval. Refer to [Vol 2] Part B, Section 2.7.2 for a detailed description of Sync_Train_Interval. The BR/EDR Controller shall select an interval from this range and return it in Sync_Train_Interval. If the Controller is unable to select a value from this range, it shall return the *Invalid HCI Command Parameters* (0x12) error code.

Once started (via the HCI_Start_Synchronization_Train command) the Synchronization Train will continue until Sync_Train_Timeout slots have passed or Connectionless Peripheral Broadcast has been disabled.

Command parameters:

Interval_Min: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum value allowed for the interval Sync_Train_Interval in slots. Range: 0x0020 to 0xFFFE; only even values are valid

Interval_Max: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum value allowed for the interval Sync_Train_Interval in slots. Range: 0x0020 to 0xFFFE; only even values are valid

Sync_Train_Timeout: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Duration in slots to continue sending the synchronization train Range: 0x00000002 to 0x07FFFFFE; only even values are valid

Service_Data: *Size: 1 octet*

Value	Parameter Description
0xXX	Host provided value to be included in octet 27 of the Synchronization Train packet payload body; see [Vol 2] Part B, Table 8.11.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Synchronization_Train_Parameters command succeeded.
0x01 to 0xFF	HCI_Write_Synchronization_Train_Parameters command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

Sync_Train_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Interval in slots between consecutive Synchronization Train packets on the same channel. Range: 0x0020 to 0xFFFE; only even values are valid

Event(s) generated (unless masked away):

When the BR/EDR Controller receives the HCI_Write_Synchronization_Train_-Parameters command, it shall send an HCI_Command_Complete event to the Host.

7.3.91 Read Secure Connections Host Support command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Secure_-Connections_Host_Support	0x0079	*none*	Status, Secure_Connections_Host_Support

Description:

This command reads the Secure_Connections_Host_Support parameter in the BR/EDR Controller. When Secure Connections Host Support is set to 'enabled' the Controller uses the enhanced reporting mechanisms for the Encryption_Enabled parameter in the HCI_Encryption_Change event (see Section 7.7.8) and the Key_Type parameter in the HCI_Link_Key_Notification event (see Section 7.7.24).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Secure_Connections_Host_Support command succeeded.
0x01 to 0xFF	HCI_Read_Secure_Connections_Host_Support command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Secure_Connections_Host_Support: *Size: 1 octet*

Value	Parameter Description
0x00	Secure_Connections_Host_Support is ‘disabled’. Host does not support Secure Connections (default)
0x01	Secure_Connections_Host_Support is ‘enabled’. Host supports Secure Connections
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Secure_Connections_Host_Support command has completed, an HCI_Command_Complete event shall be generated.

7.3.92 Write Secure Connections Host Support command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Secure_-Connections_Host_Support	0x007A	Secure_Connections_Host_Support	Status

Description:

This command writes the Secure_Connections_Host_Support parameter in the BR/EDR Controller. When Secure Connections Host Support is set to 'enabled' the Controller shall use the enhanced reporting mechanisms for the Encryption_Enabled parameter in the HCI_Encryption_Change event (see Section 7.7.8) and the Key_Type parameter in the HCI_Link_Key_Notification event (see Section 7.7.24). If the Host issues this command while the Controller is paging, has page scanning enabled, or has an ACL connection, the Controller shall return the error code *Command Disallowed* (0x0C).

The Link Manager Secure Connections (Host Support) feature bit shall be set to the Secure_Connections_Host_Support parameter. The default value for Secure_Connections_Host_Support shall be 'disabled.' When Secure_Connections_Host_Support is set to 'enabled,' the bit in the LMP features mask indicating support for Secure Connections (Host Support) shall be set to enabled in subsequent responses to an LMP_FEATURES_REQ from a remote device.

Command parameters:

Secure_Connections_Host_Support: *Size: 1 octet*

Value	Parameter Description
0x00	Secure_Connections_Host_Support is ‘disabled’. Host does not support Secure Connections (default)
0x01	Secure_Connections_Host_Support is ‘enabled’. Host supports Secure Connections
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Secure_Connections_Host_Support command succeeded.
0x01 to 0xFF	HCI_Write_Secure_Connections_Host_Support command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Secure_Connections_Host_Support command has completed, an HCI_Command_Complete event shall be generated.

7.3.93 Read Authenticated Payload Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Authenticated_-Payload_Timeout	0x007B	Connection_Handle	Status, Connection_Handle, Authenticated_Payload_Timeout

Description:

This command reads the Authenticated_Payload_Timeout (*authenticatedPayloadTO*, see [Vol 2] Part B, Appendix B for BR/EDR connections and [Vol 6] Part B, Section 5.4 for LE connections) parameter in the Controller on the specified Connection_Handle.

When the Connection_Handle identifies a BR/EDR synchronous connection or an LE BIS or CIS, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Authenticated_Payload_Timeout command succeeded.
0x01 to 0xFF	HCI_Read_Authenticated_Payload_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Authenticated_Payload_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum amount of time specified between packets authenticated by a MIC. Default = 0x0BB8 (30 s) Range: 0x0001 to 0xFFFF Time = N × 10 ms Time Range: 10 ms to 655,350 ms

Event(s) generated (unless masked away):

When the HCI_Read_Authenticated_Payload_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.94 Write Authenticated Payload Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Authenticated_-Payload_Timeout	0x007C	Connection_Handle, Authenticated_Payload_Timeout	Status, Connection_Handle

Description:

This command writes the Authenticated_Payload_Timeout (*authenticatedPayloadTO*, see [Vol 2] Part B, Appendix B and [Vol 6] Part B, Section 5.4 for the LE connection) parameter in the Controller for the specified Connection_Handle.

When the Connection_Handle identifies a BR/EDR ACL connection:

- If the connection is in Sniff mode, the Authenticated_Payload_Timeout shall be equal to or greater than T_{sniff}.
- If the connection is in Sniff Subrating mode, the Authenticated_Payload_Timeout shall be equal to or greater than

  (max subrate)xT_{sniff}.
- If the connection is in Hold mode, the Authenticated_Payload_Timeout shall be equal to or greater than the *holdTO* value.

When the Connection_Handle identifies an LE ACL connection, the Authenticated_Payload_Timeout shall be equal to or greater than *connInterval* × *connSubrateFactor* × (1 + *connPeripheralLatency*).

When the Connection_Handle is associated with a BR/EDR ACL connection, the Link Manager will use this parameter to determine when to use the LMP ping sequence.

When the Connection_Handle is associated with an LE ACL connection, the Link Layer will use this parameter to determine when to use the LE ping sequence.

When the Connection_Handle identifies a BR/EDR synchronous connection or an LE BIS or CIS, this command shall be rejected with the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Authenticated_Payload_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum amount of time specified between packets authenticated by a valid MIC. Range: 0x0001 to 0xFFFF Time = N × 10 ms Time Range: 10 ms to 655,350 ms

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Authenticated_Payload_Timeout command succeeded.
0x01 to 0xFF	HCI_Write_Authenticated_Payload_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_Write_Authenticated_Payload_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.95 Read Local OOB Extended Data command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_OOB_Extended_Data	0x007D	*none*	Status, C_192, R_192, C_256, R_256

Description:

This command obtains the Secure Simple Pairing Hash C_192, Randomizer R_192, Hash C_256, and Randomizer R_256, which are intended to be transferred to a remote device using an OOB mechanism. The BR/EDR Controller shall create new values for C_192, R_192, C_256, and R_256 for each invocation of this command. Each random number (R_192 and R_256) shall be created according to [Vol 2] Part H, Section 2.

If the Host issues this command before enabling either Secure Connections (Host Support) or Secure Simple Pairing (Host Support), then the Controller shall return the error code *Command Disallowed* (0x0C).

Note: Each OOB transfer will have unique C_192, R_192, C_256, and R_256 values.

After each OOB transfer this command shall be used to obtain a new set of values for the next OOB transfer.

Note: The Controller keeps information used to generate these values for later use in the Secure Simple Pairing process. If the BR/EDR Controller is powered off or reset then this information is lost and the values obtained before the power off or reset are invalid.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_OOB_Extended_Data command succeeded.
0x01 to 0xFF	HCI_Read_Local_OOB_Extended_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

C_192: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXX XXXXXXXXXXX XXXXXXXXX	Secure Simple Pairing Hash C derived from the P-192 public key.

R_192: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXX XXXXXXXXXXX XXXXXXXXX	Secure Simple Pairing Randomizer associated with the P-192 public key.

C_256: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXX XXXXXXXXXXX XXXXXXXXX	Secure Simple Pairing Hash C derived from the P-256 public key.

R_256: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXX XXXXXXXXXXX XXXXXXXXX	Secure Simple Pairing Randomizer associated with the P-256 public key.

Event(s) generated (unless masked away):

When the HCI_Read_Local_OOB_Extended_Data command has completed, an HCI_Command_Complete event shall be generated.

7.3.96 Read Extended Page Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Extended_Page_Timeout	0x007E	*none*	Status, Extended_Page_Timeout

Description:

This command will read the value for the Extended_Page_Timeout configuration parameter. See Section 6.41.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Extended_Page_Timeout command succeeded.
0x01 to 0x0F	HCI_Read_Extended_Page_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Extended_Page_Timeout: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Extended Page Timeout measured in number of Baseband slots. Interval Length = N × 0.625 ms (1 Baseband slot) Range: 0x0000 (default) to 0xFFFF Time Range: 0 to 40.9 s

Event(s) generated (unless masked away):

When the HCI_Read_Extended_Page_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.97 Write Extended Page Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Extended_Page_Timeout	0x007F	Extended_Page_Timeout	Status

Description:

This command will write the value for the Extended_Page_Timeout configuration parameter. See Section 6.41.

Command parameters:

Extended_Page_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Extended Page Timeout measured in number of Baseband slots. Interval Length = N × 0.625 ms (1 Baseband slot) Range: 0x0000 (default) to 0xFFFF Time Range: 0 to 40.9 s

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Extended_Page_Timeout command succeeded.
0x01 to 0x0F	HCI_Write_Extended_Page_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Extended_Page_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.3.98 Read Extended Inquiry Length command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Extended_Inquiry_-Length	0x0080	*none*	Status, Extended_Inquiry_Length

Description:

This command will read the value for the Extended_Inquiry_Length configuration parameter. See Section 6.42.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Extended_Inquiry_Length command succeeded.
0x01 to 0x0F	HCI_Read_Extended_Inquiry_Length command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Extended_Inquiry_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Extended_Inquiry_Length measured in number of Baseband slots. Interval Length = N × 0.625 ms (1 Baseband slot) Range: 0x0000 (default) to 0xFFFF Time Range: 0 to 40.9 s

Event(s) generated (unless masked away):

When the HCI_Read_Extended_Inquiry_Length command has completed, an HCI_Command_Complete event shall be generated.

7.3.99 Write Extended Inquiry Length command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Extended_Inquiry_Length	0x0081	Extended_Inquiry_Length	Status

Description:

This command will write the value for the Extended_Inquiry_Length configuration parameter. The Extended_Inquiry_Length configuration parameter defines the maximum time after the Inquiry_Length expires that the local Link Manager may wait for a Baseband inquiry response from the remote device at a locally initiated connection attempt. If this time expires and the remote device has not responded to the inquiry at Baseband level, the inquiry will be considered to have failed.

Command parameters:

Extended_Inquiry_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Extended_Inquiry_Length measured in number of Baseband slots. Interval Length = N × 0.625 ms (1 Baseband slot) Range: 0x0000 (default) to 0xFFFF Time Range: 0 to 40.9 s

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Extended_Inquiry_Length command succeeded.
0x01 to 0x0F	HCI_Write_Extended_Inquiry_Length command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Extended_Inquiry_Length command has completed, an HCI_Command_Complete event shall be generated.

7.3.100 Set Ecosystem Base Interval command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Ecosystem_Base_Interval	0x0082	Interval	Status

Description:

This command provides a hint to the Controller specifying the base communication interval the Controller can expect current and future communications to use. The Controller can assume that future activities will use an interval that is a multiple of the hint and may use that assumption when scheduling future activities. For example, if the Host expects to set up an LE ACL with a connection interval of 15 ms and a periodic advertisement with an interval of 40 ms, it would issue this command with Interval set to 5 ms. If the Host gives a range of possible intervals for an activity, the Controller could use a value in that range that is a multiple of the hint; e.g., if it gives the range 37.5 to 42.5 ms, the Controller could use 40 ms in preference to any other value. Communications being scheduled can include, but are not limited to, (e)SCO connections, BR/EDR ACL connections in Sniff mode, LE ACL connections, periodic advertisements, CISes, and BISes.

The Host may use an interval of zero to indicate that the most recently provided hint is no longer valid.

Command parameters:

Interval: *Size: 2 octets*

Value	Parameter Description
0x0000	Ignore any previous hint
N = 0xXXXX	Base interval of the ecosystem Range: 0x0002 to 0x7DF0 Time = N × 1.25 ms Time Range: 2.5 ms to 40.9 s.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Ecosystem_Base_Interval command succeeded.
All other values	HCI_Set_Ecosystem_Base_Interval command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Set_Ecosystem_Base_Interval command has completed, an HCI_Command_Complete event shall be generated.

7.3.101 Configure Data Path command

Command	OCF	Command Parameters	Return Parameters
HCI_Configure_Data_Path	0x0083	Data_Path_Direction, Data_Path_ID, Vendor_Specific_Config_Length, Vendor_Specific_Config	Status

Description:

This command is used to request the Controller to configure the data transport path in a given direction between the Controller and the Host.

The Data_Path_Direction parameter specifies the direction to be configured.

The Data_Path_ID parameter shall indicate the logical transport channel number for the non-HCI transport data path (e.g PCM interface) to be configured. The meaning of these logical transport channel numbers is vendor-specific.

The Vendor_Specific_Config parameter specifies additional vendor-specific configuration information that a Host may provide to the Controller.

If the Host issues this command with a value of Data_Path_ID that is not supported, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Data_Path_Direction: *Size: 1 octet*

Value	Parameter Description
0x00	Input (Host to Controller)
0x01	Output (Controller to Host)
All other values	Reserved for future use

Data_Path_ID: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved for future use
0x01 to 0xFE	Logical channel number; the meaning is vendor-specific.
0xFF	Reserved for future use

Vendor_Specific_Config_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Length of the vendor-specific configuration data

Vendor_Specific_Config: Size: *Vendor_Specific_Config_Length octets*

Value	Parameter Description
Variable	Vendor-specific configuration data for the data path being configured

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Configure_Data_Path command succeeded
0x01 to 0xFF	HCI_Configure_Data_Path command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Configure_Data_Path command has completed, an HCI_Command_Complete event shall be generated.

7.3.102 Set Min Encryption Key Size command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Min_Encryption_Key_Size	0x0084	Min_Encryption_Key_Size	Status

Description:

This command is used by the Host to configure the minimum encryption key size. The Controller shall not negotiate a key size smaller than this value for any subsequent connection over the BR/EDR transport. This command shall not affect any existing connections.

The Min_Encryption_Key_Size parameter specifies the new minimum encryption key size in octets. See [Vol 3] Part C, Section 5.2.2.8 for recommendations concerning key sizes.

If the Host specifies a minimum encryption key size that the Controller does not support, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Command parameters:

Min_Encryption_Key_Size: *Size: 1 octet*

Value	Parameter Description
0xXX	Minimum encryption key size in octets. Range: 0x01 to 0x10 Default: vendor-specific

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Min_Encryption_Key_Size command succeeded
0x01-0xFF	HCI_Set_Min_Encryption_Key_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Set_Min_Encryption_Key_Size command has completed, an HCI_Command_Complete event shall be generated.

7.4 Informational parameters

The informational parameters are fixed by the manufacturer of the Bluetooth hardware. These parameters provide information about the BR/EDR Controller and the capabilities of the Link Manager and Baseband in the BR/EDR Controller. The Host device cannot modify any of these parameters.

For Informational Parameters commands, the OGF is defined as 0x04.

7.4.1 Read Local Version Information command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_Version_Information	0x0001	*none*	Status, HCI_Version, HCI_Subversion, LMP_Version, Company_Identifier, LMP_Subversion

Description:

This command reads the values for the version information for the local Controller.

The HCI_Version information defines the version information of the HCI layer. The LMP_Version information defines the version of the LMP. The Company_Identifier information indicates the manufacturer of the local device.

The HCI_Subversion and LMP_Subversion are vendor-specific.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_Version_Information command succeeded.
0x01 to 0xFF	HCI_Read_Local_Version_Information command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

HCI_Version: *Size: 1 octet*

Value	Parameter Description
0xXX	Version of the HCI Specification supported by the Controller See Assigned Numbers

HCI_Subversion: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Revision of the HCI implementation in the Controller. This value is vendor-specific.

LMP_Version: *Size: 1 octet*

Value	Parameter Description
0xXX	Version of the Current LMP supported by the Controller. See Assigned Numbers

Company_Identifier: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Company identifier for the manufacturer of the Controller. See Assigned Numbers

LMP_Subversion: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Subversion of the Current LMP in the Controller. This value is vendor-specific.

Event(s) generated (unless masked away):

When the HCI_Read_Local_Version_Information command has completed, an HCI_Command_Complete event shall be generated.

7.4.2 Read Local Supported Commands command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_Supported_-Commands	0x0002	*none*	Status, Supported_Commands

Description:

This command reads the list of HCI commands supported for the local Controller.

This command shall return the Supported_Commands configuration parameter.

See Section 6.27 for more information.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0	HCI_Read_Local_Supported_Commands command succeeded
0x01 to 0xFF	HCI_Read_Local_Supported_Commands command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Supported_Commands: *Size: 64 octets*

Value	Parameter Description
	Bit mask for each HCI command. If a bit is 1, the Controller supports the corresponding command and the features required for the command. Unsupported or undefined commands shall be set to 0. See Section 6.27.

Event(s) generated (unless masked away):

When the HCI_Read_Local_Supported_Commands command has completed, an HCI_Command_Complete event shall be generated.

7.4.3 Read Local Supported Features command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_Supported_Features	0x0003	*none*	Status, LMP_Features

Description:

This command requests a list of the supported features for the local BR/EDR Controller. This command will return a list of the LMP features. For details see [Vol 2] Part C, Section 3.2.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_Supported_Features command succeeded.
0x01 to 0xFF	HCI_Read_Local_Supported_Features command failed. See [Vol 1] Part F, Controller Error Codes.

LMP_Features: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	Bit Mask List of LMP features. For details see [Vol 2] Part C, Section 3.2. On a device that does not support BR/EDR, this shall be set to either 0x0000_0060_0000_0000 or 0x8000_0060_0000_0000. Note: bit 37 previously indicated a device that does not support BR/EDR.

Event(s) generated (unless masked away):

When the HCI_Read_Local_Supported_Features command has completed, an HCI_Command_Complete event shall be generated.

7.4.4 Read Local Extended Features command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_Extended_-Features	0x0004	Page_Number	Status, Page_Number, Max_Page_Number, Extended_LMP_Features

Description:

This command returns the requested page of the extended LMP features.

Command parameters:

Page_Number: *Size: 1 octet*

Value	Parameter Description
0x00	Requests the normal LMP features as returned by Read_Local_Supported_Features.
0x01 to 0xFF	Return the corresponding page of features.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_Extended_Features command succeeded
0x01 to 0xFF	HCI_Read_Local_Extended_Features command failed. See [Vol 1] Part F, Controller Error Codes for list of error codes.

Page_Number: *Size: 1 octet*

Value	Parameter Description
0x00	The normal LMP features as returned by Read_Local_Supported_Features.
0x01 to 0xFF	The page number of the features returned.

Max_Page_Number: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xFF	The highest features page number which contains non-zero bits for the local device.

Extended_LMP_Features: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	Bit map of requested page of LMP features. See [Vol 2] Part C, Section 3.3 for details.

Event(s) generated (unless masked away):

When the HCI_Read_Local_Extended_Features command has completed, an HCI_Command_Complete event shall be generated.

7.4.5 Read Buffer Size command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Buffer_Size	0x0005	*none*	Status, ACL_Data_Packet_Length, Synchronous_Data_Packet_Length, Total_Num_ACL_Data_Packets, Total_Num_Synchronous_Data_Packets

Description:

This command is used to read the maximum size of the data portion of HCI ACL and Synchronous Data packets sent from the Host to the Controller. The Host will fragment the data to be transmitted from the Host to the Controller according to these sizes, so that the HCI Data packets will contain data with up to these sizes. The HCI_Read_Buffer_Size command also returns the total number of HCI ACL and Synchronous Data packets that can be stored in the data buffers of the Controller. The HCI_Read_Buffer_Size command shall be issued by the Host before it sends any data to the Controller.

For a device supporting BR/EDR and LE, if the HCI_LE_Read_Buffer_Size command returned zero for the number of buffers, then buffers returned by Read_Buffer_Size are shared between BR/EDR and LE.

The ACL_Data_Packet_Length parameter will be used to determine the size of the L2CAP fragments contained in ACL Data packets, which are transferred from the Host to the Controller to be broken up into Baseband packets by the Link Manager. The Synchronous_Data_Packet_Length parameter is used to determine the maximum size of HCI Synchronous Data packets. The Total_Num_ACL_Data_Packets parameter contains the total number of HCI ACL Data packets that can be stored in the data buffers of the Controller. The Host will determine how the buffers are to be divided between different Connection_Handles. The Total_Num_Synchronous_Data_Packets parameter gives the same information but for HCI Synchronous Data packets.
If the Controller does not support SCO or eSCO over HCI, then it shall set Total_Num_Synchronous_Data_Packets to zero, in which case the Host shall ignore the Synchronous_Data_Packet_Length parameter.

The ACL_Data_Packet_Length and Synchronous_Data_Packet_Length return parameters do not include the length of the HCI ACL Data packet header or the HCI Synchronous Data packet header respectively.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Buffer_Size command succeeded.
0x01 to 0xFF	HCI_Read_Buffer_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

ACL_Data_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum length (in octets) of the data portion of each HCI ACL Data packet that the Controller is able to accept. Range: 0x0001 to 0xFFFF

Synchronous_Data_Packet_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Maximum length (in octets) of the data portion of each HCI Synchronous Data packet that the Controller is able to accept. Range: 0x01 to 0xFF

Total_Num_ACL_Data_Packets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Total number of HCI ACL Data packets that can be stored in the data buffers of the Controller. Range: 0x0001 to 0xFFFF

Total_Num_Synchronous_Data_Packets: *Size: 2 octets*

Value	Parameter Description
0x0000	The Controller does not support SCO or eSCO over HCI.
0xXXXX	Total number of HCI Synchronous Data packets that can be stored in the data buffers of the Controller.

Event(s) generated (unless masked away):

When the HCI_Read_Buffer_Size command has completed, an HCI_Command_Complete event shall be generated.

7.4.6 Read BD_ADDR command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_BD_ADDR	0x0009	*none*	Status, BD_ADDR

Description:

On a BR/EDR Controller, this command reads the Bluetooth Controller address (BD_ADDR). (See [Vol 2] Part B, Section 1.2 and [Vol 3] Part C, Section 3.2.1).

On an LE Controller, this command shall read the Public Device Address as defined in [Vol 6] Part B, Section 1.3. If this Controller does not have a Public Device Address, the value 0x000000000000 shall be returned.

On a BR/EDR/LE Controller, the public address shall be the same as the BD_ADDR.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_BD_ADDR command succeeded.
0x01 to 0xFF	HCI_Read_BD_ADDR command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device

Event(s) generated (unless masked away):

When the HCI_Read_BD_ADDR command has completed, an HCI_Command_Complete event shall be generated.

7.4.7 Read Data Block Size command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Data_Block_Size	0x000A	*none*	Status, Max_ACL_Data_Packet_Length, Data_Block_Length, Total_Num_Data_Blocks

Description:

This command is used to read values regarding the maximum permitted data transfers over the Controller and the data buffering available in the Controller.

The Host uses this information when fragmenting data for transmission, and when performing block-based flow control, based on the HCI_Number_Of_Completed_Data_Blocks event. The HCI_Read_Data_Block_Size command shall be issued by the Host before it sends any data to the Controller.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Data_Block_Size command succeeded.
0x01 to 0xFF	HCI_Read_Data_Block_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Max_ACL_Data_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum length (in octets) of the data portion of an HCI ACL Data packet that the Controller is able to accept for transmission.

Data_Block_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum length (in octets) of the data portion of each HCI ACL Data packet that the Controller is able to hold in each of its data block buffers.

Total_Num_Data_Blocks: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Total number of data block buffers available in the Controller for the storage of data packets scheduled for transmission.

Event(s) generated (unless masked away):

When the HCI_Read_Data_Block_Size command has completed, an HCI_Command_Complete event shall be generated.

7.4.8 Read Local Supported Codecs command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_-Supported_Codecs [v2]	0x000D	*none*	Status, Num_Supported_Standard_Codecs, Standard_Codec_ID[i], Standard_Codec_Transport[i], Num_Supported_Vendor_Specific_Codecs, Vendor_Specific_Codec_ID[k], Vendor_Specific_Codec_Transport[k]
HCI_Read_Local_-Supported_Codecs [v1]	0x000B	*none*	Status, Num_Supported_Standard_Codecs, Standard_Codec_ID[i], Num_Supported_Vendor_Specific_Codecs, Vendor_Specific_Codec_ID[k]

The order of the return parameters in an HCI event packet is:

Status
Num_Supported_Standard_Codecs
Standard_Codec ID[0]
Standard_Codec_Transport[0]
. . .
Standard_Codec_ID[m]
Standard_Codec_Transport[m]
Num_Supported_Vendor_Specific_Codecs
Vendor_Specific_Codec ID[0]
Vendor_Specific_Codec_Transport[0]
. . .
Vendor_Specific_Codec ID[n]
Vendor_Specific_Codec_Transport[n]

Description:

This command reads a list of the Bluetooth SIG approved codecs supported by the Controller, as well as vendor specific codecs, which are defined by an individual manufacturer. The [v1] version of this command shall only return codecs supported on the BR/EDR physical transport, while the [v2] version shall return codecs supported on all physical transports.

Command parameters:

None

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_Supported_Codecs command succeeded.
0x01 to 0xFF	HCI_Read_Local_Supported_Codecs command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_Supported_Standard_Codecs: *Size: 1 octet*

Value	Parameter Description
0xXX	Total number of codecs supported

Standard_Codec_ID[i]: *Size: Num_Supported_Standard_Codecs × 1 octet*

Value	Parameter Description
0xXX	Codec identifier. See Assigned Numbers

Standard_Codec_Transport[i]: *Size: Num_Supported_Standard_Codecs × 1 octet*

Bit Number	Parameter Description
0	Codec supported over BR/EDR ACL
1	Codec supported over BR/EDR SCO and eSCO
2	Codec supported over LE CIS
3	Codec supported over LE BIS
All other bits	Reserved for future use

Num_Supported_Vendor_Specific_Codecs: *Size: 1 octet*

Value	Parameter Description
0xXX	Total number of vendor-specific codecs supported

Vendor_Specific_Codec_ID[k]: Size: Num_Supported_Vendor_Specific_Codecs × 4 octets

Value	Parameter Description
Octets 0 and 1	Company ID, see Assigned Numbers for Company Identifier
Octets 2 and 3	Vendor-defined codec ID

Vendor_Specific_Codec_Transport[k]: Size: Num_Supported_Vendor_Specific_Codecs × 1 octet

Bit Number	Parameter Description
0	Codec supported over BR/EDR ACL
1	Codec supported over BR/EDR SCO and eSCO
2	Codec supported over LE CIS
3	Codec supported over LE BIS
All other bits	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_Local_Supported_Codecs command has completed, an HCI_Command_Complete event shall be generated.

7.4.9 Read Local Simple Pairing Options command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_Simple_Pairing_-Options	0x000C	*none*	Status, Simple_Pairing_Options, Max_Encryption_Key_Size

Description:

This command is used to read the Secure Simple Pairing options and the maximum encryption key size supported. Bit 0 of the Simple_Pairing_Options parameter shall be set to 1.

Note: If this command is supported, then the Controller must support remote public key validation (see [Vol 2] Part H, Section 7.6).

Command parameters:

None

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_Simple_Pairing_Options command succeeded.
0x01 to 0xFF	HCI_Read_Local_Simple_Pairing_Options command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Simple_Pairing_Options: *Size: 1 octet*

Bit Number	Parameter Description
0	Remote public key validation is always performed.
All other bits	Reserved for future use.

Max_Encryption_Key_Size: *Size: 1 octet*

Value	Parameter Description
0x07 to 0x10	Maximum encryption key size (in octets) supported.
All other values	Reserved for future use.

Event(s) generated (unless masked away):

When the HCI_Read_Local_Simple_Pairing_Options command has completed, an HCI_Command_Complete event shall be generated.

7.4.10 Read Local Supported Codec Capabilities command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_Supported_-Codec_Capabilities	0x000E	Codec_ID, Logical_Transport_Type, Direction	Status, Num_Codec_Capabilities, Codec_Capability_Length[i], Codec_Capability[i]

Description:

This command returns a list of codec capabilities supported by the Controller for a given codec. Only capabilities for the codec specified by the Codec_ID parameter and that match the transport specified by the Logical_Transport_Type parameter and direction specified by the Direction parameter are returned.

Note: The Controller cannot provide more information than will fit in an HCI Event packet. If more capabilities than that are available, it must select which ones to return. How this is done is not specified.

Command parameters:

Codec_ID: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers
Octets 1 to 2	Company ID, see Assigned Numbers for Company Identifier. Shall be ignored if octet 0 is not 0xFF.
Octets 3 to 4	Vendor-defined codec ID. Shall be ignored if octet 0 is not 0xFF.

Logical_Transport_Type: *Size: 1 octet*

Value	Parameter Description
0x00	BR/EDR ACL
0x01	BR/EDR SCO or eSCO
0x02	LE CIS
0x03	LE BIS
All other values	Reserved for future use

Direction: *Size: 1 octet*

Value	Parameter Description
0x00	Input (Host to Controller)
0x01	Output (Controller to Host)
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_Supported_Codec_Capabilities command succeeded
0x01 to 0xFF	HCI_Read_Local_Supported_Codec_Capabilities command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Num_Codec_Capabilities: *Size: 1 octet*

Value	Parameter Description
0xXX	Total number of codec capabilities returned

Codec_Capability_Length[i]: *Size: Num_Codec_Capabilities × 1 octet*

Value	Parameter Description
0xXX	Length of the Codec_Capability[i] field

Codec_Capability[i]: *Size: SUM(Codec_Capability_Length[i]) octets*

Value	Parameter Description
Variable	Codec_Capability_Length[i] octets of codec-specific capability data Note: Each element of this array has a variable length.

Event(s) generated (unless masked away):

When the HCI_Read_Local_Supported_Codec_Capabilities command has completed, an HCI_Command_Complete event shall be generated.

7.4.11 Read Local Supported Controller Delay command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Local_Supported_-Controller_Delay	0x000F	Codec_ID, Logical_Transport_Type, Direction, Codec_Configuration_Length, Codec_Configuration	Status, Min_Controller_Delay, Max_Controller_Delay

Description:

This command returns the range of supported Controller delays for the codec specified by the Codec_ID parameter on a given transport type specified by the Logical_Transport_Type parameter, in the direction specified by the Direction parameter, and with the codec configuration specified by the Codec_Configuration parameter.

The Min_Controller_Delay and Max_Controller_Delay parameters returned by the Controller provide a range of allowed values to be used by the Host when issuing the HCI_LE_Setup_ISO_Data_Path command.

The Min_Controller_Delay parameter returned by the Controller shall be greater than or equal to the codec processing delay for the specified direction and codec configuration.

The Max_Controller_Delay parameter returned by the Controller shall be less than or equal to the sum of the codec processing delay and the maximum time the Controller can buffer the data for the specified direction and codec configuration. Max_Controller_Delay shall be greater than or equal to Min_Controller_Delay.

Command parameters:

Codec_ID: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding Format
Octets 1 to 2	Company ID, see Assigned Numbers for Company Identifier. Shall be ignored if octet 0 is not 0xFF.
Octets 3 to 4	Vendor-defined codec ID. Shall be ignored if octet 0 is not 0xFF.

Logical_Transport_Type: *Size: 1 octet*

Value	Parameter Description
0x00	BR/EDR ACL
0x01	BR/EDR SCO or eSCO
0x02	LE CIS
0x03	LE BIS
All other values	Reserved for future use

Direction: *Size: 1 octet*

Value	Parameter Description
0x00	Input (Host to Controller)
0x01	Output (Controller to Host)
All other values	Reserved for future use

Codec_Configuration_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Length of codec configuration

Codec_Configuration: *Size: Codec_Configuration_Length octets*

Value	Parameter Description
Variable	Codec-specific configuration data

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Local_Supported_Controller_Delay command succeeded
0x01 to 0xFF	HCI_Read_Local_Supported_Controller_Delay command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Min_Controller_Delay: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Minimum Controller delay in microseconds for the specified configuration Range: 0x000000 to 0x3D0900 Time range: 0 s to 4 s

Max_Controller_Delay: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Maximum Controller delay in microseconds for the specified configuration Range: 0x000000 to 0x3D0900 Time range: 0 s to 4 s

Event(s) generated (unless masked away):

When the HCI_Read_Local_Supported_Controller_Delay command has completed, an HCI_Command_Complete event shall be generated.

7.5 Status parameters

The Controller modifies all status parameters. These parameters provide information about the current state of the Link Manager and Baseband in the BR/EDR Controller. The Host device cannot modify any of these parameters other than to reset certain specific parameters.

For the status parameters commands, the OGF is defined as 0x05.

7.5.1 Read Failed Contact Counter command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Failed_Contact_Counter	0x0001	Handle	Status, Handle, Failed_Contact_Counter

Description:

This command reads the value for the Failed_Contact_Counter parameter for a particular connection to another device. The Handle shall be a Connection_Handle for an ACL connection. See Section 6.15.

Command parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Handle for the Connection for which the Failed Contact Counter should be read. Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Failed_Contact_Counter command succeeded.
0x01 to 0xFF	HCI_Read_Failed_Contact_Counter command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Handle for the connection for which the Failed Contact Counter has been read. Range: 0x0000 to 0x0EFF

Failed_Contact_Counter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of consecutive failed contacts for a connection corresponding to the Handle.

Event(s) generated (unless masked away):

When the HCI_Read_Failed_Contact_Counter command has completed, an HCI_Command_Complete event shall be generated.

7.5.2 Reset Failed Contact Counter command

Command	OCF	Command Parameters	Return Parameters
HCI_Reset_Failed_Contact_Counter	0x0002	Handle	Status, Handle

Description:

This command resets the value for the Failed_Contact_Counter parameter for a particular connection to another device. The Handle shall be a Connection_Handle for an ACL connection. See Section 6.15.

Command parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Handle for the connection for which the Failed Contact Counter should be reset. Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Reset_Failed_Contact_Counter command succeeded.
0x01 to 0xFF	HCI_Reset_Failed_Contact_Counter command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Handle for the connection for which the Failed Contact Counter has been reset. Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_Reset_Failed_Contact_Counter command has completed, an HCI_Command_Complete event shall be generated.

7.5.3 Read Link Quality command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Link_Quality	0x0003	Handle	Status, Handle, Link_Quality

Description:

This command returns the value for the Link_Quality for the specified Handle. The Handle shall be a Connection_Handle for an ACL connection. This command shall return a Link_Quality value from 0 to 255, which represents the quality of the link between two Controllers. The higher the value, the better the link quality is. Each Bluetooth module vendor will determine how to measure the link quality.

If the Host specifies a connection handle for an LE ACL connection and the Controller does not support the Connected Isochronous Stream - Central or Connected Isochronous Stream - Peripheral feature (see [Vol 6] Part B, Section 4.6), the Controller shall either begin to execute the command or return an error.

Command parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Handle for the connection for which link quality parameters are to be read. Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Link_Quality command succeeded.
0x01 to 0xFF	HCI_Read_Link_Quality command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Handle for the connection for which the link quality parameter has been read. Range: 0x0000 to 0x0EFF

Link_Quality: *Size: 1 octet*

Value	Parameter Description
0xXX	The current quality of the Link connection between the local device and the remote device specified by the Handle. Range: 0x00 to 0xFF The higher the value, the better the link quality is.

Event(s) generated (unless masked away):

When the HCI_Read_Link_Quality command has completed, an HCI_Command_Complete event shall be generated.

7.5.4 Read RSSI command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_RSSI	0x0005	Handle	Status, Handle, RSSI

Description:

This command reads the Received Signal Strength Indication (RSSI) value from a Controller.

For a BR/EDR Controller, the RSSI parameter returns the difference between the measured Received Signal Strength Indication (RSSI) and the limits of a range selected by the Controller. The lower limit shall correspond to a received power not less than -56 dBm and not greater than 6 dB above the actual sensitivity of the receiver. The upper limit shall be 20±6 dB above the lower limit. A positive RSSI value shall indicate how many dB the RSSI is above the upper limit, a negative value shall indicate how many dB the RSSI is below the lower limit, and zero shall indicate that the RSSI is inside the range.

The returned RSSI value is not required to have any specific accuracy provided that it correctly indicates whether the received signal strength was above the upper limit, below the lower limit, or between the limits.

For an LE transport, the RSSI parameter returns the absolute received signal strength value in dBm to ±6 dB accuracy. If the RSSI cannot be read, the RSSI parameter shall be set to 127.

Command parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Handle for the connection for which the RSSI is to be read. The Handle is a Connection_Handle for an ACL-U or LE-U connection. Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_RSSI command succeeded.
0x01 to 0xFF	HCI_Read_RSSI command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Handle for the connection for which the RSSI has been read. Range: 0x0000 to 0x0EFF

RSSI: *Size: 1 octet*

Value	Parameter Description
0xXX	BR/EDR Range: -128 to 127 Units: dB LE: Range: -127 to 20, 127 Units: dBm

Event(s) generated (unless masked away):

When the HCI_Read_RSSI command has completed, an HCI_Command_Complete event shall be generated.

7.5.5 Read AFH Channel Map command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_AFH_Channel_Map	0x0006	Connection_Handle	Status, Connection_Handle, AFH_Mode, AFH_Channel_Map

Description:

This command returns the values for the AFH_Mode and AFH_Channel_Map for the specified Connection_Handle. The Connection_Handle shall be a Connection_Handle for an ACL connection.

The returned values indicate the state of the hop sequence specified by the most recent LMP_SET_AFH message for the specified Connection_Handle, regardless of whether the Central has received the Baseband acknowledgment or whether the AFH_Instant has passed.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_AFH_Channel_Map command succeeded.
0x01 to 0xFF	HCI_Read_AFH_Channel_Map command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

AFH_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	AFH is disabled.
0x01	AFH is enabled.
All other values	Reserved for future use.

AFH_Channel_Map: *Size: 10 octets (79 bits meaningful)*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXX	If AFH_Mode is not AFH enabled then the contents of this parameter are reserved for future use. Otherwise: This parameter contains 80 1-bit fields. The n^{th}such field (in the range 0 to 78) contains the value for channel *n*: 0: channel *n* is unused 1: channel *n* is used The most significant bit (bit 79) is reserved for future use

Event(s) generated (unless masked away):

When the HCI_Read_AFH_Channel_Map command has completed, an HCI_Command_Complete event shall be generated.

7.5.6 Read Clock command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Clock	0x0007	Connection_Handle, Which_Clock	Status, Connection_Handle, Clock, Accuracy

Description:

This command reads the estimate of the value of the Bluetooth Clock from the BR/EDR Controller.

If the Which_Clock value is 0, then the Connection_Handle shall be ignored, the local Bluetooth Clock value shall be returned and the accuracy parameter shall be set to 0.

If the Which_Clock value is 1, then the Connection_Handle shall be a valid ACL Connection_Handle. If the current role of this ACL connection is Central, then the Bluetooth Clock of this device shall be returned. If the current role is Peripheral, then an estimate of the Bluetooth Clock of the remote Central and the accuracy of this value shall be returned.

The accuracy reflects the clock drift that might have occurred since the Peripheral last received a valid transmission from the Central.

Note: The Bluetooth Clock has a minimum accuracy of 250 ppm, or about 22 seconds drift in one day.

Note: See [Vol 2] Part B, Section 1.1 for more information about the Bluetooth Clock.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Which_Clock: *Size 1 octet*

Value	Parameter Description
0xXX	0x00 = Local Clock (Connection_Handle does not have to be valid) 0x01 = Piconet Clock (Connection_Handle shall be valid) 0x02 to 0xFF = Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Clock command succeeded.
0x01 to 0xFF	HCI_Read_Clock command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets(12 bits meaningful)*

Value	Parameter Description
0xXXXX	The Connection_Handle for the connection for which the Central's clock has been read. If the Which_Clock parameter was 0, then the Connection_Handle is reserved for future use. Range: 0x0000 to 0x0EFF

Clock: *Size: 4 octets (28 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX	Bluetooth Clock of the device requested.

Accuracy: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum (absolute) error in the Bluetooth Clock. Value of 0xFFFF means Unknown. Accuracy = ±N × 0.3125 ms (1 Bluetooth Clock) Range: 0x0000 to 0xFFFE Time Range: 0 to 20479.375 ms

Event(s) generated (unless masked away):

When the HCI_Read_Clock command has completed, an HCI_Command_Complete event shall be generated.

7.5.7 Read Encryption Key Size command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Encryption_Key_Size	0x0008	Connection_Handle	Status, Connection_Handle, Key_Size

Description:

This command reads the current encryption key size associated with the Connection_Handle. The Connection_Handle shall be a Connection_Handle for an active ACL connection.

All BR/EDR Controllers shall implement this command.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Read_Encryption_Key_Size succeeded
0x01 to 0xFF	Read_Encryption_Key_Size failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Key_Size: *Size: 1 octet*

Value	Parameter Description
0xXX	Encryption key size. See [Vol 2] Part C, Section 5.2.

Event(s) generated (unless masked away):

When the HCI_Read_Encryption_Key_Size command has completed, an HCI_Command_Complete event shall be generated.

If the ACL connection associated with the Connection_Handle is not encrypted, the Controller shall return an HCI_Command_Complete event with the error code *Insufficient Security* (0x2F).

7.5.8 [This section is no longer used]

7.5.9 [This section is no longer used]

7.5.10 [This section is no longer used]

7.5.11 Get MWS Transport Layer Configuration command

Command	OCF	Command Parameters	Return Parameters
HCI_Get_MWS_Transport_Layer_-Configuration	0x000C	*none*	Status, Num_Transports, Transport_Layer[i], Num_Baud_Rates[i], To_MWS_Baud_Rate[k], From_MWS_Baud_Rate[k]

The order of the return parameters in an HCI event packet is:

Status
Num_Transports
Transport_Layer[0]
Num_Baud_Rates[0]
. . .
Transport_Layer[n]
Num_Baud_Rates[n]
To_MWS_Baud_Rate[0]
From_MWS_Baud_Rate[0]
. . .
To_MWS_Baud_Rate[m]
From_MWS_Baud_Rate[m]

Description:

This command is used to inform the Host of the Baud rates supported by the Controller for the transport layer.

The Num_Transports parameter is used to indicate the number of MWS coexistence transport interfaces supported by the Controller.

The Num_Baud_Rates[i] parameter indicates the number of supported baud rates for each transport.

The To_MWS_Baud_Rate[k] parameters indicate the supported baud rates in the direction from Bluetooth to MWS for each transport.

The From_MWS_Baud_Rate[k] parameters indicate the supported baud rates in the direction from MWS to Bluetooth for each transport.

If one direction has more supported rates than the other direction, the Controller shall - in the direction with less supported rates - fill with sufficient zeros to produce the same number of values. The rates for the two directions are not necessarily paired.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Get_MWS_Transport_Layer_Configuration command succeeded.
0x01 to 0xFF	HCI_Get_MWS_Transport_Layer_Configuration command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

Num_Transports: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of supported MWS coexistence transport layers.

Transport_Layer[i]: *Size: Num_Transports × 1 octet*

Value	Parameter Description
0xXX	See Assigned Numbers.

Num_Baud_Rates[i]: *Size: Num_Transports × 1 octet*

Value	Parameter Description
0xXX	Number of different baud rates supported for one transport.

To_MWS_Baud_Rate[k]: *Size: SUM (Num_Baud_Rates [i])× 4 octets*

Value	Parameter Description
0xXXXXXXXX	A supported Baud rate in the Bluetooth Controller to MWS Device direction in Baud. The list shall start with the first baud rate for the first transport, followed by the remaining baud rates for the first transport, followed by the baud rates for the second transport (if any), followed by baud rates for subsequent transports (if any).

From_MWS_Baud_Rate[k]: *Size: SUM (Num_Baud_Rates[i]) × 4 octets*

Value	Parameter Description
0xXXXXXXXX	A supported Baud rate in the Bluetooth Controller for signals in the MWS to Bluetooth Controller Device direction in Baud. The list shall start with the first baud rate for the first transport, followed by the remaining baud rates for the first transport, followed by the baud rates for the second transport (if any), followed by baud rates for subsequent transports (if any).

Event(s) generated (unless masked away):

When the HCI_Get_MWS_Transport_Layer_Configuration command has completed, an HCI_Command_Complete event shall be generated.

7.5.12 Set Triggered Clock Capture command

Command	OCF	Command Parameters	Return Parameters
HCI_Set_Triggered_Clock_-Capture	0x000D	Connection_Handle, Enable, Which_Clock, LPO_Allowed, Num_Clock_Captures_To_Filter	Status

Description:

This command configures the BR/EDR Controller for triggered clock capturing.

Triggered clock capturing is enabled or disabled by the Enable parameter. If Enable is set to 0x00, all the other parameters (including Connection_Handle) shall be ignored.

If the Which_Clock value is 0, then the Connection_Handle shall be ignored. If the Which_Clock value is 1, then the Connection_Handle shall be a valid ACL Connection_Handle.

The LPO_Allowed parameter informs the BR/EDR Controller whether it may use a lower accuracy clock or not.

The Num_Clock_Captures_To_Filter parameter is used to filter triggered clock captures between sending HCI_Triggered_Clock_Capture events to the Host. When set to zero, all triggered clock captures shall result in an HCI_Triggered_Clock_Capture event sent to the Host. When set to a non-zero value, after every HCI_Triggered_Clock_Capture event, Num_Clock_Captures_To_Filter triggered clock captures in a row shall not trigger an event to be sent to the Host.

Note: An implementation should ensure that the rate of triggered clock captures does not overwhelm the HCI event queue and processing.

Note: See [Vol 2] Part B, Section 1.1 for more information about the Bluetooth Clock.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Disable triggered clock capturing on the specified Connection_Handle (default)
0x01	Enable triggered clock capturing on the specified Connection_Handle
All other values	Reserved for future use

Which_Clock: *Size: 1 octet*

Value	Parameter Description
0x00	Local Clock
0x01	Piconet Clock for the specified connection
All other values	Reserved for future use

LPO_Allowed: *Size: 1 octet*

Value	Parameter Description
0x00	Controller shall not sleep (that is, clock accuracy shall be equal to or better than ± 20 ppm)
0x01	Controller may sleep (that is, clock accuracy shall be equal to or better than ± 250 ppm)
All other values	Reserved for future use

Num_Clock_Captures_To_Filter: *Size: 1 octet*

Value	Parameter Description
0x00	All triggered clock captures result in an HCI_Triggered_Clock_Capture event sent to the Host
0x01 to 0xFF	Number of triggered clock captures filtered between sending an HCI_Triggered_Clock_Capture event to the Host.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Set_Triggered_Clock_Capture command succeeded.
0x01 to 0xFF	HCI_Set_Triggered_Clock_Capture command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Set_Triggered_Clock_Capture command has completed, an HCI_Command_Complete event shall be sent to the Host.

When Triggered Clock Capturing is enabled, HCI_Triggered_Clock_Capture events are returned until Triggered Clock Capturing is disabled.

7.6 Testing commands

The Testing commands are used to provide the ability to test various functional capabilities of the Bluetooth hardware. These commands provide the ability to arrange various conditions for testing.

For the Testing commands, the OGF is defined as 0x06.

7.6.1 Read Loopback Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Read_Loopback_Mode	0x0001	*none*	Status, Loopback_Mode

Description:

This command reads the value for the setting of the Controller's Loopback mode. The setting of the Loopback_Mode parameter shall determine the path of information. In Non-testing Mode operation, the Loopback_Mode parameter is set to Non-testing Mode and the path of the information is as specified by the Bluetooth specifications. In Local Loopback Mode, every data packet (ACL, SCO and eSCO) and command packet that is sent from the Host to the Controller is sent back with no modifications by the Controller, as shown in Figure 7.1. For details of loopback modes see Section 7.6.2.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Loopback_Mode command succeeded.
0x01 to 0xFF	HCI_Read_Loopback_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Loopback_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	No Loopback mode enabled (default).
0x01	Enable Local Loopback.

Value	Parameter Description
0x02	Enable Remote Loopback.
All other values	Reserved for future use.

Event(s) generated (unless masked away):

When the HCI_Read_Loopback_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.6.2 Write Loopback Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Loopback_Mode	0x0002	Loopback_Mode	Status

Description:

This command writes the value for the setting of the BR/EDR Controller's Loopback mode. The setting of the Loopback_Mode parameter shall determine the path of information. In Non-testing mode operation, the Loopback_Mode parameter is set to Non-testing mode and the path of the information as specified by the Bluetooth specifications. In Local Loopback mode, every data packet (ACL, SCO and eSCO) and command packet that is sent from the Host to the BR/EDR Controller is sent back with no modifications by the BR/EDR Controller, as shown in Figure 7.1.

When the BR/EDR Controller enters Local Loopback mode, it shall respond with one to four Connection_Handles, one for an ACL connection and zero to three for synchronous connections. The Host should use these Connection_Handles when sending data in Local Loopback mode. The number of Connection_Handles returned for synchronous connections (between zero and three) is implementation specific. When in Local Loopback mode, the BR/EDR Controller loops back commands and data to the Host. The HCI_Loopback_Command event is used to loop back commands that the Host sends to the Controller.

There are some commands that are not looped back in Local Loopback mode: HCI_Reset, HCI_Set_Controller_To_Host_Flow_Control, HCI_Host_Buffer_Size, HCI_Host_Number_Of_Completed_Packets, HCI_Read_Buffer_Size, HCI_Read_Loopback_Mode and HCI_Write_Loopback_Mode. These commands should be executed in the way they are normally executed. The commands HCI_Reset and HCI_Write_Loopback_Mode can be used to exit Local Loopback mode.

If HCI_Write_Loopback_Mode is used to exit Local Loopback mode on a BR/EDR Controller, HCI_Disconnection_Complete events corresponding to the HCI_Connection_Complete events that were sent when entering Local Loopback mode should be sent to the Host. Furthermore, no connections are allowed in Local Loopback mode. If there is a connection, and there is an attempt to set the device to Local Loopback mode, the attempt will be refused. When the device is in Local Loopback mode, the Controller will refuse incoming connection attempts. This allows the Host BR/EDR Controller Transport Layer to be tested without any other variables.

If a BR/EDR Controller is set to Remote Loopback mode, it will send back all data (ACL, SCO and eSCO) that comes over the air. It will only allow a maximum of one ACL connection and three synchronous connections, and these shall all be to the same remote device. If there are existing connections to a remote device and there is an attempt to set the local device to Remote Loopback mode, the attempt shall be refused.

See Figure 7.2, where the rightmost device is set to Remote Loopback mode and the leftmost device is set to Non-testing mode. This allows the BR/EDR Air link to be tested without any other variables.

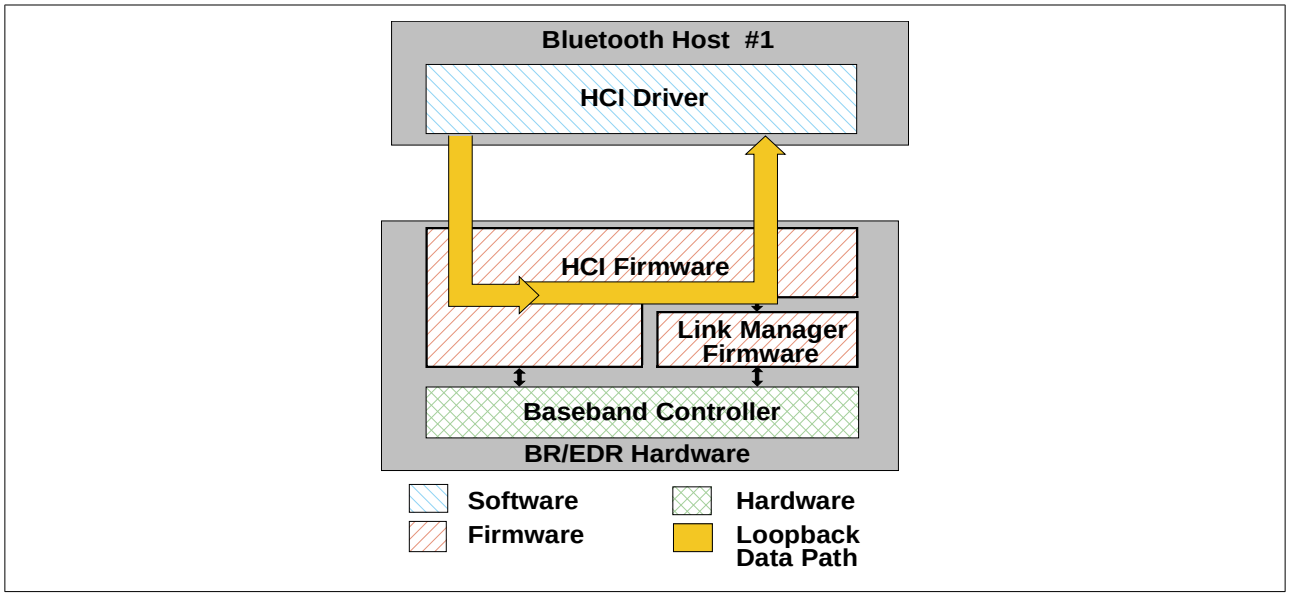


Figure 7.1: Local Loopback mode

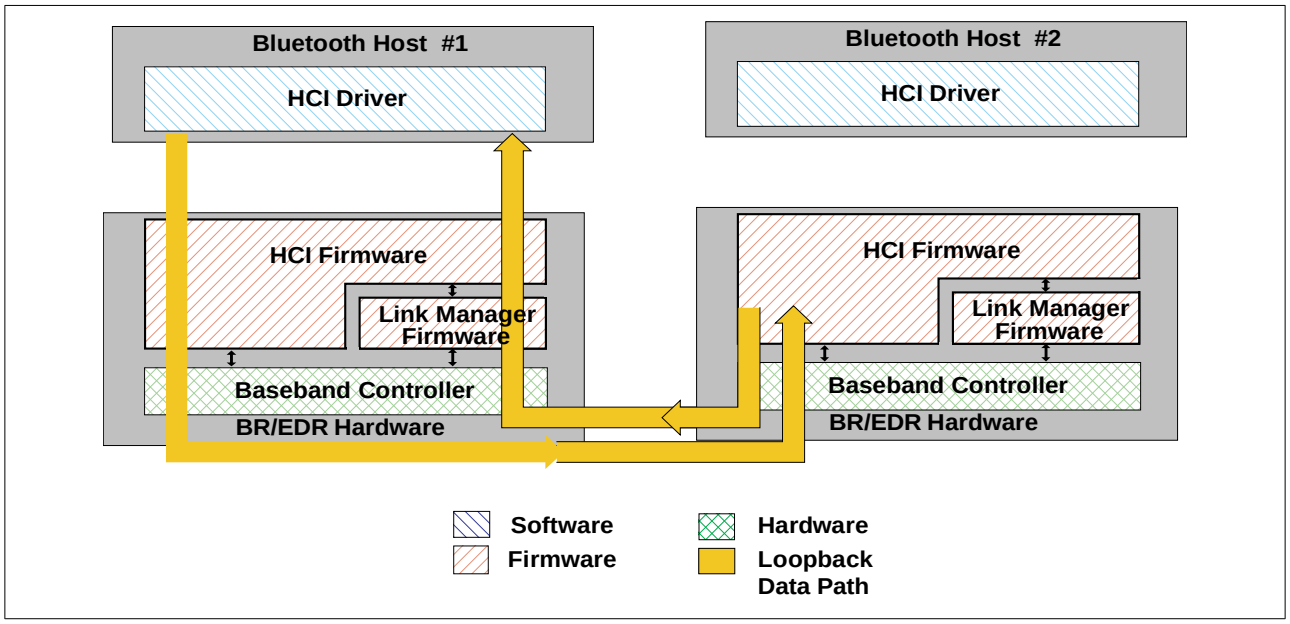

Figure 7.2: Remote Loopback mode

Command parameters:

Loopback_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	No Loopback mode enabled (default).
0x01	Enable Local Loopback.
0x02	Enable Remote Loopback.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Loopback_Mode command succeeded.
0x01 to 0xFF	HCI_Write_Loopback_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Loopback_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.6.3 Enable Implementation Under Test Mode command[1]

Command	OCF	Command Parameters	Return Parameters
HCI_Enable_-Implementation_Under_Test_Mode	0x0003	*none*	Status

Description:

This command allows the local BR/EDR Controller to enter test mode via LMP test commands for BR/EDR Controllers. For details see [Vol 2] Part C, Link Manager Protocol Specification. The Host issues this command when it wants the local device to be the IUT for the Testing scenarios as described in [Vol 3] Part D, Section 1. When the BR/EDR Controller receives this command, it shall complete the command with an HCI_Command_Complete event. The BR/EDR Controller functions as normal until the remote tester issues the LMP test command to place the local device into Implementation Under Test mode. To disable and exit the Implementation Under Test Mode, the Host may issue the HCI_Reset command. The local BR/EDR Controller shall not enter test mode, even if instructed by the remote BR/EDR Controller, before this command is issued.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Enable_Implementation_Under_Test_Mode command succeeded.
0x01 to 0xFF	HCI_Enable_Implementation_Under_Test_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Enable_Implementation_Under_Test_Mode command has completed, an HCI_Command_Complete event shall be generated.

[1]This command was formerly called “Enable Device Under Test Mode”.

7.6.4 Write Simple Pairing Debug Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Simple_Pairing_Debug_-Mode	0x0004	Simple_Pairing_Debug_Mode	Status

Description:

This command configures the BR/EDR Controller to use a predefined Diffie Hellman private key for Secure Simple Pairing to enable debug equipment to monitor the encrypted connection.

Note: Only one side (initiator or responder) needs to set Secure Simple Pairing debug mode in order for debug equipment to be able to determine the link key and, therefore, be able to monitor the encrypted connection.

When the Simple_Pairing_Debug_Mode parameter is set to enabled the BR/EDR Controller shall use the predefined Diffie Hellman private key. The BR/EDR Controller shall also set the resulting Link_Key type to "Debug Combination Key."

When in Secure Simple Pairing debug mode, the Link Manager shall use the following Diffie Hellman private / public key pairs:

For P-192:

Private key: `07915f86918ddc27005df1d6cf0c142b625ed2eff4a518ff`

Public key (X): `15207009984421a6586f9fc3fe7e4329d2809ea51125f8ed`

Public key (Y): `b09d42b81bc5bd009f79e4b59dbbaa857fca856fb9f7ea25`

For P-256:

Private key: `3f49f6d4 a3c55f38 74c9b3e3 d2103f50 4aff607b eb40b799 5899b8a6 cd3c1abd`

Public key (X): `20b003d2 f297be2c 5e2c83a7 e9f9a5b9 eff49111 acf4fddb cc030148 0e359de6`

Public key (Y): `dc809c49 652aeb6d 63329abf 5a52155c 766345c2 8fed3024 741c8ed0 1589d28b`

Command parameters:

Simple_Pairing_Debug_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Secure Simple Pairing debug mode disabled (default)
0x01	Secure Simple Pairing debug mode enabled
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Simple_Pairing_Debug_Mode command succeeded.
0x01 to 0xFF	HCI_Write_Simple_Pairing_Debug_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_Write_Simple_Pairing_Debug_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.6.5 [This section is no longer used]

7.6.6 [This section is no longer used]

7.6.7 [This section is no longer used]

7.6.8 Write Secure Connections Test Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_Write_Secure_Connections_Test_-Mode	0x000A	Connection_Handle, DM1_ACL-U_Mode, eSCO_Loopback_Mode	Status, Connection_Handle

Description:

This command configures the BR/EDR Controller to enable and disable the two test modes used for verifying the Secure Connections feature during qualification. The DM1_ACL-U_Mode parameter enables and disables the use of DM1 packets for transmitting ACL-U data. When DM1 ACL-U Mode is disabled, ACL-U traffic may use DM1 packets. When DM1 ACL-U Mode is enabled, ACL-U traffic shall not use DM1 packets unless the Packet_Type parameter only allows DM1 packets (e.g. set to 0x3306 or 0x330E).

The command is used during testing to help make transmit ACL packet selection predictable.

The eSCO_Loopback_Mode parameter enables and disables the loopback of received eSCO payloads. When the eSCO_Loopback_Mode parameter is set to Enabled, the BR/EDR Controller will send back all eSCO data that comes over the air irrespective of whether the CRC check in the received eSCO packet passes or fails. It will only allow one synchronous connection. If there is more than one synchronous connection and there is an attempt to set the local device to eSCO_Loopback_Mode, the attempt shall be refused.

See Figure 7.3, where the rightmost device has the eSCO_Loopback_Mode parameter set to enabled and the leftmost device is in a normal mode of operation. This allows the encryption and decryption of eSCO packets to be tested without any other variables.

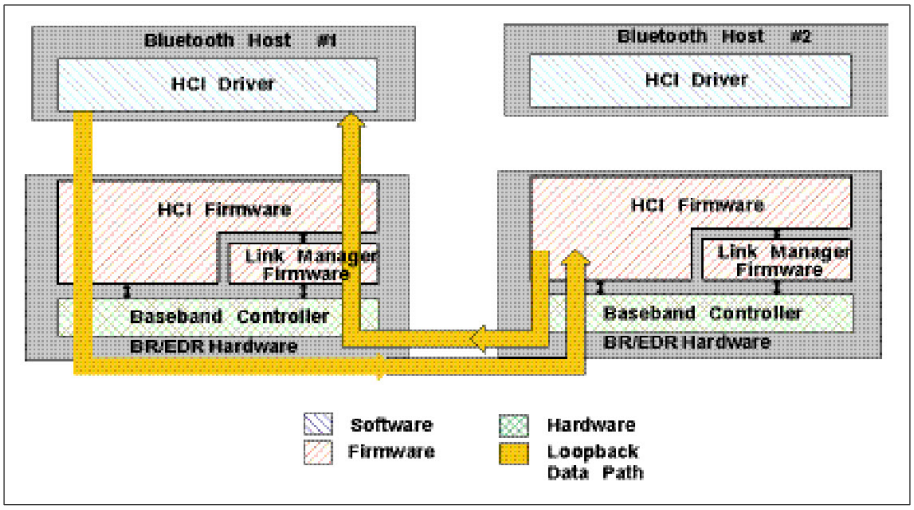

Figure 7.3: Secure Connections eSCO Loopback

The Connection_Handle shall be for an ACL connection.

When the eSCO_Loopback_Mode parameter is set to enabled, received eSCO payloads are looped back as subsequent transmitted eSCO payloads. There may be a delay of 0 or more eSCO intervals before the Controller loops back the payload. This is illustrated in Figure 7.4, Figure 7.5, and Figure 7.6.

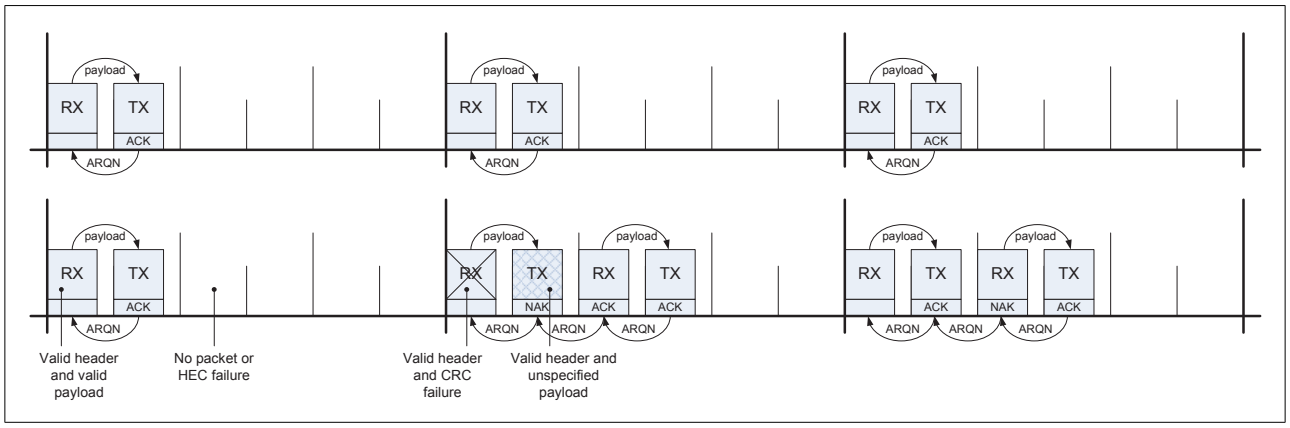

Figure 7.4: Secure Connections eSCO loopback immediate

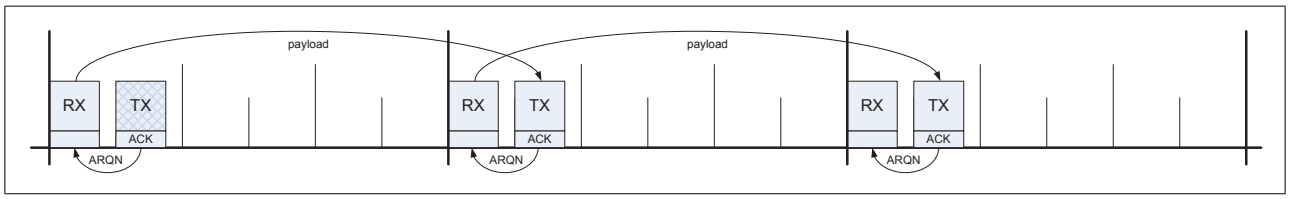

Figure 7.5: Secure Connections eSCO loopback delayed

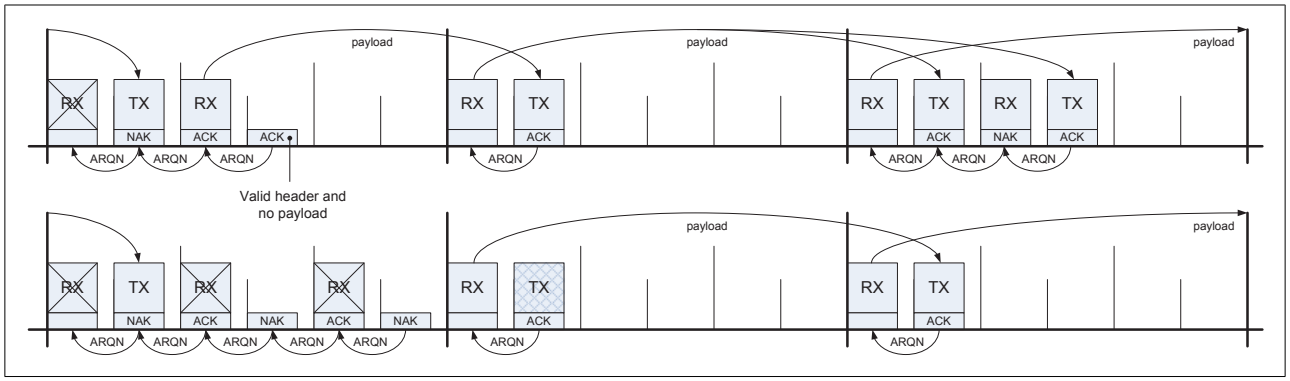

Figure 7.6: Secure Connections eSCO loopback delayed with retransmissions

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

DM1_ACL-U_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	DM1 ACL-U mode disabled (default)
0x01	DM1 ACL-U mode enabled
All other values	Reserved for future use

eSCO_Loopback_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	eSCO loopback mode disabled (default)
0x01	eSCO loopback mode enabled
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Write_Secure_Connections_Test_Mode command succeeded.
0x01 to 0xFF	HCI_Write_Secure_Connections_Test_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_Write_Secure_Connections_Test_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.7 Events

7.7.1 Inquiry Complete event

Event	Event Code	Event Parameters
HCI_Inquiry_Complete	0x01	Status

Description:

This event indicates that the Inquiry is finished. This event contains a Status parameter, which is used to indicate if the Inquiry completed successfully or if the Inquiry was not completed.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Inquiry command completed successfully.
0x01 to 0xFF	HCI_Inquiry command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

7.7.2 Inquiry Result event

Event	Event Code	Event Parameters
HCI_Inquiry_Result	0x02	Num_Responses, BD_ADDR[i], Page_Scan_Repetition_Mode[i], Reserved[i], Class_Of_Device[i] Clock_Offset[i]

Description:

This event indicates that a BR/EDR Controller or multiple BR/EDR Controllers have responded so far during the current Inquiry process. This event will be sent from the BR/EDR Controller to the Host as soon as an Inquiry Response from a remote device is received if the remote device supports only mandatory paging scheme. The BR/EDR Controller may queue these Inquiry Responses and send multiple BR/EDR Controllers information in one HCI_Inquiry_Result event. The event can be used to return one or more Inquiry responses in one event.

This event is only generated if the Inquiry_Mode parameter of the last HCI_Write_Inquiry_Mode command was set to 0x00 (Standard Inquiry Result event format) or if the HCI_Write_Inquiry_Mode command has not been used.

Event parameters:

Num_Responses: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of responses from the Inquiry.

BD_ADDR[i]: *Size: Num_Responses × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for a device which responded.

Page_Scan_Repetition_Mode[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0x00	R0
0x01	R1

Value	Parameter Description
0x02	R2
All other values	Reserved for future use

Reserved[i]: *Size: Num_Responses × 2 octets*

Value	Parameter Description
0xXXXX	Reserved for future use.

Class_Of_Device[i]: *Size: Num_Responses × 3 octets*

Value	Parameter Description
0xXXXXXX	Class of Device for the device

Clock_Offset[i]: *Size: Num_Responses × 2 octets*

Bit Number	Parameter Description
0-14	Bits 16-2 of CLKNPeripheral - CLK
15	Reserved for future use

7.7.3 Connection Complete event

Event	Event Code	Event Parameters
HCI_Connection_Complete	0x03	Status, Connection_Handle, BD_ADDR, Link_Type, Encryption_Enabled

Description:

This event indicates to both of the Hosts forming the connection that a new connection has been established. This event also indicates to the Host which issued the HCI_Create_Connection, HCI_Accept_Connection_Request, or HCI_Reject_Connection_Request command, and then received an HCI_Command_Status event, if the issued command failed or was successful.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Connection successfully completed.
0x01 to 0xFF	Connection failed to Complete. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle for the new connection Range: 0x0000 to 0x0EFF

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the other connected Device forming the connection.

Link_Type: *Size: 1 octet*

Value	Parameter Description
0x00	SCO connection.
0x01	ACL connection (Data Channels).
All other values	Reserved for future use.

Encryption_Enabled: *Size: 1 octet*

Value	Parameter Description
0x00	Link level encryption disabled.
0x01	Link level encryption enabled.
All other values	Reserved for future use.

7.7.4 Connection Request event

Event	Event Code	Event Parameters
HCI_Connection_Request	0x04	BD_ADDR, Class_Of_Device, Link_Type

Description:

This event is used to indicate that a new incoming connection is trying to be established. The connection may either be accepted or rejected. When the Host receives this event and the link type parameter is ACL, it should respond with either an HCI_Accept_Connection_Request or HCI_Reject_Connection_Request command before the timer Connection_Accept_Timeout expires. If the link type is SCO or eSCO, the Host should reply with the HCI_Accept_Synchronous_Connection_Request command, the HCI_Enhanced_Accept_Synchronous_Connection_Request command, or the HCI_Reject_Synchronous_Connection_Request command. If the link type is SCO, the Host may respond with the HCI_Accept_Connection_Request command. If the event is responded to with the HCI_Accept_Connection_Request command, then the default parameter settings of the HCI_Accept_Synchronous_Connection_Request command (see Section 7.1.27) should be used by the local Link Manager when negotiating the SCO link parameters. In that case, the HCI_Connection_Complete event and not the HCI_Synchronous_Connection_Complete event, shall be returned on completion of the connection.

Note: See Section 7.3.3 for the behavior when the HCI_Connection_Request event is masked or the connection is auto accepted.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device that requests the connection.

Class_Of_Device: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Class of Device for the device, which requests the connection.
0x000000	Unknown Class of Device

Link_Type: *Size: 1 octet*

Value	Parameter Description
0x00	SCO connection requested
0x01	ACL connection requested
0x02	eSCO connection requested
All other values	Reserved for future use.

7.7.5 Disconnection Complete event

Event	Event Code	Event Parameters
HCI_Disconnection_Complete	0x05	Status, Connection_Handle, Reason

Description:

This event occurs when a connection is terminated. The status parameter indicates if the disconnection was successful or not. The reason parameter indicates the reason for the disconnection if the disconnection was successful. If the disconnection was not successful, then the value of the reason parameter shall be ignored by the Host. For example, this can be the case if the Host has issued the HCI_Disconnect command and there was a parameter error, or the command was not presently allowed, or a Connection_Handle that didn't correspond to a connection was given.

If Connection_Handle identifies a CIS on the Central, then the handle and the associated data paths of that CIS shall remain valid (irrespective of whether the disconnection was successful or not). If Connection_Handle identifies a CIS on the Peripheral and Status is zero, then the handle and the associated data path of that CIS shall be deleted. If Connection_Handle identifies any other kind of connection and Status is zero, then the handle shall be deleted. If Connection_Handle identifies an LE ACL connection and Status is zero, then any associated CS configurations shall also be deleted.

Note: When a physical link fails, one HCI_Disconnection_Complete event will be returned for each logical channel on the physical link with the corresponding Connection_Handle as a parameter.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Disconnection has occurred.
0x01 to 0xFF	Disconnection failed to complete. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle which was disconnected. Range: 0x0000 to 0x0EFF

Reason: *Size: 1 octet*

Value	Parameter Description
0xXX	Reason for disconnection. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

7.7.6 Authentication Complete event

Event	Event Code	Event Parameters
HCI_Authentication_Complete	0x06	Status, Connection_Handle

Description:

This event occurs when authentication has been completed for the specified connection. The Connection_Handle shall be a Connection_Handle for an ACL connection.

Note: This event is only generated on the initiator of the authentication and not on the responder.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Authentication Request successfully completed.
0x01 to 0xFF	Authentication Request failed to complete. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

7.7.7 Remote Name Request Complete event

Event	Event Code	Event Parameters
HCI_Remote_Name_Request_Complete	0x07	Status, BD_ADDR, Remote_Name

Description:

This event is used to indicate that a remote name request has been completed. The Remote_Name parameter is a UTF-8 encoded string with the type utf8s{248} defined in [Vol 1] Part E, Section 2.9.3. The BD_ADDR parameter is used to identify which device the user-friendly name was obtained from.

Note: The Remote_Name parameter is a string parameter. Endianness does therefore not apply to the Remote_Name parameter. The first octet of the name is received first.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Remote_Name_Request command succeeded.
0x01 to 0xFF	HCI_Remote_Name_Request command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for the device whose name was requested.

Remote_Name: *Size: 248 octets*

Value	Parameter Description
Name[248]	A UTF-8 encoded user-friendly descriptive name for the remote device with type utf8s{248}.

7.7.8 Encryption Change event

Event	Event Code	Event Parameters
HCI_Encryption_Change [v2]	0x59	Status, Connection_Handle, Encryption_Enabled, Encryption_Key_Size
HCI_Encryption_Change [v1]	0x08	Status, Connection_Handle, Encryption_Enabled

Description:

This event is used to indicate that the change of the encryption mode has been completed. The Connection_Handle parameter will be a Connection_Handle for an ACL connection and is used to identify the remote device. The Encryption_Enabled parameter specifies the new encryption state for the connection specified by Connection_Handle. The Encryption_Key_Size parameter specifies the size, in octets, of the key used to encrypt the link. This event will occur on both devices to notify the Hosts when encryption has changed for all connections between the two devices. This event shall not be generated if encryption is paused or resumed; during a role switch, for example.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	An encryption change has occurred.
0x01 to 0xFF	An attempt to change encryption failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Encryption_Enabled: *Size: 1 octet*

Value	Parameter Description
0x00	Link Level Encryption is OFF.
0x01	Link Level Encryption is ON with E0 for BR/EDR. Link Level Encryption is ON with AES-CCM for LE.
0x02	Link Level Encryption is ON with AES-CCM for BR/EDR.
All other values	Reserved for future use.

Encryption_Key_Size: *Size: 1 octet*

Value	Parameter Description
0xXX	Encryption key size in octets. This parameter shall be ignored for LE connections and shall be ignored when Link Level Encryption is OFF. Range: 0x01 to 0x10

7.7.9 Change Connection Link Key Complete event

Event	Event Code	Event Parameters
HCI_Change_Connection_Link_Key_Complete	0x09	Status, Connection_Handle

Description:

This event is used to indicate that the change in the Link Key for all connections to a given remote BR/EDR Controller has been completed.

The Connection_Handle will be a Connection_Handle for an ACL connection to the remote Controller. The HCI_Change_Connection_Link_Key_Complete event is sent only to the Host which issued the HCI_Change_Connection_Link_Key command.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Change_Connection_Link_Key command succeeded.
0x01 to 0xFF	HCI_Change_Connection_Link_Key command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

7.7.10 Link Key Type Changed event

Event	Event Code	Event Parameters
HCI_Link_Key_Type_Changed	0x0A	Status, Connection_Handle, Key_Flag

Description:

This event is used to indicate that the Link Key managed by the Central of the piconet has been changed. The Connection_Handle will be a Connection_Handle for an ACL connection within that piconet. The link key used for the connection will be the temporary link key or the semi-permanent link key indicated by the Key_Flag. The Key_Flag parameter is used to indicate which Link Key (temporary link key or the semi-permanent link keys) is now being used in the piconet.

This event is also generated on the local Controller when the HCI_Link_Key_Selection command finishes because no change was requested or an error occurred. If a key change was attempted but failed, the remote Controller may generate the event.

Note: For a Central, the change from a semi-permanent Link Key to temporary Link Key will affect all Connection_Handles related to the piconet. For a Peripheral, this change affects only this particular Connection_Handle. A temporary link key must be used when both broadcast and point-to-point traffic are being encrypted (see [Vol 2] Part H, Section 3.2.6 and [Vol 2] Part H, Section 4.2).

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Link_Key_Selection command succeeded.
0x01 to 0xFF	HCI_Link_Key_Selection command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Key_Flag: *Size: 1 octet*

Value	Parameter Description
0x00	Using Semi-permanent Link Key.
0x01	Using Temporary Link Key.

7.7.11 Read Remote Supported Features Complete event

Event	Event Code	Event Parameters
HCI_Read_Remote_Supported_Features_Complete	0x0B	Status, Connection_Handle, LMP_Features

Description:

This event is used to indicate the completion of the process of the Link Manager obtaining the supported features of the remote BR/EDR Controller specified by the Connection_Handle parameter. Connection_Handle will be a Connection_Handle for an ACL connection. The LMP_Features parameter specifies the LMP features supported by the remote Controller. For details see [Vol 2] Part C, Link Manager Protocol Specification.

Note: If the features are requested more than once while a connection exists between the two devices, the second and subsequent requests may report a cached copy of the features rather than fetching the feature mask again.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Remote_Supported_Features command succeeded.
0x01 to 0xFF	HCI_Read_Remote_Supported_Features command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

LMP_Features: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	Bit Mask List of LMP features. See [Vol 2] Part C, Link Manager Protocol Specification.

7.7.12 Read Remote Version Information Complete event

Event	Event Code	Event Parameters
HCI_Read_Remote_Version_Information_Complete	0x0C	Status, Connection_Handle, Version, Company_Identifier, Subversion

Description:

This event is used to indicate the completion of the process obtaining the version information of the remote Controller specified by the Connection_Handle parameter. Connection_Handle shall be for an ACL connection.

The Version parameter defines the specification version of the BR/EDR or LE Controller. The Company_Identifier parameter indicates the manufacturer of the remote Controller. The Subversion parameter is controlled by the manufacturer and is vendor-specific. These parameters shall contain the same values as the CompanyID and SubVersion parameters in [Vol 2] Part C, Section 4.3.3 and [Vol 6] Part B, Section 2.4.2.13.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Remote_Version_Information command succeeded.
0x01 to 0xFF	HCI_Read_Remote_Version_Information command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Version: *Size: 1 octet*

Value	Parameter Description
0xXX	Version of the Current LMP or Link Layer supported by the remote Controller. See Assigned Numbers.

Company_Identifier: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Company identifier for the manufacturer of the remote Controller. See Assigned Numbers.

Subversion: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Revision of the LMP or Link Layer implementation in the remote Controller. This value is vendor-specific.

7.7.13 QoS Setup Complete event

Event	Event Code	Event Parameters
HCI_QoS_Setup_Complete	0x0D	Status, Connection_Handle, Unused, Service_Type, Token_Rate, Peak_Bandwidth, Latency, Delay_Variation

Description:

This event is used to indicate the completion of the process of the Link Manager setting up QoS with the remote BR/EDR Controller specified by the Connection_Handle parameter. Connection_Handle will be a Connection_Handle for an ACL connection. For more detail see [Vol 3] Part A, Logical Link Control and Adaptation Protocol Specification.

The Unused parameter is reserved for future use.

This event is generated following an HCI_QoS_Setup command issued by the local Host.

Note: This event or the HCI_Flow_Specification_Complete event can be generated if the remote device performs an LMP transaction involving the flow parameter values.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_QoS_Setup command succeeded.
0x01 to 0xFF	HCI_QoS_Setup command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Unused: *Size: 1 octet*

Value	Parameter Description
0x00	This value shall be used by the Controller.
All other values	Reserved for future use.

Service_Type: *Size: 1 octet*

Value	Parameter Description
0x00	No Traffic Available.
0x01	Best Effort Available.
0x02	Guaranteed Available.
All other values	Reserved for future use.

Token_Rate: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Available Token Rate, in octets per second.

Peak_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Available Peak Bandwidth, in octets per second.

Latency: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Available Latency, in microseconds.

Delay_Variation: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Available Delay Variation, in microseconds.

7.7.14 Command Complete event

Event	Event Code	Event Parameters
HCI_Command_Complete	0x0E	Num_HCI_Command_Packets, Command_Opcode, Return_Parameters

Description:

This event is used by the Controller for most commands to transmit return status of a command and the other event parameters that are specified for the issued HCI command.

The Num_HCI_Command_Packets parameter allows the Controller to indicate the number of HCI command packets the Host can send to the Controller. If the Controller requires the Host to stop sending commands, Num_HCI_Command_Packets will be set to zero. To indicate to the Host that the Controller is ready to receive HCI command packets, the Controller generates an HCI_Command_Complete event with the Command_Opcode parameter set to 0x0000 and Num_HCI_Command_Packets set to 1 or more. Command_Opcode 0x0000 is a special value indicating that this event is not associated with a command sent by the Host. The Controller can send an HCI_Command_Complete event with Command Opcode 0x0000 at any time to change the number of outstanding HCI command packets that the Host can send before waiting. See each command for the parameters that are returned by this event.

Event parameters:

Num_HCI_Command_Packets: *Size: 1 octet*

Value	Parameter Description
0xXX	The Number of HCI Command packets which are allowed to be sent to the Controller from the Host. Range: 0 to 255

Command_Opcode: *Size: 2 octets*

Value	Parameter Description
0x0000	No associated command
0xXXXX	(non-zero) Opcode of the command which caused this event.

Return_Parameters: *Size: Depends on command*

Value	Parameter Description
0xXX	This is the return parameter(s) for the command specified in the Command_Opcode event parameter. See each command's definition for the list of return parameters associated with that command.

7.7.15 Command Status event

Event	Event Code	Event Parameters
HCI_Command_Status	0x0F	Status, Num_HCI_Command_Packets, Command_Opcode

Description:

This event is used to indicate that the command described by the Command_Opcode parameter has been received, and that the Controller is currently performing the task for this command. This event is needed to provide mechanisms for asynchronous operation, which avoids the need for the Host to wait for a command to finish. If the command cannot begin to execute (a parameter error may have occurred, or the command may currently not be allowed), the Status parameter will contain the corresponding error code, and no complete event will follow since the command was not started. The Num_HCI_Command_Packets parameter allows the Controller to indicate the number of HCI command packets the Host can send to the Controller. If the Controller requires the Host to stop sending commands, Num_HCI_Command_Packets will be set to zero. To indicate to the Host that the Controller is ready to receive HCI command packets, the Controller generates an HCI_Command_Status event with Status 0x00 and Command_Opcode 0x0000 and Num_HCI_Command_Packets set to 1 or more. Command_Opcode 0x0000 is a special value indicating that this event is not associated with a command sent by the Host. The Controller can send an HCI_Command_Status event with Command Opcode 0x0000 at any time to change the number of outstanding HCI command packets that the Host can send before waiting.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Command now pending.
0x01 to 0xFF	Command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_HCI_Command_Packets: *Size: 1 octet*

Value	Parameter Description
0xXX	The Number of HCI Command packets which are allowed to be sent to the Controller from the Host. Range: 0 to 255

Command_Opcode: *Size: 2 octets*

Value	Parameter Description
0x0000	No associated command
0xXXXX	(non-zero) Opcode of the command which caused this event and is now pending.

7.7.16 Hardware Error event

Event	Event Code	Event Parameters
HCI_Hardware_Error	0x10	Hardware_Code

Description:

This event is used to notify the Host that a hardware failure has occurred in the Controller.

Event parameters:

Hardware_Code: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xFF	These Hardware_Codes will be implementation-specific, and can be assigned to indicate various hardware problems.

7.7.17 Flush Occurred event

Event	Event Code	Event Parameters
HCI_Flush_Occurred	0x11	Handle

Description:

This event is used to indicate that, for the specified Handle, the current user data to be transmitted has been removed. The Handle shall be a Connection_Handle for an ACL connection. This could result from the HCI_Flush command, or be due to the automatic flush. Multiple blocks of an L2CAP packet could have been pending in the Controller. If one Baseband packet part of an L2CAP PDU is flushed, then the rest of the HCI ACL Data packets for the L2CAP PDU shall also be flushed.

Event parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Handle that was flushed. Range: 0x0000 to 0x0EFF

7.7.18 Role Change event

Event	Event Code	Event Parameters
HCI_Role_Change	0x12	Status, BD_ADDR, New_Role

Description:

This event is used to indicate that the current role of the BR/EDR Controller related to the particular connection has changed. This event occurs (with Status set to zero) when both the remote and local BR/EDR Controllers have completed their role change for the BR/EDR Controller associated with the BD_ADDR parameter, allowing both affected Hosts to be notified when the Role has been changed.

This event is also generated on the local Controller when the HCI_Switch_Role command finishes because no change was requested or an error occurred. If a Baseband role switch was attempted but failed, the remote Controller may generate the event.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	A role change has occurred.
0x01 to 0xFF	A role change failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device for which a role change has completed.

New_Role: *Size: 1 octet*

Value	Parameter Description
0x00	Currently the Central for specified BD_ADDR.
0x01	Currently the Peripheral for specified BD_ADDR.

7.7.19 Number Of Completed Packets event

Event	Event Code	Event Parameters
HCI_Number_Of_Completed_Packets	0x13	Num_Handles, Handle[i], Num_Completed_Packets[i]

Description:

This event is used by the Controller to indicate to the Host how many HCI Data packets or HCI ISO Data packets have been completed for each Handle since the previous HCI_Number_Of_Completed_Packets event was sent to the Host. This means that the corresponding buffer space has been freed in the Controller and is available for new packets to be sent. Based on this information and the return parameters of the HCI_Read_Buffer_Size and HCI_LE_Read_Buffer_Size commands, the Host can determine for which Handles the following HCI packets should be sent to the Controller. The HCI_Number_Of_Completed_Packets event shall not specify a given Handle before the Controller has sent the event indicating that the corresponding connection or BIG has been created or after it has sent the event indicating disconnection of the corresponding connection or indicating that the BIG has been terminated. While the Controller has HCI Data packets or HCI ISO Data packets in its buffer, it shall keep sending the HCI_Number_Of_Completed_Packets event to the Host at least periodically, until it finally reports that all the pending packets have been completed. The rate with which this event is sent is manufacturer specific.

Note: HCI_Number_Of_Completed_Packets events will not report on synchronous Connection_Handles if synchronous Flow Control is disabled. (See Section 7.3.36 and Section 7.3.37.)

Event parameters:

Num_Handles: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of Handles and Num_HCI_Data_Packets parameters pairs contained in this event. Range: 0 to 255

Handle[i]: *Size: Num_Handles × 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle or BIS_Handle Range: 0x0000 to 0x0EFF

Num_Completed_Packets[i]: *Size: Num_Handles × 2 octets*

Value	Parameter Description
0xXXXX	The number of packets that have been completed for the associated Connection_Handle since the previous time the event was returned. Range: 0x0000 to 0xFFFF

7.7.20 Mode Change event

Event	Event Code	Event Parameters
HCI_Mode_Change	0x14	Status, Connection_Handle, Current_Mode, Interval

Description:

This event is used to indicate when the device associated with the Connection_Handle changes between Active mode, Hold mode, and Sniff mode. The Connection_Handle parameter will be a Connection_Handle for an ACL connection. Connection_Handle is used to indicate which connection the HCI_Mode_Change event is for. The Current_Mode event parameter is used to indicate which state the connection is currently in. The Interval parameter is used to specify a time amount specific to each state. Each Controller that is associated with the Connection_Handle which has changed modes shall send the HCI_Mode_Change event to its Host.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	A Mode Change has occurred.
0x01 to 0xFF	HCI_Hold_Mode, HCI_Sniff_Mode, or HCI_Exit_Sniff_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle. Range: 0x0000 to 0x0EFF

Current_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Active mode.
0x01	Hold mode.
0x02	Sniff mode.
All other values	Reserved for future use.

Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Hold: Number of Baseband slots to wait in Hold mode. Hold Interval = N × 0.625 ms (1 Baseband slot) Range: 0x0002 to 0xFFFE Time Range: 1.25 ms to 40.9 s Sniff: Number of Baseband slots between sniff anchor points. Time between sniff anchor points = N × 0.625 ms (1 Baseband slot) Range: 0x0002 to 0xFFFE Time Range: 1.25 ms to 40.9 s

7.7.21 Return Link Keys event

Event	Event Code	Event Parameters
HCI_Return_Link_Keys	0x15	Num_Keys, BD_ADDR[i], Link_Key[i]

Description:

This event is used by the BR/EDR Controller to send the Host the BD_ADDRs associated with one or more stored Link Keys. Zero or more instances of this event will occur after the HCI_Read_Stored_Link_Key command. When there are no link keys stored, no HCI_Return_Link_Keys events shall be returned. When there are link keys stored, the number of link keys returned in each HCI_Return_Link_Keys event is implementation specific. This event shall never return the value of the link keys. The link keys value parameter shall always contain the value of zero.

Event parameters:

Num_Keys: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of Link Keys contained in this event. Range: 0x01 to 0x0B

BD_ADDR[i]: *Size: Num_Keys × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for the associated Link Key.

Link_Key[i]: *Size: Num_Keys × 16 octets*

Value	Parameter Description
0x00000000000000000000000000000000	Shall be zero.

7.7.22 PIN Code Request event

Event	Event Code	Event Parameters
HCI_PIN_Code_Request	0x16	BD_ADDR

Description:

This event is used to indicate that a PIN code is required to create a new link key. The Host shall respond using either the HCI_PIN_Code_Request_Reply or the HCI_PIN_Code_Request_Negative_Reply command, depending on whether the Host can provide the Controller with a PIN code or not.

Note: If the HCI_PIN_Code_Request event is masked away, then the BR/EDR Controller will assume that the Host has no PIN Code.

When the BR/EDR Controller generates an HCI_PIN_Code_Request event in order for the local Link Manager to respond to the request from the remote Link Manager (as a result of an HCI_Create_Connection or HCI_Authentication_Requested command from the remote Host), the local Host shall respond with either an HCI_PIN_Code_Request_Reply or HCI_PIN_Code_Request_Negative_Reply command before the remote Link Manager detects LMP response timeout. (See [Vol 2] Part C, Link Manager Protocol Specification.)

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device for which a new link key is being created.

7.7.23 Link Key Request event

Event	Event Code	Event Parameters
HCI_Link_Key_Request	0x17	BD_ADDR

Description:

This event is used to indicate that a Link Key is required for the connection with the device specified in BD_ADDR. If the Host has the requested stored Link Key, then the Host shall pass the requested Key to the Controller using the HCI_Link_Key_Request_Reply command. If the Host does not have the requested stored Link Key, or the stored Link Key does not meet the security requirements for the requested service, then the Host shall use the HCI_Link_Key_Request_Negative_Reply command to indicate to the Controller that the Host does not have the requested key.

Note: If the HCI_Link_Key_Request event is masked away, then the BR/EDR Controller will assume that the Host has no additional link keys.

If the Host uses the HCI_Link_Key_Request_Negative_Reply command when the requested service requires an authenticated Link Key and the current Link Key is unauthenticated, the Host should set the Authentication_Requirements parameter one of the MITM Protection Required options.

When the Controller generates an HCI_Link_Key_Request event in order for the local Link Manager to respond to the request from the remote Link Manager (as a result of an HCI_Create_Connection or HCI_Authentication_Requested command from the remote Host), the local Host shall respond with either an HCI_Link_Key_Request_Reply or HCI_Link_Key_Request_Negative_Reply command before the remote Link Manager detects LMP response timeout. (See [Vol 2] Part C, Link Manager Protocol Specification.)

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device for which a stored link key is being requested.

7.7.24 Link Key Notification event

Event	Event Code	Event Parameters
HCI_Link_Key_Notification	0x18	BD_ADDR, Link_Key, Key_Type

Description:

This event is used to indicate to the Host that a new Link Key has been created for the connection with the device specified in BD_ADDR. The Host can save this new Link Key in its own storage for future use. Also, the Host can decide to store the Link Key in the BR/EDR Controller's Link Key Storage by using the HCI_Write_Stored_Link_Key command. The Key_Type parameter informs the Host about which key type (combination key, debug combination key, unauthenticated combination key, authenticated combination key or changed combination key) was used during pairing. If the key type is not supported or is reserved for future use, the Host may discard the key or disconnect the link.

The combination key Key_Type is used when standard pairing was used. The debug combination key Key_Type is used when Secure Simple Pairing was used and the debug public key is sent or received. The unauthenticated combination key Key_Type is used when the Just Works Secure Simple Pairing association model was used. The authenticated combination key Key_Type is used when Secure Simple Pairing was used and the Just Works association mode was not used. The changed combination key Key_Type is used when the link key has been changed using the Change Connection Link Key procedure and Secure Simple Pairing Mode is set to enabled.

Note: It is the responsibility of the Host to remember the Key_Type (combination, debug combination, unauthenticated combination, or authenticated combination) prior to changing the link key.

When the unauthenticated or authenticated combination key Key_Type is used, the Controller shall use values 0x04 and 0x05 to indicate keys created with the P-192 elliptic curve and values 0x07 and 0x08 to indicate keys created with the P-256 elliptic curve. The values 0x07 and 0x08 shall only be used when the Host has indicated support for Secure Connections in the Secure_Connections_Host_Support parameter.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Device for which the new link key has been generated.

Link_Key: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	Link Key for the associated BD_ADDR.

Key_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Combination Key
0x03	Debug Combination Key
0x04	Unauthenticated Combination Key generated from P-192
0x05	Authenticated Combination Key generated from P-192
0x06	Changed Combination Key
0x07	Unauthenticated Combination Key generated from P-256
0x08	Authenticated Combination Key generated from P-256
All other values	Reserved for future use

7.7.25 Loopback Command event

Event	Event Code	Event Parameters
HCI_Loopback_Command	0x19	HCI_Command_Packet

Description:

When in Local Loopback mode, the BR/EDR Controller loops back commands and data to the Host. This event is used to loop back all commands that the Host sends to the Controller with some exceptions. See Section 7.6.1 for a description of which commands that are not looped back. The HCI_Command_Packet parameter contains the entire HCI Command Packet including the header.

Note: The event packet is limited to a maximum of 255 octets in the payload; since an HCI Command packet has 3 octets of header data, only the first 252 octets of the command parameters will be returned.

Event parameters:

HCI_Command_Packet: *Size: Depends on command*

Value	Parameter Description
0xXXXXXX	HCI Command packet, including header.

7.7.26 Data Buffer Overflow event

Event	Event Code	Event Parameters
HCI_Data_Buffer_Overflow	0x1A	Link_Type

Description:

This event is used to indicate that the Controller's data buffers have been overflowed. This can occur if the Host has sent more packets than allowed. The Link_Type parameter is used to indicate the type of data whose buffers overflowed.

Event parameters:

Link_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Synchronous Data packet buffers
0x01	ACL Data packet buffers
0x02	ISO Data packet buffers
All other values	Reserved for future use.

7.7.27 Max Slots Change event

Event	Event Code	Event Parameters
HCI_Max_Slots_Change	0x1B	Connection_Handle, LMP_Max_Slots

Description:

This event is used to notify the Host about the LMP_Max_Slots parameter when the value of this parameter changes. It shall be sent each time the maximum allowed length, in number of slots, for Baseband packets transmitted by the local device, changes. The Connection_Handle will be a Connection_Handle for an ACL connection.

Event parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle. Range: 0x0000 to 0x0EFF

LMP_Max_Slots: *Size: 1 octet*

Value	Parameter Description
0x01, 0x03, 0x05	Maximum number of slots allowed to use for Baseband packets, see [Vol 2] Part C, Section 4.1.10 and Section 5.2.

7.7.28 Read Clock Offset Complete event

Event	Event Code	Event Parameters
HCI_Read_Clock_Offset_Complete	0x1C	Status, Connection_Handle, Clock_Offset

Description:

This event is used to indicate the completion of the process of the Link Manager obtaining the Clock Offset information of the BR/EDR Controller specified by the Connection_Handle parameter. Connection_Handle will be a Connection_Handle for an ACL connection.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Read_Clock_Offset command succeeded.
0x01 to 0xFF	HCI_Read_Clock_Offset command failed. See [Vol 1] Part F for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Clock_Offset: *Size: 2 octets*

Bit Number	Parameter Description
0-14	Bits 16-2 of CLKNPeripheral - CLK
15	Reserved for future use.

7.7.29 Connection Packet Type Changed event

Event	Event Code	Event Parameters
HCI_Connection_Packet_Type_Changed	0x1D	Status, Connection_Handle, Packet_Type

Description:

This event is used to indicate that the process has completed of the Link Manager changing which packet types can be used for the connection. This allows current connections to be dynamically modified to support different types of user data. The Packet_Type parameter specifies which packet types the Link Manager can use for the connection identified by the Connection_Handle parameter for sending L2CAP data or voice. Packet_Type does not decide which packet types the LM is allowed to use for sending LMP PDUs.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Change_Connection_Packet_Type command succeeded.
0x01 to 0xFF	HCI_Change_Connection_Packet_Type command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle. Range: 0x0000 to 0x0EFF

Packet_Type: *Size: 2 octets*

For ACL_Link_Type

Bit Number	Parameter Description
1	2-DH1 shall not be used.
2	3-DH1 shall not be used.
3	Ignored; DM1 may be used whether or not this bit is set.
4	DH1 may be used.
8	2-DH3 shall not be used.

Bit Number	Parameter Description
9	3-DH3 shall not be used.
10	DM3 may be used.
11	DH3 may be used.
12	2-DH5 shall not be used.
13	3-DH5 shall not be used.
14	DM5 may be used.
15	DH5 may be used.
All other bits	Reserved for future use.

For SCO_Link_Type

Bit Number	Parameter Description
5	HV1 may be used.
6	HV2 may be used.
7	HV3 may be used.
All other bits	Reserved for future use.

7.7.30 QoS Violation event

Event	Event Code	Event Parameters
HCI_QoS_Violation	0x1E	Handle

Description:

This event is used to indicate the Controller is unable to provide the current QoS requirement for the Connection identified by the Handle. This event indicates that the Controller is unable to provide one or more of the agreed QoS parameters.

The Host chooses what action should be done; for example, it can reissue the HCI_QoS_Setup command to renegotiate the QoS setting for Connection_Handle.

Event parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Handle for the link that the Controller cannot provide the current QoS requested. The Handle is a Connection_Handle for a BR/EDR Controller. Range: 0x0000 to 0x0EFF

7.7.31 Page Scan Repetition Mode Change event

Event	Event Code	Event Parameters
HCI_Page_Scan_Repetition_Mode_Change	0x20	BD_ADDR, Page_Scan_Repetition_Mode

Description:

This event indicates that the remote BR/EDR Controller with the specified BD_ADDR has successfully changed the Page Scan Repetition Mode (see [Vol 2] Part B, Section 8.3.1).

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the remote device.

Page_Scan_Repetition_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	R0
0x01	R1
0x02	R2
All other values	Reserved for future use

7.7.32 Flow Specification Complete event

Event	Event Code	Event Parameters
HCI_Flow_Specification_Complete	0x21	Status, Connection_Handle, Unused, Flow_Direction, Service_Type, Token_Rate, Token_Bucket_Size, Peak_Bandwidth, Access_Latency

Description:

This event is used to inform the Host about the Quality of Service for the ACL connection the Controller is able to support. The Connection_Handle will be a Connection_Handle for an ACL connection. The flow parameters refer to the outgoing or incoming traffic of the ACL link, as indicated by the Flow_Direction field. The flow parameters are defined in the L2CAP specification [Vol 3] Part A, Section 5.3. When the Status parameter indicates a successful completion, the flow parameters specify the agreed values by the Controller. When the Status parameter indicates a failed completion with the error code *QoS Unacceptable Parameter* (0x2C), the flow parameters specify the acceptable values of the Controller. This enables the Host to continue the 'QoS negotiation' with a new HCI_Flow_Specification command with flow parameter values that are acceptable for the Controller. When the Status parameter indicates a failed completion with the error code *QoS Rejected* (0x2D), this indicates a request of the Controller to discontinue the 'QoS negotiation'. When the Status parameter indicates a failed completion, the flow parameter values of the most recently successful completion shall be assumed (or the default values when there was no success completion).

The Unused parameter is reserved for future use.

This event is generated following an HCI_Flow_Specification command issued by the local Host.

Note: This event or the HCI_QoS_Setup_Complete event can be generated if the remote device performs an LMP transaction involving the flow parameter values.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Flow_Specification command succeeded
0x01 to 0xFF	HCI_Flow_Specification command failed. See [Vol 1] Part F, Controller Error Codes for list of error codes

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Unused: *Size: 1 octet*

Value	Parameter Description
0x00	This value shall be used by the Controller.
All other values	Reserved for future use.

Flow_Direction: *Size: 1 octet*

Value	Parameter Description
0x00	Outgoing Flow i.e., traffic sent over the ACL connection.
0x01	Incoming Flow i.e., traffic received over the ACL connection.
All other values	Reserved for future use.

Service_Type: *Size: 1 octet*

Value	Parameter Description
0x00	No Traffic
0x01	Best Effort
0x02	Guaranteed
All other values	Reserved for future use

Token_Rate: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Token Rate in octets per second

Token_Bucket_Size: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Token Bucket Size in octets

Peak_Bandwidth: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Peak Bandwidth in octets per second

Access_Latency: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Access Latency in microseconds

7.7.33 Inquiry Result with RSSI event

Event	Event Code	Event Parameters
HCI_Inquiry_Result_with_RSSI	0x22	Num_Responses, BD_ADDR[i], Page_Scan_Repetition_Mode[i], Reserved[i], Class_Of_Device[i], Clock_Offset[i], RSSI[i]

Description:

This event indicates that a BR/EDR Controller or multiple BR/EDR Controllers have responded so far during the current Inquiry process. This event will be sent from the BR/EDR Controller to the Host as soon as an Inquiry Response from a remote device is received if the remote device supports only mandatory paging scheme. This BR/EDR Controller may queue these Inquiry Responses and send multiple BR/EDR Controllers information in one HCI_Inquiry_Result event. The event can be used to return one or more Inquiry responses in one event. The RSSI parameter is measured during the FHS packet returned by each responding Peripheral.

This event shall only be generated if the Inquiry Mode parameter of the last HCI_Write_Inquiry_Mode command was set to 0x01 (Inquiry Result format with RSSI), or was set to 0x02 (Inquiry Result with RSSI format or Extended Inquiry Result format) and the inquiry response packet had the EIR field set to 0.

Event parameters:

Num_Responses: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of responses from the Inquiry.

BD_ADDR[i]: *Size: Num_Responses × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for a device which responded.

Page_Scan_Repetition_Mode[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0x00	R0
0x01	R1
0x02	R2
All other values	Reserved for future use

Reserved[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0xXX	Reserved for future use.

Class_Of_Device[i]: *Size: Num_Responses × 3 octets*

Value	Parameter Description
0xXXXXXX	Class of Device for the device

Clock_Offset[i]: *Size: Num_Responses × 2 octets*

Bit Number	Parameter Description
0-14	Bits 16-2 of CLKNPeripheral - CLK
15	Reserved for future use

RSSI[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm

7.7.34 Read Remote Extended Features Complete event

Event	Event Code	Event Parameters
HCI_Read_Remote_Extended_Features_Complete	0x23	Status, Connection_Handle, Page_Number, Max_Page_Number, Extended_LMP_Features

Description:

This event is used to indicate the completion of the process of the Link Manager obtaining the remote extended LMP features of the remote device specified by the Connection_Handle parameter. Connection_Handle will be a Connection_Handle for an ACL connection. The parameters include a page of the remote devices extended LMP features. For details see [Vol 2] Part C, Link Manager Protocol Specification.

Note: If a feature page is requested more than once while a connection exists between the two devices, the second and subsequent requests may report a cached copy of that page rather than fetching it again.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Request for remote extended features succeeded
0x01 to 0xFF	Request for remote extended features failed. See [Vol 1] Part F, Controller Error Codes for error codes.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Page_Number: *Size: 1 octet*

Value	Parameter Description
0x00	The normal LMP features as returned by HCI_Read_Remote_Supported_Features command
0x01 to 0xFF	The page number of the features returned

Max_Page_Number: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xFF	The highest features page number which contains non-zero bits for the remote device

Extended_LMP_Features: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	Bit map of requested page of LMP features. See [Vol 2] Part C, Section 3.3 for details.

7.7.35 Synchronous Connection Complete event

Event	Event Code	Event Parameters
HCI_Synchronous_Connection_Complete	0x2C	Status, Connection_Handle, BD_ADDR, Link_Type, Transmission_Interval, Retransmission_Window, RX_Packet_Length, TX_Packet_Length, Air_Mode

Description:

This event is sent to indicate completion of any of the following commands:

- HCI_Setup_Synchronous_Connection
- HCI_Accept_Synchronous_Connection_Request
- HCI_Reject_Synchronous_Connection_Request
- HCI_Enhanced_Setup_Synchronous_Connection
- HCI_Enhanced_Accept_Synchronous_Connection_Request

This event returns the completion status for the command.

If the HCI_Synchronous_Connection_Complete event was triggered by the HCI_Enhanced_Setup_Synchronous_Connection or HCI_Enhanced_Accept_Synchronous_Connection_Request commands, then the Controller shall set the Air_Mode parameter to the first octet of the Transmit_Coding_Format parameter of the original command. Otherwise the Controller should set the Air_Mode parameter to the Air_Mode that was negotiated over LMP for the connection.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Connection successfully completed.
0x01 to 0xFF	Connection failed to complete. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the other connected device forming the connection.

Link_Type: *Size: 1 octet*

Value	Parameter Description
0x00	SCO connection
0x01	Reserved for future use
0x02	eSCO connection
All other values	Reserved for future use

Transmission_Interval: *Size: 1 octet*

Value	Parameter Description
0xXX	Time between two consecutive eSCO instants measured in slots. Shall be zero for SCO links.

Retransmission_Window: *Size: 1 octet*

Value	Parameter Description
0xXX	The size of the retransmission window measured in slots. Shall be zero for SCO links.

RX_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Length in bytes of the eSCO payload in the receive direction. Shall be zero for SCO links.

TX_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Length in bytes of the eSCO payload in the transmit direction. Shall be zero for SCO links.

Air_Mode: *Size: 1 octet*

Value	Parameter Description
0xXX	See Assigned Numbers for Coding_Format

7.7.36 Synchronous Connection Changed event

Event	Event Code	Event Parameters
HCI_Synchronous_Connection_Changed	0x2D	Status, Connection_Handle, Transmission_Interval, Retransmission_Window, RX_Packet_Length, TX_Packet_Length

Description:

This event indicates to the Host that an existing synchronous connection has been reconfigured. This event also indicates to the initiating Host (if the change was Host initiated) if the issued command failed or was successful.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Connection successfully reconfigured.
0x01 to 0xFF	Reconfiguration failed to complete. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Transmission_Interval: *Size: 1 octet*

Value	Parameter Description
0xXX	Time between two consecutive SCO/eSCO instants measured in slots.

Retransmission_Window: *Size: 1 octet*

Value	Parameter Description
0xXX	The size of the retransmission window measured in slots. Shall be zero for SCO links.

RX_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Length in bytes of the SCO/eSCO payload in the receive direction.

TX_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Length in bytes of the SCO/eSCO payload in the transmit direction.

7.7.37 Sniff Subrating event

Event	Event Code	Event Parameters
HCI_Sniff_Subrating	0x2E	Status, Connection_Handle, Max_TX_Latency, Max_RX_Latency, Min_Remote_Timeout, Min_Local_Timeout

Description:

This event indicates that the device associated with the Connection_Handle has either enabled sniff subrating or the sniff subrating parameters have been renegotiated by the link manager. The Connection_Handle parameter will be a Connection_Handle for an ACL connection. Connection_Handle indicates which connection the HCI_Sniff_Subrating event is for.

Each BR/EDR Controller that is associated with the Connection_Handle that has changed its subrating parameters will send the Sniff Subrating event to its Host.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Sniff_Subrating command succeeded
0x01 to 0xFF	HCI_Sniff_Subrating command failed to complete. See [Vol 1] Part F, Controller Error Codes for error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle. Range: 0x0000 to 0x0EFF

Max_TX_Latency: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum latency for data being transmitted from the local device to the remote device. Latency = N × 0.625 ms (1 Baseband slot) Range: 0x0000 to 0xFFFE Time Range: 0 s to 40.9 s

Max_RX_Latency: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum latency for data being received by the local device from the remote device. Latency = N × 0.625 ms (1 Baseband slot) Range: 0x0000 to 0xFFFE Time Range: 0 s to 40.9 s

Min_Remote_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The base sniff subrate timeout in Baseband slots that the remote device shall use. Timeout = N × 0.625 ms (1 Baseband slot) Range: 0x0000 to 0xFFFE Time Range: 0 s to 40.9 s

Min_Local_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The base sniff subrate timeout in Baseband slots that the local device will use. Timeout = N × 0.625 ms (1 Baseband slot) Range: 0x0000 to 0xFFFE Time Range: 0 s to 40.9 s

7.7.38 Extended Inquiry Result event

Event	Event Code	Event Parameters
HCI_Extended_Inquiry_Result	0x2F	Num_Responses, BD_ADDR, Page_Scan_Repetition_Mode, Reserved, Class_Of_Device, Clock_Offset, RSSI, Extended_Inquiry_Response

Description:

This event indicates that a BR/EDR Controller has responded during the current inquiry process with extended inquiry response data. This event will be sent from the BR/EDR Controller to the Host upon reception of an Extended Inquiry Response from a remote device. One single Extended Inquiry Response is returned per event. This event contains RSSI and inquiry response data for the BR/EDR Controller that responded to the latest inquiry. The RSSI parameter is measured during the FHS packet returned by each responding Peripheral. The Num_Responses parameter shall be set to one.

This event is only generated if the Inquiry_Mode parameter of the last HCI_Write_Inquiry_Mode command was set to 0x02 (Inquiry Result with RSSI format or Extended Inquiry Result format).

Note: This ensures that a Host that does not support Extended Inquiry Results will never receive the HCI_Extended_Inquiry_Result event.

If an inquiry response packet with the EIR field set to zero is received, the HCI_Inquiry_Result_with_RSSI event format shall be used. If the EIR bit is set to one the HCI_Extended_Inquiry_Result event format shall be used. If the EIR bit is set to one but the Controller failed to receive the extended inquiry response packet, the Extended_Inquiry_Response parameter is set to zeros. If an extended inquiry response packet from the same device is correctly received in a later response, another event shall be generated.

Note: The only difference between the HCI_Extended_Inquiry_Result event and the HCI_Inquiry_Result_with_RSSI event is the additional Extended_Inquiry_Response parameter.

Note: The Extended_Inquiry_Response parameter is not interpreted by the Controller. The tagged data set by the other Host should be passed unaltered if it has been correctly received.

Event parameters:

Num_Responses: *Size: 1 octet*

Value	Parameter Description
0x01	Number of responses from the inquiry. The HCI_Extended_Inquiry_Result event always contains a single response.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR for the device that responded.

Page_Scan_Repetition_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	R0
0x01	R1
0x02	R2
All other values	Reserved for future use

Reserved: *Size: 1 octet*

Value	Parameter Description
0xXX	Reserved for future use.

Class_Of_Device: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Class of Device for the device that responded.

Clock_Offset: *Size: 2 octets*

Bit Number	Parameter Description
0-14	Bits 16-2 of CLKNPeripheral - CLK
15	Reserved for future use.

RSSI: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm

Extended_Inquiry_Response: *Size: 240 octets*

Value	Parameter Description
none	Extended Inquiry Response data as defined in [Vol 3] Part C, Section 8

7.7.39 Encryption Key Refresh Complete event

Event	Event Code	Event Parameters
HCI_Encryption_Key_Refresh_Complete	0x30	Status, Connection_Handle

Description:

This event is used to indicate to the Host that the encryption key was refreshed on the given Connection_Handle any time encryption is paused and then resumed. The Controller shall send this event when the encryption key has been refreshed due to encryption being started or resumed.

If the HCI_Encryption_Key_Refresh_Complete event was generated due to an encryption pause and resume operation embedded within a change connection link key procedure, the HCI_Encryption_Key_Refresh_Complete event shall be sent prior to the HCI_Change_Connection_Link_Key_Complete event.

If the HCI_Encryption_Key_Refresh_Complete event was generated due to an encryption pause and resume operation embedded within a role switch procedure, the HCI_Encryption_Key_Refresh_Complete event shall be sent prior to the HCI_Role_Change event.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Encryption key refresh completed successfully
0x01 to 0xFF	Encryption key refresh failed. See [Vol 1] Part F, Controller Error Codes for list of error codes

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

7.7.40 IO Capability Request event

Event	Event Code	Event Parameters
HCI_IO_Capability_Request	0x31	BD_ADDR

Description:

This event is used to indicate that the IO capabilities of the Host are required for a Secure Simple Pairing process. The Host shall respond with an HCI_IO_Capability_Request_Reply command or HCI_IO_Capability_Request_Negative_Reply command. This event shall only be generated if Secure Simple Pairing has been enabled with the HCI_Write_Simple_Pairing_Mode command.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

7.7.41 IO Capability Response event

Event	Event Code	Event Parameters
HCI_IO_Capability_Response	0x32	BD_ADDR, IO_Capability, OOB_Data_Present, Authentication_Requirements

Description:

This event is used to indicate to the Host that IO capabilities from a remote device specified by BD_ADDR have been received during a Secure Simple Pairing process. This event will only be generated if Secure Simple Pairing has been enabled with the HCI_Write_Simple_Pairing_Mode command.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR identifying the device to which the IO capabilities apply.

IO_Capability: *Size: 1 octet*

Value	Parameter Description
0x00	DisplayOnly
0x01	DisplayYesNo
0x02	KeyboardOnly
0x03	NoInputNoOutput
All other values	Reserved for future use

OOB_Data_Present: *Size: 1 octet*

Value	Parameter Description
0x00	OOB authentication data not present
0x01	OOB authentication data from remote device present
All other values	Reserved for future use

Authentication_Requirements: *Size: 1 octet*

Value	Parameter Description
0x00	MITM Protection Not Required – No Bonding. Numeric comparison with automatic accept allowed.
0x01	MITM Protection Required – No Bonding. Use IO Capabilities to determine authentication procedure
0x02	MITM Protection Not Required – Dedicated Bonding. Numeric comparison with automatic accept allowed.
0x03	MITM Protection Required – Dedicated Bonding. Use IO Capabilities to determine authentication procedure
0x04	MITM Protection Not Required – General Bonding. Numeric Comparison with automatic accept allowed.
0x05	MITM Protection Required – General Bonding. Use IO capabilities to determine authentication procedure.
All other values	Reserved for future use

7.7.42 User Confirmation Request event

Event	Event Code	Event Parameters
HCI_User_Confirmation_Request	0x33	BD_ADDR, Numeric_Value

Description:

This event is used to indicate that user confirmation of a numeric value is required. The Host shall reply with either the HCI_User_Confirmation_Request_Reply or the HCI_User_Confirmation_Request_Negative_Reply command. If the Host has output capability (DisplayYesNo or KeyboardOnly), it shall display the Numeric_Value until the HCI_Simple_Pairing_Complete event is received. It shall reply based on the yes/no response from the user. If the Host has no input and no output it shall reply with the HCI_User_Confirmation_Request_Reply command. When the Controller generates an HCI_User_Confirmation_Request event, in order for the local Link Manager to respond to the request from the remote Link Manager, the local Host shall respond with either an HCI_User_Confirmation_Request_Reply or an HCI_User_Confirmation_Request_Negative_Reply command before the remote Link Manager detects LMP response timeout. (See [Vol 2] Part C, Link Manager Protocol Specification.)

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of device involved in the Secure Simple Pairing process.

Numeric_Value: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0x000F423F	Numeric value to be displayed. Valid values are decimal 000000 to 999999.

7.7.43 User Passkey Request event

Event	Event Code	Event Parameters
HCI_User_Passkey_Request	0x34	BD_ADDR

Description:

This event is used to indicate that a passkey is required as part of a Secure Simple Pairing process. The Host shall respond with either an HCI_User_Passkey_Request_Reply or HCI_User_Passkey_Request_Negative_Reply command. This event will only be generated if Secure Simple Pairing has been enabled with the HCI_Write_Simple_Pairing_Mode command. When the Controller generates an HCI_User_Passkey_Request event, in order for the local Link Manager to respond to the request from the remote Link Manager, the local Host shall respond with either an HCI_User_Passkey_Request_Reply or HCI_User_Passkey_Request_Negative_Reply command before the remote Link Manager detects LMP response timeout. (See [Vol 2] Part C, Link Manager Protocol Specification.)

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device involved in the Secure Simple Pairing process.

7.7.44 Remote OOB Data Request event

Event	Event Code	Event Parameters
HCI_Remote_OOB_Data_Request	0x35	BD_ADDR

Description:

This event is used to indicate that the Secure Simple Pairing Hash C and Randomizer R are required for the Secure Simple Pairing process involving the device identified by BD_ADDR. The C and R values were transferred to the Host from the remote device via an OOB mechanism. This event is sent by the Controller because the Host previously set the OOB Data Present parameter to "OOB authentication data from remote device present" in an HCI_IO_Capability_Request_Reply command. If both the Host and Controller support Secure Connections the Host shall respond with the values using the HCI_Remote_OOB_Extended_Data_Request_Reply command. Otherwise, the Host shall respond with the values using the HCI_Remote_OOB_Data_Request_Reply command. In either case, if the Host does not have the C and R values for the device, it shall respond with the HCI_Remote_OOB_Data_Request_Negative_Reply command.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device from which the C and R values were received.

7.7.45 Simple Pairing Complete event

Event	Event Code	Event Parameters
HCI_Simple_Pairing_Complete	0x36	Status, BD_ADDR

Description:

This event is used to indicate that the Secure Simple Pairing process has completed. A Host that is displaying a numeric value can use this event to change its UI.

When the LMP Secure Simple Pairing sequences fail for any reason, the HCI_Simple_Pairing_Complete event shall be sent to the Host. When HCI_Simple_Pairing_Complete event is sent in response to the IO capability exchange failing, the Status parameter shall be set to the error code received from the remote device. Otherwise, the Status shall be set to the error code *Authentication Failure* (0x05).

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Secure Simple Pairing succeeded
0x01 to 0xFF	Secure Simple Pairing failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device involved in the Secure Simple Pairing process.

7.7.46 Link Supervision Timeout Changed event

Event	Event Code	Event Parameters
HCI_Link_Supervision_Timeout_Changed	0x38	Connection_Handle, Link_Supervision_Timeout

Description:

This event is used to notify the Peripheral's Host when the Link_Supervision_Timeout parameter is changed in the Peripheral's Controller. This event shall only be sent to the Host by the Peripheral's Controller upon receiving an LMP_SUPERVISION_TIMEOUT PDU from the Central.

Note: The Connection_Handle used for this command shall be the ACL connection of the appropriate device.

Event parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Link_Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Measured in number of Baseband slots Link_Supervision_Timeout = N × 0.625 ms (1 Baseband slot) Range: 0x0001 to 0xFFFF Time Range: 0.625 ms to 40.9 s (0 means infinite timeout)

7.7.47 Enhanced Flush Complete event

Event	Event Code	Event Parameters
HCI_Enhanced_Flush_Complete	0x39	Handle

Description:

This event is used to indicate that an Enhanced Flush is complete for the specified Handle.

Event parameters:

Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Handle of the connection for which the Enhanced Flush was done. The Handle is a Connection_Handle for a BR/EDR Controller. Range: 0x0000 to 0x0EFF

7.7.48 User Passkey Notification event

Event	Event Code	Event Parameters
HCI_User_Passkey_Notification	0x3B	BD_ADDR, Passkey

Description:

This event is used to provide a passkey for the Host to display to the user as required as part of a Secure Simple Pairing process. The Passkey parameter shall be a random number created according to [Vol 2] Part H, Section 2, *mod* 1,000,000.

This event will be generated if the IO capabilities of the local device are DisplayOnly or DisplayYesNo and the IO capabilities of the remote device are KeyboardOnly.

This event shall only be generated if Secure Simple Pairing has been enabled with the HCI_Write_Simple_Pairing_Mode command.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the device involved in the Secure Simple Pairing process.

Passkey: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0x000F423F	Passkey to be displayed. Valid values are decimal 000000 to 999999.

7.7.49 Keypress Notification event

Event	Event Code	Event Parameters
HCI_Keypress_Notification	0x3C	BD_ADDR, Notification_Type

Description:

This event is sent to the Host after a passkey notification has been received by the Link Manager on the given BD_ADDR. The Notification_Type parameter may be used by the Host's user interface.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device involved in the Secure Simple Pairing process

Notification_Type: *Size: 1 octet*

Value	Parameter Description
0	Passkey entry started
1	Passkey digit entered
2	Passkey digit erased
3	Passkey cleared
4	Passkey entry completed
All other values	Reserved for future use

7.7.50 Remote Host Supported Features Notification event

Event	Event Code	Event Parameters
HCI_Remote_Host_Supported_Features_Notification	0x3D	BD_ADDR, Host_Supported_Features

Description:

This event is used to return the LMP extended features page containing the Host features. The BD_ADDR shall be the address of the remote device.

This event shall only be generated after the LMP extended features are read from the remote device during a connection initiated by an HCI_Remote_Name_Request command.

Note: This event is not generated during a connection initiated by the HCI_Create_Connection command.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of remote device.

Host_Supported_Features: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	Bit map of Host Supported Features page of LMP extended features. For more information, see [Vol 2] Part C, Link Manager Protocol Specification.

7.7.59 Number Of Completed Data Blocks event

Event	Event Code	Event Parameters
HCI_Number_Of_Completed_Data_Blocks	0x48	Total_Num_Data_Blocks, Num_Handles, Connection_Handle[i], Num_Completed_Packets[i], Num_Completed_Blocks[i]

Description:

This event is used by the Controller to indicate to the Host how many HCI ACL Data packets have been completed (transmitted or flushed), and how many data block buffers have been freed, for each Connection_Handle since the previous HCI_Number_Of_Completed_Data_Blocks event was sent to the Host. This means that the corresponding buffer space has been freed in the Controller. Based on this information, and the Total_Num_Data_Blocks parameter, the Host can determine for which Handles the following HCI ACL Data packets should be sent to the Controller.

The Host should determine the number of blocks occupied by each ACL data packet by dividing the ACL data packet size by the Data_Block_Length parameter of the HCI_Read_Data_Block_Size command.

The Total_Num_Data_Blocks parameter indicates the total number of buffer blocks available in the Controller. Before any HCI_Number_Of_Completed_Data_Blocks event is received, the value of Total_Num_Data_Blocks from the HCI_Read_Data_Block_Size command is used. This allows the value to be updated at any time, which provides the Controller with some flexibility on its buffer allocation.

If the Controller were permitted to reduce its buffer pool in an arbitrary way then there is a potential race condition, in the case where the Host has just started to transmit a new packet. In order to prevent this race condition, the Total_Num_Data_Blocks parameter shall not indicate a reduction in the pool of blocks greater than the sum of the Num_Completed_Blocks values in this event. If a greater reduction in the block pool is required then the value 0 shall be indicated here. The value 0 has a special meaning and indicates that the Host shall re-issue the HCI_Read_Data_Block_Size command in order to find the new buffer pool size. The Host shall wait for any outstanding TX to complete and shall defer further TX until the HCI_Read_Data_Block_Size command has been issued and completed. The Controller shall reduce its allocation only after the HCI_Read_Data_Block_Size command has been issued and completed. This ensures that the race condition described above is avoided.

Event parameters:

Total_Num_Data_Blocks: *Size: 2 octets*

Value	Parameter Description
0x0000	The size of the buffer pool may have changed. The Host is requested to issue an HCI_Read_Data_Block_Size command in order to determine the new value of Total_Num_Data_Blocks.
0xXXXX	Total number of data block buffers available in the Controller for the storage of data packets scheduled for transmission. This indicates the existing value is unchanged, or increased, or reduced by up to the sum of the Num_Completed_Blocks values in this command.

Num_Handles: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of Handles and Num_Completed_Packets and Num_Completed_Blocks parameter triples contained in this event. Range: 0 to 255

Connection_Handle[i]: *Size: Num_Handles × 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle for a BR/EDR connection. Range: 0x0000 to 0x0EFF

Num_Completed_Packets[i]: *Size: Num_Handles × 2 octets*

Value	Parameter Description
0xXXXX	The number of HCI ACL Data packets that have been completed (transmitted or flushed) for the associated Handle since the previous time that an HCI_Number_Of_Completed_Data_Blocks event provided information about this Handle. Range: 0x0000 to 0xFFFF

Num_Completed_Blocks[i]: *Size: Num_Handles × 2 octets*

Value	Parameter Description
0xXXXX	The number of data blocks that have been freed for the associated Handle since the previous time that an HCI_Number_Of_Completed_Data_Blocks event provided information about this Handle. Range: 0x0000 to 0xFFFF

7.7.65 LE Meta event

Description:

The LE Meta event is used to encapsulate all LE Controller specific events. The Event Code of all LE Meta events shall be 0x3E. The Subevent_Code is the first octet of the event parameters. The Subevent_Code shall be set to one of the valid Subevent_Codes from an LE specific event. All other parameters are defined in the LE Controller specific events.

7.7.65.1 LE Connection Complete event

Event	Event Code	Event Parameters
HCI_LE_Connection_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Role, Peer_Address_Type, Peer_Address, Connection_Interval, Peripheral_Latency, Supervision_Timeout, Central_Clock_Accuracy

Description:

This event indicates to both of the Hosts forming the connection that a new connection has been created. Upon the creation of the connection a Connection_Handle shall be assigned by the Controller, and passed to the Host in this event. If the connection creation fails this event shall be provided to the Host that had issued the HCI_LE_Create_Connection command.

This event indicates to the Host which issued an HCI_LE_Create_Connection command and received an HCI_Command_Status event if the connection creation failed or was successful.

The Central_Clock_Accuracy parameter is only valid for a Peripheral. On a Central, this parameter shall be set to 0x00.

Note: This event is not sent if the HCI_LE_Enhanced_Connection_Complete event (see Section 7.7.65.10) is unmasked.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x01	Subevent code for the HCI_LE_Connection_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Connection successfully completed.
0x01 to 0xFF	Connection failed to complete. [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Role: *Size: 1 octet*

Value	Parameter Description
0x00	Connection is Central
0x01	Connection is Peripheral
All other values	Reserved for future use

Peer_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Peer is using a Public Device Address
0x01	Peer is using a Random Device Address
All other values	Reserved for future use

Peer_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address or Random Device Address of the peer device

Connection_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Connection interval used on this connection. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4000 ms.

Peripheral_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Peripheral latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Connection supervision timeout. Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s

Central_Clock_Accuracy: *Size: 1 octet*

Value	Parameter Description
0x00	500 ppm
0x01	250 ppm
0x02	150 ppm
0x03	100 ppm
0x04	75 ppm
0x05	50 ppm
0x06	30 ppm
0x07	20 ppm
All other values	Reserved for future use

7.7.65.2 LE Advertising Report event

Event	Event Code	Event Parameters
HCI_LE_Advertising_Report	0x3E	Subevent_Code, Num_Reports, Event_Type[i], Address_Type[i], Address[i], Data_Length[i], Data[i], RSSI[i]

Description:

This event indicates that one or more Bluetooth devices have responded to an active scan or have broadcast advertisements that were received during a passive scan. The Controller may queue these advertising reports and send information from multiple devices in one HCI_LE_Advertising_Report event.

This event shall only be generated if scanning was enabled using the HCI_LE_Set_Scan_Enable command. It only reports advertising events that used legacy advertising PDUs.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x02	Subevent code for the HCI_LE_Advertising_Report event

Num_Reports: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x19	Number of responses in event.
All other values	Reserved for future use

Event_Type[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x00	Connectable and scannable undirected advertising (ADV_IND)
0x01	Connectable directed advertising (ADV_DIRECT_IND)

Value	Parameter Description
0x02	Scannable undirected advertising (ADV_SCAN_IND)
0x03	Non connectable undirected advertising (ADV_NONCONN_IND)
0x04	Scan Response (SCAN_RSP)
All other values	Reserved for future use

Address_Type[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Public Identity Address (Corresponds to a resolved RPA)
0x03	Random (static) Identity Address (Corresponds to a resolved RPA)
All other values	Reserved for future use

Address[i]: *Size: Num_Reports × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address or Random (static) Identity Address of the advertising device.

Data_Length[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x00 to 0x1F	Length of the Data[i] field for the device which responded.
All other values	Reserved for future use.

Data[i]: *Size: SUM (Data_Length[i]) octets*

Parameter Description
Data_Length[i] octets of advertising or scan response data formatted as defined in [Vol 3] Part C, Section 11. Note: Each element of this array has a variable length.

RSSI[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	RSSI is not available

7.7.65.3 LE Connection Update Complete event

Event	Event Code	Event Parameters
HCI_LE_Connection_Update_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Connection_Interval, Peripheral_Latency, Supervision_Timeout

Description:

This event is used to indicate that the Connection Update procedure has completed.

This event shall be issued if the HCI_LE_Connection_Update command was issued by the Host or if the connection parameters are updated following a request from the peer device. If no parameters are updated following a request from the peer device or the parameters were changed using the Connection Subrate Update procedure, then this event shall not be issued.

If the Status parameter is zero and the connection interval has changed, then the Link Layer must have set the subrating factor to 1 and the continuation number to 0 (see [Vol 6] Part B, Section 5.1.1).

Note: This event can be issued autonomously by the Central's Controller if it decides to change the connection interval based on the range of allowable connection intervals for that connection.

Note: The parameter values returned in this event may be different from the parameter values provided by the Host through the HCI_LE_Connection_Update command (Section 7.8.18) or the HCI_LE_Remote_Connection_Parameter_Request_Reply command (Section 7.8.31).

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x03	Subevent code for the HCI_LE_Connection_Update_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Connection_Update command successfully completed.
0x01 to 0xFF	HCI_LE_Connection_Update command failed to complete. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Connection_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Connection interval used on this connection. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4000 ms.

Peripheral_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Peripheral latency for the connection in number of subrated connection events. Range: 0x0000 to 0x01F3

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Supervision timeout for this connection. Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32000 ms

7.7.65.4 LE Read Remote Features Page 0 Complete event[1]

Event	Event Code	Event Parameters
HCI_LE_Read_Remote_Features_Page_0_Complete	0x3E	Subevent_Code, Status, Connection_Handle, LE_Features

Description:

This event is used to indicate the completion of the process of the Controller obtaining page 0 of the features used on the connection and the features supported by the remote Bluetooth device specified by the Connection_Handle parameter.

If page 0 is requested more than once while a connection exists between the two devices, then the second and subsequent requests may report a cached copy of page 0 rather than fetching the feature mask again.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x04	Subevent code for the HCI_LE_Read_Remote_Features_Page_0_Complete event.

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Remote_Features_Page_0 command successfully completed.
0x01 to 0xFF	HCI_LE_Read_Remote_Features_Page_0 command failed to complete. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

[1]This event was formerly called “LE Read Remote Features Complete”.

LE_Features: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	Bit Mask List of page 0 of the LE features. See [Vol 6] Part B, Section 4.6.

7.7.65.5 LE Long Term Key Request event

Event	Event Code	Event Parameters
HCI_LE_Long_Term_Key_Request	0x3E	Subevent_Code, Connection_Handle, Random_Number, Encrypted_Diversifier

Description:

This event indicates that the peer device, in the Central role, is attempting to encrypt or re-encrypt the link and is requesting the Long Term Key from the Host. (See [Vol 6] Part B, Section 5.1.3).

This event shall only be generated when the local device's role is Peripheral.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x05	Subevent code for the HCI_LE_Long_Term_Key_Request event

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Random_Number: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	64-bit random number.

Encrypted_Diversifier: *Size: 2 octets*

Value	Parameter Description
0xXXXX	16-bit encrypted diversifier.

7.7.65.6 LE Remote Connection Parameter Request event

Event	Event Code	Event Parameters
HCI_LE_Remote_Connection_Parameter_Request	0x3E	Subevent_Code, Connection_Handle, Interval_Min, Interval_Max, Max_Latency, Timeout

Description:

This event indicates to the Central's Host or the Peripheral's Host that the remote device is requesting a change in the connection parameters using the Connection Update procedure. The Host replies either with the HCI_LE_Remote_Connection_Parameter_Request_Reply command or the HCI_LE_Remote_Connection_Parameter_Request_Negative_Reply command.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x06	Subevent code for the HCI_LE_Remote_Connection_Parameter_Request event.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Interval_Min: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum value of the connection interval requested by the remote device. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s

Interval_Max: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum value of the connection interval requested by the remote device. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum allowed Peripheral latency for the connection specified as the number of subrated connection events requested by the remote device. Range: 0x0000 to 0x01F3 (499)

Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Supervision timeout for the connection requested by the remote device. Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s

7.7.65.7 LE Data Length Change event

Event	Event Code	Event Parameters
HCI_LE_Data_Length_Change	0x3E	Subevent_Code, Connection_Handle, Max_TX_Octets, Max_TX_Time, Max_RX_Octets, Max_RX_Time

Description:

This event notifies the Host of a change to either the maximum LL Data PDU Payload length or the maximum transmission time of packets containing LL Data PDUs in either direction. The values reported are the limits imposed on the connection by the Link Layer following the change (see [Vol 6] Part B, Section 4.5.10); the actual maximum used on the connection may be less for other reasons. This event shall not be generated if the values have not changed.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x07	Subevent code for the HCI_LE_Data_Length_Change event

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Max_TX_Octets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The maximum number of payload octets in a LLData PDU that the local Controller will send on this connection (*connEffectiveMaxTxOctets* defined in [Vol 6] Part B, Section 4.5.10). Range 0x001B to 0x00FB

Max_TX_Time: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The maximum time that the local Controller will take to send a Link Layer packet containing an LL Data PDU on this connection (*connEffectiveMaxTxTime* defined in [Vol 6] Part B, Section 4.5.10). Range 0x0148 to 0x4290

Max_RX_Octets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The maximum number of payload octets in a Link Layer packet that the local Controller expects to receive on this connection (*connEffectiveMaxRxOctets* defined in [Vol 6] Part B, Section 4.5.10). Range 0x001B to 0x00FB

Max_RX_Time: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The maximum time that the local Controller expects to take to receive a Link Layer packet on this connection *(connEffectiveMaxRxTime* defined in [Vol 6] Part B, Section 4.5.10). Range 0x0148 to 0x4290

7.7.65.8 LE Read Local P-256 Public Key Complete event

Event	Event Code	Event Parameters
HCI_LE_Read_Local_P-256_Public_Key_Complete	0x3E	Subevent_Code, Status, Key_X_Coordinate, Key_Y_Coordinate

Description:

This event is generated when local P-256 key generation is complete.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x08	Subevent code for the HCI_LE_Read_Local_P-256_Public_Key_Complete event.

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Local_P-256_Public_Key command completed successfully.
0x01 to 0xFF	HCI_LE_Read_Local_P-256_Public_Key command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Key_X_Coordinate: *Size: 32 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX	Local P-256 public key X coordinate.

Key_Y_Coordinate: *Size: 32 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX	Local P-256 public key Y coordinate.

7.7.65.9 LE Generate DHKey Complete event

Event	Event Code	Event Parameters
HCI_LE_Generate_DHKey_Complete	0x3E	Subevent_Code, Status, DH_Key

Description:

This event indicates that LE Diffie Hellman key generation has been completed by the Controller.

If the Remote_P-256_Public_Key parameter of the HCI_LE_Generate_DHKey command (see Section 7.8.37) was invalid (see [Vol 3] Part H, Section 2.3.5.6.1), then all octets of the DH_Key parameter shall be set to 0xFF.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x09	Subevent code for the HCI_LE_Generate_DHKey_Complete event.

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Generate_DHKey command completed successfully.
0x01 to 0xFF	HCI_LE_Generate_DHKey command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

DH_Key: *Size: 32 octets*

Value	Parameter Description
0xXXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX	Diffie Hellman Key.

7.7.65.10 LE Enhanced Connection Complete event

Event	Event Code	Event Parameters
HCI_LE_Enhanced_Connection_Complete [v2]	0x3E	Subevent_Code, Status, Connection_Handle, Role, Peer_Address_Type, Peer_Address, Local_Resolvable_Private_Address, Peer_Resolvable_Private_Address, Connection_Interval, Peripheral_Latency, Supervision_Timeout, Central_Clock_Accuracy, Advertising_Handle, Sync_Handle
HCI_LE_Enhanced_Connection_Complete [v1]	0x3E	Subevent_Code, Status, Connection_Handle, Role, Peer_Address_Type, Peer_Address, Local_Resolvable_Private_Address, Peer_Resolvable_Private_Address Connection_Interval, Peripheral_Latency, Supervision_Timeout, Central_Clock_Accuracy

Description:

This event indicates to both of the Hosts forming the connection that a new connection has been created. Upon the creation of the connection a Connection_Handle shall be assigned by the Controller, and passed to the Host in this event. If the connection creation fails, this event shall be provided to the Host that had issued the HCI_LE_Create_Connection or HCI_LE_Extended_Create_Connection command.

If this event is unmasked and the HCI_LE_Connection_Complete event is unmasked, only the HCI_LE_Enhanced_Connection_Complete event is sent when a new connection has been created.

This event indicates to the Host that issued an HCI_LE_Create_Connection or HCI_LE_Extended_Create_Connection command and received an HCI_Command_Status event if the connection creation failed or was successful.

The Peer_Address, Peer_Resolvable_Private_Address, and Local_Resolvable_Private_Address shall always reflect the most recent packet sent and received on air.

The Central_Clock_Accuracy parameter is only valid for a Peripheral. On a Central, this parameter shall be set to 0x00.

If the connection is established from periodic advertising with responses and Role is 0x00, then the Advertising_Handle parameter shall be set according to the periodic advertising train the connection was established from. If the connection is established from periodic advertising with responses and Role is 0x01, then the Sync_Handle parameter shall be set according to the periodic advertising train the connection was established from. In all other circumstances, Advertising_Handle and Sync_Handle shall be set to No Advertising_Handle and No Sync_Handle and shall be ignored by the Host.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x29	Subevent code for the HCI_LE_Enhanced_Connection_Complete event [v2]
0x0A	Subevent code for the HCI_LE_Enhanced_Connection_Complete event [v1]

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Connection successfully completed.
0x01 to 0xFF	Connection failed to complete. See [Vol 1] Part F for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Role: *Size: 1 octet*

Value	Parameter Description
0x00	Connection is Central
0x01	Connection is Peripheral
All other values	Reserved for future use

Peer_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address (default)
0x01	Random Device Address
0x02	Public Identity Address (Corresponds to a resolved RPA)
0x03	Random (Static) Identity Address (Corresponds to a resolved RPA)
All other values	Reserved for future use

Peer_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, or Random Device Address, Public Identity Address or Random (static) Identity Address of the device to be connected.

Local_Resolvable_Private_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Resolvable Private Address being used by the local device for this connection. This is only valid when the Own_Address_Type (from the HCI_LE_Create_Connection, HCI_LE_Set_Advertising_Parameters, HCI_LE_Set_Extended_Advertising_Parameters, or HCI_LE_Extended_Create_Connection commands) is set to 0x02 or 0x03, and the Controller generated a resolvable private address for the local device using a non-zero local IRK. For other Own_Address_Type values, the Controller shall return all zeros.

Peer_Resolvable_Private_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Resolvable Private Address being used by the peer device for this connection. This is only valid for Peer_Address_Type 0x02 and 0x03. For other Peer_Address_Type values, the Controller shall return all zeros.

Connection_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Connection interval used on this connection. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4000 ms.

Peripheral_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Peripheral latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Connection supervision timeout. Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s

Central_Clock_Accuracy: *Size: 1 octet*

Value	Parameter Description
0x00	500 ppm
0x01	250 ppm
0x02	150 ppm
0x03	100 ppm
0x04	75 ppm
0x05	50 ppm
0x06	30 ppm
0x07	20 ppm
All other values	Reserved for future use

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF
0xFF	No Advertising_Handle

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train Range: 0x0000 to 0x0EFF
0xFFFF	No Sync_Handle

7.7.65.11 LE Directed Advertising Report event

Event	Event Code	Event Parameters
HCI_LE_Directed_Advertising_Report	0x3E	Subevent_Code, Num_Reports, Event_Type[i], Address_Type[i], Address[i], Direct_Address_Type[i], Direct_Address[i], RSSI[i]

Description:

This event indicates that directed advertisements have been received where the advertiser is using a resolvable private address for the TargetA field of the advertising PDU which the Controller is unable to resolve and the Scanning_Filter_Policy is equal to 0x02 or 0x03, see Section 7.8.10. Direct_Address_Type and Direct_Address specify the address the directed advertisements are being directed to. Address_Type and Address specify the address of the advertiser sending the directed advertisements. The Controller may queue these advertising reports and send information from multiple advertisers in one HCI_LE_Directed_Advertising_Report event.

This event shall only be generated if scanning was enabled using the HCI_LE_Set_Scan_Enable command. It only reports advertising events that used legacy advertising PDUs.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x0B	Subevent code for the HCI_LE_Directed_Advertising_Report event

Num_Reports: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x19	Number of responses in event
All other values	Reserved for future use

Event_Type[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x01	Connectable directed legacy advertising (ADV_DIRECT_IND)
All other values	Reserved for future use

Address_Type[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x00	Public Device Address (default)
0x01	Random Device Address
0x02	Public Identity Address (Corresponds to a resolved RPA)
0x03	Random (static) Identity Address (Corresponds to a resolved RPA)
All other values	Reserved for future use

Address[i]: *Size: Num_Reports × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address or Random (static) Identity Address of the advertising device.

Direct_Address_Type[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x01	Random Device Address (default)
All other values	Reserved for future use

Direct_Address[i]: *Size: Num_Reports × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Random Device Address

RSSI[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	RSSI is not available

7.7.65.12 LE PHY Update Complete event

Event	Event Code	Event Parameters
HCI_LE_PHY_Update_Complete	0x3E	Subevent_Code, Status, Connection_Handle, TX_PHY, RX_PHY

Description:

This event is used to indicate that the Controller has changed the transmitter PHY or receiver PHY in use.

If the Controller changes the transmitter PHY, the receiver PHY, or both PHYs, this event shall be issued.

If an HCI_LE_Set_PHY command was sent and the Controller determines that neither PHY will change as a result, it issues this event immediately.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x0C	Subevent code for the HCI_LE_PHY_Update_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_PHY command succeeded or autonomous PHY update made by the Controller.
0x01 to 0xFF	HCI_LE_Set_PHY command failed. See [Vol 1] Part F for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

TX_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	The transmitter PHY for the connection is LE 1M
0x02	The transmitter PHY for the connection is LE 2M
0x03	The transmitter PHY for the connection is LE Coded
All other values	Reserved for future use

RX_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	The receiver PHY for the connection is LE 1M
0x02	The receiver PHY for the connection is LE 2M
0x03	The receiver PHY for the connection is LE Coded
All other values	Reserved for future use

7.7.65.13 LE Extended Advertising Report event

Event	Event Code	Event Parameters
HCI_LE_Extended_Advertising_Report	0x3E	Subevent_Code, Num_Reports, Event_Type[i], Address_Type[i], Address[i], Primary_PHY[i], Secondary_PHY[i], Advertising_SID[i], TX_Power[i], RSSI[i], Periodic_Advertising_Interval[i], Direct_Address_Type[i], Direct_Address[i], Data_Length[i], Data[i]

Description:

This event indicates that one or more Bluetooth devices have responded to an active scan or have broadcast advertisements that were received during a passive scan. The Controller may coalesce multiple advertising reports from the same or different advertisers into a single HCI_LE_Extended_Advertising_Report event, provided all the parameters from all the advertising reports fit in a single HCI event.

This event shall only be generated if scanning was enabled using the HCI_LE_Set_-Extended_Scan_Enable command. It reports advertising events using either legacy or extended advertising PDUs.

The Controller may split the data from a single advertisement or scan response (whether one PDU or several) into several reports. If so, each report except the last shall have an Event_Type with a data status field of "incomplete, more data to come", while the last shall have the value "complete"; the Address_Type, Address, Advertising_SID, Primary_PHY, and Secondary_PHY fields shall be the same in all the reports. No further reports shall be sent for a given advertisement or scan response after one with a Data_Status other than "incomplete, more data to come".

When a scan response is received, bits 0 to 2 and 4 of the event type shall indicate the properties of the original advertising event and the Advertising_SID field should be set to the value in the original scannable advertisement.

An Event_Type with a data status field of "incomplete, data truncated" shall indicate that the Controller attempted to receive an AUX_CHAIN_IND PDU but was not successful or received it but was unable to store the data.

Where the event being reported used a legacy advertising PDU, the Controller shall set the Event_Type to the value specified in Table 7.1.

PDU Type	Event_Type
ADV_IND	0b0010011
ADV_DIRECT_IND	0b0010101
ADV_SCAN_IND	0b0010010
ADV_NONCONN_IND	0b0010000
SCAN_RSP to an ADV_IND	0b0011011
SCAN_RSP to an ADV_SCAN_IND	0b0011010

Table 7.1: Event_Type values for legacy PDUs

If the Event_Type indicates a legacy PDU (bit 4 = 1), the Primary_PHY parameter shall indicate the LE 1M PHY and the Secondary_PHY parameter shall be set to 0x00. Otherwise, the Primary_PHY parameter shall indicate the PHY used to send the advertising PDU on the primary advertising physical channel and the Secondary_PHY parameter shall indicate the PHY used to send the advertising PDU(s), if any, on the secondary advertising physical channel. If the Advertising Coding Selection (Host Support) Link Layer feature bit is set (see [Vol 6] Part B, Section 4.6) and the Primary_PHY or Secondary_PHY parameter indicates that the LE Coded PHY was used, then the parameter shall also indicate which coding was used.

The Periodic_Advertising_Interval parameter shall be set to zero when no periodic advertising exists as part of the advertising set.

The Direct_Address_Type and Direct_Address parameters shall contain the TargetA address in the advertising PDU for directed advertising event types (bit 2 = 1). These parameters shall be ignored for undirected advertising event types (bit 2 = 0). If the TargetA address is a resolvable private address that the Controller successfully resolved, then the value of Direct_Address_Type shall depend on the value of the Own_Address_Type parameter of the command that set the extended scan parameters. Direct_Address shall be set as follows:

- If Direct_Address_Type equals 0x02, then Direct_Address shall be set to either the TargetA field in the received advertisement or to the public device address of the scanning device.
- If Direct_Address_Type equals 0x03, then Direct_Address shall be set to either the TargetA field in the received advertisement or to the address set by the HCI_LE_Set_Random_Address command.

- Otherwise Direct_Address shall be set to the TargetA field in the received advertisement.

When multiple advertising packets are used to complete a single advertising report (e.g., a packet containing an ADV_EXT_IND PDU combined with one containing an AUX_ADV_IND PDU), the RSSI parameter shall be set based on the last packet received and the TX_Power parameter shall be based on the last packet of the current advertisement or scan response received that contains a TxPower field. If there is no packet containing a TxPower field, then TX_Power shall be set to 0x7F. However, if an event has been sent with a TX_Power value other than 0x7F and a Data_Status of "incomplete, more data to come", and if no subsequent PDU with a TxPower field has been received, then subsequent events may instead have a TX_Power value of 0x7F.

If the Controller receives an AUX_CHAIN_IND with no AdvData, it should send the report (or the last report if it has split the data) immediately without waiting for any subsequent AUX_CHAIN_IND PDUs.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x0D	Subevent code for the HCI_LE_Extended_Advertising_Report event

Num_Reports: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x0A	Number of separate reports in the event
All other values	Reserved for future use

Event_Type[i]: *Size: Num_Reports × 2 octets*

Bit Number	Parameter Description
0	Connectable advertising
1	Scannable advertising
2	Directed advertising
3	Scan response
4	Legacy advertising PDUs used

Bit Number	Parameter Description
5 to 6	Data status: 0b00 = Complete 0b01 = Incomplete, more data to come 0b10 = Incomplete, data truncated, no more to come 0b11 = Reserved for future use
All other bits	Reserved for future use

Address_Type[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Public Identity Address (corresponds to a resolved RPA)
0x03	Random (static) Identity Address (corresponds to a resolved RPA)
0xFF	No address provided (anonymous advertisement)
All other values	Reserved for future use

Address[i]: *Size: Num_Reports × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address or Random (static) Identity Address of the advertising device.

Primary_PHY[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x01	Advertiser PHY is LE 1M
0x03	If the Advertising Coding Selection (Host Support) feature bit is set: Advertising PHY is LE Coded with S=8 data coding Otherwise: Advertiser PHY is LE Coded
0x04	If the Advertising Coding Selection (Host Support) feature bit is set: Advertising PHY is LE Coded with S=2 data coding Otherwise: Reserved for future use
All other values	Reserved for future use

Secondary_PHY[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x00	No packets on the secondary advertising physical channel
0x01	Advertiser PHY is LE 1M
0x02	Advertiser PHY is LE 2M
0x03	If the Advertising Coding Selection (Host Support) feature bit is set: Advertising PHY is LE Coded with S=8 data coding Otherwise: Advertiser PHY is LE Coded
0x04	If the Advertising Coding Selection (Host Support) feature bit is set: Advertising PHY is LE Coded with S=2 data coding Otherwise: Reserved for future use
All other values	Reserved for future use

Advertising_SID[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x00 to 0x0F	Value of the Advertising SID subfield in the ADI field of the PDU or, for scan responses, in the ADI field of the original scannable advertisement
0xFF	No ADI field provided
All other values	Reserved for future use

TX_Power[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	Tx Power information not available

RSSI[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	RSSI is not available

Periodic_Advertising_Interval[i]: *Size: Num_Reports × 2 octets*

Value	Parameter Description
0x0000	No periodic advertising
N = 0xXXXX	Interval of the periodic advertising Range: 0x0006 to 0xFFFF Time = N × 1.25 ms Time Range : 7.5 ms to 81,918.75 s

Direct_Address_Type[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Non-resolvable Private Address or Static Device Address
0x02	Resolvable Private Address (resolved by Controller; Own_Address_Type was 0x00 or 0x02)
0x03	Resolvable Private Address (resolved by Controller; Own_Address_Type was 0x01 or 0x03)
0xFE	Resolvable Private Address (Controller unable to resolve)
All other values	Reserved for future use

Direct_Address[i]: *Size: Num_Reports × 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	TargetA field in the advertisement or either Public Identity Address or Random (static) Identity Address of the target device

Data_Length[i]: *Size: Num_Reports × 1 octet*

Value	Parameter Description
0 to 229	Length of the Data[i] field for each device which responded
All other values	Reserved for future use

Data[i]: *Size: SUM (Data_Length[i]) octets*

Parameter Description
Data_Length[i] octets of advertising or scan response data formatted as defined in [Vol 3] Part C, Section 11. Note: Each element of this array has a variable length.

7.7.65.14 LE Periodic Advertising Sync Established event

Event	Event Code	Event Parameters
HCI_LE_Periodic_Advertising_Sync_Established [v2]	0x3E	Subevent_Code, Status, Sync_Handle, Advertising_SID, Advertiser_Address_Type, Advertiser_Address, Advertiser_PHY, Periodic_Advertising_Interval, Advertiser_Clock_Accuracy, Num_Subevents, Subevent_Interval, Response_Slot_Delay, Response_Slot_Spacing
HCI_LE_Periodic_Advertising_Sync_Established [v1]	0x3E	Subevent_Code, Status, Sync_Handle, Advertising_SID, Advertiser_Address_Type, Advertiser_Address, Advertiser_PHY, Periodic_Advertising_Interval, Advertiser_Clock_Accuracy

Description:

This event indicates that the Controller has received the first periodic advertising packet from an advertiser after the HCI_LE_Periodic_Advertising_Create_Sync command has been sent to the Controller.

The Sync_Handle parameter identifies the periodic advertising train in subsequent commands and events and shall be assigned by the Controller.

The Advertising_SID parameter is set to the value of the Advertising SID subfield in the ADI field of the advertising PDU referring to the periodic advertising train.

The Advertiser_Address_Type and Advertiser_Address parameters specify the address of the periodic advertiser.

The Advertiser_PHY parameter specifies the PHY used for the periodic advertising.

The Periodic_Advertising_Interval parameter specifies the interval between the periodic advertising events.

The Advertiser_Clock_Accuracy parameter specifies the accuracy of the periodic advertiser's clock.

If the periodic advertising has subevents or response slots, then the Num_Subevents, Subevent_Interval, Response_Slot_Delay, and Response_Slot_Spacing specify the parameters for these subevents, otherwise these values shall be set to 0x00.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x24	Subevent code for the HCI_LE_Periodic_Advertising_Sync_Established event [v2]
0x0E	Subevent code for the HCI_LE_Periodic_Advertising_Sync_Established event [v1]

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Periodic advertising sync successful
0x01 to 0xFF	Periodic advertising sync failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train Range: 0x0000 to 0x0EFF

Advertising_SID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Value of the Advertising SID subfield in the ADI field of the PDU

Advertiser_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Public Identity Address (corresponds to a resolved RPA)
0x03	Random (static) Identity Address (corresponds to a resolved RPA)
All other values	Reserved for future use

Advertiser_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the advertiser

Advertiser_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	Advertiser PHY is LE 1M
0x02	Advertiser PHY is LE 2M
0x03	Advertiser PHY is LE Coded
All other values	Reserved for future use

Periodic_Advertising_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Periodic advertising interval Range: 0x0006 to 0xFFFF Time = N × 1.25 ms Time Range: 7.5 ms to 81.91875 s

Advertiser_Clock_Accuracy: *Size: 1 octet*

Value	Parameter Description
0x00	500 ppm
0x01	250 ppm
0x02	150 ppm
0x03	100 ppm
0x04	75 ppm

Value	Parameter Description
0x05	50 ppm
0x06	30 ppm
0x07	20 ppm
All other values	Reserved for future use

Num_Subevents: *Size: 1 octet*

Value	Parameter Description
0x00	No subevents
N = 0xXX	Number of subevents. Range: 0x01 to 0x80

Subevent_Interval: *Size: 1 octet*

Value	Parameter Description
0x00	No subevents
N = 0xXX	Subevent interval. Range: 0x06 to 0xFF Time = N × 1.25 ms Time Range: 7.5 ms to 318.75 ms

Response_Slot_Delay: *Size: 1 octet*

Value	Parameter Description
0x00	No response slots
N = 0xXX	Response slot delay. Range: 0x01 to 0xFE Time = N × 1.25 ms Time Range: 1.25 ms to 317.5 ms

Response_Slot_Spacing: *Size: 1 octet*

Value	Parameter Description
0x00	No response slots
N = XX	Response slot spacing Range: 0x02 to 0xFF Time = N × 0.125 ms Time Range: 0.25 ms to 31.875

7.7.65.15 LE Periodic Advertising Report event

Event	Event Code	Event Parameters
HCI_LE_Periodic_Advertising_Report [v2]	0x3E	Subevent_Code, Sync_Handle, TX_Power, RSSI, CTE_Type, Periodic_Event_Counter, Subevent, Data_Status, Data_Length, Data
HCI_LE_Periodic_Advertising_Report [v1]	0x3E	Subevent_Code, Sync_Handle, TX_Power, RSSI, CTE_Type, Data_Status, Data_Length, Data

Description:

This event indicates that the Controller has received a periodic advertisement or has failed to receive an AUX_SYNC_SUBEVENT_IND PDU.

The Sync_Handle parameter identifies the periodic advertising train that the report relates to.

The RSSI parameter contains the RSSI value, excluding any Constant Tone Extension. If the Controller supports the Connectionless CTE Receiver feature, RSSI shall not be set to 0x7F. When multiple advertising packets are used to complete a periodic advertising report (e.g., a packet containing an AUX_SYNC_IND PDU combined with one containing an AUX_CHAIN PDU), the RSSI parameter shall be set based on the last packet received and the TX_Power parameter shall be set based on the AUX_SYNC_IND PDU if that contains a TxPower field and shall be set to 0x7F otherwise. However, the second or subsequent events for the same periodic advertisement may instead have a TX_Power value of 0x7F.

The Controller may split the data from a single periodic advertisement (whether one PDU or several) into several reports. If so, each report except the last shall have a

Data_Status of "incomplete, more data to come", while the last shall have the value "complete". No further reports shall be sent for a given periodic advertisement after one with a Data_Status other than "incomplete, more data to come".

A Data_Status of "incomplete, data truncated" indicates that the Controller attempted to receive an AUX_CHAIN_IND PDU but was not successful or received it but was unable to store the data.

The CTE_Type parameter indicates the type of Constant Tone Extension in the periodic advertising packets.

The Periodic_Event_Counter parameter indicates the periodic advertising event counter (*paEventCounter*) of the event that the periodic advertising packet was received in.

The Subevent parameter indicates the Periodic Advertising with Responses subevent that the periodic advertising packet was received in. If the Periodic Advertising does not have subevents, then Subevent shall be set to 0xFF.

If the Controller receives an AUX_CHAIN_IND PDU with no AdvData, it should send the report (or the last report if it has split the data) immediately without waiting for any subsequent AUX_CHAIN_IND PDUs.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x25	Subevent code for the HCI_LE_Periodic_Advertising_Report event [v2]
0x0F	Subevent code for the HCI_LE_Periodic_Advertising_Report event [v1]

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF

TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	Tx Power information not available

RSSI: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	RSSI is not available

CTE_Type: *Size: 1 octet*

Value	Parameter Description
0x00	AoA Constant Tone Extension
0x01	AoD Constant Tone Extension with 1 µs slots
0x02	AoD Constant Tone Extension with 2 µs slots
0xFF	No Constant Tone Extension
All other values	Reserved for future use

Periodic_Event_Counter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The value of paEventCounter (see [Vol 6] Part B, Section 4.4.2.1) for the reported periodic advertising packet

Subevent: *Size: 1 octet*

Value	Parameter Description
0xXX	The subevent number. Range: 0x00 to 0x7F
0xFF	No subevents

Data_Status: *Size: 1 octet*

Value	Parameter Description
0x00	Data complete
0x01	Data incomplete, more data to come
0x02	Data incomplete, data truncated, no more to come
0xFF	Failed to receive an AUX_SYNC_SUBEVENT_IND PDU
All other values	Reserved for future use

Data_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Length of the Data field

Data: *Size: Data_Length octets*

Value	Parameter Description
Variable	Data received from a Periodic Advertising packet

7.7.65.16 LE Periodic Advertising Sync Lost event

Event	Event Code	Event Parameters
HCI_LE_Periodic_Advertising_Sync_Lost	0x3E	Subevent_Code, Sync_Handle

Description:

This event indicates that the Controller has not received a Periodic Advertising packet from the train identified by Sync_Handle within the timeout period.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x10	Subevent code for the HCI_LE_Periodic_Advertising_Sync_Lost event

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF

7.7.65.17 LE Scan Timeout event

Event	Event Code	Event Parameters
HCI_LE_Scan_Timeout	0x3E	Subevent_Code

Description:

This event indicates that scanning has ended because the duration has expired.

This event shall only be generated if scanning was enabled using the HCI_LE_Set_Extended_Scan_Enable command.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x11	Subevent code for the HCI_LE_Scan_Timeout event

7.7.65.18 LE Advertising Set Terminated event

Event	Event Code	Event Parameters
HCI_LE_Advertising_Set_-Terminated	0x3E	Subevent_Code, Status, Advertising_Handle, Connection_Handle, Num_Completed_Extended_Advertising_Events

Description:

This event indicates that the Controller has terminated advertising in the advertising sets specified by the Advertising_Handle parameter.

This event shall be generated every time connectable advertising in an advertising set results in a connection being created or because the advertising duration or the maximum number of extended advertising events has been reached. It shall not be generated if the Host disables the advertising set.

This event shall only be generated if advertising was enabled using the HCI_LE_Set_-Extended_Advertising_Enable command.

The Connection_Handle parameter is only valid when advertising ends because a connection was created.

If the Max_Extended_Advertising_Events parameter in the HCI_LE_Set_Extended_-Advertising_Enable command was non-zero, the Num_Completed_Extended_-Advertising_Events parameter shall be set to the number of completed extended advertising events the Controller had transmitted when either the duration elapsed or the maximum number of extended advertising events was reached; otherwise it shall be set to zero.

If advertising has terminated as a result of the advertising duration elapsing, the Status parameter shall be set to the error code *Advertising Timeout* (0x3C).

If advertising has terminated because the Max_Extended_Advertising_Events was reached, the Status parameter shall be set to the error code *Limit Reached* (0x43).

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x12	Subevent code for the HCI_LE_Advertising_Set_Terminated event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Advertising successfully ended with a connection being created
0x01 to 0xFF	Advertising ended for another reason. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Advertising_Handle in which advertising has ended Range: 0x00 to 0xEF

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle of the connection whose creation ended the advertising Range: 0x0000 to 0x0EFF

Num_Completed_Extended_Advertising_Events: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of completed extended advertising events transmitted by the Controller

7.7.65.19 LE Scan Request Received event

Event	Event Code	Event Parameters
HCI_LE_Scan_Request_Received	0x3E	Subevent_Code, Advertising_Handle, Scanner_Address_Type, Scanner_Address

Description:

This event indicates that a SCAN_REQ PDU or an AUX_SCAN_REQ PDU has been received by the advertiser. The request contains a device address from a scanner that is allowed by the advertising filter policy. The advertising set is identified by Advertising_Handle.

This event shall only be generated if advertising was enabled using the HCI_LE_Set_Extended_Advertising_Enable command.

The Scanner_Address_Type and Scanner_Address indicates the type of the address and the address of the scanner device.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x13	Subevent code for the HCI_LE_Scan_Request_Received event

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Scanner_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Public Identity Address (corresponds to a resolved RPA)
0x03	Random (static) Identity Address (corresponds to a resolved RPA)
All other values	Reserved for future use

Scanner_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address or Random (static) Identity Address of the advertising device

7.7.65.20 LE Channel Selection Algorithm event

Event	Event Code	Event Parameters
HCI_LE_Channel_Selection_Algorithm	0x3E	Subevent_Code, Connection_Handle, Channel_Selection_Algorithm

Description:

The HCI_LE_Channel_Selection_Algorithm event indicates which channel selection algorithm is used on a data physical channel connection (see [Vol 6] Part B, Section 4.5.8).

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x14	Subevent code for the HCI_LE_Channel_Selection_Algorithm event

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Channel_Selection_Algorithm: *Size: 1 octet*

Value	Parameter Description
0x00	LE Channel Selection Algorithm #1 is used
0x01	LE Channel Selection Algorithm #2 is used
All other values	Reserved for future use

7.7.65.21 LE Connectionless IQ Report event

Event	Event Code	Event Parameters
HCI_LE_Connectionless_IQ_Report	0x3E	Subevent_Code, Sync_Handle, Channel_Index, RSSI, RSSI_Antenna_ID, CTE_Type, Slot_Durations, Packet_Status, Periodic_Event_Counter, Sample_Count, I_Sample[i], Q_Sample[i]

Description:

This event is used by the Controller to report IQ information from the Constant Tone Extension of a received advertising packet forming part of the periodic advertising train identified by Sync_Handle and to report IQ information from the Constant Tone Extension of a received Test Mode packet (see Section 7.8.28).

The index of the channel on which the packet was received, the RSSI of the packet (excluding the Constant Tone Extension), the ID of the antenna on which this was measured, the type of Constant Tone Extension, the value of *paEventCounter*, and the IQ samples of the Constant Tone Extension of the advertisement are reported in the corresponding parameters. For any given sample, either both or neither of I_Sample[i] and Q_Sample[i] shall equal 0x80.

The Slot_Durations parameter specifies the sampling rate used by the Controller.

The Packet_Status parameter indicates whether the received packet had a valid CRC and, if not, whether the Controller has determined the position and size of the Constant Tone Extension using the Length and CTETime fields.

Note: A Controller is not required to generate this event for packets that have a bad CRC.

The Constant Tone Extension format is defined in [Vol 6] Part B, Section 2.5.1.

If the PDU contains AdvData, then any HCI_LE_Periodic_Advertising_Report event triggered by this PDU shall be generated before this event.

Not all PDUs in a periodic advertisement will necessarily trigger an HCI_LE_Periodic_Advertising_Report event. For example, PDUs without AdvData might not trigger that event (see [Vol 6] Part B, Section 4.4.5.1).

The Controller is not required to generate this event for a Constant Tone Extension with a type that it does not support.

This event is also used by the Controller to report that it has insufficient resources to report IQ samples for all received Constant Tone Extensions and has failed to sample at least once. In this case Packet_Status shall be set to 0xFF and Sample_Count to 0x00.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x15	Subevent code for HCI_LE_Connectionless_IQ_Report event

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF
0x0FFF	Receiver Test

Channel_Index: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x27	The index of the channel on which the packet was received. Note: 0x25 to 0x27 can be used only for packets generated during test modes.
All other values	Reserved for future use

RSSI: *Size: 2 octets*

Value	Parameter Description
0xXXXX	RSSI of the packet Range: -1270 to +200 Units: 0.1 dBm

RSSI_Antenna_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	Antenna ID

CTE_Type: *Size: 1 octet*

Value	Parameter Description
0x00	AoA Constant Tone Extension
0x01	AoD Constant Tone Extension with 1 µs slots
0x02	AoD Constant Tone Extension with 2 µs slots
All other values	Reserved for future use

Slot_Durations: *Size: 1 octet*

Value	Parameter Description
0x01	Switching and sampling slots are 1 µs each
0x02	Switching and sampling slots are 2 µs each
All other values	Reserved for future use

Packet_Status: *Size: 1 octet*

Value	Parameter Description
0x00	CRC was correct
0x01	CRC was incorrect and the Length and CTETime fields of the packet were used to determine sampling points
0x02	CRC was incorrect but the Controller has determined the position and length of the Constant Tone Extension in some other way
0xFF	Insufficient resources to sample (Channel_Index, CTE_Type, and Slot_Durations invalid).
All other values	Reserved for future use

Periodic_Event_Counter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The value of paEventCounter (see [Vol 6] Part B, Section 4.4.2.1) for the reported AUX_SYNC_IND PDU

Sample_Count: *Size: 1 octet*

Value	Parameter Description
0x00	No samples provided (only permitted if Packet_Status is 0xFF).
0x09 to 0x52	Total number of sample pairs (there shall be the same number of I samples and Q samples). Note: This number is dependent on the switch and sample slot durations used.
All other values	Reserved for future use

I_Sample[i]: *Size: Sample_Count × 1 octet*

Value	Parameter Description
0x80	No valid sample available
All other values	I sample for the reported packet (signed integer). The list is in the order of the sampling points within the packet.

Q_Sample[i]: *Size: Sample Count × 1 octet*

Value	Parameter Description
0x80	No valid sample available
All other values	Q sample for the reported packet (signed integer). The list is in the order of the sampling points within the packet.

7.7.65.22 LE Connection IQ Report event

Event	Event Code	Event Parameters
HCI_LE_Connection_IQ_Report	0x3E	Subevent_Code, Connection_Handle, RX_PHY, Data_Channel_Index, RSSI, RSSI_Antenna_ID, CTE_Type, Slot_Durations, Packet_Status, Connection_Event_Counter, Sample_Count, I_Sample[i], Q_Sample[i]

Description:

This event is used by the Controller to report the IQ samples from the Constant Tone Extension of a received packet (see [Vol 6] Part B, Section 2.4).

The Connection_Handle parameter identifies the connection that corresponds to the reported information.

The receiver PHY, the index of the data channel, the RSSI value of the packet (excluding the Constant Tone Extension), the ID of the antenna on which this was measured, the type of Constant Tone Extension, the value of *connEventCounter*, and the IQ samples of the Constant Tone Extension of the received packet are reported in the corresponding parameters. For any given sample, either both or neither of I_Sample[i] and Q_Sample[i] shall equal 0x80.

The Slot_Durations parameter specifies the sampling rate used by the Controller.

The Packet_Status parameter indicates whether the received packet had a valid CRC and, if not, whether the Controller has determined the position and size of the Constant Tone Extension using the Length and CTETime fields.

Note: A Controller is not required to generate this event for packets that have a bad CRC.

This event is also used by the Controller to report that it has insufficient resources to report IQ samples for all received Constant Tone Extensions and has failed to sample at least once. In this case Packet_Status shall be set to 0xFF and Sample_Count to 0x00.

The Constant Tone Extension format is defined in [Vol 6] Part B, Section 2.1.5.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x16	Subevent code for HCI_LE_Connection_IQ_Report event

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

RX_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	The receiver PHY for the connection is LE 1M
0x02	The receiver PHY for the connection is LE 2M
All other values	Reserved for future use

Data_Channel_Index: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x24	The index of the data channel on which the Data Physical Channel PDU was received.
All other values	Reserved for future use

RSSI: *Size: 2 octets*

Value	Parameter Description
0xXXXX	RSSI of the packet Range: -1270 to +200 Units: 0.1 dBm

RSSI_Antenna_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	ID of the antenna on which the RSSI is measured

CTE_Type: *Size: 1 octet*

Value	Parameter Description
0x00	AoA Constant Tone Extension
0x01	AoD Constant Tone Extension with 1 µs slots
0x02	AoD Constant Tone Extension with 2 µs slots
All other values	Reserved for future use

Slot_Durations: *Size: 1 octet*

Value	Parameter Description
0x01	Switching and sampling slots are 1 µs each
0x02	Switching and sampling slots are 2 µs each
All other values	Reserved for future use

Packet_Status: *Size: 1 octet*

Value	Parameter Description
0x00	CRC was correct
0x01	CRC was incorrect and the Length and CTETime fields of the packet were used to determine sampling points
0x02	CRC was incorrect but the Controller has determined the position and length of the Constant Tone Extension in some other way
0xFF	Insufficient resources to sample (Data_Channel_Index, CTE_Type, and Slot_Durations invalid).
All other values	Reserved for future use

Connection_Event_Counter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The value of connEventCounter (see [Vol 6] Part B, Section 4.5.1) for the reported PDU

Sample_Count: *Size: 1 octet*

Value	Parameter Description
0x00	No samples provided (only permitted if Packet_Status is 0xFF).
0x09 to 0x52	Total number of sample pairs (there shall be the same number of I samples and Q samples). Note: This number is dependent on the switch and sample slot durations used.
All other values	Reserved for future use

I_Sample[i]: *Size: Sample_Count × 1 octet*

Value	Parameter Description
0x80	No valid sample available
All other values	I sample for the reported PDU (signed integer). The list is in the order of the sampling points within the PDU.

Q_Sample[i]: *Size: Sample_Count × 1 octet*

Value	Parameter Description
0x80	No valid sample available
All other values	Q sample for the reported PDU (signed integer). The list is in the order of the sampling points within the PDU.

7.7.65.23 LE CTE Request Failed event

Event	Event Code	Event Parameters
HCI_LE_CTE_Request_Failed	0x3E	Subevent_Code, Status, Connection_Handle

Description:

This event is used by the Controller to report an issue following a request to a peer device to reply with a packet containing an LL_CTE_RSP PDU and a Constant Tone Extension. It shall be generated if the packet containing the LL_CTE_RSP PDU sent in response did not contain a Constant Tone Extension or if the peer rejected the request. It shall not be generated if the packet containing the LL_CTE_RSP PDU had a CRC error or if the procedure response timeout timer (see [Vol 6] Part B, Section 5.2) expired.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x17	Subevent code for HCI_LE_CTE_Request_Failed event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	LL_CTE_RSP PDU received successfully but without a Constant Tone Extension field.
0x01 to 0xFF	Peer rejected the request. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

7.7.65.24 LE Periodic Advertising Sync Transfer Received event

Event	Event Code	Event Parameters
HCI_LE_Periodic_Advertising_Sync_Transfer_Received [v2]	0x3E	Subevent_Code, Status, Connection_Handle, Service_Data, Sync_Handle, Advertising_SID, Advertiser_Address_Type, Advertiser_Address, Advertiser_PHY, Periodic_Advertising_Interval, Advertiser_Clock_Accuracy, Num_Subevents, Subevent_Interval, Response_Slot_Delay, Response_Slot_Spacing
HCI_LE_Periodic_Advertising_Sync_Transfer_Received [v1]	0x3E	Subevent_Code, Status, Connection_Handle, Service_Data, Sync_Handle, Advertising_SID, Advertiser_Address_Type, Advertiser_Address, Advertiser_PHY, Periodic_Advertising_Interval, Advertiser_Clock_Accuracy

Description:

This event is used by the Controller to report that it has received periodic advertising synchronization information from the device referred to by the Connection_Handle parameter and either successfully synchronized to the periodic advertising train or timed out while attempting to synchronize. The Status will be zero if it successfully synchronized and non-zero otherwise.

The Service_Data value is provided by the Host of the device sending the information.

The Sync_Handle identifies the periodic advertising in subsequent commands and events and shall be assigned by the Controller.

The remaining parameters provide information about the periodic advertising (see Section 7.7.65.14). If there are no subevents or response slots, then the Controller shall set the Num_Subevents parameter to zero and the Host shall ignore the Subevent_Interval, Response_Slot_Delay, and Response_Slot_Spacing parameters.

If Status is non-zero, all parameter values are valid except Sync_Handle, which the Host shall ignore.

Note: If the Controller is already synchronized to the periodic advertising train described in the received information, no event will be generated.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x26	Subevent code for the HCI_LE_Periodic_Advertising_Sync_Transfer_Received event [v2]
0x18	Subevent code for the HCI_LE_Periodic_Advertising_Sync_Transfer_Received event [v1]

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Synchronization to the periodic advertising train succeeded.
0x01 to 0xFF	Synchronization to the periodic advertising train failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Service_Data: *Size: 2 octets*

Value	Parameter Description
0xXXXX	A value provided by the peer device

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF

Advertising_SID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Value of the Advertising SID used to advertise the periodic advertising
All other values	Reserved for future use

Advertiser_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Public Identity Address (corresponds to a resolved RPA)
0x03	Random (static) Identity Address (corresponds to a resolved RPA)
All other values	Reserved for future use

Advertiser_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the advertiser

Advertiser_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	Advertiser PHY is LE 1M
0x02	Advertiser PHY is LE 2M
0x03	Advertiser PHY is LE Coded
All other values	Reserved for future use

Periodic_Advertising_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Periodic advertising interval Range: 0x0006 to 0xFFFF Time = N × 1.25 ms Time Range: 7.5 ms to 81.91875 s

Advertiser_Clock_Accuracy: *Size: 1 octet*

Value	Parameter Description
0x00	500 ppm
0x01	250 ppm
0x02	150 ppm
0x03	100 ppm
0x04	75 ppm
0x05	50 ppm
0x06	30 ppm
0x07	20 ppm
All other values	Reserved for future use

Num_Subevents: *Size: 1 octet*

Value	Parameter Description
0x00	No subevents
N=0xXX	Number of subevents. Range: 0x01 to 0x80

Subevent_Interval: *Size: 1 octet*

Value	Parameter Description
N=0xXX	Subevent interval. Range: 0x06 to 0xFF Time = N × 1.25 ms Time Range: 7.5 ms to 318.75 ms

Response_Slot_Delay: *Size: 1 octet*

Value	Parameter Description
N=0xXX	Response slot delay. Range: 0x01 to 0xFE Time = N × 1.25 ms Time Range: 1.25 ms to 317.5 ms

Response_Slot_Spacing: *Size: 1 octet*

Value	Parameter Description
N=0xXX	Response slot spacing Range: 0x02 to 0xFF Time = N × 0.125 ms Time Range: 0.25 ms to 31.875 ms

7.7.65.25 LE CIS Established event

Event	Event Code	Event Parameters
HCI_LE_CIS_Established [v2]	0x3E	Subevent_Code, Status, Connection_Handle, CIG_Sync_Delay, CIS_Sync_Delay, Transport_Latency_C_To_P, Transport_Latency_P_To_C, PHY_C_To_P, PHY_P_To_C, NSE, BN_C_To_P, BN_P_To_C, FT_C_To_P, FT_P_To_C, Max_PDU_C_To_P, Max_PDU_P_To_C, ISO_Interval, Sub_Interval, Max_SDU_C_To_P, Max_SDU_P_To_C, SDU_Interval_C_To_P, SDU_Interval_P_To_C, Framing

Event	Event Code	Event Parameters
HCI_LE_CIS_Established [v1]	0x3E	Subevent_Code, Status, Connection_Handle, CIG_Sync_Delay, CIS_Sync_Delay, Transport_Latency_C_To_P, Transport_Latency_P_To_C, PHY_C_To_P, PHY_P_To_C, NSE, BN_C_To_P, BN_P_To_C, FT_C_To_P, FT_P_To_C, Max_PDU_C_To_P, Max_PDU_P_To_C, ISO_Interval

Description:

This event indicates that a CIS has been established, was considered lost before being established, or—on the Central—was rejected by the Peripheral. It is generated by the Controller in the Central and Peripheral. The Connection_Handle parameter shall be set to the value provided in the HCI_LE_Create_CIS command on the Central and in the HCI_LE_CIS_Request event on the Peripheral.

The CIG_Sync_Delay parameter is the maximum time, in microseconds, for transmission of PDUs of all CISes in a CIG event (see [Vol 6] Part B, Section 4.5.14.1).

The CIS_Sync_Delay parameter is the maximum time, in microseconds, for transmission of PDUs of the specified CIS in a CIG event (see [Vol 6] Part B, Section 4.5.14.1).

The Transport_Latency_C_To_P and Transport_Latency_P_To_C parameters are the actual transport latencies, in microseconds, as described in [Vol 6] Part G, Section 3.2.1 and [Vol 6] Part G, Section 3.2.2.

The PHY_C_To_P parameter indicates the PHY selected for packets from the Central to Peripheral.

The PHY_P_To_C parameter indicates the PHY selected for packets from the Peripheral to Central.

The remaining parameters are the corresponding parameters of the CIS (see [Vol 6] Part B, Section 4.5.13.1).

If this event is generated on the Peripheral with a non-zero status, the Controller shall delete the Connection_Handle and any associated ISO data paths.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x2A	Subevent Code for HCI_LE_CIS_Established [v2] event
0x19	Subevent Code for HCI_LE_CIS_Established [v1] event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The CIS is successfully established.
0x01 to 0xFF	The CIS failed to be established. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS Range: 0x0000 to 0x0EFF

CIG_Sync_Delay: *Size: 3 octets*

Value	Parameter Description
0x0000F2 to 0x7FFFFF	The maximum time, in microseconds, for transmission of PDUs of all CISes in a CIG event
All other values	Reserved for future use

CIS_Sync_Delay: *Size: 3 octets*

Value	Parameter Description
0x0000F2 to 0x7FFFFF	The maximum time, in microseconds, for transmission of PDUs of the specified CIS in a CIG event
All other values	Reserved for future use

Transport_Latency_C_To_P: *Size: 3 octets*

Value	Parameter Description
0x0000F2 to 0x7FFFFF	The actual transport latency, in microseconds, from Central to Peripheral
All other values	Reserved for future use

Transport_Latency_P_To_C: *Size: 3 octets*

Bit Number	Parameter Description
0x0000F2 to 0x7FFFFF	The actual transport latency, in microseconds, from Peripheral to Central
All other values	Reserved for future use

PHY_C_To_P: *Size: 1 octet*

Value	Parameter Description
0x01	The transmitter PHY of packets from the Central is LE 1M.
0x02	The transmitter PHY of packets from the Central is LE 2M.
0x03	The transmitter PHY of packets from the Central is LE Coded.
All other values	Reserved for future use.

PHY_P_To_C: *Size: 1 octet*

Value	Parameter Description
0x01	The transmitter PHY of packets from the Peripheral is LE 1M.
0x02	The transmitter PHY of packets from the Peripheral is LE 2M.
0x03	The transmitter PHY of packets from the Peripheral is LE Coded.
All other values	Reserved for future use.

NSE: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Maximum number of subevents in each CIS event
All other values	Reserved for future use

BN_C_To_P: *Size: 1 octet*

Value	Parameter Description
0x00	No isochronous data from the Central to the Peripheral
0x01 to 0x0F	The burst number for Central to Peripheral transmission
All other values	Reserved for future use

BN_P_To_C: *Size: 1 octet*

Value	Parameter Description
0x00	No isochronous data from the Peripheral to the Central
0x01 to 0x0F	The burst number for Peripheral to Central transmission
All other values	Reserved for future use

FT_C_To_P: *Size: 1 octet*

Value	Parameter Description
0xXX	The flush timeout, in multiples of the ISO_Interval for the CIS, for each payload sent from the Central to the Peripheral. Range: 0x01 to 0xFF

FT_P_To_C: *Size: 1 octet*

Value	Parameter Description
0xXX	The flush timeout, in multiples of the ISO_Interval for the CIS, for each payload sent from the Peripheral to the Central. Range: 0x01 to 0xFF

Max_PDU_C_To_P: *Size: 2 octets*

Value	Parameter Description
0x0000 to 0x00FB	Maximum size, in octets, of the payload from Central to Peripheral
All other values	Reserved for future use

Max_PDU_P_To_C: *Size: 2 octets*

Value	Parameter Description
0x0000 to 0x00FB	Maximum size, in octets, of the payload from Peripheral to Central
All other values	Reserved for future use

ISO_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The time between two consecutive CIS anchor points. Range: 0x0004 to 0x0C80 Time = N × 1.25 ms Time Range: 5 ms to 4 s.

Sub_Interval: *Size: 3 octets*

Value	Parameter Description
0x000000	NSE = 1 (meaning there is no Sub_Interval)
0xXXXXXX	Time, in microseconds, between the start of consecutive subevents in a CIS event Range: 0x000190 to ISO_Interval×1250 – 1

Max_SDU_C_To_P: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum size, in octets, of the payload from the Central's Host Range: 0 to 0x0FFF

Max_SDU_P_To_C: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum size, in octets, of the payload from the Peripheral's Host Range: 0 to 0x0FFF

SDU_Interval_C_To_P: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Time, in microseconds, between the start of consecutive SDUs sent by the Central Range: 0x0000FF to 0x0FFFFF

SDU_Interval_P_To_C: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Time, in microseconds, between the start of consecutive SDUs sent by the Peripheral Range: 0x0000FF to 0x0FFFFF

Framing: *Size: 1 octet*

Value	Parameter Description
0x00	Unframed PDUs
0x01	Framed PDUs
All other values	Reserved for future use

7.7.65.26 LE CIS Request event

Event	Event Code	Event Parameters
HCI_LE_CIS_Request	0x3E	Subevent_Code, ACL_Connection_Handle, CIS_Connection_Handle, CIG_ID, CIS_ID

Description:

This event indicates that a Controller has received a request to establish a CIS. If the Controller receives such a request while the HCI_LE_CIS_Request event is masked away, it shall reject it. Otherwise the Controller shall assign a connection handle for the requested CIS and send the handle in the CIS_Connection_Handle parameter of the event.

When the Host receives this event it shall respond with either an HCI_LE_Accept_CIS_Request command or an HCI_LE_Reject_CIS_Request command before the timer Connection_Accept_Timeout expires. If it does not, the Controller shall reject the request and generate an HCI_LE_CIS_Established event with the status *Connection Accept Timeout Exceeded* (0x10).

The ACL_Connection_Handle is the connection handle of the ACL connection that is associated with the requested CIS.

The CIG_ID parameter contains the identifier of the CIG that contains the requested CIS. This parameter is sent by the Central in the request to establish the CIS.

The CIS_ID parameter contains the identifier of the requested CIS. This parameter is sent by the Central in the request to establish the CIS.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x1A	Subevent Code for the HCI_LE_CIS_Request event

ACL_Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the ACL Range: 0x0000 to 0x0EFF

CIS_Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS Range: 0x0000 to 0x0EFF

CIG_ID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Identifier of the CIG
All other values	Reserved for future use

CIS_ID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Identifier of the CIS
All other values	Reserved for future use

7.7.65.27 LE Create BIG Complete event

Event	Event Code	Event Parameters
HCI_LE_Create_BIG_Complete	0x3E	Subevent_Code, Status, BIG_Handle, BIG_Sync_Delay, Transport_Latency_BIG, PHY, NSE, BN, PTO, IRC, Max_PDU, ISO_Interval, Num_BIS, Connection_Handle[i]

Description:

This event indicates that the HCI_LE_Create_BIG or HCI_LE_Create_BIG_Test command has completed and, if successful, the Link Layer has entered the Isochronous Broadcasting state.

The BIG_Handle parameter shall be the same as the one specified in the command that has completed.

The BIG_Sync_Delay parameter is the maximum time, in microseconds, for transmission of PDUs of all BISes in a BIG event (see [Vol 6] Part B, Section 4.4.6.4).

The Transport_Latency_BIG parameter is the actual transport latency, in microseconds, as described in [Vol 6] Part G, Section 3.2.1 and [Vol 6] Part G, Section 3.2.2.

The Num_BIS parameter is the total number of BISes in the BIG. This parameter shall be the same as the parameter that is provided by the Host in the command that has completed.

The PHY parameter is the PHY used to create the BIG.

The NSE, BN, PTO, IRC, Max_PDU, and ISO_Interval parameters are the corresponding parameters of the BIS (see [Vol 6] Part B, Section 4.4.6.3).

The Connection_Handle arrayed parameter contains the connection handles of all the BIS in the BIG.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x1B	Subevent Code for the HCI_LE_Create_BIG_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The BIG was successfully created.
0x01 to 0xFF	There was an error creating the BIG. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	The identifier of the BIG
All other values	Reserved for future use

BIG_Sync_Delay: *Size: 3 octets*

Value	Parameter Description
0x000030 to 0x7FFFFF	The maximum time, in microseconds, for transmission of PDUs of all BISes in a BIG event
All other values	Reserved for future use.

Transport_Latency_BIG: *Size: 3 octets*

Value	Parameter Description
0x000030 to 0x7FFFFF	The actual transport latency, in microseconds
All other values	Reserved for future use

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	The PHY used to create the BIG is LE 1M.
0x02	The PHY used to create the BIG is LE 2M.

Value	Parameter Description
0x03	The PHY used to create the BIG is LE Coded.
All other values	Reserved for future use.

NSE: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	The number of subevents in each BIS event in the BIG
All other values	Reserved for future use

BN: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	The number of new payloads in each BIS event
All other values	Reserved for future use

PTO: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Offset used for pre-transmissions
All other values	Reserved for future use

IRC: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x0F	The number of times a payload is transmitted in a BIS event
All other values	Reserved for future use

Max_PDU: *Size: 2 octets*

Value	Parameter Description
0x0001 to 0x00FB	Maximum size, in octets, of the payload
All other values	Reserved for future use

ISO_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The time between two consecutive BIG anchor points. Range: 0x0004 to 0x0C80 Time = N × 1.25 ms Time Range: 5 ms to 4 s.

Num_BIS: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Total number of BISes in the BIG
All other values	Reserved for future use

Connection_Handle[i]: *Size: 2 octets (12 bits meaningful) × Num_BIS*

Value	Parameter Description
0xXXXX	Connection handle of a BIS Range: 0x0000 to 0x0EFF

7.7.65.28 LE Terminate BIG Complete event

Event	Event Code	Event Parameters
HCI_LE_Terminate_BIG_Complete	0x3E	Subevent_Code, BIG_Handle, Reason

Description:

This event indicates that the transmission of all the BISes in the BIG are terminated.

The BIG_Handle parameter is used to identify the BIG that is terminated. This parameter is provided by the Host in the HCI_LE_Terminate_BIG command.

If the BIG is terminated by the local Host, the Reason parameter shall be set to the error code *Connection Terminated By Local Host* (0x16).

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x1C	Subevent Code for the HCI_LE_Terminate_BIG_Complete event

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	The identifier of the BIG
All other values	Reserved for future use

Reason: *Size: 1 octet*

Value	Parameter Description
0xXX	Reason for termination. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

7.7.65.29 LE BIG Sync Established event

Event	Event Code	Event Parameters
HCI_LE_BIG_Sync_Established	0x3E	Subevent_Code, Status, BIG_Handle, Transport_Latency_BIG, NSE, BN, PTO, IRC, Max_PDU, ISO_Interval, Num_BIS, Connection_Handle[i]

Description:

This event indicates that the HCI_LE_BIG_Create_Sync command has completed.

The BIG_Handle parameter is used to identify the BIG. This parameter is provided by the Host in the HCI_LE_BIG_Create_Sync command.

The Transport_Latency_BIG parameter is the actual transport latency, in microseconds, as described in [Vol 6] Part G, Section 3.2.1 and [Vol 6] Part G, Section 3.2.2.

The NSE, BN, PTO, IRC, Max_PDU, and ISO_Interval parameters are the corresponding parameters of the BIS (see [Vol 6] Part B, Section 4.4.6.3).

The Num_BIS parameter indicates the number of BISes in the synchronized BIG specified by the HCI_LE_BIG_Create_Sync command. This parameter shall be the same as the parameter that is provided by the Host in the HCI_LE_BIG_Create_Sync command.

The Connection_Handle arrayed parameter is the list of connection handle(s) of the BIS(es) that are requested in the HCI_LE_BIG_Create_Sync command. The order of the connection handle(s) shall correspond to the order of the BIS(s) that are requested in the BIS arrayed parameter field of the HCI_LE_BIG_Create_Sync command.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x1D	Subevent Code for the HCI_LE_BIG_Sync_Established event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Synchronization to the BIG is completed.
0x01 to 0xFF	Synchronization to the BIG failed to complete. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	The identifier of the BIG
All other values	Reserved for future use

Transport_Latency_BIG: *Size: 3 octets*

Value	Parameter Description
0x000030 to 0x7FFFFF	The actual transport latency, in microseconds
All other values	Reserved for future use

NSE: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	The number of subevents in each BIS event in the BIG
All other values	Reserved for future use

BN: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	The number of new payloads in each BIS event
All other values	Reserved for future use

PTO: Size: 1 octet

Value	Parameter Description
0x00 to 0x0F	Offset used for pre-transmissions
All other values	Reserved for future use

IRC: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x0F	The number of times a payload is transmitted in a BIS event
All other values	Reserved for future use

Max_PDU: *Size: 2 octets*

Value	Parameter Description
0x0001 to 0x00FB	Maximum size, in octets, of the payload
All other values	Reserved for future use

ISO_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The time between two consecutive BIG anchor points. Range: 0x0004 to 0x0C80 Time = N × 1.25 ms Time Range: 5 ms to 4 s.

Num_BIS: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Total number of BISes in the BIG
All other values	Reserved for future use

Connection_Handle[i]: *Size: Num_BIS × 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a BIS in the BIG Range: 0x0000 to 0x0EFF

7.7.65.30 LE BIG Sync Lost event

Event	Event Code	Event Parameters
HCI_LE_BIG_Sync_Lost	0x3E	Subevent_Code, BIG_Handle, Reason

Description:

This event indicates that the Controller has not received any PDUs on a BIG within the timeout period BIG_Sync_Timeout or the BIG has been terminated by the remote device.

The BIG_Handle parameter is used to identify the BIG. This parameter is provided by the Host in the HCI_LE_BIG_Create_Sync command.

The Reason parameter is used to indicate the reason why the synchronization was lost or terminated. If synchronization was terminated due to the Broadcaster terminating the BIG, the Reason parameter shall be set to the error code *Remote User Terminated Connection* (0x13). If synchronization was terminated due to a timeout, the Reason parameter shall be set to the error code *Connection Timeout* (0x08). If synchronization was terminated due to a MIC failure, the Reason parameter shall be set to the error code *Connection Terminated due to MIC Failure* (0x3D).

When the HCI_LE_BIG_Sync_Lost event occurs, the Controller shall remove the connection handle(s) and data paths of all BIS(s) in the BIG with which the Controller was synchronized.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x1E	Subevent Code for the HCI_LE_BIG_Sync_Lost event

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	The identifier of a BIG
All other values	Reserved for future use

Reason: *Size: 1 octet*

Value	Parameter Description
0xXX	The synchronization to BIG is terminated. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

7.7.65.31 LE Request Peer SCA Complete event

Event	Event Code	Event Parameters
HCI_LE_Request_Peer_SCA_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Peer_Clock_Accuracy

Description:

This event indicates that the HCI_LE_Request_Peer_SCA command has been completed.

The Peer_Clock_Accuracy parameter contains the sleep clock accuracy of the peer.

The Connection_Handle is the connection handle of the ACL connection in which the HCI_LE_Request_Peer_SCA command is issued.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x1F	Subevent Code for the HCI_LE_Request_Peer_SCA_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The Peer_Clock_Accuracy parameter is successfully received.
0x01 to 0xFF	The reception of Peer_Clock_Accuracy parameter failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the ACL Range: 0x0000 to 0x0EFF

Peer_Clock_Accuracy: *Size: 1 octet*

Value	Parameter Description
0x00	251 ppm to 500 ppm
0x01	151 ppm to 250 ppm
0x02	101 ppm to 150 ppm
0x03	76 ppm to 100 ppm
0x04	51 ppm to 75 ppm
0x05	31 ppm to 50 ppm
0x06	21 ppm to 30 ppm
0x07	0 ppm to 20 ppm
All other values	Reserved for future use

7.7.65.32 LE Path Loss Threshold event

Event	Event Code	Event Parameters
HCI_LE_Path_Loss_Threshold	0x3E	Subevent_Code, Connection_Handle, Current_Path_Loss, Zone_Entered

Description:

This event is used to report a path loss threshold crossing (see [Vol 6] Part B, Section 4.5.16) on the ACL connection identified by the Connection_Handle parameter.

The Current_Path_Loss parameter indicates the current path loss value as calculated by the Controller.

The Zone_Entered parameter indicates which zone was entered. If Current_Path_Loss is set to 0xFF then Zone_Entered shall be ignored.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x20	Subevent code for the HCI_LE_Path_Loss_Threshold event

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Current_Path_Loss: *Size: 1 octet*

Value	Parameter Description
0xXX	Current path loss (always zero or positive) Units: dB
0xFF	Unavailable

Zone_Entered: *Size: 1 octet*

Value	Parameter Description
0x00	Entered low zone
0x01	Entered middle zone
0x02	Entered high zone
All other values	Reserved for future use

7.7.65.33 LE Transmit Power Reporting event

Event	Event Code	Event Parameters
HCI_LE_Transmit_Power_Reporting	0x3E	Subevent_Code, Status, Connection_Handle, Reason, PHY, TX_Power_Level, TX_Power_Level_Flag, Delta

Description:

This event is used to report the transmit power level on the ACL connection identified by the Connection_Handle parameter.

The Reason parameter indicates why the event was sent and the device whose transmit power level is being reported.

Whenever the transmit power changes and local reporting has been enabled by the HCI_LE_Set_Transmit_Power_Reporting_Enable command, the Controller shall generate this event with Reason set to 0x00. In this case, the PHY, TX_Power_Level, TX_Power_Level_Flag and Delta parameters shall refer to the local device and the Status parameter shall be ignored.

Whenever the Controller becomes aware that the peer's transmitter power has changed other than through an HCI_LE_Read_Remote_Transmit_Power_Level command and remote reporting has been enabled by the HCI_LE_Set_Transmit_Power_Reporting_Enable command, the Controller shall generate this event with Reason set to 0x01. In this case, the PHY, TX_Power_Level, TX_Power_Level_Flag and Delta parameters shall refer to the remote device and the Status parameter shall be ignored.

When the Reason is set to 0x02, this event indicates completion of an HCI_LE_Read_Remote_Transmit_Power_Level command. In this case, the PHY, TX_Power_Level, TX_Power_Level_Flag and Delta parameters shall refer to the remote device.

The PHY parameter shall indicate the PHY involved (which might not be the current transmit PHY for the relevant device).

The TX_Power_Level parameter shall indicate the transmit power level for the PHY.

The TX_Power_Level_Flag parameter shall indicate whether the transmit power level that is being reported has reached its minimum and/or maximum level. TX_Power_Level_Flag shall be ignored if the TX_Power_Level parameter is set to 0x7E or 0x7F.

The Delta parameter shall be set to the change in power level for the transmitter being reported, whenever it changes its transmit power level. When this event is generated with Reason set to 0x02, Delta shall be set to zero. Delta shall be ignored if the TX_Power_Level parameter is set to 0x7E.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x21	Subevent code for the HCI_LE_Transmit_Power_Reporting event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Remote_Transmit_Power_Level command succeeded.
0x01 to 0xFF	HCI_LE_Read_Remote_Transmit_Power_Level command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Reason: *Size: 1 octet*

Value	Parameter Description
0x00	Local transmit power changed
0x01	Remote transmit power changed
0x02	HCI_LE_Read_Remote_Transmit_Power_Level command completed
All other values	Reserved for future use

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	LE 1M PHY
0x02	LE 2M PHY
0x03	LE Coded PHY with S=8 data coding
0x04	LE Coded PHY with S=2 data coding
All other values	Reserved for future use

TX_Power_Level: *Size: 1 octet*

Value	Parameter Description
0xXX	Transmit power level Range: -127 to 20 Units: dBm
0x7E	Remote device is not managing power levels on this PHY.
0x7F	Transmit power level is not available

TX_Power_Level_Flag: *Size: 1 octet*

Bit Number	Parameter Description
0	Transmit power level is at minimum level
1	Transmit power level is at maximum level
All other bits	Reserved for future use

Delta: *Size: 1 octet*

Value	Parameter Description
0xXX	Change in transmit power level (positive indicates increased power, negative indicates decreased power, zero indicates unchanged) Units: dB
0x7F	Change is not available or is out of range.

7.7.65.34 LE BIGInfo Advertising Report event

Event	Event Code	Event Parameters
HCI_LE_BIGInfo_Advertising_Report	0x3E	Subevent_Code, Sync_Handle Num_BIS, NSE, ISO_Interval, BN, PTO, IRC, Max_PDU, SDU_Interval, Max_SDU, PHY, Framing, Encryption

Description:

This event indicates that the Controller has received an Advertising PDU that contained a BIGInfo field. If the Controller also generates an HCI_LE_Periodic_Advertising_Report event, the HCI_LE_BIGInfo_Advertising_Report event shall immediately follow that event.

An HCI_LE_BIGInfo_Advertising_Report event shall be generated even if the Controller is already synchronized to the BIG.

The Sync_Handle parameter shall identify the periodic advertising train containing the BIGInfo field and shall be the same as the corresponding field in the HCI_LE_Periodic_Advertising_Report event if one is generated.

The Num_BIS, NSE, ISO_Interval, BN, PTO, IRC, Max_PDU, SDU_Interval, Max_SDU, and PHY parameters correspond to the associated fields in the BIGInfo field of the Advertising PDU. The Framing parameter corresponds to both the Framed and Framing_Mode fields in the BIGInfo field.

If the BIGInfo field indicates that the corresponding BIG is encrypted, the Encryption parameter shall be set to 0x01. Otherwise, the Encryption parameter shall be set to 0x00.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x22	Subevent code for the HCI_LE_BIGInfo_Advertising_Report event

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF

Num_BIS: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Value of the Num_BIS subfield of the BIGInfo field
All other values	Reserved for future use

NSE: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Value of the NSE subfield of the BIGInfo field
All other values	Reserved for future use

ISO_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Value of the ISO_Interval subfield of the BIGInfo field

BN: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	Value of the BN subfield of the BIGInfo field
All other values	Reserved for future use

PTO: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Value of the PTO subfield of the BIGInfo field
All other values	Reserved for future use

IRC: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x0F	Value of the IRC subfield of the BIGInfo field
All other values	Reserved for future use

Max_PDU: *Size: 2 octets*

Value	Parameter Description
0x0001 to 0x00FB	Value of the Max_PDU subfield of the BIGInfo
All other values	Reserved for future use

SDU_Interval: *Size: 3 octets*

Value	Parameter Description
0x0000FF to 0x0FFFFF	Value of the SDU_Interval subfield of the BIGInfo field
All other values	Reserved for future use

Max_SDU: *Size: 2 octets*

Value	Parameter Description
0x0001 to 0x0FFF	Value of the Max_SDU subfield of the BIGInfo field in the Advertising PDU
All other values	Reserved for future use

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	The BIG is transmitted on the LE 1M PHY
0x02	The BIG is transmitted on the LE 2M PHY
0x03	The BIG is transmitted on the LE Coded PHY
All other values	Reserved for future use

Framing: *Size: 1 octet*

Value	Parameter Description
0x00	Unframed PDUs
0x01	Framed PDUs, Segmentable mode
0x02	Framed PDUs, Unsegmented mode
All other values	Reserved for future use

Encryption: *Size: 1 octet*

Value	Parameter Description
0x00	BIG carries unencrypted data
0x01	BIG carries encrypted data
All other values	Reserved for future use

7.7.65.35 LE Subrate Change event

Event	Event Code	Event Parameters
HCI_LE_Subrate_Change	0x3E	Subevent_Code, Status, Connection_Handle, Subrate_Factor, Peripheral_Latency, Continuation_Number, Supervision_Timeout

Description:

This event is used to indicate that a Connection Subrate Update procedure has completed and some parameters of the specified connection have changed.

This event shall be issued if the HCI_LE_Subrate_Request command was issued by the Host or the parameters are updated successfully following a request from the peer device. If no parameters are updated following a request from the peer device or the parameters were changed using the Connection Update procedure, then this event shall not be issued.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x23	Subevent Code for the HCI_LE_Subrate_Change event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_Subrate_Request command succeeded or this event was generated following a request from the peer device.
0x01 to 0xFF	The HCI_LE_Subrate_Request command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle Range: 0x0000 to 0x0EFF

Subrate_Factor: *Size: 2 octets*

Value	Parameter Description
0xXXXX	New subrate factor applied to the specified underlying connection interval Range 0x0001 to 0x01F4
All other values	Reserved for future use

Peripheral_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	New Peripheral latency for the connection in number of subrated connection events Range: 0x0000 to 0x01F3
All other values	Reserved for future use

Continuation_Number: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of underlying connection events to remain active after a packet containing a Link Layer PDU with a non-zero Length field is sent or received Range: 0x0000 to 0x01F3
All other values	Reserved for future use

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	New supervision timeout for this connection. Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s

7.7.65.36 LE Periodic Advertising Subevent Data Request event

Event	Event Code	Event Parameters
HCI_LE_Periodic_Advertising_Subevent_Data_Request	0x3E	Subevent_Code, Advertising_Handle, Subevent_Start, Subevent_Data_Count

Description:

This event is used to allow the Controller to indicate that it is ready to transmit one or more subevents and is requesting the advertising data for these subevents. The Subevent_Data_Count parameter shall be less than or equal to the number of subevents. The Subevent_Start parameter is the first subevent being requested and the Subevent_Data_Count parameter determines the subsequent subevents being requested. The subevent numbers wrap from one less than the number of subevents to zero.

This event should be sent from the Controller when it has no data for upcoming subevents. The Controller should request data for as many subevents as it has memory to accept to minimize the number of events generated by the Controller.

The Controller shall not send this event more than once for the same subevent of the same periodic advertising event.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x27	Subevent code for the HCI_LE_Periodic_Advertising_Subevent_Data_Request event

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify a periodic advertising train Range: 0x00 to 0xEF

Subevent_Start: *Size: 1 octet*

Value	Parameter Description
0xXX	The first subevent that data is requested for. Range: 0x00 to 0x7F

Subevent_Data_Count: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of subevents that data is requested for. Range: 0x01 to 0x80

7.7.65.37 LE Periodic Advertising Response Report event

Event	Event Code	Event Parameters
HCI_LE_Periodic_Advertising_Response_Report	0x3E	Subevent_Code, Advertising_Handle, Subevent, TX_Status, Num_Responses, TX_Power[i], RSSI[i], CTE_Type[i], Response_Slot[i] Data_Status[i], Data_Length[i], Data[i]

Description:

This event indicates that one or more Bluetooth devices have responded to a periodic advertising subevent during a PAwR train. The Controller may queue these advertising reports and send information from multiple devices in one HCI_LE_Periodic_Advertising_Response_Report event. The Controller shall only send reports for response slots that the Host requested it listen to.

The Controller may fail to transmit the synchronization packet required to enable the response packets to be sent. If this happens, the Controller shall report this to the Host using the TX_Status parameter.

The Controller may split the data from a single response into several reports. If so, each report except the last shall have a Data_Status of "incomplete, more data to come", while the last shall have the value "complete". No further reports shall be sent for a given response slot after one with a Data_Status other than "incomplete, more data to come".

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x28	Subevent code for the HCI_LE_Periodic_Advertising_Response_Report event

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify a periodic advertising train Range: 0x00 to 0xEF

Subevent: *Size: 1 octet*

Value	Parameter Description
0xXX	The subevent number. Range: 0x00 to 0x7F

TX_Status: *Size: 1 octet*

Value	Parameter Description
0x00	AUX_SYNC_SUBEVENT_IND packet was transmitted.
0x01	AUX_SYNC_SUBEVENT_IND packet was not transmitted.
All other values	Reserved for future use

Num_Responses: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x19	Number of responses in event.
All other values	Reserved for future use

TX_Power[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	Tx Power information not available

RSSI[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	RSSI is not available

CTE_Type[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0x00	AoA Constant Tone Extension
0x01	AoD Constant Tone Extension with 1 µs slots
0x02	AoD Constant Tone Extension with 2 µs slots
0xFF	No Constant Tone Extension
All other values	Reserved for future use

Response_Slot[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0xXX	The response slot the data was received in. Range: 0x00 to 0xFF

Data_Status[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0x00	Data complete
0x01	Data incomplete, more data to come
0xFF	Failed to receive or listen for an AUX_SYNC_SUBEVENT_RSP PDU
All other values	Reserved for future use

Data_Length[i]: *Size: Num_Responses × 1 octet*

Value	Parameter Description
0xXX	Length of the Data field

Data[i]: *Size: SUM (Data_Length[i]) octets*

Value	Parameter Description
Variable	Periodic advertising response data formatted as defined in [Vol 3] Part C, Section 11. Note: Each element of this array has a variable length.

7.7.65.38 LE Read All Remote Features Complete event

Event	Event Code	Event Parameters
HCI_LE_Read_All_Remote_Features_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Max_Remote_Page, Max_Valid_Page, LE_Features

Description:

This event is used to indicate the completion of the process of the Controller obtaining the features supported by the remote Bluetooth device specified by the Connection_Handle event parameter.

The Max_Remote_Page parameter specifies the highest-numbered page of the remote device's supported LE features that contains at least one bit set to 1; all higher-number pages therefore only contain zeroes. The Max_Valid_Page parameter specifies the highest-numbered page of features that the Controller has obtained from the remote device or, if it has obtained all pages from 1 to Max_Remote_Page, then any value greater than or equal to Max_Remote_Page.

The LE_Features parameter contains the LE features. The Controller shall set all pages between 0 and Max_Valid_Page to valid data and shall set all higher-numbered pages to all zero bits.

Note: If Max_Valid_Page ≥ Max_Remote_Page, then all pages will contain valid data, which will be all zero bits for pages numbered greater than Max_Remote_Page.

If the feature mask is requested more than once while a connection exists between the two devices, then the second and subsequent requests may report a cached copy of the feature mask rather than fetching the feature mask again.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x2B	Subevent code for the HCI_LE_Read_All_Remote_Features_Complete event.

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_All_Remote_Features command successfully completed.
0x01 to 0xFF	HCI_LE_Read_All_Remote_Features command failed to complete. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Max_Remote_Page: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of the highest-numbered page of the remote device's supported LE features that contains at least one bit set to 1. Range: 0x00 to 0x0A

Max_Valid_Page: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of the highest-numbered page of LE_Features that contains valid data. Range: 0x00 to 0x0A

LE_Features: *Size: 248 octets*

Value	Parameter Description
0xXX...XX	Bit Mask List of the LE features. See [Vol 6] Part B, Section 4.6.

7.7.65.39 LE CS Read Remote Supported Capabilities Complete event

Event	Event Code	Event Parameters
HCI_LE_CS_Read_Remote_Supported_-Capabilities_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Num_Config_Supported, Max_Consecutive_Procedures_Supported, Num_Antennae_Supported, Max_Antenna_Paths_Supported, Roles_Supported, Modes_Supported, RTT_Capability, RTT_AA_Only_N, RTT_Sounding_N, RTT_Random_Sequence_N, NADM_Sounding_Capability, NADM_Random_Capability, CS_SYNC_PHYs_Supported, Subfeatures_Supported, T_IP1_Times_Supported, T_IP2_Times_Supported, T_FCS_Times_Supported, T_PM_Times_Supported, T_SW_Time_Supported, TX_SNR_Capability

Description:

This event shall be generated when a locally initiated CS Capabilities Exchange procedure has completed or when the local Controller has received an LL_CS_CAPABILITIES_REQ from the remote Controller.

The Num_Config_Supported parameter indicates the number of CS configurations that are supported by the remote Controller.

The Max_Consecutive_Procedures_Supported parameter indicates the maximum number of consecutive CS procedures that are supported by the remote Controller.

The Num_Antennae_Supported parameter indicates the number of antenna elements that are available for CS tone exchanges.

The Max_Antenna_Paths_Supported parameter indicates the maximum number of antenna paths that are supported by the remote Controller for CS tone exchanges.

The Roles_Supported parameter indicates the CS roles that are supported by the remote Controller.

The Modes_Supported parameter indicates the optional CS modes that are supported by the remote Controller.

The RTT_Capability, RTT_AA_Only_N, RTT_Sounding_N, and RTT_Random_-Payload_N parameters indicate the time-of-flight accuracy as described in [Vol 6] Part B, Section 2.4.2.44.

The NADM_Sounding_Capability and NADM_Random_Capability parameters indicate the support by the remote Controller for reporting Normalized Attack Detector Metric (NADM) when a CS_SYNC with a sounding sequence or random sequence is received.

The CS_SYNC_PHYs_Supported parameter indicates the optional transmit and receive PHYs supported by the remote Controller for CS_SYNC exchanges as described in [Vol 6] Part H, Section 4.3.

The Subfeatures_Supported parameter indicates which of the following optional subfeatures are supported by the remote Controller:

- A Frequency Actuation Error of zero for all allowed CS channels as described in [Vol 6] Part A, Section 3.5.
- Channel Selection Algorithm #3c as described in [Vol 6] Part H, Section 4.1.4.2.
- Phase-based ranging from a sounding sequence as described in [Vol 6] Part H, Section 3.3.1.

The T_IP1_Times_Supported, T_IP2_Times_Supported, T_FCS_Times_Supported, T_PM_Times_Supported, and T_SW_Time_Supported parameters indicate the supported optional time durations used in CS steps as described in [Vol 6] Part H, Section 4.3.

The TX_SNR_Capability parameter indicated the supported SNR levels used for the CS_SYNC packets used in mode-1 and mode-3 steps as described in [Vol 6] Part A, Section 3.1.3.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x2C	Subevent code for the HCI_LE_CS_Read_Remote_Supported_-Capabilities_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	LE_CS_Read_Remote_Supported_Capabilities command successfully completed
0x01 to 0xFF	LE_CS_Read_Remote_Supported_Capabilities command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Num_Config_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Number of CS configurations supported per connection
All other values	Reserved for future use

Max_Consecutive_Procedures_Supported: *Size: 2 octets*

Value	Parameter Description
0x0000	Support for both a fixed number of consecutive CS procedures and for an indefinite number of CS procedures until termination.
0x0001 to 0xFFFF	Maximum number of consecutive CS procedures supported.

Num_Antennae_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Number of antennae supported
All other values	Reserved for future use

Max_Antenna_Paths_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Maximum number of antenna paths supported
All other values	Reserved for future use

Roles_Supported: *Size: 1 octet*

Bit Number	Parameter Description
0	Initiator
1	Reflector
All other values	Reserved for future use

Modes_Supported: *Size: 1 octet*

Bit Number	Parameter Description
0	Mode-3
All other values	Reserved for future use

RTT_Capability: *Size: 1 octet*

Bit Number	Parameter Description
0	If set to 1, then the value reflected in the RTT_AA_Only_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_AA_Only_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_AA_Only_N field is set to 0, then the bit shall be ignored.
1	If set to 1, then the value reflected in the RTT_Sounding_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_Sounding_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_Sounding_N field is set to 0, then the bit shall be ignored.
2	If set to 1, then the value reflected in the RTT_Random_Sequence_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_Random_Sequence_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_Random_Sequence_N field is set to 0, then the bit shall be ignored.
All other bits	Reserved for future use

RTT_AA_Only_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT AA Only not supported
0x01 to 0xFF	Number of CS steps of single packet exchanges needed to satisfy the precision requirements

RTT_Sounding_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT Sounding not supported
0x01 to 0xFF	Number of CS steps of single packet exchanges needed to satisfy the precision requirements

RTT_Random_Sequence_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT Random Sequence not supported
0x01 to 0xFF	Number of CS steps of single packet exchanges needed to satisfy the precision requirements

NADM_Sounding_Capability: *Size: 2 octets*

Bit Number	Parameter Description
0	Support for Phase-based Normalized Attack Detector Metric when a CS_SYNC with sounding sequence is received
All other bits	Reserved for future use

NADM_Random_Capability: *Size: 2 octets*

Bit Number	Parameter Description
0	Support for Phase-based Normalized Attack Detector Metric when a CS_SYNC with random sequence is received
All other bits	Reserved for future use

CS_SYNC_PHYs_Supported: *Size: 1 octet*

Bit Number	Parameter Description
1	LE 2M PHY
2	LE 2M 2BT PHY
All other values	Reserved for future use

Subfeatures_Supported: *Size: 2 octets*

Bit Number	Parameter Description
1	CS with no transmitter Frequency Actuation Error
2	CS Channel Selection Algorithm #3c
3	CS phase-based ranging from RTT sounding sequence
All other bits	Reserved for future use

T_IP1_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported
6	80 µs supported
All other values	Reserved for future use

T_IP2_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported
6	80 µs supported
All other values	Reserved for future use

T_FCS_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	15 µs supported
1	20 µs supported

Bit Number	Parameter Description
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported
6	80 µs supported
7	100 µs supported
8	120 µs supported
All other values	Reserved for future use

T_PM_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
All other values	Reserved for future use

T_SW_Time_Supported: *Size: 1 octet*

Value	Parameter Description
0x00, 0x01, 0x02, 0x04, or 0x0A	Time in microseconds for the antenna switch period of the CS tones
All other values	Reserved for future use

TX_SNR_Capability: *Size: 1 octet*

Bit Number	Parameter Description
0	18 dB supported
1	21 dB supported
2	24 dB supported
3	27 dB supported
4	30 dB supported
All other values	Reserved for future use

7.7.65.40 LE CS Read Remote FAE Table Complete event

Event	Event Code	Event Parameters
HCI_LE_CS_Read_Remote_FAE_Table_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Remote_FAE_Table

Description:

This event shall be generated when a locally initiated CS Mode-0 Frequency Actuation Error Table Update procedure has completed.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x2D	Subevent code for the HCI_LE_CS_Read_Remote_FAE_Table_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	LE_CS_Read_Remote_FAE_Table command successfully completed
0x01 to 0xFF	LE_CS_Read_Remote_FAE_Table command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Remote_FAE_Table: *Size: 72 octets*

Value	Parameter Description
Variable	Per-channel mode-0 Frequency Actuation Error table of the remote Controller as described in [Vol 6] Part B, Section 2.4.2.52.

7.7.65.41 LE CS Security Enable Complete event

Event	Event Code	Event Parameters
HCI_LE_CS_Security_Enable_Complete	0x3E	Subevent_Code, Status, Connection_Handle

Description:

This event shall be generated when a locally initiated CS Security Start procedure has completed or when the local Controller has responded to a CS security request from the remote Controller.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x2E	Subevent code for the HCI_LE_CS_Security_Enable_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	CS security parameters successfully exchanged
0x01 to 0xFF	CS security parameter exchange failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

7.7.65.42 LE CS Config Complete event

Event	Event Code	Event Parameters
HCI_LE_CS_Config_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Config_ID, Action, Main_Mode_Type, Sub_Mode_Type, Min_Main_Mode_Steps, Max_Main_Mode_Steps, Main_Mode_Repetition, Mode_0_Steps, Role, RTT_Type, CS_SYNC_PHY, Channel_Map, Channel_Map_Repetition, Channel_Selection_Type, Ch3c_Shape, Ch3c_Jump, Reserved, T_IP1_Time, T_IP2_Time, T_FCS_Time, T_PM_Time

Description:

This event shall be generated when a locally initiated Channel Sounding Configuration procedure has completed or when the local Controller has responded to a CS configuration request from the remote Controller for the CS configuration identified by Config_ID or when a CS configuration is created only with local context. The Action parameter indicates if a CS configuration was requested to be created or removed. The Status parameter indicates whether the request indicated by the Action parameter was successful.

When the Action parameter is set to 0x00, all the remaining event parameters are ignored.

The Main_Mode_Type and Sub_Mode_Type parameters indicate the CS modes used during the CS procedure for the specified CS configuration. The Min_Main_Mode_Steps and Max_Main_Mode_Steps parameters indicate the range of main mode CS steps executed before a submode CS step is executed during the CS procedure. The Main_Mode_Repetition parameter indicates the number of main mode CS steps repeated from the last CS subevent at the beginning of the current CS subevent. The Mode_0_Steps parameter indicates the number of mode-0 CS steps included at the beginning of each CS subevent.

The Role parameter indicates the CS role for the local Controller for the specified CS configuration. The RTT_Type parameter indicates the RTT variant to be used during the CS procedure, and the CS_SYNC_PHY parameter indicates the PHY to be used for CS_SYNC exchanges during the CS procedure for the specified CS configuration.

The Channel_Map parameter indicates the channels to be used or unused during the CS procedure, and the Channel_Map_Repetition parameter indicates the number of times the channels specified by Channel_Map will be repeated for non-mode-0 steps during the CS procedure (see [Vol 6] Part H, Section 4.1.4).

The Channel_Selection_Type parameter indicates the Channel Selection Algorithm to be used during the CS procedure for non-mode-0 steps. When the Channel_Selection_Type parameter is set to 0x01, the Ch3c_Shape and the Ch3c_Jump parameters indicate the selected shape and channels to be skipped as described in [Vol 6] Part H, Section 4.1.4.2.

The T_IP1_Time, T_IP2_Time, T_FCS_Time, T_PM_Time, and T_SW_Time parameters indicate the time durations used in CS steps as described in [Vol 6] Part H, Section 4.3.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x2F	Subevent code for the HCI_LE_CS_Config_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	Channel Sounding Configuration procedure succeeded
0x01 to 0xFF	Channel Sounding Configuration procedure failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Config_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	CS configuration identifier Range: 0 to 3
All other values	Reserved for future use

Action: *Size: 1 octet*

Value	Parameter Description
0x00	CS configuration is removed
0x01	CS configuration is created
All other values	Reserved for future use

Main_Mode_Type: *Size: 1 octet*

Value	Parameter Description
0x01	Mode-1
0x02	Mode-2
0x03	Mode-3
All other values	Reserved for future use

Sub_Mode_Type: *Size: 1 octet*

Value	Parameter Description
0x01	Mode-1
0x02	Mode-2
0x03	Mode-3
0xFF	Unused
All other values	Reserved for future use

Min_Main_Mode_Steps: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	Minimum number of CS main mode steps to be executed before a submode step is executed
All other values	Reserved for future use

Max_Main_Mode_Steps: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	Maximum number of CS main mode steps to be executed before a submode step is executed
All other values	Reserved for future use

Main_Mode_Repetition: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x03	Number of main mode steps taken from the end of the last CS subevent to be repeated at the beginning of the current CS subevent directly after the last mode-0 step of that event
All other values	Reserved for future use

Mode_0_Steps: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x03	Number of CS mode-0 steps to be included at the beginning of each CS subevent
All other values	Reserved for future use

Role: *Size: 1 octet*

Value	Parameter Description
0x00	Initiator
0x01	Reflector
All other values	Reserved for future use

RTT_Type: *Size: 1 octet*

Value	Parameter Description
0x00	RTT AA Only
0x01	RTT with 32-bit sounding sequence

Value	Parameter Description
0x02	RTT with 96-bit sounding sequence
0x03	RTT with 32-bit random sequence
0x04	RTT with 64-bit random sequence
0x05	RTT with 96-bit random sequence
0x06	RTT with 128-bit random sequence
All other values	Reserved for future use

CS_SYNC_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	LE 1M PHY
0x02	LE 2M PHY
0x03	LE 2M 2BT PHY
All other values	Reserved for future use

Channel_Map: *Size: 10 octets (79 bits meaningful)*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXX	This parameter contains 80 1-bit fields. The nth such field (in the range 0 to 78) contains the value for the CS channel index n. Channel n is enabled for CS procedure = 1 Channel n is disabled for CS procedure = 0 Channels n = 0, 1, 23, 24, 25, 77, and 78 shall be ignored and shall be set to zero. At least 15 channels shall be enabled. The most significant bit (bit 79) is reserved for future use.

Channel_Map_Repetition: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	The number of times the Channel_Map field will be cycled through for non-mode-0 steps within a CS procedure
All other values	Reserved for future use

Channel_Selection_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Use Channel Selection Algorithm #3b for non-mode-0 CS steps
0x01	Use Channel Selection Algorithm #3c for non-mode-0 CS steps
All other values	Reserved for future use

Ch3c_Shape: *Size: 1 octet*

Value	Parameter Description
0x00	Use Hat shape for user-specified channel sequence
0x01	Use X shape for user-specified channel sequence
All other values	Reserved for future use

Ch3c_Jump: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x08	Number of channels skipped in each rising and falling sequence
All other values	Reserved for future use

Reserved: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved, shall be set to 0x00

T_IP1_Time: *Size: 1 octet*

Value	Parameter Description
0x0A, 0x14, 0x1E, 0x28, 0x32, 0x3C, 0x50, or 0x91	Interlude time in microseconds between the CS_SYNC packets used in mode-0 and mode-1 steps
All other values	Reserved for future use

T_IP2_Time: *Size: 1 octet*

Value	Parameter Description
0x0A, 0x14, 0x1E, 0x28, 0x32, 0x3C, 0x50, or 0x91	Interlude time in microseconds between the CS tones
All other values	Reserved for future use

T_FCS_Time: *Size: 1 octet*

Value	Parameter Description
0x0F, 0x14, 0x1E, 0x28, 0x32, 0x3C, 0x50, 0x64, 0x78, or 0x96	Time in microseconds for frequency changes
All other values	Reserved for future use

T_PM_Time: *Size: 1 octet*

Value	Parameter Description
0x0A, 0x14, or 0x28	Time in microseconds for the phase measurement period of the CS tones
All other values	Reserved for future use

7.7.65.43 LE CS Procedure Enable Complete event

Event	Event Code	Event Parameters
HCI_LE_CS_Procedure_Enable_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Config_ID, State, Tone_Antenna_Config_Selection, Selected_TX_Power, Subevent_Len, Subevents_Per_Event, Subevent_Interval, Event_Interval, Procedure_Interval, Procedure_Count, Max_Procedure_Len

Description:

This event shall be generated when the local or remote Controller has scheduled a new CS procedure measurement or disabled an ongoing CS procedure measurement as a result of an HCI_LE_CS_Procedure_Enable command. When a new CS procedure measurement is enabled, the HCI_LE_CS_Procedure_Enable_Complete event shall be sent to the Host after the LL_CS_IND is transmitted or received and before any CS subevent results are available.

When the State parameter is set to 0x00, all the remaining event parameters are ignored.

The Tone_Antenna_Config_Selection parameter indicates the Antenna Configuration Index used in the CS procedure.

The Controller shall set the Selected_TX_Power parameter to the transmit power level that it will use for the CS procedures as described in [Vol 6] Part B, Section 5.1.26. If the radiated power level will vary between packets (e.g., because of frequency-dependent properties of the transmitter), then the value should be the best estimate of the transmit power level that will be used.

The Subevent_Len parameter indicates the selected maximum duration of each CS subevent during the CS procedure. The Subevents_Per_Event parameter indicates the number of CS subevents that are anchored off the same associated LE ACL

anchor point. The Subevent_Interval parameter indicates the gap between the start of two consecutive CS subevents that are anchored off the same associated LE ACL anchor point. The Event_Interval parameter indicates the number of connection intervals between consecutive LE ACL anchor points from which CS subevents are anchored.

The Procedure_Interval parameter indicates the selected interval between consecutive CS procedures, in units of ACL connection events. The Procedure_Count parameter indicates the selected number of consecutive CS procedures to be scheduled as part of this measurement. The Max_Procedure_Len parameter indicates the selected maximum duration of each CS procedure.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x30	Subevent code for the HCI_LE_CS_Procedure_Enable event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	LE_CS_Procedure_Enable command successful
0x01 to 0xFF	LE_CS_Procedure_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Config_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	CS configuration identifier Range: 0 to 3
All other values	Reserved for future use

State: *Size: 1 octet*

Value	Parameter Description
0x00	CS procedures are disabled
0x01	CS procedures are enabled
All other values	Reserved for future use

Tone_Antenna_Config_Selection: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x07	Antenna Configuration Index as described in [Vol 6] Part A, Section 5.3
All other values	Reserved for future use

Selected_TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	Transmit power level used for CS procedure Range: -127 to 20 Units: dBm
0x7F	Transmit power level is unavailable
All other values	Reserved for future use

Subevent_Len: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Duration for each CS subevent in microseconds Range: 1250 µs to 4 s
All other values	Reserved for future use

Subevents_Per_Event: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x20	Number of CS subevents anchored off the same ACL connection event
All other values	Reserved for future use

Subevent_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Time between consecutive CS subevents anchored off the same ACL connection event. Units: 0.625 ms

Event_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of ACL connection events between consecutive CS event anchor points

Procedure_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of ACL connection events between consecutive CS procedure anchor points

Procedure_Count: *Size: 2 octets*

Value	Parameter Description
0x0000	CS procedures to continue until disabled
0xXXXX	Number of CS procedures to be scheduled Range: 0x0001 to 0xFFFF

Max_Procedure_Len: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum duration for each CS procedure Range: 0x0001 to 0xFFFF Time = N × 0.625 ms Time range: 0.625 ms to 40.959375 s
All other values	Reserved for future use

7.7.65.44 LE CS Subevent Result event

Event	Event Code	Event Parameters
HCI_LE_CS_Subevent_Result	0x3E	Subevent_Code, Connection_Handle, Config_ID, Start_ACL_Conn_Event_Counter, Procedure_Counter, Frequency_Compensation, Reference_Power_Level, Procedure_Done_Status, Subevent_Done_Status, Abort_Reason, Num_Antenna_Paths, Num_Steps_Reported, Step_Mode[i], Step_Channel[i], Step_Data_Length[i], Step_Data[i]

Description:

This event shall be generated when the local Controller has results to report for a CS subevent during the CS procedure. Depending on the number of CS steps in the CS subevent, the Controller may choose to report complete or partial results. When the number of CS steps exceeds the maximum HCI event size, the Controller may report further results for the CS subevent using the HCI_LE_CS_Subevent_Result_Continue event.

When Connection_Handle is set to 0x0FFF, the Config_ID and Start_ACL_Conn_-Event_Counter parameters shall be ignored.

The Start_ACL_Conn_Event_Counter parameter indicates the starting ACL connection event count from which the CS event results reported in this HCI event are anchored. A CS procedure may have CS subevents in multiple ACL connection events anchored to the same ACL connection event count as defined by the Event_Interval return parameter in the HCI_LE_CS_Procedure_Enable_Complete event.

The Procedure_Counter parameter indicates the associated CS procedure count for the results reported in this HCI event (see [Vol 6] Part B, Section 5.1.24).

The Frequency_Compensation parameter indicates the value of the fractional frequency offset (FFO) used by the initiator device to align the timing of CS steps and transmit frequencies during non-mode-0 CS steps (see [Vol 6] Part A, Section 3.5.1).

The Reference_Power_Level parameter is expressed in dBm and is described in [Vol 6] Part H, Section 4.6 and [Vol 6] Part H, Section 3.3.1. If the reference power level value is not available during a subevent, then this value shall be set to 0x7F.

When bits 0 to 3 of Subevent_Done_Status are set to 0x1, the Controller shall send one or more LE CS Subevent Result Continue events for the current CS subevent. Otherwise, the Controller sends no further events for the current CS subevent.

When bits 0 to 3 of Procedure_Done_Status are set to 0x1, the Controller shall send one or more LE CS Subevent Result or LE CS Subevent Result Continue events for the current or subsequent CS procedure. Otherwise, the Controller sends no further events for the current CS procedure. When bits 0 to 3 of Procedure_Done_Status are set to 0xF or when results of all CS procedures are sent to the Host, the Controller sends no further events until a new CS procedure measurement is enabled by the Host.

The allowed combinations of Procedure_Done_Status and Subevent_Done_Status are shown in Table 7.2.

Procedure_Done_Status (Bits 0 to 3)	**Allowed values of Subevent_Done_Status (Bits 0 to 3)**
0x0	0x0, 0xF
0x1	0x0, 0x1, 0xF
0xF	0x0, 0xF

Table 7.2: Allowed combinations of done status

The Num_Antenna_Paths parameter indicates the number of antenna paths used for CS tone exchanges.

The Num_Steps_Reported parameter indicates the number of CS steps for which results are reported. The Step_Mode[i] parameter indicates the CS mode for each CS step, and the Step_Channel[i] parameter indicates the channel used for each CS step. A Controller may return a value 0 when a subevent is aborted.

The Step_Data_Length[i] and Step_Data[i] parameters indicate the reported data that varies based on the CS mode and the CS role of the local device. When Step_Data_Length[i] is set to zero, it indicates that the Step may have been aborted for unspecified reasons. Otherwise, the Step_Data[i] indicates the mode- and role-specific information being reported.

For each CS procedure in a repeat sequence, the Controller shall report the results for each CS step in each CS subevent of the CS procedure even if the CS step has

been aborted for any reason. In order to terminate reporting of pending CS steps in a CS subevent, the Controller shall set the Subevent_Done_Status parameter to 0xF in the HCI_LE_CS_Subevent_Result or the HCI_LE_CS_Subevent_Result_Continue event and shall not report any additional HCI_LE_CS_Subevent_Result_Continue events for that CS subevent. The Controller may terminate reporting of pending CS procedures by setting the Procedure_Done_Status parameter to 0xF in the HCI_LE_CS_Subevent_Result or the HCI_LE_CS_Subevent_Result_Continue event and shall not report any additional HCI_LE_CS_Subevent_Result_Continue events for that CS measurement.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x31	Subevent code for the HCI_LE_CS_Subevent_Result event

Connection_Handle: *Size: 2 octets*

Value	Parameter Description
0x0000 to x0EFF	Connection_Handle
0x0FFF	CS test
All other values	Reserved for future use

Config_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	CS configuration identifier Range: 0 to 3
All other values	Reserved for future use

Start_ACL_Conn_Event_Counter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Starting ACL connection event counter for the results reported in the event

Procedure_Counter: *Size: 2 octets*

Value	Parameter Description
0xXXXX	CS procedure count since completion of the Channel Sounding Security Start procedure Range: 0x0000 to 0xFFFF

Frequency_Compensation: *Size: 2 octets (15 bits meaningful)*

Value	Parameter Description
0xXXXX	Frequency compensation value in units of 0.01 ppm (15-bit signed integer) Range: -100 ppm (0x58F0) to +100 ppm (0x2710) Units: 0.01 ppm
0xC000	Frequency compensation value is not available, or the role is not initiator
All other values	Reserved for future use

Reference_Power_Level: *Size: 1 octet*

Value	Parameter Description
0xXX	Reference power level Range: -127 to 20 Units: dBm
0x7F	Reference power level is not applicable
All other values	Reserved for future use

Procedure_Done_Status: *Size: 1 octet*

Bit Number	Parameter Description
0 to 3	0x0 = All results complete for the CS procedure 0x1 = Partial results with more to follow for the CS procedure 0xF = All subsequent CS procedures aborted All other values = Reserved for future use
4 to 7	Reserved for future use

Subevent_Done_Status: *Size: 1 octet*

Bit Number	Parameter Description
0 to 3	0x0 = All results complete for the CS subevent 0x1 = Partial results with more to follow for the CS subevent 0xF = Current CS subevent aborted All other values = Reserved for future use
4 to 7	Reserved for future use

Abort_Reason: *Size: 1 octet*

Bit Number	Parameter Description
0 to 3	Indicates the abort reason when Procedure_Done_Status is set to 0xF, otherwise the default value is set to zero. 0x0 = Report with no abort 0x1 = Abort because of local Host or remote request 0x2 = Abort because filtered channel map has less than 15 channels 0x3 = Abort because the channel map update instant has passed 0xF = Abort because of unspecified reasons All other values = Reserved for future use
4 to 7	Indicates the abort reason when Subevent_Done_Status is set to 0xF, otherwise the default value is set to zero. 0x0 = Report with no abort 0x1 = Abort because of local Host or remote request 0x2 = Abort because no CS_SYNC (mode-0) received 0x3 = Abort because of scheduling conflicts or limited resources 0xF = Abort because of unspecified reasons All other values = Reserved for future use

Num_Antenna_Paths: *Size: 1 octet*

Value	Parameter Description
0x00	Ignored because phase measurement does not occur during the CS step
0x01 to 0x04	Number of antenna paths used during the phase measurement stage of the CS step
All other values	Reserved for future use

Num_Steps_Reported: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xA0	Number of steps in the CS subevent for which results are reported
All other values	Reserved for future use

Step_Mode[i]: *Size: Num_Steps_Reported × 1 octet*

Value	Parameter Description
0x00 to 0x03	Mode type
All other values	Reserved for future use

Step_Channel[i]: *Size: Num_Steps_Reported × 1 octet*

Value	Parameter Description
0x00 to 0x4E	CS channel index. Refer to [Vol 6] Part A, Section 2 for valid CS channels.
All other values	Reserved for future use

Step_Data_Length[i]: *Size: Num_Steps_Reported × 1 octet*

Value	Parameter Description
0x00 to 0xFF	Length of mode- and role-specific information being reported
All other values	Reserved for future use

Step_Data[i]: *Size: $\sum_i$(Step_Data_Length[i]) octets*

Value	Parameter Description
Variable	Mode- and role-specific information being reported as Mode_Role_Specific_Info object

When the mode type is 0 and the role is initiator, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_RSSI
- Packet_Antenna
- Measured_Freq_Offset (as measured relative to the other device)

When the mode type is 0 and the role is reflector, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_RSSI
- Packet_Antenna

When the mode type is 1 and the role is initiator, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_NADM
- Packet_RSSI
- ToA_ToD_Initiator
- Packet_Antenna

When the mode type is 1, the role is initiator, sounding phase-based ranging is supported, and the RTT type contains a sounding sequence, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_NADM
- Packet_RSSI
- ToA_ToD_Initiator
- Packet_Antenna
- Packet_PCT1
- Packet_PCT2

When the mode type is 1 and the role is reflector, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_NADM
- Packet_RSSI
- ToD_ToA_Reflector
- Packet_Antenna

When the mode type is 1, the role is reflector, sounding phase-based ranging is supported, and the RTT type contains a sounding sequence, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_NADM
- Packet_RSSI
- ToD_ToA_Reflector
- Packet_Antenna
- Packet_PCT1
- Packet_PCT2

When the mode type is 2 and the role is either initiator or reflector, the parameters of the Mode_Role_Specific_Info object are as follows:

- Antenna_Permutation_Index
- Tone_PCT[k]
- Tone_Quality_Indicator[k]

When the mode type is 3 and the role is initiator, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_NADM
- Packet_RSSI
- ToA_ToD_Initiator
- Packet_Antenna
- Antenna_Permutation_Index
- Tone_PCT[k]
- Tone_Quality_Indicator[k]

When the mode type is 3, the role is initiator, sounding phase-based ranging is supported, and the RTT type contains a sounding sequence, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_NADM

- Packet_RSSI
- ToA_ToD_Initiator
- Packet_Antenna
- Packet_PCT1
- Packet_PCT2
- Antenna_Permutation_Index
- Tone_PCT[k]
- Tone_Quality_Indicator[k]

When the mode type is 3 and the role is reflector, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_NADM
- Packet_RSSI
- ToD_ToA_Reflector
- Packet_Antenna
- Antenna_Permutation_Index
- Tone_PCT[k]
- Tone_Quality_Indicator[k]

When the mode type is 3, the role is reflector, sounding phase-based ranging is supported, and the RTT type contains a sounding sequence, the parameters of the Mode_Role_Specific_Info object are as follows:

- Packet_Quality
- Packet_NADM
- Packet_RSSI
- ToD_ToA_Reflector
- Packet_Antenna
- Packet_PCT1
- Packet_PCT2
- Antenna_Permutation_Index
- Tone_PCT[k]

- Tone_Quality_Indicator[k]

The bits 0 to 3 of the Tone_Quality_Indicator[k] parameter indicate the CS tone quality values as described in [Vol 6] Part H, Section 4.6. The bits 4 to 7 of the Tone_Quality_Indicator[k] parameter indicate whether the tone slot is a tone extension slot, and if so, whether it was expected to carry a transmission, as described in [Vol 6] Part H, Section 4.3.3 and [Vol 6] Part H, Section 4.3.4.

When the RTT type contains a random or sounding sequence, the Packet_Quality parameter indicates the number of bit errors detected. Otherwise, the parameter is ignored by the Host. A Controller may calculate the number of bit errors in an implementation-dependent manner.

The Packet_NADM parameter indicates the estimated chance of an attack on the received packet based on the normalized attack detector metric (NADM) as described in [Vol 6] Part H, Section 3.5.1.

The parameters of the Mode_Role_Specific_Info object are described below.

Packet_Quality: *Size: 1 octet*

Bit Number	Parameter Description
0 to 3	0x0 = CS Access Address check is successful, and all bits match the expected sequence 0x1 = CS Access Address check contains one or more bit errors 0x2 = CS Access Address not found All other values = Reserved for future use
4 to 7	Number of bit errors being reported on the payload with a random or sounding sequence. Value 0 may indicate zero bit errors or no report available. Value 15 may indicate 15 or more bit errors.

Packet_NADM: *Size: 1 octet*

Value	Parameter Description
0x00	Attack is extremely unlikely
0x01	Attack is very unlikely
0x02	Attack is unlikely
0x03	Attack is possible
0x04	Attack is likely
0x05	Attack is very likely
0x06	Attack is extremely likely

Value	Parameter Description
0xFF	Unknown NADM. Default value for RTT types that do not have a random or sounding sequence.
All other values	Reserved for future use

Packet_RSSI: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	RSSI is not available
All other values	Reserved for future use

Packet_Antenna: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Antenna identifier used for the CS_SYNC packets
All other values	Reserved for future use

Packet_PCT1: *Size: 4 octets*

Value	Parameter Description
0x00XXXXXX	Phase Correction Term (bits 0 to 11 are the I sample with type *sint12*, bits 12 to 23 are the Q sample with type *sint12*, and bits 24 to 31 are reserved for future use)
0xFFFFFFFF	Phase Correction Term is not available
All other values	Reserved for future use

Packet_PCT2: *Size: 4 octets*

Value	Parameter Description
0x00XXXXXX	Phase Correction Term (bits 0 to 11 are the I sample with type *sint12*, bits 12 to 23 are the Q sample with type *sint12*, and bits 24 to 31 are reserved for future use)
0xFFFFFFFF	Phase Correction Term is not available
All other values	Reserved for future use

Measured_Freq_Offset: *Size: 2 octets (15 bits meaningful)*

Value	Parameter Description
0xXXXX	Measured frequency offset in units of 0.01 ppm (15-bit signed integer) Range: -100 ppm (0x58F0) to +100 ppm (0x2710) Units: 0.01 ppm
0xC000	Frequency offset is not available
All other values	Reserved for future use

ToA_ToD_Initiator: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Time difference in units of 0.5 nanoseconds between the time of arrival and the time of departure of the CS packets at the initiator during a CS step (16-bit signed integer), where the known nominal offsets are excluded. The known offsets (i.e., the interlude time between packets and the length of the packet itself) are described in [Vol 6] Part H, Section 4.3.2 and [Vol 6] Part H, Section 4.3.4 for Mode-1 and Mode-3, respectively.
0x8000	Time difference is not available
All other values	Reserved for future use

ToD_ToA_Reflector: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Time difference in units of 0.5 nanoseconds between the time of departure and the time of arrival of the CS packets at the reflector during a CS step (16-bit signed integer), where the known nominal offsets are excluded. The known offsets (i.e., the interlude time between packets and the lengths of the packets itself) are described in [Vol 6] Part H, Section 4.3.2 and [Vol 6] Part H, Section 4.3.4 for Mode-1 and Mode-3, respectively.
0x8000	Time difference is not available
All other values	Reserved for future use

Antenna_Permutation_Index: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x17	Antenna Permutation Index for the chosen Num_Antenna_Paths parameter used during the phase measurement stage of the CS step
All other values	Reserved for future use

Tone_PCT[k]: *Size: (Num_Antenna_Paths + 1) × 3 octets*

Value	Parameter Description
0xXXXXXX	Phase Correction Term (24 bits, including 12 LSBs to indicate the I sample as a signed integer and 12 MSBs to indicate the Q sample as a signed integer)

Tone_Quality_Indicator[k]: *Size: (Num_Antenna_Paths + 1) × 1 octet*

Bit Number	Parameter Description
0 to 3	0x0 = Tone quality is high 0x1 = Tone quality is medium 0x2 = Tone quality is low 0x3 = Tone quality indication is not available All other values = Reserved for future use
4 to 7	0x0 = Not tone extension slot 0x1 = Tone extension slot; tone not expected to be present 0x2 = Tone extension slot; tone expected to be present All other values = Reserved for future use

7.7.65.45 LE CS Subevent Result Continue event

Event	Event Code	Event Parameters
HCI_LE_CS_Subevent_Result_Continue	0x3E	Subevent_Code, Connection_Handle, Config_ID, Procedure_Done_Status, Subevent_Done_Status, Abort_Reason, Num_Antenna_Paths, Num_Steps_Reported, Step_Mode[i], Step_Channel[i], Step_Data_Length[i], Step_Data[i]

Description:

This event shall be generated after the local Controller has completed a new CS subevent measurement and has already sent an HCI_LE_CS_Subevent_Result event for the specified CS subevent.

When Connection_Handle is set to 0x0FFF, the Config_ID parameter shall be ignored.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x32	Subevent code for the HCI_LE_CS_Subevent_Result_Continue event

Connection_Handle: *Size: 2 octets*

Value	Parameter Description
0x0000 to x0EFF	Connection_Handle
0x0FFF	CS test
All other values	Reserved for future use

Config_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	CS configuration identifier Range: 0 to 3
All other values	Reserved for future use

Procedure_Done_Status: *Size: 1 octet*

Bit Number	Parameter Description
0 to 3	0x0 = All results complete for the CS procedure 0x1 = Partial results with more to follow for the CS procedure 0xF = All subsequent CS procedures aborted All other values = Reserved for future use
4 to 7	Reserved for future use

Subevent_Done_Status: *Size: 1 octet*

Bit Number	Parameter Description
0 to 3	0x0 = All results complete for the CS subevent 0x1 = Partial results with more to follow for the CS subevent 0xF = Current CS subevent aborted All other values = Reserved for future use
4 to 7	Reserved for future use

Abort_Reason: *Size: 1 octet*

Bit Number	Parameter Description
0 to 3	Indicates the abort reason when Procedure_Done_Status is set to 0xF, otherwise the default value is set to zero. 0x0 = Report with no abort 0x1 = Abort because of local Host or remote request 0x2 = Abort because filtered channel map has less than 15 channels 0x3 = Abort because the channel map update instant has passed 0xF = Abort because of unspecified reasons All other values = Reserved for future use

Bit Number	Parameter Description
4 to 7	Indicates the abort reason when Subevent_Done_Status is set to 0xF, otherwise the default value is set to zero. 0x0 = Report with no abort 0x1 = Abort because of local Host or remote request 0xF = Abort because of unspecified reasons All other values = Reserved for future use

Num_Antenna_Paths: *Size: 1 octet*

Value	Parameter Description
0x00	Ignored because phase measurement does not occur during the CS step
0x01 to 0x04	Number of antenna paths used during the phase measurement stage of the CS step
All other values	Reserved for future use

Num_Steps_Reported: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xA0	Number of steps in the CS subevent for which results are reported
All other values	Reserved for future use

Step_Mode[i]: *Size: Num_Steps_Reported × 1 octet*

Value	Parameter Description
0x00 to 0x03	Mode type
All other values	Reserved for future use

Step_Channel[i]: *Size: Num_Steps_Reported × 1 octet*

Value	Parameter Description
0x00 to 0x4E	CS channel index. Refer to [Vol 6] Part A, Section 2 for valid CS channels.
All other values	Reserved for future use

Step_Data_Length[i]: *Size: Num_Steps_Reported × 1 octet*

Value	Parameter Description
0x00 to 0xFF	Length of mode- and role-specific information being reported
All other values	Reserved for future use

Step_Data[i]: *Size:* $\sum_i$ (*Step_Data_Length[i]*) *octets*

Value	Parameter Description
Variable	Mode- and role-specific information being reported as Mode_Role_-Specific_Info object. Refer to Section 7.7.65.44 for details on Mode_Role_-Specific_Info object.

7.7.65.46 LE CS Test End Complete event

Event	Event Code	Event Parameters
HCI_LE_CS_Test_End_Complete	0x3E	Subevent_Code, Status

Description:

This event shall be generated when the local Controller has stopped an ongoing CS test as a result of the HCI_LE_CS_Test_End command. When the HCI_LE_CS_Test_End command is issued by the Host, the HCI_LE_CS_Test_End_Complete event shall be sent to the Host after any pending CS test result events are sent to the Host.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x33	Subevent code for the HCI_LE_CS_Test_End_Complete event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	LE_CS_Test_End command successful.
0x01 to 0xFF	LE_CS_Test_End command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

7.7.65.47 LE Monitored Advertisers Report event

Event	Event Code	Event Parameters
HCI_LE_Monitored_Advertisers_Report	0x3E	Subevent_Code, Address_Type, Address, Condition

Description:

This event indicates that an advertiser on the Monitored Advertisers List has met an RSSI threshold condition established by the HCI_LE_Add_Device_To_Monitored_Advertisers_List command.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x34	Subevent code for the HCI_LE_Monitored_Advertisers_Report event

Address_Type: *Size: 1 octet*

Value	Parameters Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Public Identity Address (corresponds to the Resolved Private Address)
0x03	Random (static) Identity Address (corresponds to the Resolved Private Address)
All other values	Reserved for future use

Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the device being monitored.

Condition: *Size: 1 octet*

Value	Parameters Description
0x00	Received RSSI value below the RSSI low threshold for longer than the timeout period or no RSSI value received
0x01	Received RSSI value greater than or equal to the RSSI high threshold
All other values	Reserved for future use

7.7.65.48 LE Frame Space Update Complete event

Event	OCF	Event Parameters
HCI_LE_Frame_Space_Update_Complete	0x3E	Subevent_Code, Status, Connection_Handle, Initiator, Frame_Space, PHYS, Spacing_Types

Description:

This event is used to indicate that the Frame Space Update procedure has completed (see [Vol 6] Part B, Section 5.1.30) and, if initiated autonomously by the local Controller or the peer device, that at least one frame space value has changed.

The Initiator parameter indicates who initiated the Frame Space Update procedure.

The Frame_Space parameter indicates the new frame space value that the Controller is now using.

The PHYS and Spacing_Types parameters indicate which PHYs and spacing types are using the new frame space value.

Event parameters:

Subevent_Code: *Size: 1 octet*

Value	Parameter Description
0x35	Subevent code for the HCI_LE_Frame_Space_Update event

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Frame_Space_Update command succeeded or the Controller updated the frame space value autonomously.
0x01 to 0xFF	HCI_LE_Frame_Space_Update command failed. See [Vol 1] Part F for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Used to identify a connection handle. Range: 0x0000 to 0x0EFF

Initiator: *Size: 1 octet*

Value	Parameter Description
0x00	Local Host initiated
0x01	Local Controller initiated
0x02	Peer initiated
All other values	Reserved for future use

Frame_Space: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The new frame space value being used, in microseconds Range: 0x0000 to 0x2710

PHYS: *Size: 1 octet*

Bit Number	Parameter Description
0	LE 1M
1	LE 2M
2	LE Coded PHY
All other bits	Reserved for future use

Spacing_Types: *Size: 2 octets*

Bit Number	Parameter Description
0	T_IFS_ACL_CP
1	T_IFS_ACL_PC
2	T_MCES
3	T_IFS_CIS
4	T_MSS_CIS
All other bits	Reserved for future use

7.7.66 Triggered Clock Capture event

Event	Event Code	Event Parameters
HCI_Triggered_Clock_Capture	0x4E	Connection_Handle, Which_Clock, Clock, Slot_Offset

Description:

This event is sent to indicate that a triggering event has occurred at the specified clock and offset value. The Which_Clock parameter indicates whether the clock is local or a piconet clock. The Connection_Handle parameter is used when the clock is a piconet clock to indicate which piconet's clock was reported.

The Clock parameter indicates the value of the selected clock at the instant of the triggering event, with bits 1 and 0 set to 0b00.

The Slot_Offset parameter indicates the number of microseconds (from 0 to 1249) from the instant at which the selected clock took the value Clock until the triggering event.

Note: What constitutes a triggering event is defined by the Controller implementation. For example, it could be an interrupt signal received by the Controller hardware.

Event parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Which_Clock: *Size: 1 octet*

Value	Parameter Description
0xXX	0x00 = Local Clock (Connection_Handle does not have to be valid) 0x01 = Piconet Clock (Connection_Handle shall be valid) 0x02 to 0xFF = Reserved for future use

Clock: *Size: 4 octets (28 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX	Bluetooth clock of the device requested with bits 1 and 0 set to 0b00.

Slot_Offset: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of microseconds from the selected clock attaining the value Clock until the triggering event. Range: 0 to 1249.

7.7.67 Synchronization Train Complete event

Event	Event Code	Event Parameters
HCI_Synchronization_Train_Complete	0x4F	Status

Description:

This event indicates that the HCI_Start_Synchronization_Train command has completed.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Start_Synchronization_Train command completed successfully.
0x01 to 0xFF	HCI_Start_Synchronization_Train command failed. See [Vol 1] Part F, Controller Error Codes, for error codes and descriptions.

7.7.68 Synchronization Train Received event

Event	Event Code	Event Parameters
HCI_Synchronization_Train_Received	0x50	Status, BD_ADDR, Clock_Offset, AFH_Channel_Map, LT_ADDR, Next_Broadcast_Instant, Connectionless_Peripheral_Broadcast_Interval, Service_Data

Description:

This event provides information received from a synchronization train packet transmitted by a Connectionless Peripheral Broadcast transmitter with the given BD_ADDR.
If synchronization was successful, it provides the clock offset, AFH channel map, LT_ADDR, next broadcast instant, broadcast interval, and service data as received from the synchronization train payload. If the command returns a status of 0x01 to 0xFF, then all other parameters are undefined and shall be ignored.

A packet with the Connectionless Peripheral Broadcast LT_ADDR field in the payload set to zero shall be ignored for the purposes of this event.

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Receive_Synchronization_Train command completed successfully.
0x01 to 0xFF	HCI_Receive_Synchronization_Train command failed. See [Vol 1] Part F, for error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the Connectionless Peripheral Broadcast transmitter.

Clock_Offset: *Size: 4 octets (28 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX	(CLKNreceiver - CLKNtransmitter) *mod* 2^{28}

AFH_Channel_Map: *Size: 10 octets (79 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX XXXXXXXXXX XX	This parameter contains 80 1-bit fields. The n^{th} such field (in the range 0 to 78) contains the value for channel *n*: 0: channel n is unused 1: channel n is used The most significant bit (bit 79) is reserved for future use

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR of Connectionless Peripheral Broadcast channel.
All other values	Reserved for future use

Next_Broadcast_Instant: *Size: 4 octets (28 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX	CLK of a future broadcast on this channel

Connectionless_Peripheral_Broadcast_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Interval between Connectionless Peripheral Broadcast instants in slots. Range: 0x0002 to 0xFFFE; only even values are valid

Service_Data: *Size: 1 octet*

Value	Parameter Description
0xXX	Value from octet 27 of the Synchronization Train packet; see [Vol 2] Part B, Table 8.11.

7.7.69 Connectionless Peripheral Broadcast Receive event

Event	Event Code	Event Parameters
HCI_Connectionless_Peripheral_Broadcast_Receive	0x51	BD_ADDR, LT_ADDR, Clock, Offset, RX_Status, Fragment, Data_Length, Data

Description:

This event shall be sent by the BR/EDR Controller every Connectionless Peripheral Broadcast Instant on which the BR/EDR Controller is scheduled to receive a Connectionless Peripheral Broadcast packet. If the packet is not received successfully, the event returns a RX_Status of 0x01. Otherwise, the event returns the payload Data along with the Piconet Clock and the offset from the local CLKN when the packet was received.

The BR/EDR Controller shall send multiple HCI_Connectionless_Peripheral_Broadcast_Receive events if the length of the received data exceeds the capacity of a single HCI_Connectionless_Peripheral_Broadcast_Receive event. The fragments shall be marked as starting, continuation, or ending to allow the Host to reassemble the received packet. Only a single event shall be generated for a Connectionless Peripheral Broadcast instant on which a Connectionless Peripheral Broadcast packet was scheduled for reception but the BR/EDR Controller failed to successfully receive it.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the broadcasting (transmitter) device

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR of the Connectionless Peripheral Broadcast
All other values	Reserved for future use

Clock: *Size: 4 octets (28 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX	CLK when Connectionless Peripheral Broadcast data was received

Offset: *Size: 4 octets (28 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX	(CLKNreceiver - CLKNtransmitter) *mod* 2^{28}

RX_Status: *Size: 1 octet*

Value	Parameter Description
0x00	Packet received successfully
0x01	Packet not received successfully (Fragment, Data_Length, and Data fields invalid)
All other values	Reserved for future use

Fragment: *Size: 1 octet*

Value	Parameter Description
0x00	Continuation fragment
0x01	Starting fragment
0x02	Ending fragment
0x03	No fragmentation (single fragment)
All other values	Reserved for future use

Data_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Length of Data field

Data: *Size: Data_Length octets*

Value	Parameter Description
Variable	Data received from a Connectionless Peripheral Broadcast packet.

7.7.70 Connectionless Peripheral Broadcast Timeout event

Event	Event Code	Event Parameters
HCI_Connectionless_Peripheral_Broadcast_Timeout	0x52	BD_ADDR, LT_ADDR

Description:

On the Connectionless Peripheral Broadcast Receiver, this event indicates to the Host that the BR/EDR Controller has lost synchronization with the Connectionless Peripheral Broadcast because no Connectionless Peripheral Broadcast packets have been received for the timeout interval, *CPB_supervisionTO*, specified in the HCI_Set_Connectionless_Peripheral_Broadcast_Receive command.

On the Connectionless Peripheral Broadcast Transmitter, this event indicates to the Host that the BR/EDR Controller has been unable to transmit a Connectionless Peripheral Broadcast packet for the timeout interval, *CPB_supervisionTO*, specified in the HCI_Set_Connectionless_Peripheral_Broadcast command.

Event parameters:

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the broadcasting (transmitter) device

LT_ADDR: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	LT_ADDR of the Connectionless Peripheral Broadcast
All other values	Reserved for future use

7.7.71 Truncated Page Complete event

Event	Event Code	Event Parameters
HCI_Truncated_Page_Complete	0x53	Status, BD_ADDR

Description:

This event indicates to the Host that an HCI_Truncated_Page command completed. Truncated Paging is considered to be successful when a Peripheral page response ID packet has been received by the local BR/EDR Controller. See [Vol 2] Part B, Section 8.3.3 for more information.

An HCI_Truncated_Page_Complete event shall always be sent for each HCI_Truncated_Page command. If the Host issues an HCI_Truncated_Page_Cancel command before the Controller returns the HCI_Truncated_Page_Complete event, then the HCI_Truncated_Page_Complete event shall be sent after the HCI_Command_Complete event for the HCI_Truncated_Page_Cancel command. If the cancellation was successful, the HCI_Truncated_Page_Complete event shall be generated with the error code *Unknown Connection Identifier* (0x02).

Event parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_Truncated_Page command completed successfully.
0x01 to 0xFF	HCITruncated_Page command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BD_ADDR: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	BD_ADDR of the paged (Peripheral) device

7.7.72 Peripheral Page Response Timeout event

Event	Event Code	Event Parameters
HCI_Peripheral_Page_Response_Timeout	0x54	*none*

Description:

This event indicates to the Host that a Peripheral page response timeout has occurred in the BR/EDR Controller.

Note: This event will be generated if the Peripheral BR/EDR Controller responds to a page but does not receive the Central FHS packet (see [Vol 2] Part B, Section 8.3.3) within *pagerespTO*.

Event parameters:

None

7.7.73 Connectionless Peripheral Broadcast Channel Map Change event

Event	Event Code	Event Parameters
HCI_Connectionless_Peripheral_Broadcast_Channel_Map_Change	0x55	Channel_Map

Description:

This event is sent by the Transmitter's BR/EDR Controller to the Transmitter's Host to indicate that the Transmitter's BR/EDR Controller has moved to a new AFH channel map for the PBD logical link.

After an AFH channel map change takes effect for the PBD logical link, the Connectionless Peripheral Broadcast Transmitter BR/EDR Controller shall send this event to the Host. Upon reception of this event, the Host may restart the synchronization train to allow receivers to obtain the updated AFH channel map.

This event shall also be sent if the Host issues an HCI_Set_AFH_Host_Channel_Classification command which causes the Connectionless Peripheral Broadcast Channel Map to change.

Event parameters:

Channel_Map: *Size: 10 octets (79 bits meaningful)*

Value	Parameter Description
0xXXXXXXXX XXXXXXXXXX XX	This parameter contains 80 1-bit fields. The n^{th} such field (in the range 0 to 78) contains the value for channel *n*: 0: channel *n* is unused 1: channel *n* is used The most significant bit (bit 79) is reserved for future use

7.7.74 Inquiry Response Notification event

Event	Event Code	Event Parameters
HCI_Inquiry_Response_Notification	0x56	LAP, RSSI

Description:

This event indicates to the Host that the BR/EDR Controller responded to an Inquiry message. The LAP parameter in the event indicates the LAP used to create the access code received. The parameter may be used by the Host to determine which access code was used in cases where the BR/EDR Controller is performing inquiry scan on multiple inquiry access codes using parallel scanning or sequential scanning. See [Vol 3] Part C, Section 4.1.2.1 for details on sequential and parallel scanning.

The LAP parameter returned by the BR/EDR Controller shall be one of the LAPs currently enabled. LAPs are enabled via the HCI_Write_Current_IAC_LAP command.

The RSSI parameter indicates the signal strength of the received ID packet.

Event parameters:

LAP: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	The LAP from which the IAC was derived; see Assigned Numbers. Range: 0x9E8B00 to 0x9E8B3F

RSSI: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -100 to 20, +127 indicates unknown RSSI Units: dBm

7.7.75 Authenticated Payload Timeout Expired event

Event	Event Code	Event Parameters
HCI_Authenticated_Payload_Timeout_Expired	0x57	Connection_Handle

Description:

This event is used to indicate that a packet containing a valid MIC on the Connection_Handle was not received within the *authenticatedPayloadTO* (see [Vol 2] Part B, Appendix B for the BR/EDR and [Vol 6] Part B, Section 5.4 for the LE connection).

Note: A Host may choose to disconnect the link when this occurs.

Event parameters:

Connection_Handle: *Size: 2 octet (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

7.7.76 SAM Status Change event

Event	Event Code	Event Parameters
HCI_SAM_Status_Change	0x58	Connection_Handle, Local_SAM_Index, Local_SAM_TX_Availability, Local_SAM_RX_Availability, Remote_SAM_Index, Remote_SAM_TX_Availability, Remote_SAM_RX_Availability

Description:

This event indicates that the Controller has changed the SAM status for the connection identified by the Connection_Handle; i.e., a new SAM slot map has been enabled or the existing one disabled.

Note: A change from one SAM slot map to another only generates one event, not two.

Event parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Local_SAM_Index: *Size: 1 octet*

Value	Parameter Description
0xXX	The index of the current SAM slot map used by the local device.0xFF means SAM is disabled (i.e. all slots are available)

Local_SAM_TX_Availability: *Size: 1 octet*

Value	Parameter Description
0xXX	The proportion of slots available for the local device to transmit. 0 represents "less than 1 in 255" and 255 represents "all"; other proportions shall be linearly scaled. That is, Local_SAM_-TX_Availability = (total_available_TX_slots ÷ local_T_{SAM}) × 255, rounded to the integer below, where total_available_TX_slots is the total number of slots available for transmission in the current local SAM slot map and local_TSAM is T_{SAM} for the current local SAM slot map.

Local_SAM_RX_Availability: *Size: 1 octet*

Value	Parameter Description
0xXX	The proportion of slots available for the local device to receive. 0 represents "less than 1 in 255" and 255 represents "all"; other proportions shall be linearly scaled. That is, Local_SAM_-RX_Availability = (total_available_RX_slots ÷ local_T_{SAM}) × 255, rounded to the integer below, where total_available_RX_slots is the total number of slots available for reception in the current local SAM slot map and local_T_{SAM} is T_{SAM} for the current local SAM slot map.

Remote_SAM_Index: *Size: 1 octet*

Value	Parameter Description
0xXX	The index of the current SAM slot map used by the remote device.0xFF means SAM is disabled (i.e. all slots are available)

Remote_SAM_TX_Availability: *Size: 1 octet*

Value	Parameter Description
0xXX	The proportion of slots available for the remote device to transmit. 0 represents "less than 1 in 255" and 255 represents "all"; other proportions shall be linearly scaled. That is, Remote_SAM_TX_Availability = (total_available_TX_slots ÷ remote_T_{SAM}) × 255, rounded to the integer below, where total_available_TX_slots is the total number of slots available for transmission in the current remote SAM slot map and remote_T_{SAM} is T_{SAM} for the current remote SAM slot map.

Remote_SAM_RX_Availability: *Size: 1 octet*

Value	Parameter Description
0xXX	The proportion of slots available for the remote device to receive. 0 represents "less than 1 in 255" and 255 represents "all"; other proportions shall be linearly scaled. That is, Remote_SAM_RX_Availability = (total_available_RX_slots ÷ remote_T_{SAM}) × 255, rounded to the integer below, where total_available_RX_slots is the total number of slots available for reception in the current remote SAM slot map and remote_T_{SAM} is T_{SAM} for the current remote SAM slot map.

7.8 LE Controller commands

The LE Controller commands provide access and control to various capabilities of the Bluetooth hardware, as well as methods for the Host to affect how the Link Layer manages the piconet and controls connections.

For the LE Controller commands, the OGF code is defined as 0x08.

7.8.1 LE Set Event Mask command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Event_Mask	0x0001	LE_Event_Mask	Status

Description:

This command is used to control which LE events are generated by the HCI for the Host. If the bit in the LE_Event_Mask is set to a one, then the event associated with that bit will be enabled. The event mask allows the Host to control which events will interrupt it.

The Controller shall ignore those bits which are reserved for future use or represent events which it does not support. If the Host sets any of these bits to 1, the Controller shall act as if they were set to 0.

For LE events to be generated, the LE Meta event bit in the Event_Mask shall also be set. If that bit is not set, then LE events shall not be generated, regardless of how the LE_Event_Mask is set.

Command parameters:

LE_Event_Mask: *Size: 8 octets*

Bit	LE Subevent Types
0	LE Connection Complete event
1	LE Advertising Report event
2	LE Connection Update Complete event
3	LE Read Remote Features Page 0 Complete event
4	LE Long Term Key Request event
5	LE Remote Connection Parameter Request event
6	LE Data Length Change event
7	LE Read Local P-256 Public Key Complete event
8	LE Generate DHKey Complete event

Bit	LE Subevent Types
9	LE Enhanced Connection Complete event [v1]
10	LE Directed Advertising Report event
11	LE PHY Update Complete event
12	LE Extended Advertising Report event
13	LE Periodic Advertising Sync Established event [v1]
14	LE Periodic Advertising Report event [v1]
15	LE Periodic Advertising Sync Lost event
16	LE Scan Timeout event
17	LE Advertising Set Terminated event
18	LE Scan Request Received event
19	LE Channel Selection Algorithm event
20	LE Connectionless IQ Report event
21	LE Connection IQ Report event
22	LE CTE Request Failed event
23	LE Periodic Advertising Sync Transfer Received event [v1]
24	LE CIS Established event [v1]
25	LE CIS Request event
26	LE Create BIG Complete event
27	LE Terminate BIG Complete event
28	LE BIG Sync Established event
29	LE BIG Sync Lost event
30	LE Request Peer SCA Complete event
31	LE Path Loss Threshold event
32	LE Transmit Power Reporting event
33	LE BIGInfo Advertising Report event
34	LE Subrate Change event
35	LE Periodic Advertising Sync Established event [v2]
36	LE Periodic Advertising Report event [v2]
37	LE Periodic Advertising Sync Transfer Received event [v2]
38	LE Periodic Advertising Subevent Data Request event
39	LE Periodic Advertising Response Report event
40	LE Enhanced Connection Complete event [v2]
41	LE CIS Established event [v2]

Bit	LE Subevent Types
42	LE Read All Remote Features Complete event
43	LE CS Read Remote Supported Capabilities Complete event
44	LE CS Read Remote FAE Table Complete event
45	LE CS Security Enable Complete event
46	LE CS Config Complete event
47	LE CS Procedure Enable Complete event
48	LE CS Subevent Result event
49	LE CS Subevent Result Continue event
50	LE CS Test End Complete event
51	LE Monitored Advertisers Report event
52	LE Frame Space Update Complete event
60 to 63	Reserved for specification development purposes

The value with all bits set to 0 indicates that no events are specified. The default is for bits 0 to 4 (the value 0x0000 0000 0000 001F) to be set.

All bits not listed in this table are reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Event_Mask command succeeded.
0x01 to 0xFF	HCI_LE_Set_Event_Mask command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Event_Mask command has completed, an HCI_Command_Complete event shall be generated.

7.8.2 LE Read Buffer Size command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Buffer_Size [v2]	0x0060	*none*	Status, LE_ACL_Data_Packet_Length, Total_Num_LE_ACL_Data_Packets, ISO_Data_Packet_Length, Total_Num_ISO_Data_Packets
HCI_LE_Read_Buffer_Size [v1]	0x0002	*none*	Status, LE_ACL_Data_Packet_Length, Total_Num_LE_ACL_Data_Packets

Description:

This command is used to read the maximum size of the data portion of ACL data packets and isochronous data packets sent from the Host to the Controller. The Host shall fragment the data transmitted to the Controller according to these values so that the HCI ACL Data packets and HCI ISO Data packets will contain data up to this size ("data" includes optional fields in the HCI ISO Data packet, such as ISO_SDU_Length). The HCI_LE_Read_Buffer_Size command also returns the total number of HCI LE ACL Data packets and isochronous data packets that can be stored in the data buffers of the Controller. The HCI_LE_Read_Buffer_Size command shall be issued by the Host before it sends any data to an LE Controller (see Section 4.1.1). If the Controller supports HCI ISO Data packets, it shall return non-zero values for the ISO_Data_Packet_Length and Total_Num_ISO_Data_Packets parameters.

If the Controller returns a length value of zero for ACL data packets, the Host shall use the HCI_Read_Buffer_Size command to determine the size of the data buffers (shared between BR/EDR and LE transports).

Note: Both the HCI_Read_Buffer_Size command and the HCI_LE_Read_Buffer_Size command may return buffer length and number of packets parameter values that are nonzero. This allows a Controller to offer different buffers and number of buffers for BR/EDR data packets and LE data packets.

The LE_ACL_Data_Packet_Length parameter shall be used to determine the maximum size of the L2CAP PDU fragments that are contained in ACL data packets, and which are transferred from the Host to the Controller to be broken up into packets by the Link Layer. The Total_Num_LE_ACL_Data_Packets parameter contains the total number of HCI ACL Data packets that can be stored in the data buffers of the Controller. The Host determines how to divide the buffers between different connection handles.

The ISO_Data_Packet_Length parameter shall be used to determine the maximum size of the SDU fragments that are contained in isochronous data packets, and which are transferred from the Host to the Controller. The Total_Num_ISO_Data_Packets parameter contains the total number of isochronous data packets that can be stored in the data buffers of the Controller. The Host determines how to divide the buffers between different connection handle(s).

Note: The LE_ACL_Data_Packet_Length and ISO_Data_Packet_Length return parameters do not include the length of the HCI ACL Data packet header or the HCI ISO Data packet header respectively.

Command parameters:

None

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_Read_Buffer_Size command succeeded.
0x01 to 0xFF	The HCI_LE_Read_Buffer_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

LE_ACL_Data_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0x0000	No dedicated LE Buffer exists. Use the HCI_Read_Buffer_Size command.
0x0001 to 0x001A	Reserved for future use.
0x001B to 0xFFFF	Maximum length (in octets) of the data portion of each HCI ACL data packet.

Total_Num_LE_ACL_Data_Packets: *Size: 1 octet*

Value	Parameter Description
0x00	No dedicated LE Buffer exists. Use the HCI_Read_Buffer_Size command.
0x01 to 0xFF	The total number of HCI ACL data packets that can be stored in the data buffers of the Controller.

ISO_Data_Packet_Length: *Size: 2 octets*

Value	Parameter Description
0x0000	No dedicated ISO Buffer exists.
0x0001 to 0xFFFF	The maximum length (in octets) of the data portion of each HCI ISO data packet.

Total_Num_ISO_Data_Packets: *Size: 1 octet*

Value	Parameter Description
0x00	No dedicated ISO Buffer exists.
0x01 to 0xFF	The total number of HCI ISO data packets that can be stored in the ISO buffers of the Controller.

Event(s) generated (unless masked away):

When the HCI_LE_Read_Buffer_Size command has completed, an HCI_Command_Complete event shall be generated.

7.8.3 LE Read Local Supported Features Page 0 command[1]

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Local_Supported_-Features_Page_0	0x0003	*none*	Status, LE_Features

Description:

This command requests page 0 of the list of the supported LE features for the Controller.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Local_Supported_Features_Page_0 command succeeded.
0x01 to 0xFF	HCI_LE_Read_Local_Supported_Features_Page_0 command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

LE_Features: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	Bit Mask List of page 0 of the supported LE features. See [Vol 6] Part B, Section 4.6.

Event(s) generated (unless masked away):

When the HCI_LE_Read_Local_Supported_Features_Page_0 command has completed, an HCI_Command_Complete event shall be generated.

[1]This command was formerly called “LE Read Local Supported Features”.

7.8.4 LE Set Random Address command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Random_Address	0x0005	Random_Address	Status

Description:

This command is used by the Host to set the LE Random Device Address in the Controller (see [Vol 6] Part B, Section 1.3).

If this command is used to change the address, the new random address shall take effect for advertising no later than the next successful HCI_LE_Set_Advertising_Enable command, for scanning no later than the next successful HCI_LE_Set_Scan_Enable command or HCI_LE_Set_Extended_Scan_Enable command, and for initiating or creating a connection from a PAwR train no later than the next successful HCI_LE_Create_Connection command or HCI_LE_Extended_Create_Connection command.

Note: If the extended advertising commands are in use, this command only affects the address used for scanning and initiating. The addresses used for advertising are set by the HCI_LE_Set_Advertising_Set_Random_Address command (see Section 7.8.52).

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	Any of advertising (created using legacy advertising commands), scanning, or creating a connection are enabled in the Controller.	*Command Disallowed* (0x0C)

Command parameters:

Random_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Random Device Address as defined by [Vol 6] Part B, Section 1.3.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Random_Address command succeeded.
0x01 to 0xFF	HCI_LE_Set_Random_Address command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Random_Address command has completed, an HCI_Command_Complete event shall be generated.

7.8.5 LE Set Advertising Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Advertising_Parameters	0x0006	Advertising_Interval_Min, Advertising_Interval_Max, Advertising_Type, Own_Address_Type, Peer_Address_Type, Peer_Address, Advertising_Channel_Map, Advertising_Filter_Policy	Status

Description:

This command is used by the Host to set the advertising parameters.

The Advertising_Interval_Min shall be less than or equal to the Advertising_Interval_Max. The Advertising_Interval_Min and Advertising_Interval_Max should not be the same value to enable the Controller to determine the best advertising interval given other activities.

For high duty cycle directed advertising, i.e. when Advertising_Type is 0x01 (ADV_DIRECT_IND, high duty cycle), the Advertising_Interval_Min and Advertising_Interval_Max parameters are not used and shall be ignored.

The Advertising_Type is used to determine the packet type that is used for advertising when advertising is enabled.

Own_Address_Type parameter indicates the type of address being used in the advertising packets.

If Own_Address_Type equals 0x02 or 0x03, the Peer_Address parameter contains the peer's Identity Address and the Peer_Address_Type parameter contains the Peer's Identity Type (i.e. 0x00 or 0x01). These parameters are used to locate the corresponding local IRK in the resolving list; this IRK is used to generate the own address used in the advertisement.

If directed advertising is performed, i.e. when Advertising_Type is set to 0x01 (ADV_DIRECT_IND, high duty cycle) or 0x04 (ADV_DIRECT_IND, low duty cycle mode), then the Peer_Address_Type and Peer_Address shall be valid.

If Own_Address_Type equals 0x02 or 0x03, the Controller generates the peer's Resolvable Private Address using the peer's IRK corresponding to the peer's Identity

Address contained in the Peer_Address parameter and peer's Identity Address Type (i.e. 0x00 or 0x01) contained in the Peer_Address_Type parameter.

The Advertising_Channel_Map is a bit field that indicates the advertising channel indices that shall be used when transmitting advertising packets. At least one channel bit shall be set in the Advertising_Channel_Map parameter.

The Advertising_Filter_Policy parameter shall be ignored when directed advertising is enabled.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	Advertising is enabled in the Controller.	*Command Disallowed* (0x0C)
MC	The advertising interval range (Advertising_Interval_Min, Advertising_Interval_Max) does not overlap with the advertising interval range supported by the Controller.	*Unsupported Feature or Parameter Value* (0x11)

Command parameters:

Advertising_Interval_Min: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: 0x0800 (1.28 s) Time = N × 0.625 ms Time Range: 20 ms to 10.24 s

Advertising_Interval_Max: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: 0x0800 (1.28 s) Time = N × 0.625 ms Time Range: 20 ms to 10.24 s

Advertising_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Connectable and scannable undirected advertising (ADV_IND) (default)
0x01	Connectable high duty cycle directed advertising (ADV_DIRECT_IND, high duty cycle)
0x02	Scannable undirected advertising (ADV_SCAN_IND)
0x03	Non connectable undirected advertising (ADV_NONCONN_IND)
0x04	Connectable low duty cycle directed advertising (ADV_DIRECT_IND, low duty cycle)
All other values	Reserved for future use

Own_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address (default)
0x01	Random Device Address
0x02	Controller generates Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, use the public address.
0x03	Controller generates Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, use the random address from LE_Set_Random_Address.
All other values	Reserved for future use

Peer_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address (default) or Public Identity Address
0x01	Random Device Address or Random (static) Identity Address
All other values	Reserved for future use

Peer_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the device to be connected.

Advertising_Channel_Map: *Size: 1 octet*

Bit Number	Parameter Description
0	Channel 37 shall be used
1	Channel 38 shall be used
2	Channel 39 shall be used
All other bits	Reserved for future use

The default is 0x07 (all three channels enabled).

Advertising_Filter_Policy: *Size: 1 octet*

Value	Parameter Description
0x00	Process scan and connection requests from all devices (i.e., the Filter Accept List is not in use) (default).
0x01	Process connection requests from all devices and scan requests only from devices that are in the Filter Accept List.
0x02	Process scan requests from all devices and connection requests only from devices that are in the Filter Accept List.
0x03	Process scan and connection requests only from devices in the Filter Accept List.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Advertising_Parameters command succeeded.
0x01 to 0xFF	HCI_LE_Set_Advertising_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Advertising_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.6 LE Read Advertising Physical Channel Tx Power command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Advertising_Channel_Tx_-Power	0x0007	*none*	Status, TX_Power_Level

Description:

This command is used by the Host to read the transmit power level used for LE advertising physical channel packets.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Advertising_Physical_Channel_Tx_Power command succeeded.
0x01 to 0xFF	HCI_LE_Read_Advertising_Physical_Channel_Tx_Power failed. See [Vol 1] Part F for a list of error codes and descriptions.

TX_Power_Level: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to 20 Units: dBm Accuracy: ±4 dB

Event(s) generated (unless masked away):

When the HCI_LE_Read_Advertising_Physical_Channel_Tx_Power command has completed, an HCI_Command_Complete event shall be generated.

7.8.7 LE Set Advertising Data command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Advertising_Data	0x0008	Advertising_Data_Length, Advertising_Data	Status

Description:

This command is used to set the data used in advertising packets that have a data field.

Only the significant part of the Advertising_Data should be transmitted in the advertising packets, as defined in [Vol 3] Part C, Section 11.

If advertising is currently enabled, the Controller shall use the new data in subsequent advertising events. If an advertising event is in progress when this command is issued, the Controller may use the old or new data for that event. If advertising is currently disabled, the data shall be kept by the Controller and used once advertising is enabled.

The default Advertising_Data_Length shall be zero and the default Advertising_Data shall be 31 all-zero octets.

Command parameters:

Advertising_Data_Length: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x1F	The number of significant octets in the Advertising_Data.

Advertising_Data: *Size: 31 octets*

Parameter Description
31 octets of advertising data formatted as defined in [Vol 3] Part C, Section 11.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Advertising_Data command succeeded.
0x01 to 0xFF	HCI_LE_Set_Advertising_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Advertising_Data command has completed, an HCI_Command_Complete event shall be generated.

7.8.8 LE Set Scan Response Data command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Scan_Response_-Data	0x0009	Scan_Response_Data_Length, Scan_Response_Data	Status

Description:

This command is used to provide data used in Scanning Packets that have a data field.

Only the significant part of the Scan_Response_Data should be transmitted in the Scanning Packets, as defined in [Vol 3] Part C, Section 11.

If advertising is currently enabled, the Controller shall use the new data in subsequent advertising events. If an advertising event is in progress when this command is issued, the Controller may use the old or new data for that event. If advertising is currently disabled, the data shall be kept by the Controller and used once advertising is enabled.

The default Scan_Response_Data_Length shall be zero and the default Scan_Response_Data shall be 31 all-zero octets.

Command parameters:

Scan_Response_Data_Length: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x1F	The number of significant octets in the Scan_Response_Data.

Scan_Response_Data: *Size: 31 octets*

Parameter Description
31 octets of Scan_Response_Data formatted as defined in [Vol 3] Part C, Section 11.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Scan_Response_Data command succeeded.
0x01 to 0xFF	HCI_LE_Set_Scan_Response_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Scan_Response_Data command has completed, an HCI_Command_Complete event shall be generated.

7.8.9 LE Set Advertising Enable command[1]

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Advertising_Enable	0x000A	Advertising_Enable	Status

Description:

This command is used to request the Controller to start or stop advertising. The Controller manages the timing of advertisements as per the advertising parameters given in the HCI_LE_Set_Advertising_Parameters command.

The Controller shall continue advertising until the Host issues an HCI_LE_Set_Advertising_Enable command with Advertising_Enable set to 0x00 (Advertising is disabled). a connection is created using the advertising, or the Advertising is timed out due to high duty cycle Directed Advertising. In these cases, advertising is then disabled.

Enabling advertising when it is already enabled can cause the random address to change. Disabling advertising when it is already disabled has no effect.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
R	Advertising_Enable is set to 0x01, the advertising parameters' Own_Address_Type parameter is set to 0x00, and the device does not have a public address.	*Invalid HCI Command Parameters* (0x12)
MC	Advertising_Enable is set to 0x01, the advertising parameters' Own_Address_Type parameter is set to 0x01, and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command.	*Invalid HCI Command Parameters* (0x12)
R	Advertising_Enable is set to 0x01, the advertising parameters' Own_Address_Type parameter is set to 0x02, the Controller's resolving list does not contain a matching entry, and the device does not have a public address.	*Invalid HCI Command Parameters* (0x12)
MC	Advertising_Enable is set to 0x01, the advertising parameters' Own_Address_Type parameter is set to 0x03, the Controller's resolving list does not contain a matching entry, and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command.	*Invalid HCI Command Parameters* (0x12)

[1]This command was formerly called “LE Set Advertise Enable”.

Command parameters:

Advertising_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Advertising is disabled (default)
0x01	Advertising is enabled.
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Advertising_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Set_Advertising_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Advertising_Enable command has completed, an HCI_Command_Complete event shall be generated.

If the Advertising_Type parameter is 0x01 (ADV_DIRECT_IND, high duty cycle) and the directed advertising fails to create a connection, an HCI_LE_Connection_Complete or HCI_LE_Enhanced_Connection_Complete event shall be generated with the Status code set to Advertising Timeout (0x3C).

If the Advertising_Type parameter is 0x00 (ADV_IND), 0x01 (ADV_DIRECT_IND, high duty cycle), or 0x04 (ADV_DIRECT_IND, low duty cycle) and a connection is created, an HCI_LE_Connection_Complete or HCI_LE_Enhanced_Connection_Complete event shall be generated.

Note: There is a possible race condition if the Advertising_Enable parameter is set to 0x00 (Disable) and the Advertising_Type parameter is 0x00, 0x01, or 0x04. The advertisements might not be stopped before a connection is created, and therefore both the HCI_Command_Complete event and either an HCI_LE_Connection_Complete event or an HCI_LE_Enhanced_Connection_Complete event could be generated. This can also occur when high duty cycle directed advertising is timed out and this command disables advertising.

7.8.10 LE Set Scan Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Scan_Parameters	0x000B	LE_Scan_Type, LE_Scan_Interval, LE_Scan_Window, Own_Address_Type, Scanning_Filter_Policy	Status

Description:

This command is used to set the scan parameters.

The LE_Scan_Type parameter controls the type of scan to perform.

The LE_Scan_Interval and LE_Scan_Window parameters are recommendations from the Host on how long (LE_Scan_Window) and how frequently (LE_Scan_Interval) the Controller should scan (See [Vol 6] Part B, Section 4.4.3). The LE_Scan_Window parameter shall always be set to a value smaller or equal to the value set for the LE_Scan_Interval parameter. If they are set to the same value scanning should be run continuously.

Own_Address_Type parameter indicates the type of address being used in the scan request packets.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	Scanning is enabled in the Controller.	*Command Disallowed* (0x0C)

Command parameters:

LE_Scan_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Passive Scanning. No scanning PDUs shall be sent (default)
0x01	Active scanning. Scanning PDUs may be sent.
All other values	Reserved for future use

LE_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N × 0.625 ms Time Range: 2.5 ms to 10.24 s

LE_Scan_Window: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N × 0.625 ms Time Range: 2.5 ms to 10.24 s

Own_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address (default)
0x01	Random Device Address
0x02	Controller generates Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, use the public address.
0x03	Controller generates Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, use the random address from LE_Set_Random_Address.
All other values	Reserved for future use.

Scanning_Filter_Policy: *Size: 1 octet*

Value	Parameter Description
0x00	Basic unfiltered scanning filter policy
0x01	Basic filtered scanning filter policy
0x02	Extended unfiltered scanning filter policy

Value	Parameter Description
0x03	Extended filtered scanning filter policy
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Scan_Parameters command succeeded.
0x01 to 0xFF	HCI_LE_Set_Scan_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Scan_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.11 LE Set Scan Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Scan_Enable	0x000C	LE_Scan_Enable, Filter_Duplicates	Status

Description:

This command is used to start and stop scanning for legacy PDUs (but not extended PDUs, even if the device supports extended advertising). Scanning is used to discover advertising devices nearby.

The Filter_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (Filtering_Enabled) to the Host, or if the Link Layer should generate advertising reports for each packet received (Filtering_Disabled). See [Vol 6] Part B, Section 4.4.3.5. If LE_Scan_Enable is set to 0x00 then Filter_Duplicates shall be ignored.

If the LE_Scan_Enable parameter is set to 0x01 and scanning is already enabled, any change to the Filter_Duplicates setting shall take effect.

Disabling scanning when it is disabled has no effect.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
R	LE_Scan_Enable is set to 0x01, the scanning parameters' Own_Address_Type parameter is set to 0x00 or 0x02, and the device does not have a public address.	*Invalid HCI Command Parameters* (0x12)
MC	LE_Scan_Enable is set to 0x01, the scanning parameters' Own_Address_Type parameter is set to 0x01 or 0x03, and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command.	*Invalid HCI Command Parameters* (0x12)

Command parameters:

LE_Scan_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Scanning disabled.
0x01	Scanning enabled.
All other values	Reserved for future use.

Filter_Duplicates: *Size: 1 octet*

Value	Parameter Description
0x00	Duplicate filtering disabled.
0x01	Duplicate filtering enabled.
All other values	Reserved for future use.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Scan_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Set_Scan_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Scan_Enable command has completed, an HCI_Command_Complete event shall be generated.

Zero or more HCI_LE_Advertising_Report events are generated by the Controller based on legacy advertising packets received and the duplicate filtering. More than one advertising packet may be reported in each HCI_LE_Advertising_Report event. No report shall be issued for extended advertising PDUs.

When the Scanning_Filter_Policy is set to 0x02 or 0x03 (see Section 7.8.10) and a directed advertisement was received where the advertiser used a resolvable private address which the Controller is unable to resolve, an HCI_LE_Directed_Advertising_Report event shall be generated instead of an HCI_LE_Advertising_Report event.

7.8.12 LE Create Connection command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Create_Connection	0x000D	LE_Scan_Interval, LE_Scan_Window, Initiator_Filter_Policy, Peer_Address_Type, Peer_Address, Own_Address_Type, Connection_Interval_Min, Connection_Interval_Max, Max_Latency, Supervision_Timeout, Min_CE_Length, Max_CE_Length	*none*

Description:

This command is used to create an ACL connection, with the local device in the Central role, to a connectable advertiser.

If a connection is created with the local device in the Peripheral role while this command is pending, then this command remains pending.

The LE_Scan_Interval and LE_Scan_Window parameters are recommendations from the Host on how long (LE_Scan_Window) and how frequently (LE_Scan_Interval) the Controller should scan. The LE_Scan_Window parameter shall be set to a value smaller or equal to the value set for the LE_Scan_Interval parameter. If both are set to the same value, scanning should run continuously.

The Initiator_Filter_Policy is used to determine whether the Filter Accept List is used. If the Filter Accept List is not used, the Peer_Address_Type and the Peer_Address parameters specify the address type and address of the advertising device to connect to.

Peer_Address_Type parameter indicates the type of address used in the connectable advertisement sent by the peer. The Host shall not set Peer_Address_Type to either 0x02 or 0x03 if both the Host and the Controller support the HCI_LE_Set_Privacy_Mode command. If a Controller that supports the HCI_LE_Set_Privacy_Mode command receives the HCI_LE_Create_Connection command with Peer_Address_Type set to either 0x02 or 0x03, it may use either device privacy mode or network privacy mode for that peer device.

Peer_Address parameter indicates the Peer's Public Device Address, Random (static) Device Address, Non-Resolvable Private Address or Resolvable Private Address depending on the Peer_Address_Type parameter.

Own_Address_Type parameter indicates the type of address being used in the connection request packets.

The Connection_Interval_Min and Connection_Interval_Max parameters define the minimum and maximum allowed connection interval. The Connection_Interval_Min parameter shall not be greater than the Connection_Interval_Max parameter.

The Max_Latency parameter defines the maximum allowed Peripheral latency (see [Vol 6] Part B, Section 4.5.1).

The Supervision_Timeout parameter defines the link supervision timeout for the connection. The Supervision_Timeout in milliseconds shall be larger than (1 + Max_Latency) × Connection_Interval_Max × 2, where Connection_Interval_Max is given in milliseconds. (See [Vol 6] Part B, Section 4.5.2).

The Min_CE_Length and Max_CE_Length parameters provide the Controller with the expected minimum and maximum length of the connection events. The Min_CE_Length parameter shall be less than or equal to the Max_CE_Length parameter. The Controller is not required to use these values.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	Another HCI_LE_Create_Connection command is pending in the Controller.	*Command Disallowed* (0x0C)
M	The local device is already connected to the same device address as the advertiser (including two different Resolvable Private Addresses that resolve to the same IRK).	*Connection Already Exists* (0x0B)
R	Own_Address_Type is set to 0x00 and the device does not have a public address.	*Invalid HCI Command Parameters* (0x12)
MC	Own_Address_Type is set to 0x01 and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command.	*Invalid HCI Command Parameters* (0x12)
R	Own_Address_Type is set to 0x02, Initiator_Filter_Policy is set to 0x00, the Controller's resolving list does not contain a matching entry, and the device does not have a public address.	*Invalid HCI Command Parameters* (0x12)
R	Own_Address_Type is set to 0x02, Initiator_Filter_Policy is set to 0x01, and the device does not have a public address.	*Invalid HCI Command Parameters* (0x12)

Type	Condition	Error code
MC	Own_Address_Type is set to 0x03, Initiator_Filter_Policy is set to 0x00, the Controller's resolving list does not contain a matching entry, and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command.	*Invalid HCI Command Parameters* (0x12)
MC	Own_Address_Type is set to 0x03, Initiator_Filter_Policy is set to 0x01, and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command.	*Invalid HCI Command Parameters* (0x12

Command parameters:

LE_Scan_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Time = N × 0.625 ms Time Range: 2.5 ms to 10.24 s

LE_Scan_Window: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Amount of time for the duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Time = N × 0.625 ms Time Range: 2.5 ms to 10.24 s

Initiator_Filter_Policy: *Size: 1 octet*

Value	Parameter Description
0x00	Filter Accept List is not used to determine which advertiser to connect to. Peer_Address_Type and Peer_Address shall be used.
0x01	Filter Accept List is used to determine which advertiser to connect to. Peer_Address_Type and Peer_Address shall be ignored.
All other values	Reserved for future use.

Peer_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Public Identity Address (Corresponds to peer's Resolvable Private Address). This value shall only be used by the Host if either the Host or the Controller does not support the HCI_LE_Set_Privacy_Mode command.
0x03	Random (static) Identity Address (Corresponds to peer's Resolvable Private Address). This value shall only be used by a Host if either the Host or the Controller does not support the HCI_LE_Set_Privacy_Mode command.
All other values	Reserved for future use

Peer_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the device to be connected

Own_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Controller generates Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, use the public address.
0x03	Controller generates Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, use the random address from the most recent successful HCI_LE_Set_Random_Address command.
All other values	Reserved for future use

Connection_Interval_Min: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum value for the connection interval. This shall be less than or equal to Connection_Interval_Max. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s.

Connection_Interval_Max: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum value for the connection interval. This shall be greater than or equal to Connection_Interval_Min. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s.

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum Peripheral latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Supervision timeout for the LE Link. (See [Vol 6] Part B, Section 4.5.2) Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s

Min_CE_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The minimum length of connection event recommended for this LE connection. Range: 0x0000 to 0xFFFF Time = N × 0.625 ms.

Max_CE_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The maximum length of connection event recommended for this LE connection. Range: 0x0000 to 0xFFFF Time = N × 0.625 ms.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Create_Connection command, the Controller sends the HCI_Command_Status event to the Host. An HCI_LE_Connection_Complete or HCI_LE_Enhanced_Connection_Complete event shall be generated when a connection is created because of this command or the connection creation procedure is cancelled; until one of these events is generated, the command is considered pending. If a connection is created and the Controller supports the LE Channel Selection Algorithm #2 feature, this event shall be immediately followed by an HCI_LE_Channel_Selection_Algorithm event.

7.8.13 LE Create Connection Cancel command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Create_Connection_Cancel	0x000E	*none*	Status

Description:

This command is used to cancel the HCI_LE_Create_Connection or HCI_LE_Extended_Create_Connection commands.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	No HCI_LE_Create_Connection or HCI_LE_Extended_Create_Connection command is pending.	*Command Disallowed* (0x0C)

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Create_Connection_Cancel command succeeded.
0x01 to 0xFF	HCI_LE_Create_Connection_Cancel command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Create_Connection_Cancel command has completed, an HCI_Command_Complete event shall be generated.

If the cancellation was successful then, after the HCI_Command_Complete event for the HCI_LE_Create_Connection_Cancel command, either an HCI_LE_Connection_Complete or an HCI_LE_Enhanced_Connection_Complete event shall be generated. In either case, the event shall be sent with the error code *Unknown Connection Identifier* (0x02).

7.8.14 LE Read Filter Accept List Size command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Filter_Accept_List_Size	0x000F	*none*	Status, Filter_Accept_List_Size

Description:

This command is used to read the number of Filter Accept List entries (including those already stored there) that the Controller can store at the present time.

Note: The number of entries that can be stored is not fixed and the Controller can change it at any time (e.g., because the memory used to store the list can also be used for other purposes).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Filter_Accept_List_Size command succeeded.
0x01 to 0xFF	HCI_LE_Read_Filter_Accept_List_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Filter_Accept_List_Size: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	Total number of Filter Accept List entries that can be stored in the Controller.
0x00	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_Read_Filter_Accept_List_Size command has completed, an HCI_Command_Complete event shall be generated.

7.8.15 LE Clear Filter Accept List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Clear_Filter_Accept_List	0x0010	*none*	Status

Description:

This command is used to clear the Filter Accept List stored in the Controller.

This command shall not be used when:

- any advertising filter policy uses the Filter Accept List and advertising is enabled,
- the scanning filter policy uses the Filter Accept List and scanning is enabled, or
- the initiator filter policy uses the Filter Accept List and an HCI_LE_Create_Connection or HCI_LE_Extended_Create_Connection command is pending.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Clear_Filter_Accept_List command succeeded.
0x01 to 0xFF	HCI_LE_Clear_Filter_Accept_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Clear_Filter_Accept_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.16 LE Add Device To Filter Accept List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Add_Device_To_Filter_Accept_-List	0x0011	Address_Type, Address	Status

Description:

This command is used to add a single device to the Filter Accept List stored in the Controller.

This command shall not be used when:

- any advertising filter policy uses the Filter Accept List and advertising is enabled,
- the scanning filter policy uses the Filter Accept List and scanning is enabled, or
- the initiator filter policy uses the Filter Accept List and an HCI_LE_Create_Connection or HCI_LE_Extended_Create_Connection command is pending.

If the device is already in the Filter Accept List, the Controller should not add the device to the Filter Accept List again and should return success.

Address shall be ignored when Address_Type is set to 0xFF.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	The Controller cannot add a device to the Filter Accept List because there is no space available.	*Memory Capacity Exceeded* (0x07)

Command parameters:

Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0xFF	Devices sending anonymous advertisements
All other values	Reserved for future use.

Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address or Random Device Address of the device to be added to the Filter Accept List.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Add_Device_To_Filter_Accept_List command succeeded.
0x01 to 0xFF	HCI_LE_Add_Device_To_Filter_Accept_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Add_Device_To_Filter_Accept_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.17 LE Remove Device From Filter Accept List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remove_Device_From_Filter_-Accept_List	0x0012	Address_Type, Address	Status

Description:

This command is used to remove a single device from the Filter Accept List stored in the Controller.

This command shall not be used when:

- any advertising filter policy uses the Filter Accept List and advertising is enabled,
- the scanning filter policy uses the Filter Accept List and scanning is enabled, or
- the initiator filter policy uses the Filter Accept List and an HCI_LE_Create_Connection or HCI_LE_Extended_Create_Connection command is pending.

Address shall be ignored when Address_Type is set to 0xFF.

Command parameters:

Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0xFF	Devices sending anonymous advertisements
All other values	Reserved for future use.

Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address or Random Device Address of the device to be removed from the Filter Accept List.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Remove_Device_From_Filter_Accept_List command succeeded.
0x01 to 0xFF	HCI_LE_Remove_Device_From_Filter_Accept_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Remove_Device_From_Filter_Accept_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.18 LE Connection Update command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Connection_Update	0x0013	Connection_Handle, Connection_Interval_Min, Connection_Interval_Max, Max_Latency, Supervision_Timeout, Min_CE_Length, Max_CE_Length	*none*

Description:

This command is used to change the ACL connection parameters. This command may be issued on both the Central and Peripheral.

The Connection_Interval_Min and Connection_Interval_Max parameters are used to define the minimum and maximum allowed connection interval. The Connection_Interval_Min parameter shall not be greater than the Connection_Interval_Max parameter.

The Max_Latency parameter shall define the maximum allowed Peripheral latency.

The Supervision_Timeout parameter shall define the link supervision timeout for the LE link. The Supervision_Timeout in milliseconds shall be larger than (1 + Max_Latency) × Subrate_Factor × Connection_Interval_Max × 2, where Connection_Interval_Max is given in milliseconds and Subrate_Factor is the current subrate factor of the connection.

The Min_CE_Length and Max_CE_Length are information parameters providing the Controller with a hint about the expected minimum and maximum length of the connection events. The Min_CE_Length shall be less than or equal to the Max_CE_Length.

The actual parameter values selected by the Link Layer may be different from the parameter values provided by the Host through this command.

If this command completes successfully and the connection interval has changed, then the subrating factor shall be set to 1 and the continuation number to 0. In this case, Max_Latency must be interpreted in underlying connection events. Otherwise the subrating factor and continuation number shall be unchanged and Max_Latency must be interpreted in subrated events.

Errors:

See Section 4.5.2 for a list of error types and descriptions.

Type	Condition	Error code
MC	One or more CS procedures have been enabled using the HCI_LE_CS_Procedure_Enable command.	*Command Disallowed* (0x0C)
M	The Controller is the Peripheral and the local Controller does not support the Connection Parameters Request procedure (see [Vol 6] Part B, Section 5.1.7).	*Unsupported Feature or Parameter Value* (0x11)
M	The Controller is the Peripheral and the local Controller supports the Connection Parameters Request procedure but the peer Controller does not.	*Unsupported Remote Feature* (0x1A)

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Connection_Interval_Min: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum value for the connection interval. This shall be less than or equal to Connection_Interval_Max. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s.

Connection_Interval_Max: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum value for the connection interval. This shall be greater than or equal to Connection_Interval_Min. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s.

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum Peripheral latency for the connection in number of subrated connection events. Range: 0x0000 to 0x01F3

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Supervision timeout for the LE Link. Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s

Min_CE_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Information parameter about the minimum length of connection event needed for this LE connection. How this value is used is outside the scope of this specification. Range: 0x0000 to 0xFFFF Time = N × 0.625 ms.

Max_CE_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Information parameter about the maximum length of connection event needed for this LE connection. How this value is used is outside the scope of this specification. Range: 0x0000 to 0xFFFF Time = N × 0.625 ms.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Connection_Update command, the Controller sends the HCI_Command_Status event to the Host. The HCI_LE_Connection_Update_Complete event shall be generated after the connection parameters have been applied by the Controller or if the command subsequently fails.

7.8.19 LE Set Host Channel Classification command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Host_Channel_Classification	0x0014	Channel_Map	Status

Description:

This command allows the Host to specify a channel classification for the data, secondary advertising, periodic, and isochronous physical channels based on its "local information". This classification persists until overwritten with a subsequent HCI_LE_Set_Host_Channel_Classification command or until the Controller is reset using the HCI_Reset command (see [Vol 6] Part B, Section 4.5.8.1).

If this command is used, the Host should send it within 10 seconds of knowing that the channel classification has changed. The interval between two successive commands sent shall be at least one second.

Command parameters:

Channel_Map: *Size: 5 octets (37 bits meaningful)*

Value	Parameter Description
0xXXXXXXXXXX	This parameter contains 37 1-bit fields. The n^{th} such field (in the range 0 to 36) contains the value for the Link Layer channel index n. Channel n is bad = 0. Channel n is unknown = 1. The most significant bits are reserved for future use. At least one channel shall be marked as unknown.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Host_Channel_Classification command succeeded.
0x01 to 0xFF	HCI_LE_Set_Host_Channel_Classification command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Host_Channel_Classification command has completed, an HCI_Command_Complete event shall be generated.

7.8.20 LE Read Channel Map command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Channel_Map	0x0015	Connection_Handle	Status, Connection_Handle, Channel_Map

Description:

This command returns the current Channel_Map for the specified Connection_Handle. The returned value indicates the state of the Channel_Map specified by the last transmitted or received Channel_Map (in a CONNECT_IND or LL_CHANNEL_MAP_IND message) for the specified Connection_Handle, regardless of whether the Central has received an acknowledgment. If the connection handle does not identify an ACL connection, the Controller shall reject the command and should return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Channel_Map command succeeded.
0x01 to 0xFF	HCI_LE_Read_Channel_Map command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Channel_Map: *Size: 5 octets*

Value	Parameter Description
0xXXXXXXXXXX	This parameter contains 37 1-bit fields. The n^{th} such field (in the range 0 to 36) contains the value for the Link Layer channel index n. Channel n is unused = 0. Channel n is used = 1. The most significant bits are reserved for future use.

Event(s) generated (unless masked away):

When the HCI_LE_Read_Channel_Map command has completed, an HCI_Command_Complete event shall be generated.

7.8.21 LE Read Remote Features Page 0 command[1]

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Remote_Features_Page_0	0x0016	Connection_Handle	*none*

Description:

This command requests, from the remote device identified by the Connection_Handle, page 0 of the features used on the connection and the features supported by the remote device. For details see [Vol 6] Part B, Section 4.6.

This command may be issued on both the Central and Peripheral.

If a connection already exists between the two devices and page 0 of the features have already been fetched on that connection, the Controller may use a cached copy of page 0 of the features.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Read_Remote_Features_Page_0 command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has completed the procedure to determine the remote features or has determined that it will be using a cached copy, the Controller shall send an HCI_LE_Read_Remote_Features_Page_0_Complete event to the Host.

The HCI_LE_Read_Remote_Features_Page_0_Complete event contains the status of this command and the parameter describing page 0 of the features used on the connection and the features supported by the remote device.

[1]This command was formerly called “LE Read Remote Features”.

7.8.22 LE Encrypt command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Encrypt	0x0017	Key, Plaintext_Data	Status, Encrypted_Data

Description:

This command is used to request the Controller to encrypt the Plaintext_Data in the command using the Key given in the command and returns the Encrypted_Data to the Host. The AES-128 bit block cypher is defined in NIST Publication FIPS-197 (http://csrc.nist.gov/publications/fips/fips197/fips-197.pdf).

Command parameters:

Key: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	128 bit key for the encryption of the data given in the command. The most significant octet of the key corresponds to key[0] using the notation specified in FIPS 197.

Plaintext_Data: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	128 bit data block that is requested to be encrypted. The most significant octet of the PlainText_Data corresponds to in[0] using the notation specified in FIPS 197.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Encrypt command succeeded.
0x01 to 0xFF	HCI_LE_Encrypt command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Encrypted_Data: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	128 bit encrypted data block. The most significant octet of the Encrypted_Data corresponds to out[0] using the notation specified in FIPS 197.

Event(s) generated (unless masked away):

When the HCI_LE_Encrypt command has completed, an HCI_Command_Complete event shall be generated.

7.8.23 LE Rand command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Rand	0x0018	*none*	Status, Random_Number

Description:

This command is used to request the Controller to generate 8 octets of random data to be sent to the Host. The Random_Number shall be generated according to [Vol 2] Part H, Section 2.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Rand command succeeded.
0x01 to 0xFF	HCI_LE_Rand command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Random_Number: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	Random Number

Event(s) generated (unless masked away):

When the HCI_LE_Rand command has completed, an HCI_Command_Complete event shall be generated.

7.8.24 LE Enable Encryption command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Enable_Encryption	0x0019	Connection_Handle, Random_Number, Encrypted_Diversifier, Long_Term_Key	*none*

Description:

This command is used to authenticate the given encryption key associated with the remote device specified by the Connection_Handle, and once authenticated will encrypt the connection. The parameters are as defined in [Vol 3] Part H, Section 2.4.4.

If the connection is already encrypted then the Controller shall pause connection encryption before attempting to authenticate the given encryption key, and then re-encrypt the connection. While encryption is paused no user data shall be transmitted.

If the Connection_Handle parameter identifies an ACL with an associated CIS that has been created, the Controller shall return the error code *Command Disallowed* (0x0C).

On an authentication failure, the connection shall be automatically disconnected by the Link Layer. If this command succeeds, then the connection shall be encrypted.

This command shall only be used when the local device's role is Central.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Random_Number: *Size: 8 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX	64 bit random number.

Encrypted_Diversifier: *Size: 2 octets*

Value	Parameter Description
0xXXXX	16 bit encrypted diversifier.

Long_Term_Key: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	128 bit long term key.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Enable_Encryption command it shall send the HCI_Command_Status event to the Host. If the connection is not encrypted when this command is issued, an HCI_Encryption_Change event shall occur when encryption has been started for the connection. If the connection is encrypted when this command is issued, an HCI_Encryption_Key_Refresh_Complete event shall occur when encryption has been resumed.

7.8.25 LE Long Term Key Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Long_Term_Key_Request_Reply	0x001A	Connection_Handle, Long_Term_Key	Status, Connection_Handle

Description:

This command is used to reply to an HCI_LE_Long_Term_Key_Request event from the Controller, and specifies the Long_Term_Key parameter that shall be used for this Connection_Handle. The Long_Term_Key is used as defined in [Vol 6] Part B, Section 5.1.3.

This command shall only be used when the local device's role is Peripheral.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Long_Term_Key: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	128 bit long term key for the given connection.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Long_Term_Key_Request_Reply command succeeded.
0x01 to 0xFF	HCI_LE_Long_Term_Key_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Long_Term_Key_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.8.26 LE Long Term Key Request Negative Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Long_Term_Key_Request_-Negative_Reply	0x001B	Connection_Handle	Status, Connection_Handle

Description:

This command is used to reply to an HCI_LE_Long_Term_Key_Request event from the Controller if the Host cannot provide a Long Term Key for this Connection_Handle.

This command shall only be used when the local device's role is Peripheral.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Long_Term_Key_Request_Negative_Reply command succeeded.
0x01 to 0xFF	HCI_LE_Long_Term_Key_Request_Negative_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Long_Term_Key_Request_Negative_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.8.27 LE Read Supported States command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Supported_States	0x001C	*none*	Status, LE_States

Description:

This command reads the states, roles, and combinations of states and roles that the Link Layer supports. See [Vol 6] Part B, Section 1.1.1.

The LE_States parameter is a bit field. If a bit is set to 1 then this state, role, or combination is supported by the Controller; each combination consists of the states indicated by 'X' in the associated row of the table and excludes those states with an empty cell in that row. Multiple bits in LE_States may be set to 1 to indicate support for multiple combinations.

Note: This command only provides information about the supported states and roles that can be used with legacy advertising. It does not provide information about those that can only be used with the extended advertising commands (see Section 3.1.1).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Supported_States command succeeded.
0x01 to 0xFF	HCI_LE_Read_Supported_States command failed. See [Vol 1] Part F for a list of error codes and descriptions.

LE_States: *Size: 8 octets*

	SUPPORTED STATES & ROLES

41									X		X

All bits not listed in this table, and the value with all bits set to 0, are reserved for future use.

Event(s) generated (unless masked away):

When the HCI_LE_Read_Supported_States command has completed, an HCI_Command_Complete event will be generated.

7.8.28 LE Receiver Test command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Receiver_Test [v3]	0x004F	RX_Channel, PHY, Modulation_Index, Expected_CTE_Length, Expected_CTE_Type, Slot_Durations, Switching_Pattern_Length, Antenna_IDs[i]	Status
HCI_LE_Receiver_Test [v2]	0x0033	RX_Channel, PHY, Modulation_Index	Status
HCI_LE_Receiver_Test [v1]	0x001D	RX_Channel	Status

Description:

This command is used to start a test where the IUT receives test reference packets at a fixed interval. The tester generates the test reference packets.

The RX_Channel and PHY parameters specify the RF channel and PHY to be used by the receiver. If the Host sets the PHY parameter to a PHY that the Controller does not support, including a value that is reserved for future use, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Modulation_Index parameter specifies whether or not the Controller should assume the receiver has a stable modulation index.

The Expected_CTE_Length and Expected_CTE_Type parameters specify the expected length and type of the Constant Tone Extensions in received test reference packets. When receiving on a PHY that allows Constant Tone Extensions, if the Constant Tone Extension in a received test reference packet does not match both of these, the IUT shall discard that packet. If Expected_CTE_Length is not zero and PHY specifies a PHY that does not allow Constant Tone Extensions, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Slot_Durations parameter is set to 0x01 and the Controller does not support 1 µs switching and sampling, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Slot_Durations, Switching_Pattern_Length, and Antenna_IDs[i] are only used when expecting an AoA Constant Tone Extension and shall be ignored when expecting an AoD Constant Tone Extension.

If the Controller determines that any of the Antenna_IDs[i] values do not identify an antenna in the device's antenna array, it shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Note: Some Controllers may be unable to determine which values do or do not identify an antenna.

Missing parameters:

When a version of this command is issued that does not include all the parameters, the following values shall be used for any missing parameters:

Parameter	Value
PHY	0x01
Modulation_Index	0x00
Expected_CTE_Length	0x00
Expected_CTE_Type	*any valid value*
Slot_Durations	*any valid value*
Switching_Pattern_Length	*any valid value*
Antenna_IDs[i]	*any valid value*

Command parameters:

RX_Channel: *Size: 1 octet*

Value	Parameter Description
N = 0xXX	N = (F-2402) ÷ 2 Range: 0x00 to 0x27. Frequency Range: 2402 MHz to 2480 MHz

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	Receiver set to use the LE 1M PHY
0x02	Receiver set to use the LE 2M PHY
0x03	Receiver set to use the LE Coded PHY
All other values	Reserved for future use

Modulation_Index: *Size: 1 octet*

Value	Parameter Description
0x00	Assume transmitter will have a standard modulation index
0x01	Assume transmitter will have a stable modulation index
All other values	Reserved for future use

Expected_CTE_Length: *Size: 1 octet*

Value	Parameter Description
0x00	No Constant Tone Extension expected (default)
0x02 to 0x14	Expected length of the Constant Tone Extension in 8 µs units
All other values	Reserved for future use

Expected_CTE_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Expect AoA Constant Tone Extension
0x01	Expect AoD Constant Tone Extension with 1 µs slots
0x02	Expect AoD Constant Tone Extension with 2 µs slots
All other values	Reserved for future use

Slot_Durations: *Size: 1 octet*

Value	Parameter Description
0x01	Switching and sampling slots are 1 µs each
0x02	Switching and sampling slots are 2 µs each
All other values	Reserved for future use

Switching_Pattern_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x4B	The number of Antenna IDs in the pattern
All other values	Reserved for future use

Antenna_IDs[i]: *Size: Switching_Pattern_Length × 1 octet*

Value	Parameter Description
0xXX	Antenna ID in the pattern

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Receiver_Test command succeeded.
0x01 to 0xFF	HCI_LE_Receiver_Test command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Receiver_Test command has completed, an HCI_Command_-Complete event shall be generated.

If the Expected_CTE_Length parameter is not set to zero, then HCI_LE_-Connectionless_IQ_Report events may be generated by the Controller.

7.8.29 LE Transmitter Test command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Transmitter_Test [v4]	0x007B	TX_Channel, Test_Data_Length, Packet_Payload, PHY, CTE_Length, CTE_Type, Switching_Pattern_Length, Antenna_IDs[i], TX_Power_Level	Status
HCI_LE_Transmitter_Test [v3]	0x0050	TX_Channel, Test_Data_Length, Packet_Payload, PHY, CTE_Length, CTE_Type, Switching_Pattern_Length, Antenna_IDs[i]	Status
HCI_LE_Transmitter_Test [v2]	0x0034	TX_Channel, Test_Data_Length, Packet_Payload, PHY	Status
HCI_LE_Transmitter_Test [v1]	0x001E	TX_Channel, Test_Data_Length, Packet_Payload	Status

The order of the command parameters in an HCI command packet is:

TX_Channel
Test_Data_Length
Packet_Payload
PHY
CTE_Length
CTE_Type
Switching_Pattern_Length
Antenna_IDs[0]
…

Antenna_IDs[n]
TX_Power_Level

Description:

This command is used to start a test where the IUT generates test reference packets at a fixed interval. The Controller shall transmit at the power level indicated by the TX_Power_Level parameter.

The TX_Channel and PHY parameters specify the RF channel and PHY to be used by the transmitter. If the Host sets the PHY parameter to a PHY that the Controller does not support, including a value that is reserved for future use, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Test_Data_Length and Packet_Payload parameters specify the length and contents of the Payload of the test reference packets. An LE Controller supporting the HCI_LE_Transmitter_Test command shall support Packet_Payload values 0x00, 0x01 and 0x02. An LE Controller supporting the LE Coded PHY shall also support Packet_Payload value 0x04. An LE Controller may support other values of Packet_Payload.

The CTE_Length and CTE_Type parameters specify the length and type of the Constant Tone Extension in the test reference packets. If the CTE_Type parameter is set to 0x01 and the Controller does not support 1 µs switching, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11). If CTE_Length is not zero and PHY specifies a PHY that does not allow Constant Tone Extensions, the Controller shall return the error code *Command Disallowed* (0x0C).

The Switching_Pattern_Length and Antenna_IDs[i] parameters specify the antenna switching pattern. They are only used when transmitting an AoD Constant Tone Extension and shall be ignored when transmitting an AoA Constant Tone Extension.

If the Controller determines that any of the Antenna_IDs[i] values do not identify an antenna in the device's antenna array, it shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Note: Some Controllers may be unable to determine which values do or do not identify an antenna.

The TX_Power_Level parameter specifies the transmit power level to be used by the transmitter. If the parameter is set to a value other than 0x7E or 0x7F, then the Controller shall make the requested change or shall make the nearest change that it is capable of doing.

Missing parameters:

When a version of this command is issued that does not include all the parameters, the following values shall be used for any missing parameters:

Parameter	Value
PHY	0x01
CTE_Length	0x00
CTE_Type	*any valid value*
Switching_Pattern_Length	*any valid value*
Antenna_IDs[i]	*any valid value*
TX_Power_Level	0x7F

Command parameters:

TX_Channel: *Size: 1 octet*

Value	Parameter Description
N = 0xXX	N = (F-2402) ÷ 2 Range: 0x00 to 0x27 Frequency Range: 2402 MHz to 2480 MHz

Test_Data_Length: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xFF	Length in bytes of payload data in each packet

Packet_Payload: *Size: 1 octet*

Value	Parameter Description
0x00	PRBS9 sequence '11111111100000111101...' (in transmission order) as described in [Vol 6] Part F, Section 4.1.5
0x01	Repeated '11110000' (in transmission order) sequence as described in [Vol 6] Part F, Section 4.1.5
0x02	Repeated '10101010' (in transmission order) sequence as described in [Vol 6] Part F, Section 4.1.5
0x03	PRBS15 sequence as described in [Vol 6] Part F, Section 4.1.5
0x04	Repeated '11111111' (in transmission order) sequence
0x05	Repeated '00000000' (in transmission order) sequence
0x06	Repeated '00001111' (in transmission order) sequence

Value	Parameter Description
0x07	Repeated '01010101' (in transmission order) sequence
All other values	Reserved for future use

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	Transmitter set to use the LE 1M PHY
0x02	Transmitter set to use the LE 2M PHY
0x03	Transmitter set to use the LE Coded PHY with S=8 data coding
0x04	Transmitter set to use the LE Coded PHY with S=2 data coding
All other values	Reserved for future use

CTE_Length: *Size: 1 octet*

Value	Parameter Description
0x00	Do not transmit a Constant Tone Extension
0x02 to 0x14	Length of the Constant Tone Extension in 8 µs units
All other values	Reserved for future use

CTE_Type: *Size: 1 octet*

Value	Parameter Description
0x00	AoA Constant Tone Extension
0x01	AoD Constant Tone Extension with 1 µs slots
0x02	AoD Constant Tone Extension with 2 µs slots
All other values	Reserved for future use

Switching_Pattern_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x4B	The number of Antenna IDs in the pattern
All other values	Reserved for future use

Antenna_IDs[i]: *Size: Switching_Pattern_Length × 1 octet*

Value	Parameter Description
0xXX	Antenna ID in the pattern

TX_Power_Level: *Size: 1 octet*

Value	Parameter Description
0xXX	Set transmitter to the specified or the nearest transmit power level. Range: -127 to +20 Units: dBm
0x7E	Set transmitter to minimum transmit power level
0x7F	Set transmitter to maximum transmit power level

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_-Transmitter_-Test command succeeded.
0x01 to 0xFF	HCI_LE_-Transmitter_-Test command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Transmitter_Test command has completed, an HCI_Command_Complete event shall be generated.

7.8.30 LE Test End command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Test_End	0x001F	*none*	Status, Num_Packets

Description:

This command is used to stop any test which is in progress. The Num_Packets for a transmitter test shall be reported as 0x0000. The Num_Packets is an unsigned number and contains the number of received packets.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Test_End command succeeded.
0x01 to 0xFF	HCI_LE_Test_End command failed See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_Packets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Number of packets received

Event(s) generated (unless masked away):

When the HCI_LE_Test_End command has completed, an HCI_Command_Complete event shall be generated.

7.8.31 LE Remote Connection Parameter Request Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remote_Connection_-Parameter_Request_Reply	0x0020	Connection_Handle, Interval_Min, Interval_Max, Max_Latency, Timeout, Min_CE_Length, Max_CE_Length	Status, Connection_Handle

Description:

Both the Central's Host and the Peripheral's Host use this command to reply to the HCI_LE_Remote_Connection_Parameter_Request event. This indicates that the Host has accepted the remote device's request to change connection parameters.

The Interval_Min and Interval_Max parameters define the minimum and maximum allowed connection interval. The Interval_Min parameter shall not be greater than the Interval_Max parameter.

The Max_Latency parameter shall define the maximum allowed Peripheral latency for the connection.

The Timeout parameter shall define the link supervision timeout for the LE link. The Timeout in milliseconds shall be larger than (1 + Max_Latency) × Subrate_Factor × Interval_Max × 2, where Interval_Max is given in milliseconds and Subrate_Factor is the current subrate factor of the connection.

The Min_CE_Length and Max_CE_Length are information parameters providing the Controller with a hint about the expected minimum and maximum length of the connection events. The Min_CE_Length shall be less than or equal to the Max_CE_Length.

The actual parameter values selected by the Link Layer may be different from the parameter values provided by the Host through this command.

If this command completes successfully and the connection interval has changed, then the subrating factor shall be set to 1 and the continuation number to 0. In this case, Max_Latency must be interpreted in underlying connection events. Otherwise the subrating factor and continuation number shall be unchanged and Max_Latency must be interpreted in subrated events.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Interval_Min: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum value of the connection interval. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s

Interval_Max: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum value of the connection interval. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum allowed Peripheral latency for the connection specified as the number of subrated connection events. Range: 0x0000 to 0x01F3 (499)

Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Supervision timeout for the connection. Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s

Min_CE_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Information parameter about the minimum length of connection event needed for this LE connection. Range: 0x0000 to 0xFFFF Time = N × 0.625 ms Time Range: 0 ms to 40.9 s

Max_CE_Length: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Information parameter about the maximum length of connection event needed for this LE connection. Range: 0x0000 to 0xFFFF Time = N × 0.625 ms Time Range: 0 ms to 40.9 s

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Remote_Connection_Parameter_Request_Reply command succeeded.
0x01 to 0xFF	HCI_LE_Remote_Connection_Parameter_Request_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Remote_Connection_Parameter_Request_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.8.32 LE Remote Connection Parameter Request Negative Reply command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remote_Connection_-Parameter_Request_Negative_Reply	0x0021	Connection_Handle, Reason	Status, Connection_Handle

Description:

Both the Central's Host and the Peripheral's Host use this command to reply to the HCI_LE_Remote_Connection_Parameter_Request event. This indicates that the Host has rejected the remote device's request to change connection parameters. The reason for the rejection is given in the Reason parameter.

Instead of issuing this command, the Host should try to provide alternative connection parameters to the Link Layer via the HCI_LE_Remote_Connection_Parameter_Request_Reply command (Section 7.8.31).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Reason: *Size: 1 octet*

Value	Parameter Description
0x3B	Reason that the connection parameter request was rejected: *Unacceptable Connection Parameters*.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Remote_Connection_Parameter_Request_Negative_Reply command succeeded.
0x01 to 0xFF	HCI_LE_Remote_Connection_Parameter_Request_Negative_Reply command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Remote_Connection_Parameter_Request_Negative_Reply command has completed, an HCI_Command_Complete event shall be generated.

7.8.33 LE Set Data Length command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Data_Length	0x0022	Connection_Handle, TX_Octets, TX_Time	Status, Connection_Handle

Description:

This command allows the Host to suggest the maximum transmission payload size and maximum packet transmission time (*connMaxTxOctets* and *connMaxTxTime* - see [Vol 6] Part B, Section 4.5.10) to be used for LL Data PDUs on a given connection. The Controller may use smaller or larger values based on local information.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

TX_Octets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Preferred maximum number of payload octets that the local Controller should include in a single LL Data PDU on this connection. Range 0x001B to 0x00FB

TX_Time: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Preferred maximum number of microseconds that the local Controller should use to transmit a single Link Layer packet containing an LL Data PDU on this connection. Range 0x0148 to 0x4290

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Data_Length command succeeded.
0x01 to 0xFF	HCI_LE_Set_Data_Length command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Data_Length command has completed, an HCI_Command_Complete event shall be generated.

If the command causes the maximum transmission packet size or maximum packet transmission time to change, an HCI_LE_Data_Length_Change event shall be generated.

7.8.34 LE Read Suggested Default Data Length command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Suggested_-Default_Data_Length	0x0023	*none*	Status, Suggested_Max_TX_Octets, Suggested_Max_TX_Time

Description:

This command allows the Host to read the Host's suggested values (Suggested_Max_TX_Octets and Suggested_Max_TX_Time) for the Controller's maximum transmitted number of payload octets and maximum packet transmission time for packets containing LL Data PDUs to be used for new connections (see [Vol 6] Part B, Section 4.5.10).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Suggested_Default_Data_Length command succeeded
0x01 to 0xFF	HCI_LE_Read_Suggested_Default_Data_Length command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Suggested_Max_TX_Octets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The Host's suggested value for the Controller's maximum transmitted number of payload octets in LL Data PDUs to be used for new connections. Range 0x001B to 0x00FB Default: 0x001B

Suggested_Max_TX_Time: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The Host's suggested value for the Controller's maximum packet transmission time for packets containing LL Data PDUs to be used for new connections. Range 0x0148 to 0x4290 Default: 0x0148

Event(s) generated (unless masked away):

When the HCI_LE_Read_Suggested_Default_Data_Length command has completed, an HCI_Command_Complete event shall be generated.

7.8.35 LE Write Suggested Default Data Length command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Write_Suggested_Default_-Data_Length	0x0024	Suggested_Max_TX_Octets, Suggested_Max_TX_Time	Status

Description:

This command allows the Host to specify its suggested values for the Controller's maximum transmission number of payload octets and maximum packet transmission time for packets containing LL Data PDUs to be used for new connections.
The Controller may use smaller or larger values for *connInitialMaxTxOctets* and *connInitialMaxTxTime* based on local information. (See [Vol 6] Part B, Section 4.5.10).

Command parameters:

Suggested_Max_TX_Octets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The Host's suggested value for the Controller's maximum transmitted number of payload octets in LL Data PDUs to be used for new connections. Range 0x001B to 0x00FB

Suggested_Max_TX_Time: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The Host's suggested value for the Controller's maximum packet transmission time for packets containing LL Data PDUs to be used for new connections. Range 0x0148 to 0x4290

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Write_Suggested_Default_Data_Length command succeeded.
0x01 to 0xFF	HCI_LE_Write_Suggested_Default_Data_Length command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Write_Suggested_Default_Data_Length command has completed, an HCI_Command_Complete event shall be generated.

7.8.36 LE Read Local P-256 Public Key command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Local_P-256_Public_Key	0x0025	*none*	*none*

Description:

This command is used to return the local P-256 public key from the Controller. The Controller shall generate a new P-256 public/private key pair upon receipt of this command.

The keys returned via this command shall not be used when Secure Connections is used over the BR/EDR transport.

Command parameters:

None.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Read_Local_P-256_Public_Key command, the Controller shall send the HCI_Command_Status event to the Host. When the local P-256 public key generation finishes, an HCI_LE_Read_Local_P-256_Public_Key_Complete event shall be generated.

7.8.37 LE Generate DHKey command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Generate_DHKey [v2]	0x005E	Key_X_Coordinate, Key_Y_Coordinate, Key_Type	*none*
HCI_LE_Generate_DHKey [v1]	0x0026	Key_X_Coordinate, Key_Y_Coordinate	*none*

Description:

This command is used to initiate generation of a Diffie-Hellman key in the Controller for use over the LE transport. This command takes the remote P-256 public key specified in the Key_X_Coordinate and Key_Y_Coordinate parameters as input. The Diffie-Hellman key generation uses the private key generated by the HCI_LE_Read_Local_P-256_Public_Key command or the private debug key (see [Vol 3] Part H, Section 2.3.5.6.1).

The Diffie-Hellman key returned via this command shall not be generated using any keys used for Secure Connections over the BR/EDR transport.

If the remote P-256 public key is invalid (see [Vol 3] Part H, Section 2.3.5.6.1), the Controller shall return an error and should use the error code *Invalid HCI Command Parameters* (0x12).

Missing parameters:

When a version of this command is issued that does not include all the parameters, the following values shall be used for any missing parameters:

Parameter	Value
Key_Type	0x00

Command parameters:

Key_X_Coordinate: *Size: 32 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX	The remote P-256 public key X coordinate

Key_Y_Coordinate: *Size: 32 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX	The remote P-256 public key Y coordinate

Key_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Use the generated private key
0x01	Use the debug private key
All other values	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Generate_DHKey command, the Controller shall send the HCI_Command_Status event to the Host. When the DHKey generation finishes, an HCI_LE_Generate_DHKey_Complete event shall be generated.

7.8.38 LE Add Device To Resolving List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Add_Device_To_-Resolving_List	0x0027	Peer_Identity_Address_Type, Peer_Identity_Address, Peer_IRK, Local_IRK	Status

Description:

This command is used to add one device to the resolving list used to generate and resolve Resolvable Private Addresses in the Controller.

This command shall not be used when address resolution is enabled in the Controller and:

- Advertising (other than periodic advertising) is enabled,
- Scanning is enabled, or
- an HCI_LE_Create_Connection, HCI_LE_Extended_Create_Connection, or HCI_LE_Periodic_Advertising_Create_Sync command is pending.

This command may be used at any time when address resolution is disabled in the Controller.

The added device shall be set to Network Privacy mode.

If Peer_Identity_Address_Type is 0x01 and Peer_Identity_Address is not a static address, then the Controller should return the error code *Invalid HCI Command Parameters* (0x12).

When a Controller cannot add a device to the list because there is no space available, it shall return the error code *Memory Capacity Exceeded* (0x07).

If an entry already exists in the resolving list with the same four parameter values, the Controller shall either reject the command or not add the device to the resolving list again and return success. If the command is rejected then the error code *Invalid HCI Command Parameters* (0x12) should be used.

If there is an existing entry in the resolving list with the same Peer_Identity_Address and Peer_Identity_Address_Type, or with the same non-zero Peer_IRK, the Controller should return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Peer_Identity_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Identity Address
0x01	Random (static) Identity Address
All other values	Reserved for future use

Peer_Identity_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public or Random (static) Identity Address of the peer device

Peer_IRK: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX	IRK of the peer device

Local_IRK: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX	IRK of the local device

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Add_Device_To_Resolving_List command succeeded
0x01 to 0xFF	HCI_LE_Add_Device_To_Resolving_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Add_Device_To_Resolving_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.39 LE Remove Device From Resolving List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remove_Device_From_-Resolving_List	0x0028	Peer_Identity_Address_Type, Peer_Identity_Address	Status

Description:

This command is used to remove one device from the resolving list used to resolve Resolvable Private Addresses in the Controller.

This command shall not be used when address resolution is enabled in the Controller and:

- Advertising (other than periodic advertising) is enabled,
- Scanning is enabled, or
- an HCI_LE_Create_Connection, HCI_LE_Extended_Create_Connection, or HCI_LE_Periodic_Advertising_Create_Sync command is pending.

This command may be used at any time when address resolution is disabled in the Controller.

When a Controller cannot remove a device from the resolving list because it is not found, it shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Peer_Identity_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Identity Address
0x01	Random (static) Identity Address
All other values	Reserved for future use

Peer_Identity_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public or Random (static) Identity Address of the peer device

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Remove_Device_From_Resolving_List command succeeded
0x01 to 0xFF	HCI_LE_Remove_Device_From_Resolving_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Remove_Device_From_Resolving_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.40 LE Clear Resolving List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Clear_Resolving_List	0x0029	*none*	Status

Description:

This command is used to remove all devices from the resolving list used to resolve Resolvable Private Addresses in the Controller.

This command shall not be used when address resolution is enabled in the Controller and:

- Advertising (other than periodic advertising) is enabled,
- Scanning is enabled, or
- an HCI_LE_Create_Connection, HCI_LE_Extended_Create_Connection, or HCI_LE_Periodic_Advertising_Create_Sync command is pending.

This command may be used at any time when address resolution is disabled in the Controller.

Command parameters:

None

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Clear_Resolving_List command succeeded
0x01 to 0xFF	HCI_LE_Clear_Resolving_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Clear_Resolving_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.41 LE Read Resolving List Size command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Resolving_List_Size	0x002A	*none*	Status, Resolving_List_Size

Description:

This command is used to read the total number of entries in the resolving list that can be stored in the Controller.

Note: The number of entries that can be stored is not fixed and the Controller can change it at any time (e.g. because the memory used to store the list can also be used for other purposes).

Command parameters:

None

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Resolving_List_Size command succeeded
0x01 to 0xFF	HCI_LE_Read_Resolving_List_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Resolving_List_Size: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of entries in the resolving list

Event(s) generated (unless masked away):

When the HCI_LE_Read_Resolving_List_Size command has completed, an HCI_Command_Complete event shall be generated.

7.8.42 LE Read Peer Resolvable Address command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Peer_-Resolvable_Address	0x002B	Peer_Identity_Address_Type, Peer_Identity_Address	Status, Peer_Resolvable_Address

Description:

This command is used to get the current peer Resolvable Private Address being used for the corresponding peer Public and Random (static) Identity Address. The peer's resolvable address being used may change after the command is called.

This command may be used at any time.

When a Controller cannot find a Resolvable Private Address associated with the Peer Identity Address, or if the Peer Identity Address cannot be found in the resolving list, it shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Peer_Identity_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Identity Address
0x01	Random (static) Identity Address
All other values	Reserved for future use

Peer_Identity_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public or Random (static) Identity Address of the peer device

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Peer_Resolvable_Address command succeeded
0x01 to 0xFF	HCI_LE_Read_Peer_Resolvable_Address command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Peer_Resolvable_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Resolvable Private Address being used by the peer device

Event(s) generated (unless masked away):

When the HCI_LE_Read_Peer_Resolvable_Address command has completed, an HCI_Command_Complete event shall be generated.

7.8.43 LE Read Local Resolvable Address command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Local_-Resolvable_Address	0x002C	Peer_Identity_Address_Type, Peer_Identity_Address	Status, Local_Resolvable_Address

Description:

This command is used to get the current local Resolvable Private Address being used for the corresponding peer Identity Address. The local resolvable address being used may change after the command is called.

This command may be used at any time.

When a Controller cannot find a Resolvable Private Address associated with the Peer Identity Address, or if the Peer Identity Address cannot be found in the resolving list, it shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Peer_Identity_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Identity Address
0x01	Random (static) Identity Address
All other values	Reserved for future use

Peer_Identity_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Identity Address or Random (static) Identity Address of the peer device, 48 bit value.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Local_Resolvable_Address command succeeded
0x01 to 0xFF	HCI_LE_Read_Local_Resolvable_Address command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Local_Resolvable_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Resolvable Private Address being used by the local device

Event(s) generated (unless masked away):

When the HCI_LE_Read_Local_Resolvable_Address command has completed, an HCI_Command_Complete event shall be generated.

7.8.44 LE Set Address Resolution Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Address_Resolution_-Enable	0x002D	Address_Resolution_Enable	Status

Description:

This command is used to enable resolution of Resolvable Private Addresses in the Controller. This causes the Controller to use the resolving list whenever the Controller receives a local or peer Resolvable Private Address.

This command shall not be used when:

- Advertising (other than periodic advertising) is enabled,
- Scanning is enabled, or
- an HCI_LE_Create_Connection, HCI_LE_Extended_Create_Connection, or HCI_LE_Periodic_Advertising_Create_Sync command is pending.

Enabling address resolution when it is already enabled, or disabling it when it is already disabled, has no effect.

The requirements in [Vol 6] Part B, Section 6 related to the generation of Resolvable Private Addresses and the privacy of the device are independent of this command.

Command parameters:

Address_Resolution_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Address Resolution in Controller disabled (default)
0x01	Address Resolution in Controller enabled
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Address_Resolution_Enable command succeeded
0x01 to 0xFF	HCI_LE_Set_Address_Resolution_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Address_Resolution_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.8.45 LE Set Resolvable Private Address Timeout command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Resolvable_Private_Address_Timeout [v2]	0x009E	RPA_Timeout_Min, RPA_Timeout_Max	Status
HCI_LE_Set_Resolvable_Private_Address_Timeout [v1]	0x002E	RPA_Timeout	Status

Description:

Version [v1] of this command sets the length of time the Controller uses a Resolvable Private Address before a new Resolvable Private Address is generated and starts being used.

Version [v2] of this command sets the range of time the Controller uses a Resolvable Private Address before a new Resolvable Private Address is generated and starts being used.

This timeout applies to all resolvable private addresses generated by the Controller.

The RPA_Timeout parameter specifies the time after which a new Resolvable Private Address shall start being used.

The RPA_Timeout_Min parameter specifies the minimum time after which a new Resolvable Private Address shall start being used.

The RPA_Timeout_Max parameter specifies the maximum time after which a new Resolvable Private Address shall start being used.

When the Controller supports the HCI_LE_Set_Resolvable_Private_Address_Timeout [v2] command and needs to set a new timeout (e.g., when the RPA is set for the first time, or when the current timeout expires), the new timeout shall be a random value between RPA_Timeout_Min and RPA_Timeout_Max generated so as to meet the requirements for random number generation defined in [Vol 2] Part H, Section 2.

If RPA_Timeout_Min is greater than RPA_Timeout_Max, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

RPA_Timeout: *Size: 2 octets*

Value	Parameter Description
0xXXXX	RPA timeout, in seconds Range: 0x0001 to 0x0E10 Time range: 1 s to 1 hour Default: 0x0384 (900 s or 15 minutes)

RPA_Timeout_Min: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum RPA timeout, in seconds Range: 0x0001 to 0x0E10 Time range: 1 s to 1 hour Default: 0x01E0 (480 s or 8 minutes)

RPA_Timeout_Max: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum RPA timeout, in seconds Range: 0x0001 to 0x0E10 Time range: 1 s to 1 hour Default: 0x0384 (900 s or 15 minutes)

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Resolvable_Private_Address_Timeout command succeeded
0x01 to 0xFF	HCI_LE_Set_Resolvable_Private_Address_Timeout command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Resolvable_Private_Address_Timeout command has completed, an HCI_Command_Complete event shall be generated.

7.8.46 LE Read Maximum Data Length command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Maximum_Data_-Length	0x002F	*none*	Status, Supported_Max_TX_Octets, Supported_Max_TX_Time, Supported_Max_RX_Octets, Supported_Max_RX_Time

Description:

This command allows the Host to read the Controller's maximum supported payload octets and packet duration times for transmission and reception (Supported_Max_TX_Octets, Supported_Max_TX_Time, Supported_Max_RX_Octets, and Supported_Max_RX_Time, see [Vol 6] Part B, Section 4.5.10).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Maximum_Data_Length command succeeded.
0x01 to 0xFF	HCI_LE_Read_Maximum_Data_Length command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Supported_Max_TX_Octets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum number of payload octets that the local Controller supports for transmission of a single Link Layer packet on an ACL connection. Range 0x001B to 0x00FB

Supported_Max_TX_Time: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum time, in microseconds, that the local Controller supports for transmission of a single Link Layer packet on an ACL connection. Range 0x0148 to 0x4290

Supported_Max_RX_Octets: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum number of payload octets that the local Controller supports for reception of a single Link Layer packet on an ACL connection. Range 0x001B to 0x00FB

Supported_Max_RX_Time: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum time, in microseconds, that the local Controller supports for reception of a single Link Layer packet on an ACL connection. Range 0x0148 to 0x4290

Event(s) generated (unless masked away):

When the HCI_LE_Read_Maximum_Data_Length command has completed, an HCI_Command_Complete event shall be generated.

7.8.47 LE Read PHY command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_PHY	0x0030	Connection_Handle	Status, Connection_Handle, TX_PHY, RX_PHY

Description:

This command is used to read the current transmitter PHY and receiver PHY on the connection identified by the Connection_Handle.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range:0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_PHY command succeeded.
0x01 to 0xFF	HCI_LE_Read_PHY command failed. See [Vol 1] Part F for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range:0x0000 to 0x0EFF

TX_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	The transmitter PHY for the connection is LE 1M
0x02	The transmitter PHY for the connection is LE 2M

Value	Parameter Description
0x03	The transmitter PHY for the connection is LE Coded
All other values	Reserved for future use

RX_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	The receiver PHY for the connection is LE 1M
0x02	The receiver PHY for the connection is LE 2M
0x03	The receiver PHY for the connection is LE Coded
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_Read_PHY command has completed, an HCI_Command_Complete event shall be generated.

7.8.48 LE Set Default PHY command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Default_PHY	0x0031	All_PHYs, TX_PHYs, RX_PHYs	Status

Description:

This command allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

The All_PHYs parameter is a bit field that allows the Host to specify, for each direction, whether it has no preference among the PHYs that the Controller supports in a given direction or whether it has specified particular PHYs that it prefers in the TX_PHYs or RX_PHYs parameter.

The TX_PHYs parameter is a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use. If the All_PHYs parameter specifies that the Host has no preference, the TX_PHYs parameter shall be ignored; otherwise at least one bit shall be set to 1.

The RX_PHYs parameter is a bit field that indicates the receiver PHYs that the Host prefers the Controller to use. If the All_PHYs parameter specifies that the Host has no preference, the RX_PHYs parameter shall be ignored; otherwise at least one bit shall be set to 1.

If the Host sets, in the TX_PHYs or RX_PHYs parameter, a bit for a PHY that the Controller does not support, including a bit that is reserved for future use, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller does not support asymmetric connections (see [Vol 6] Part B, Section 4.6.9.1) and the Host sets All_PHYs to 0x00 and TX_PHYs to a different value than RX_PHYs, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Command parameters:

All_PHYs: *Size: 1 octet*

Bit Number	Parameter Description
0	The Host has no preference among the transmitter PHYs supported by the Controller
1	The Host has no preference among the receiver PHYs supported by the Controller
All other bits	Reserved for future use

TX_PHYs: *Size: 1 octet*

Bit Number	Parameter Description
0	The Host prefers to use the LE 1M transmitter PHY (possibly among others)
1	The Host prefers to use the LE 2M transmitter PHY (possibly among others)
2	The Host prefers to use the LE Coded transmitter PHY (possibly among others)
All other bits	Reserved for future use

RX_PHYs: *Size: 1 octet*

Bit Number	Parameter Description
0	The Host prefers to use the LE 1M receiver PHY (possibly among others)
1	The Host prefers to use the LE 2M receiver PHY (possibly among others)
2	The Host prefers to use the LE Coded receiver PHY (possibly among others)
All other bits	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Default_PHY command succeeded.
0x01 to 0xFF	HCI_LE_Set_Default_PHY command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Event(s) generated (unless masked away):

When the HCI_LE_Set_Default_PHY command has completed, an HCI_Command_Complete event shall be generated.

7.8.49 LE Set PHY command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_PHY	0x0032	Connection_Handle, All_PHYs, TX_PHYs, RX_PHYs, PHY_Options	*none*

Description:

This command is used to set the PHY preferences for the connection identified by the Connection_Handle. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable (e.g., because it could not schedule other activities if the requested PHY was used or because it requires a PHY that supports Constant Tone Extensions).

The All_PHYs parameter is a bit field that allows the Host to specify, for each direction, whether it has no preference among the PHYs that the Controller supports in a given direction or whether it has specified particular PHYs that it prefers in the TX_PHYs or RX_PHYs parameter.

The TX_PHYs parameter is a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use. If the All_PHYs parameter specifies that the Host has no preference, the TX_PHYs parameter shall be ignored; otherwise at least one bit shall be set to 1.

The RX_PHYs parameter is a bit field that indicates the receiver PHYs that the Host prefers the Controller to use. If the All_PHYs parameter specifies that the Host has no preference, the RX_PHYs parameter shall be ignored; otherwise at least one bit shall be set to 1.

The Controller shall request a change unless it determines that this is unnecessary or that the current PHY is preferable, in which case it may, but need not, request a change.

The PHY preferences provided by the HCI_LE_Set_PHY command override those provided via the HCI_LE_Set_Default_PHY command (Section 7.8.48) or any preferences previously set using the HCI_LE_Set_PHY command on the same connection.

The PHY_Options parameter is a bit field that allows the Host to specify options for PHYs. The default value for a new connection shall be all zero bits. The Controller may override any preferred coding for transmitting on the LE Coded PHY.

The Host may specify a preferred coding even if it prefers not to use the LE Coded transmitter PHY since the Controller may override the PHY preference.

If the Host sets, in the TX_PHYs or RX_PHYs parameter, a bit for a PHY that the Controller does not support, including a bit that is reserved for future use, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller does not support asymmetric connections (see [Vol 6] Part B, Section 4.6.9.1) and the Host sets All_PHYs to 0x00 and TX_PHYs to a different value than RX_PHYs, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

All_PHYs: *Size: 1 octet*

Bit Number	Parameter Description
0	The Host has no preference among the transmitter PHYs supported by the Controller
1	The Host has no preference among the receiver PHYs supported by the Controller
All other bits	Reserved for future use

TX_PHYs: *Size: 1 octet*

Bit Number	Parameter Description
0	The Host prefers to use the LE 1M transmitter PHY (possibly among others)
1	The Host prefers to use the LE 2M transmitter PHY (possibly among others)
2	The Host prefers to use the LE Coded transmitter PHY (possibly among others)
All other bits	Reserved for future use

RX_PHYs: *Size: 1 octet*

Bit Number	Parameter Description
0	The Host prefers to use the LE 1M receiver PHY (possibly among others)
1	The Host prefers to use the LE 2M receiver PHY (possibly among others)
2	The Host prefers to use the LE Coded receiver PHY (possibly among others)
All other bits	Reserved for future use

PHY_Options: *Size: 2 octets*

Bit Number	Parameter Description
0 to 1	0 = the Host has no preferred coding when transmitting on the LE Coded PHY 1 = the Host prefers that S=2 coding be used when transmitting on the LE Coded PHY 2 = the Host prefers that S=8 coding be used when transmitting on the LE Coded PHY 3 = Reserved for future use
All other bits	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Set_PHY command, the Controller shall send the HCI_Command_Status event to the Host. The HCI_LE_PHY_Update_Complete event shall be generated either when one or both PHY changes or when the Controller determines that neither PHY will change immediately.

Note: If the peer negotiation resulted in no change to either PHY, this is not an error and the HCI_LE_PHY_Update_Complete event will contain a status indicating success.

7.8.50 [This section is no longer used]

See Section 7.8.28 for the LE Receiver Test command.

7.8.51 [This section is no longer used]

See Section 7.8.29 for the LE Transmitter Test command.

7.8.52 LE Set Advertising Set Random Address command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Advertising_Set_Random_-Address	0x0035	Advertising_Handle, Random_Address	Status

Description:

This command is used by the Host to set the random device address specified by the Random_Address parameter. This address is used in the Controller (see [Vol 6] Part B, Section 1.3.2) for the advertiser's address contained in the advertising PDUs for the advertising set specified by the Advertising_Handle parameter.

This command may be issued at any time after an advertising set identified by the Advertising_Handle parameter has been created using the HCI_LE_Set_Extended_Advertising_Parameters command (see Section 7.8.53). However, if the Host issues this command while the advertising set identified by the Advertising_Handle parameter is using connectable advertising and is enabled, the Controller shall return the error code *Command Disallowed* (0x0C).

If this command is used to change the address, the new random address shall take effect for advertising no later than the next successful HCI_LE_Set_Extended_Advertising_Enable command and for periodic advertising no later than the next successful HCI_LE_Periodic_Advertising_Enable command.

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Random_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Random Device Address as defined by [Vol 6] Part B, Section 1.3.2

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Advertising_Set_Random_Address command succeeded
0x01 to 0xFF	HCI_LE_Set_Advertising_Set_Random_Address command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Event(s) generated (unless masked away):

When the HCI_LE_Set_Advertising_Set_Random_Address command has completed, an HCI_Command_Complete event shall be generated.

7.8.53 LE Set Extended Advertising Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Extended_-Advertising_Parameters [v2]	0x007F	Advertising_Handle, Advertising_Event_Properties, Primary_Advertising_Interval_Min, Primary_Advertising_Interval_Max, Primary_Advertising_Channel_Map, Own_Address_Type, Peer_Address_Type, Peer_Address, Advertising_Filter_Policy, Advertising_TX_Power, Primary_Advertising_PHY, Secondary_Advertising_Max_Skip, Secondary_Advertising_PHY, Advertising_SID, Scan_Request_Notification_Enable Primary_Advertising_PHY_Options, Secondary_Advertising_PHY_Options	Status, Selected_TX_Power
HCI_LE_Set_Extended_-Advertising_Parameters [v1]	0x0036	Advertising_Handle, Advertising_Event_Properties, Primary_Advertising_Interval_Min, Primary_Advertising_Interval_Max, Primary_Advertising_Channel_Map, Own_Address_Type, Peer_Address_Type, Peer_Address, Advertising_Filter_Policy, Advertising_TX_Power, Primary_Advertising_PHY, Secondary_Advertising_Max_Skip, Secondary_Advertising_PHY, Advertising_SID, Scan_Request_Notification_Enable	Status, Selected_TX_Power

Description:

This command is used by the Host to set the advertising parameters.

The Advertising_Handle parameter identifies the advertising set whose parameters are being configured.

The Advertising_Event_Properties parameter describes the type of advertising event that is being configured and its basic properties. The type shall be one supported by the Controller. In particular, the following restrictions apply to this parameter:

- If legacy advertising PDU types are being used, then the parameter value shall be one of those specified in Table 7.3. If the advertising set already contains data, the type shall be one that supports advertising data and the amount of data shall not exceed 31 octets.

Event Type	PDU Type	Advertising Event Properties	Advertising Data
Connectable and scannable undirected	ADV_IND	0b00000000_00010011	Supported
Connectable directed (low duty cycle)	ADV_DIRECT_IND	0b00000000_00010101	Not allowed
Connectable directed (high duty cycle)	ADV_DIRECT_IND	0b00000000_00011101	Not allowed
Scannable undirected	ADV_SCAN_IND	0b00000000_00010010	Supported
Non-connectable and non-scannable undirected	ADV_NON-CONN_IND	0b00000000_00010000	Supported

Table 7.3: Advertising_Event_Properties values for legacy PDUs

- If extended advertising PDU types are being used (bit 4 = 0), then the advertisement shall not be both connectable and scannable (bits 0 and 1 must not both be set to 1) and high duty cycle directed connectable advertising (≤ 3.75 ms advertising interval) shall not be used (bit 3 = 0).

If the Advertising_Event_Properties parameter does not describe an event type supported by the Controller, contains an invalid bit combination, or specifies a type that does not support advertising data when the advertising set already contains some, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

The parameters beginning with “Secondary” are only valid when extended advertising PDU types are being used (bit 4 = 0).

The Own_Address_Type parameter shall be ignored for undirected anonymous advertising (bit 2 = 0 and bit 5 = 1).

If Directed advertising is selected, the Peer_Address_Type and Peer_Address shall be valid and the Advertising_Filter_Policy parameter shall be ignored.

The Primary_Advertising_Interval_Min parameter shall be less than or equal to the Primary_Advertising_Interval_Max parameter. The Primary_Advertising_Interval_Min and Primary_Advertising_Interval_Max parameters should not be the same value so that the Controller can choose the best advertising interval given other activities.

For high duty cycle connectable directed advertising event type (ADV_DIRECT_IND), the Primary_Advertising_Interval_Min and Primary_Advertising_Interval_Max parameters are not used and shall be ignored.

If the primary advertising interval range provided by the Host (Primary_Advertising_Interval_Min, Primary_Advertising_Interval_Max) does not overlap with the advertising interval range supported by the Controller, then the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Primary_Advertising_Channel_Map is a bit field that indicates the advertising channel indices that shall be used when transmitting advertising packets. At least one channel bit shall be set in the Primary_Advertising_Channel_Map parameter.

The Own_Address_Type parameter specifies the type of address being used in the advertising packets. For random addresses, the address is specified by the HCI_LE_Set_Advertising_Set_Random_Address command.

If Own_Address_Type equals 0x02 or 0x03, the Peer_Address parameter contains the peer's Identity Address and the Peer_Address_Type parameter contains the peer's Identity Type (i.e., 0x00 or 0x01). These parameters are used to locate the corresponding local IRK in the resolving list; this IRK is used to generate their own address used in the advertisement.

The Advertising_TX_Power parameter indicates the maximum power level at which the advertising packets are to be transmitted on the advertising physical channels. The Controller shall choose a power level lower than or equal to the one specified by the Host.

The Primary_Advertising_PHY parameter indicates the PHY on which the advertising packets are transmitted on the primary advertising physical channel. If legacy advertising PDUs are being used, the Primary_Advertising_PHY shall indicate the LE 1M PHY. The Secondary_Advertising_PHY parameter indicates the PHY on which the advertising packets are be transmitted on the secondary advertising physical channel. If the Host specifies a PHY that is not supported by the Controller, including a value that is reserved for future use, it should return the error code *Unsupported Feature or Parameter Value* (0x11). If Constant Tone Extensions are enabled for the advertising set

and Secondary_Advertising_PHY specifies a PHY that does not allow Constant Tone Extensions, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Primary_Advertising_PHY indicates the LE Coded PHY, then the Primary_Advertising_PHY_Options shall indicate the Host's preference or requirement concerning coding scheme. Otherwise, Primary_Advertising_PHY_Options shall be ignored. If the Secondary_Advertising_PHY indicates the LE Coded PHY, then the Secondary_Advertising_PHY_Options shall indicate the Host's preference or requirement concerning coding scheme (including for periodic advertising). Otherwise, Secondary_Advertising_PHY_Options shall be ignored. If the Host specifies that it requires a specific coding (i.e., value 0x03 or 0x04) in the Primary_Advertising_PHY_Options or Secondary_Advertising_PHY_Options and the Controller supports the LE Feature (Advertising Coding Selection) but is currently unable to provide all the required settings, then the Controller shall return the error code *Command Disallowed* (0x0C).

The Secondary_Advertising_Max_Skip parameter is the maximum number of advertising events that can be skipped before the AUX_ADV_IND can be sent.

The Advertising_SID parameter specifies the value to be transmitted in the Advertising SID subfield of the ADI field of the Extended Header of those advertising physical channel PDUs that have an ADI field. If the advertising set only uses PDUs that do not contain an ADI field, Advertising_SID shall be ignored.

The Scan_Request_Notification_Enable parameter indicates whether the Controller shall send notifications upon the receipt of a scan request PDU that is in response to an advertisement from the specified advertising set that contains its device address and is from a scanner that is allowed by the advertising filter policy.

The Controller shall set the Selected_TX_Power parameter to the transmit power that it will use for transmitting the advertising packets for the specified advertising set. The Controller shall only change this value if requested by the Host. If the radiated power level will vary between packets (e.g., because of frequency-dependent properties of the transmitter) then the value should be the best estimate of the maximum power used.

If the Host issues this command when advertising is enabled for the specified advertising set, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command when periodic advertising is enabled for the specified advertising set and connectable, scannable, legacy, or anonymous advertising is specified, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If periodic advertising is enabled for the advertising set and the Secondary_Advertising_PHY parameter does not specify the PHY currently being

used for the periodic advertising, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Advertising_Handle does not identify an existing advertising set and the Controller is unable to support a new advertising set at present, the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If the advertising set already contains advertising data or scan response data, extended advertising is being used, and the length of the data is greater than the maximum that the Controller can transmit within the longest possible auxiliary advertising segment consistent with the parameters, the Controller shall return the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

If the Controller does not support the LE Feature (Advertising Coding Selection) and the Host does not set both Primary_Advertising_PHY_Options and Secondary_Advertising_PHY_Options to zero, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Missing parameters:

When a version of this command is issued that does not include all the parameters, the following values shall be used for any missing parameters:

Parameter	Value
Primary_Advertising_PHY_Options	0x00
Secondary_Advertising_PHY_Options	0x00

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Advertising_Event_Properties: *Size: 2 octets*

Bit Number	Parameter Description
0	Connectable advertising
1	Scannable advertising

Bit Number	Parameter Description
2	Directed advertising
3	High Duty Cycle Directed Connectable advertising (≤ 3.75 ms Advertising Interval)
4	Use legacy advertising PDUs
5	Omit advertiser's address from all PDUs ("anonymous advertising")
6	Include TxPower in the extended header of at least one advertising PDU
7	Use decision PDUs when advertising
8	Include AdvA in the extended header of all decision PDUs
9	Include ADI in the extended header of all decision PDUs
All other bits	Reserved for future use

Primary_Advertising_Interval_Min: *Size: 3 octets*

Value	Parameter Description
N = 0xXXXXXX	Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x000020 to 0xFFFFFF Time = N × 0.625 ms Time Range: 20 ms to 10,485.759375 s

Primary_Advertising_Interval_Max: *Size: 3 octets*

Value	Parameter Description
N = 0xXXXXXX	Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x000020 to 0xFFFFFF Time = N × 0.625 ms Time Range: 20 ms to 10,485.759375 s

Primary_Advertising_Channel_Map: *Size: 1 octet*

Bit Number	Parameter Description
0	Channel 37 shall be used
1	Channel 38 shall be used
2	Channel 39 shall be used
All other bits	Reserved for future use

Own_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Controller generates the Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, use the public address.
0x03	Controller generates the Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, use the random address from LE_Set_Advertising_Set_Random_Address.
All other values	Reserved for future use

Peer_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address or Public Identity Address
0x01	Random Device Address or Random (static) Identity Address
All other values	Reserved for future use

Peer_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the device to be connected.

Advertising_Filter_Policy: *Size: 1 octet*

Value	Parameter Description
0x00	Process scan and connection requests from all devices (i.e., the Filter Accept List is not in use)
0x01	Process connection requests from all devices and scan requests only from devices that are in the Filter Accept List.
0x02	Process scan requests from all devices and connection requests only from devices that are in the Filter Accept List.
0x03	Process scan and connection requests only from devices in the Filter Accept List.
All other values	Reserved for future use

Advertising_TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm
0x7F	Host has no preference

Primary_Advertising_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	Primary advertisement PHY is LE 1M
0x03	Primary advertisement PHY is LE Coded
All other values	Reserved for future use

Secondary_Advertising_Max_Skip: *Size: 1 octet*

Value	Parameter Description
0x00	AUX_ADV_IND shall be sent prior to the next advertising event
0x01 to 0xFF	Maximum advertising events the Controller can skip before sending the AUX_ADV_IND packets on the secondary advertising physical channel

Secondary_Advertising_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	Secondary advertisement PHY is LE 1M
0x02	Secondary advertisement PHY is LE 2M
0x03	Secondary advertisement PHY is LE Coded
All other values	Reserved for future use

Advertising_SID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Value of the Advertising SID subfield in the ADI field of the PDU
All other values	Reserved for future use

Scan_Request_Notification_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Scan request notifications disabled
0x01	Scan request notifications enabled
All other values	Reserved for future use

Primary_Advertising_PHY_Options: *Size: 1 octet*

Value	Parameter Description
0x00	The Host has no preferred or required coding when transmitting on the LE Coded PHY
0x01	The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY
0x02	The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY
0x03	The Host requires that S=2 coding be used when transmitting on the LE Coded PHY
0x04	The Host requires that S=8 coding be used when transmitting on the LE Coded PHY
All other values	Reserved for future use

Secondary_Advertising_PHY_Options: *Size: 1 octet*

Value	Parameter Description
0x00	The Host has no preferred or required coding when transmitting on the LE Coded PHY
0x01	The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY
0x02	The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY
0x03	The Host requires that S=2 coding be used when transmitting on the LE Coded PHY
0x04	The Host requires that S=8 coding be used when transmitting on the LE Coded PHY
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Extended_Advertising_Parameters command succeeded
0x01 to 0xFF	HCI_LE_Set_Extended_Advertising_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Selected_TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm

Event(s) generated (unless masked away):

When the HCI_LE_Set_Extended_Advertising_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.54 LE Set Extended Advertising Data command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Extended_Advertising_-Data	0x0037	Advertising_Handle, Operation, Fragment_Preference, Advertising_Data_Length, Advertising_Data	Status

Description:

This command is used to set the data used in advertising PDUs that have a data field. This command may be issued at any time after an advertising set identified by the Advertising_Handle parameter has been created using the HCI_LE_Set_Extended_Advertising_Parameters command (see Section 7.8.53), regardless of whether advertising in that set is enabled or disabled.

If advertising is currently enabled for the specified advertising set, the Controller shall use the new data in subsequent extended advertising events for this advertising set. If an extended advertising event is in progress when this command is issued, the Controller may use the old or new data for that event.

If advertising is currently disabled for the specified advertising set, the data shall be kept by the Controller and used once advertising is enabled for that set. The data shall be discarded when the advertising set is removed.

Only the significant part of the advertising data should be transmitted in the advertising packets as defined in [Vol 3] Part C, Section 11.

The Host may set the advertising data in one or more operations using the Operation parameter in the command. If the combined length of the data exceeds the capacity of the advertising set identified by the Advertising_Handle parameter (see Section 7.8.57 LE Read Maximum Advertising Data Length command) or the amount of memory currently available, all the data shall be discarded and the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If the advertising set uses extended advertising and the combined length of the data is greater than the maximum that the Controller can transmit within the longest possible auxiliary advertising segment consistent with the current parameters of the advertising set (using the current advertising interval if advertising is enabled), all the data shall be discarded and the Controller shall return the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

If Operation indicates the start of new data (values 0x01 or 0x03), then any existing partial or complete advertising data shall be discarded.

If the advertising data is discarded by the command or the combined length of the data after the command completes is zero, the advertising set will have no advertising data.

If Operation is 0x04, the behavior is the same as if the current advertising data had been sent again; this can be used to cause the Advertising DID value to be updated (see [Vol 6] Part B, Section 4.4.2.11).

The Fragment_Preference parameter provides a hint to the Controller as to whether advertising data should be fragmented.

If the advertising set specifies a type that does not support advertising data, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the advertising set uses legacy advertising PDUs that support advertising data and either Operation is not 0x03 or the Advertising_Data_Length parameter exceeds 31 octets, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If Operation is 0x04 and:

- advertising is currently disabled for the advertising set;
- the advertising set contains no data;
- the advertising set uses legacy PDUs; or
- Advertising_Data_Length is not zero;

then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If Operation is not 0x03 or 0x04 and Advertising_Data_Length is zero, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If advertising is currently enabled for the specified advertising set and Operation does not have the value 0x03 or 0x04, the Controller shall return the error code *Command Disallowed* (0x0C).

If the advertising set corresponding to the Advertising_Handle parameter does not exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Operation: *Size: 1 octet*

Value	Parameter Description
0x00	Intermediate fragment of fragmented extended advertising data
0x01	First fragment of fragmented extended advertising data
0x02	Last fragment of fragmented extended advertising data
0x03	Complete extended advertising data
0x04	Unchanged data (just update the Advertising DID)
All other values	Reserved for future use

Fragment_Preference: *Size: 1 octet*

Value	Parameter Description
0x00	The Controller may fragment all Host advertising data
0x01	The Controller should not fragment or should minimize fragmentation of Host advertising data
All other values	Reserved for future use

Advertising_Data_Length: *Size: 1 octet*

Value	Parameter Description
0 to 251	The number of octets in the Advertising Data parameter
All other values	Reserved for future use

Advertising_Data: *Size: Advertising_Data_Length octets*

Parameter Description
Advertising data formatted as defined in [Vol 3] Part C, Section 11 Note: This parameter has a variable length.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Extended_Advertising_Data command succeeded
0x01 to 0xFF	HCI_LE_Set_Extended_Advertising_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Event(s) generated (unless masked away):

When the HCI_LE_Set_Extended_Advertising_Data command has completed, an HCI_Command_Complete event shall be generated.

7.8.55 LE Set Extended Scan Response Data command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Extended_Scan_-Response_Data	0x0038	Advertising_Handle, Operation, Fragment_Preference, Scan_Response_Data_Length, Scan_Response_Data	Status

Description:

This command is used to provide scan response data used in scanning response PDUs. This command may be issued at any time after the advertising set identified by the Advertising_Handle parameter has been created using the HCI_LE_Set_Extended_Advertising_Parameters command (see Section 7.8.53) regardless of whether advertising in that set is enabled or disabled.

If advertising is currently enabled for the specified advertising set, the Controller shall use the new data in subsequent extended advertising events for this advertising set. If an extended advertising event is in progress when this command is issued, the Controller may use the old or new data for that event.

If advertising is currently disabled for the specified advertising set, the data shall be kept by the Controller and used once advertising is enabled for that set. The data shall be discarded when the advertising set is removed.

Only the significant part of the scan response data should be transmitted in the advertising packets as defined in [Vol 3] Part C, Section 11.

The Host may set the scan response data in one or more operations using the Operation parameter in the command. If the combined length of the data exceeds the capacity of the advertising set identified by the Advertising_Handle parameter (see Section 7.8.57 LE Read Maximum Advertising Data Length command) or the amount of memory currently available, all the data shall be discarded and the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If Operation indicates the start of new data (values 0x01 or 0x03), then any existing partial or complete scan response data shall be discarded.

If the scan response data is discarded by the command or the combined length of the data after the command completes is zero, the advertising set will have no scan response data.

The Fragment_Preference parameter provides a hint to the Controller as to whether advertising data should be fragmented.

If the advertising set is non-scannable and the Host uses this command other than to discard existing data, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12). If the advertising set uses scannable legacy advertising PDUs and either Operation is not 0x03 or the Scan_Response_Data_Length parameter exceeds 31 octets, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If Operation is not 0x03 and Scan_Response_Data_Length is zero, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If advertising is currently enabled for the specified advertising set and Operation does not have the value 0x03, the Controller shall return the error code *Command Disallowed* (0x0C).

If the advertising set uses extended advertising and the combined length of the data is greater than the maximum that the Controller can transmit within the longest possible auxiliary advertising segment consistent with the current parameters of the advertising set (using the current advertising interval if advertising is enabled), all the data shall be discarded and the Controller shall return the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

If the advertising set uses scannable extended advertising PDUs, advertising is currently enabled for the specified advertising set, and Scan_Response_Data_Length is zero, the Controller shall return the error code *Command Disallowed* (0x0C).

If the advertising set corresponding to the Advertising_Handle parameter does not exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Operation: *Size: 1 octet*

Value	Parameter Description
0x00	Intermediate fragment of fragmented scan response data
0x01	First fragment of fragmented scan response data

Value	Parameter Description
0x02	Last fragment of fragmented scan response data
0x03	Complete scan response data
All other values	Reserved for future use

Fragment_Preference: *Size: 1 octet*

Value	Parameter Description
0x00	The Controller may fragment all scan response data
0x01	The Controller should not fragment or should minimize fragmentation of scan response data
All other values	Reserved for future use

Scan_Response_Data_Length: *Size: 1 octet*

Value	Parameter Description
0 to 251	The number of octets in the Scan_Response Data parameter
All other values	Reserved for future use

Scan_Response_Data: *Size: Scan_Response_Data_Length octets*

Parameter Description
Scan response data formatted as defined in [Vol 3] Part C, Section 11 Note: This parameter has a variable length.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Extended_Scan_Response_Data command succeeded
0x01 to 0xFF	HCI_LE_Set_Extended_Scan_Response_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Event(s) generated (unless masked away):

When the HCI_LE_Set_Extended_Scan_Response_Data command has completed, an HCI_Command_Complete event shall be generated.

7.8.56 LE Set Extended Advertising Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Extended_-Advertising_Enable	0x0039	Enable, Num_Sets, Advertising_Handle[i], Duration[i], Max_Extended_Advertising_Events[i]	Status

Description:

This command is used to request the Controller to enable or disable one or more advertising sets using the advertising sets identified by the Advertising_Handle[i] parameter. The Controller manages the timing of advertisements in accordance with the advertising parameters given in the HCI_LE_Set_Extended_Advertising_Parameters command. The Num_Sets parameter is the number of advertising sets contained in the parameter arrays. If Enable and Num_Sets are both set to 0x00, then all advertising sets are disabled.

The Controller shall only start an advertising event when the corresponding advertising set is enabled. The Controller shall continue advertising until all advertising sets have been disabled. An advertising set shall be disabled when the Host issues an HCI_LE_Set_Extended_Advertising_Enable command with the Enable parameter set to 0x00 (Advertising is disabled), a connection is created using that advertising set, the duration specified in the Duration[i] parameter expires, or the number of extended advertising events transmitted for the set exceeds the Max_Extended_Advertising_Events[i] parameter.

The Duration[i] parameter indicates the duration for which that advertising set is enabled. The duration begins at the start of the first advertising event of this advertising set. The Controller should not start an extended advertising event that it cannot complete within the duration.

If the advertising is high duty cycle connectable directed advertising, then Duration[i] shall be less than or equal to 1.28 seconds and shall not be equal to 0.

The Max_Extended_Advertising_Events[i] parameter, if non-zero, indicates the maximum number of extended advertising events that shall be sent prior to disabling the extended advertising set even if the Duration[i] parameter has not expired.

Duration[i] and Max_Extended_Advertising_Events[i] shall be ignored when Enable is set to 0x00.

If the HCI_LE_Set_Extended_Advertising_Enable command is sent again for an advertising set while that set is enabled, the timer used for the duration and the number of events counter are reset and any change to the random address shall take effect.

Disabling the advertising set identified by the Advertising_Handle[i] parameter does not disable any periodic advertising associated with that set.

Disabling an advertising set that is already disabled has no effect.

If the same advertising set is identified by more than one entry in the Advertising_Handle[i] arrayed parameter, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the advertising set corresponding to the Advertising_Handle[i] parameter does not exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

The remainder of this section only applies if Enable is set to 0x01.

If the Controller does not have enough resources to schedule all the advertising sets in the command, the Controller should return an error code which should be *Connection Rejected due to Limited Resources* (0x0D).

If Num_Sets is set to 0x00, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the advertising set contains partial advertising data or partial scan response data, the Controller shall return the error code *Command Disallowed* (0x0C).

If the advertising set uses scannable extended advertising PDUs and no scan response data is currently provided, the Controller shall return the error code *Command Disallowed* (0x0C).

If the advertising set uses connectable extended advertising PDUs and the advertising data in the advertising set will not fit in the AUX_ADV_IND PDU, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Note: The maximum amount of data that will fit in the PDU depends on which options are selected and on the maximum length of PDU that the Controller is able to transmit.

If extended advertising is being used and the length of any advertising data or of any scan response data is greater than the maximum that the Controller can transmit within the longest possible auxiliary advertising segment consistent with the chosen advertising interval, the Controller shall return the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, the S=8 coding shall be assumed unless the current

advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

If the advertising set's Own_Address_Type parameter is set to 0x00 and the device does not have a public address, the Controller should return an error code which should be *Invalid HCI Command Parameters* (0x12).

If the advertising set's Own_Address_Type parameter is set to 0x01 and the random address for the advertising set has not been initialized using the HCI_LE_Set_Advertising_Set_Random_Address command, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the advertising set's Own_Address_Type parameter is set to 0x02, the Controller's resolving list did not contain a matching entry, and the device does not have a public address, the Controller should return an error code which should be *Invalid HCI Command Parameters* (0x12).

If the advertising set's Own_Address_Type parameter is set to 0x03, the Controller's resolving list did not contain a matching entry, and the random address for the advertising set has not been initialized using the HCI_LE_Set_Advertising_Set_Random_Address command, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Advertising is disabled
0x01	Advertising is enabled
All other values	Reserved for future use

Num_Sets: *Size: 1 octet*

Value	Parameter Description
0x00	Disable all advertising sets
0x01 to 0x3F	Number of advertising sets to enable or disable
All other values	Reserved for future use

Advertising_Handle[i]: *Size: Num_Sets × 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify an advertising set
All other values	Reserved for future use

Duration[i]: *Size: Num_Sets × 2 octets*

Value	Parameter Description
0x0000	No advertising duration. Advertising to continue until the Host disables it.
N = 0xXXXX	Advertising duration Range: 0x0001 to 0xFFFF Time = N × 10 ms Time Range: 10 ms to 655,350 ms

Max_Extended_Advertising_Events[i]: *Size: Num_Sets × 1 octet*

Value	Parameter Description
0xXX	Maximum number of extended advertising events the Controller shall attempt to send prior to terminating the extended advertising
0x00	No maximum number of advertising events.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Extended_Advertising_Enable command succeeded
0x01 to 0xFF	HCI_LE_Set_Extended_Advertising_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Extended_Advertising_Enable command has completed, an HCI_Command_Complete event shall be generated.

If the Duration[i] parameter is set to a value other than 0x0000, an HCI_LE_Advertising_Set_Terminated event shall be generated when the duration specified in the Duration[i] parameter expires. However, if the advertising set is for high duty cycle connectable directed advertising and no connection is created before the duration expires, an HCI_LE_Connection_Complete or HCI_LE_Enhanced_Connection_Complete event with the Status parameter set to the

error code *Advertising Timeout* (0x3C) may be generated instead of or in addition to the HCI_LE_Advertising_Set_Terminated event. If the Controller generates both events, they may be in either order.

If the Max_Extended_Advertising_Events[i] parameter is set to a value other than 0x00, an HCI_LE_Advertising_Set_Terminated event shall be generated when the maximum number of extended advertising events has been transmitted by the Controller.

If the advertising set is connectable and a connection gets created, an HCI_LE_Connection_Complete or HCI_LE_Enhanced_Connection_Complete event shall be generated followed by an HCI_LE_Advertising_Set_Terminated event with the Status parameter set to 0x00. The Controller should not send any other events in between these two events. If the Controller supports the LE Channel Selection Algorithm #2 feature, then the HCI_LE_Advertising_Set_Terminated event may be immediately preceded or followed by an HCI_LE_Channel_Selection_Algorithm event.

Note: If this command is used to disable advertising at about the same time that a connection is established or the advertising duration expires, there is a possible race condition in that it is possible to receive both an HCI_LE_Connection_Complete, HCI_LE_Enhanced_Connection_Complete, or HCI_LE_Advertising_Set_Terminated event and the HCI_Command_Complete event for this command.

7.8.57 LE Read Maximum Advertising Data Length command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Maximum_-Advertising_Data_Length	0x003A	*none*	Status, Max_Advertising_Data_Length

Description:

This command is used to read the maximum length of data supported by the Controller for use as advertisement data or scan response data in an advertising event or as periodic advertisement data.

Note: The maximum amount may be fragmented across multiple PDUs (see [Vol 6] Part B, Section 2.3.4.9).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Maximum_Advertising_Data_Length command succeeded
0x01 to 0xFF	HCI_LE_Read_Maximum_Advertising_Data_Length command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Max_Advertising_Data_Length: *Size: 2 octets*

Value	Parameter Description
0x001F to 0x0672	Maximum supported advertising data length
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_Read_Maximum_Advertising_Data_Length command has completed, an HCI_Command_Complete event shall be generated.

7.8.58 LE Read Number of Supported Advertising Sets command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Number_of_-Supported_Advertising_Sets	0x003B	*none*	Status, Num_Supported_Advertising_Sets

Description:

This command is used to read the number of advertising sets (including those already created) that the advertising Controller can support at the present time.

Note: The number of advertising sets that can be supported is not fixed and the Controller can change it at any time (e.g., because the memory used to store advertising sets can also be used for other purposes).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Number_of_Supported_Advertising_Sets command succeeded
0x01 to 0xFF	HCI_LE_Read_Number_of_Supported_Advertising_Sets command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_Supported_Advertising_Sets: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xF0	Number of advertising sets supported at the same time
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_Read_Number_of_Supported_Advertising_Sets command has completed, an HCI_Command_Complete event shall be generated.

7.8.59 LE Remove Advertising Set command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remove_Advertising_Set	0x003C	Advertising_Handle	Status

Description:

This command is used to remove an advertising set from the Controller.

If the advertising set corresponding to the Advertising_Handle parameter does not exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42). If advertising or periodic advertising on the advertising set is enabled, then the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Remove_Advertising_Set command succeeded
0x01 to 0xFF	HCI_LE_Remove_Advertising_Set command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Remove_Advertising_Set command has completed, an HCI_Command_Complete event shall be generated.

7.8.60 LE Clear Advertising Sets command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Clear_Advertising_Sets	0x003D	*none*	Status

Description:

This command is used to remove all existing advertising sets from the Controller.

If advertising or periodic advertising is enabled on any advertising set, then the Controller shall return the error code *Command Disallowed* (0x0C).

Note: All advertising sets are cleared on HCI reset.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Clear_Advertising_Sets command succeeded
0x01 to 0xFF	HCI_LE_Clear_Advertising_Sets command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Clear_Advertising_Sets command has completed, an HCI_Command_Complete event shall be generated.

7.8.61 LE Set Periodic Advertising Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Periodic_-Advertising_Parameters [v2]	0x0086	Advertising_Handle, Periodic_Advertising_Interval_Min, Periodic_Advertising_Interval_Max, Periodic_Advertising_Properties, Num_Subevents, Subevent_Interval, Response_Slot_Delay, Response_Slot_Spacing, Num_Response_Slots	Status, Advertising_Handle
HCI_LE_Set_Periodic_-Advertising_Parameters [v1]	0x003E	Advertising_Handle, Periodic_Advertising_Interval_Min, Periodic_Advertising_Interval_Max, Periodic_Advertising_Properties	Status

Description:

This command is used by the Host to set the parameters for periodic advertising.

The Advertising_Handle parameter identifies the advertising set whose periodic advertising parameters are being configured. If the corresponding advertising set does not already exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

The Periodic_Advertising_Interval_Min parameter shall be less than or equal to the Periodic_Advertising_Interval_Max parameter. The Periodic_Advertising_Interval_Min and Periodic_Advertising_Interval_Max parameters should not be the same value to enable the Controller to determine the best advertising interval given other activities.

If the periodic advertising interval range provided by the Host (Periodic_Advertising_-Interval_Min, Periodic_Advertising_Interval_Max) does not overlap with the periodic advertising interval range supported by the Controller, then the Controller shall return an error which should use the error code *Unsupported Feature or Parameter Value* (0x11).

The Periodic_Advertising_Properties parameter indicates which fields should be included in the advertising packet.

The Num_Subevents parameter identifies the number of subevents that shall be transmitted for each periodic advertising event. If the Num_Subevents parameter value

is 0x00, then the Periodic Advertising does not have responses and the Controller shall ignore the Subevent_Interval, Response_Slot_Delay, Response_Slot_Spacing, and Num_Response_Slots parameters. If Num_Subevents is greater than 0, then the Periodic Advertising is PAwR.

The Subevent_Interval parameter identifies the time between the subevents of PAwR. The Subevent_Interval shall be less than or equal to the Periodic_Advertising_Interval_Min divided by the Num_Subevents of the advertising set. If Num_Subevents is set to 1, then the Controller shall ignore Subevent_Interval and uses of Subevent_Interval in the next two paragraphs shall be replaced by Periodic_Advertising_Interval_Max.

The Response_Slot_Delay parameter identifies the time between the start of the advertising packet at the start of a subevent and the start of the first response slot. The Response_Slot_Delay shall be less than the Subevent_Interval.

The Response_Slot_Spacing parameter identifies the time between the start of two consecutive response slots. The Response_Slot_Spacing shall be less than or equal to 10 × (Subevent_Interval − Response_Slot_Delay) ÷ Num_Response_Slots. If the Num_Response_Slots parameter is set to 1, then the Controller shall ignore the Response_Slot_Spacing parameter.

The Num_Response_Slots parameter identifies the number of response slots in a subevent.

If the advertising set identified by the Advertising_Handle specified scannable, connectable, legacy, or anonymous advertising, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command when periodic advertising is enabled for the specified advertising set, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Advertising_Handle does not identify an advertising set that is already configured for periodic advertising and the Controller is unable to support more periodic advertising at present, the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If the advertising set already contains periodic advertising data and the length of the data is greater than the maximum that the Controller can transmit within a periodic advertising interval of Periodic_Advertising_Interval_Max, the Controller shall return the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

Missing parameters:

When a version of this command is issued that does not include all the parameters, the following values shall be used for any missing parameters:

Parameter	Value
Num_Subevents	0
Subevent_Interval	*ignored*
Response_Slot_Delay	*ignored*
Response_Slot_Spacing	*ignored*
Num_Response_Slots	*ignored*

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify a periodic advertising train Range: 0x00 to 0xEF

Periodic_Advertising_Interval_Min: *Size: 2 octets*

Value	Parameter Description
N =0xXXXX	Minimum advertising interval for periodic advertising. Range: 0x0006 to 0xFFFF Time = N × 1.25 ms Time Range: 7.5 ms to 81.91875 s

Periodic_Advertising_Interval_Max: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum advertising interval for periodic advertising. Range: 0x0006 to 0xFFFF Time = N × 1.25 ms Time Range: 7.5 ms to 81.91875 s

Periodic_Advertising_Properties: *Size: 2 octets*

Bit Number	Parameter Description
6	Include TxPower in the advertising PDU
All other bits	Reserved for future use

Num_Subevents: *Size: 1 octet*

Value	Parameter Description
0x00	Periodic Advertising without responses
0xXX	Number of subevents in the PAwR. Range: 0x01 to 0x80

Subevent_Interval: *Size: 1 octet*

Value	Parameter Description
N=0xXX	Interval between subevents. Range: 0x06 to 0xFF Time = N × 1.25 ms Time Range: 7.5 ms to 318.75 ms

Response_Slot_Delay: *Size: 1 octet*

Value	Parameter Description
N=0xXX	Time between the advertising packet in a subevent and the first response slot. Range: 0x01 to 0xFE Time = N × 1.25 ms Time Range: 1.25 ms to 317.5 ms

Response_Slot_Spacing: *Size: 1 octet*

Value	Parameter Description
N=0xXX	Time between response slots. Range: 0x02 to 0xFF Time = N × 0.125 ms Time Range: 0.25 ms to 31.875 ms

Num_Response_Slots: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of subevent response slots. Range: 0x01 to 0xFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Periodic_Advertising_Parameters command succeeded
0x01 to 0xFF	HCI_LE_Set_Periodic_Advertising_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify a periodic advertising train Range: 0x00 to 0xEF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Periodic_Advertising_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.62 LE Set Periodic Advertising Data command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Periodic_Advertising_Data	0x003F	Advertising_Handle, Operation, Advertising_Data_Length, Advertising_Data	Status

Description:

This command is used to set the data used in periodic advertising PDUs. This command may be issued at any time after the advertising set identified by the Advertising_Handle parameter has been configured for periodic advertising using the HCI_LE_Set_Periodic_Advertising_Parameters command (see Section 7.8.61), regardless of whether periodic advertising in that set is enabled or disabled. If the advertising set has not been configured for periodic advertising or has been configured for Periodic Advertising with Responses, then the Controller shall return the error code *Command Disallowed* (0x0C).

If periodic advertising is currently enabled for the specified advertising set, the Controller shall use the new data in subsequent periodic advertising events for this advertising set. If a periodic advertising event is in progress when this command is issued, the Controller may use the old or new data for that event.

If periodic advertising is currently disabled for the specified advertising set, the data shall be kept by the Controller and used once periodic advertising is enabled for that set. The data shall be discarded when the advertising set is removed.

Only the significant part of the periodic advertising data should be transmitted in the advertising packets as defined in [Vol 3] Part C, Section 11.

The Host may set the periodic advertising data in one or more operations using the Operation parameter in the command. If the combined length of the data exceeds the capacity of the advertising set identified by the Advertising_Handle parameter (see Section 7.8.57 LE Read Maximum Advertising Data Length command) or the amount of memory currently available, all the data shall be discarded and the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If the combined length of the data is greater than the maximum that the Controller can transmit within the current periodic advertising interval (if periodic advertising is currently enabled) or the Periodic_Advertising_Interval_Max for the advertising set (if currently disabled), all the data shall be discarded and the Controller shall return the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an

advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

If Operation indicates the start of new data (values 0x01 or 0x03), then any existing partial or complete data shall be discarded.

If Operation is 0x04, then the behavior is the same as if the current periodic advertising data had been sent again; this can be used to cause the Advertising DID value to be updated (see [Vol 6] Part B, Section 4.4.2.11).

If Operation is 0x04 and:

- periodic advertising is currently disabled for the advertising set;
- the periodic advertising set contains no data; or
- Advertising_Data_Length is not zero;

then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If Operation is not 0x03 or 0x04 and Advertising_Data_Length is zero, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the periodic advertising data is discarded by the command or the combined length of the data after the command completes is zero, the advertising set will have no periodic advertising data.

If periodic advertising is currently enabled for the specified advertising set and Operation does not have the value 0x03 or 0x04, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the advertising set corresponding to the Advertising_Handle parameter does not exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Operation: *Size: 1 octet*

Value	Parameter Description
0x00	Intermediate fragment of fragmented periodic advertising data
0x01	First fragment of fragmented periodic advertising data
0x02	Last fragment of fragmented periodic advertising data
0x03	Complete periodic advertising data
0x04	Unchanged data (just update the Advertising DID of the periodic advertising)
All other values	Reserved for future use

Advertising_Data_Length: *Size: 1 octet*

Value	Parameter Description
0 to 252	The number of octets in the Advertising Data parameter
All other values	Reserved for future use

Advertising_Data: *Size: Advertising_Data_Length octets*

Parameter Description
Periodic advertising data formatted as defined in [Vol 3] Part C, Section 11. Note: This parameter has a variable length.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Periodic_Advertising_Data command succeeded
0x01 to 0xFF	HCI_LE_Set_Periodic_Advertising_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Periodic_Advertising_Data command has completed, an HCI_Command_Complete event shall be generated.

7.8.63 LE Set Periodic Advertising Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Periodic_Advertising_Enable	0x0040	Enable, Advertising_Handle	Status

Description:

This command is used to request the Controller to enable or disable the periodic advertising for the advertising set specified by the Advertising_Handle parameter (ordinary advertising is not affected).

If the advertising set is not currently enabled (see the HCI_LE_Set_Extended_Advertising_Enable command), the periodic advertising is not started until the advertising set is enabled. Once the advertising set has been enabled, the Controller shall continue periodic advertising until the Host issues an HCI_LE_Set_Periodic_Advertising_Enable command with bit 0 of Enable set to 0 (periodic advertising is disabled). Disabling the advertising set has no effect on the periodic advertising once the advertising set has been enabled.

The Controller manages the timing of advertisements in accordance with the advertising parameters given in the HCI_LE_Set_Periodic_Advertising_Parameters command.

If the advertising set corresponding to the Advertising_Handle parameter does not exist, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If bit 0 of Enable is set to 1 (periodic advertising is enabled) and the advertising set contains partial periodic advertising data, the Controller shall return the error code *Command Disallowed* (0x0C).

If bit 0 of Enable is set to 1 and the Host has not issued the HCI_LE_Set_Periodic_Advertising_Parameters command for the advertising set, the Controller shall either use vendor-specified parameters or return the error code *Command Disallowed* (0x0C).

If bit 0 of Enable is set to 1 and the length of the periodic advertising data is greater than the maximum that the Controller can transmit within the chosen periodic advertising interval, the Controller shall return the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

If bit 0 of Enable is set to 1 and the advertising set identified by the Advertising_Handle specified scannable, connectable, legacy, or anonymous advertising, the Controller shall return the error code *Command Disallowed* (0x0C).

If bit 0 of Enable is set to 0 and the Controller supports the Periodic Advertising ADI Support feature, then the Controller shall ignore bit 1.

If bit 1 of Enable is set to 1 and the Controller does not support the Periodic Advertising ADI Support feature, the Controller shall return an error which should use the error code *Unsupported Feature or Parameter Value* (0x11).

Enabling periodic advertising when it is already enabled can cause the random address to change. Disabling periodic advertising when it is already disabled has no effect.

Command parameters:

Enable: *Size: 1 octet*

Bit Number	Parameter Description
0	Enable periodic advertising
1	Include the ADI field in AUX_SYNC_IND and AUX_SYNC_SUBEVENT_IND PDUs
All other bits	Reserved for future use

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Periodic_Advertising_Enable command succeeded
0x01 to 0xFF	HCI_LE_Set_Periodic_Advertising_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Periodic_Advertising_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.8.64 LE Set Extended Scan Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Extended_Scan_Parameters	0x0041	Own_Address_Type, Scanning_Filter_Policy, Scanning_PHYs, Scan_Type[i], Scan_Interval[i], Scan_Window[i]	Status

Description:

This command is used to set the extended scan parameters to be used on the advertising physical channels.

The Scanning_PHYs parameter indicates the PHY(s) on which the advertising packets should be received on the primary advertising physical channel. The Host may enable one or more scanning PHYs. If the Host specifies a PHY that is not supported by the Controller, including a bit that is reserved for future use, it should return the error code *Unsupported Feature or Parameter Value* (0x11). The Scan_Type[i], Scan_Interval[i], and Scan_Window[i] parameters array elements are ordered in the same order as the set bits in the Scanning_PHY parameter, starting from bit 0. The number of array elements is determined by the number of bits set in the Scanning_PHY parameter.

The Scan_Type[i] parameter specifies the type of scan to perform.

The Scan_Interval[i] and Scan_Window[i] parameters are recommendations from the Host on how long (Scan_Window[i]) and how frequently (Scan_Interval[i]) the Controller should scan (see [Vol 6] Part B, Section 4.4.3); however the frequency and length of the scan is implementation specific. If the requested scan cannot be supported by the implementation, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

The Own_Address_Type parameter indicates the type of address being used in the scan request packets.

If the Host issues this command when scanning is enabled in the Controller, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Controller does not support the Decision-Based Advertising Filtering feature and the Host issues this command with bits 2 and 3 of Scanning_Filter_Policy set to a value other than 0b00, the Controller shall return an error code which should be *Unsupported Feature or Parameter Value* (0x11).

Command parameters:

Own_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Controller generates the Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, then use the public address.
0x03	Controller generates the Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, then use the random address from LE_Set_Random_Address.
All other values	Reserved for future use

Scanning_Filter_Policy: *Size: 1 octet*

Bit Number	Parameter Description
0	0 = unfiltered scanning policy 1 = filtered scanning policy
1	0 = Basic filter policy 1 = Extended filter policy
2 and 3	Decision scanning filter policy mode: 0b00 = No-decisions mode 0b01 = All-PDUs mode 0b11 = Decisions-only mode
All other bits	Reserved for future use

Scanning_PHYs: *Size: 1 octet*

Bit Number	Parameter Description
0	Scan advertisements on the LE 1M PHY
2	Scan advertisements on the LE Coded PHY
All other bits	Reserved for future use

Scan_Type[i]: *Size: Bits set in Scanning_PHYs × 1 octet*

Value	Parameter Description
0x00	Passive Scanning. No scan request PDUs shall be sent.
0x01	Active Scanning. Scan request PDUs may be sent.
All other values	Reserved for future use

Scan_Interval[i]: *Size: Bits set in Scanning_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	Time interval from when the Controller started its last scan until it begins the subsequent scan on the primary advertising physical channel. Range: 0x0004 to 0xFFFF Time = N × 0.625 ms Time Range: 2.5 ms to 40.959375 s

Scan_Window[i]: *Size: Bits set in Scanning_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	Duration of the scan on the primary advertising physical channel. Range: 0x0004 to 0xFFFF Time = N × 0.625 ms Time Range: 2.5 ms to 40.959375 s

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Extended_Scan_Parameters command succeeded
0x01 to 0xFF	HCI_LE_Set_Extended_Scan_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Extended_Scan_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.65 LE Set Extended Scan Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Extended_Scan_Enable	0x0042	Enable, Filter_Duplicates, Duration, Period	Status

Description:

This command is used to enable or disable scanning for both legacy and extended advertising PDUs.

The Enable parameter determines whether scanning is enabled or disabled. If it is set to 0x00, the remaining parameters shall be ignored.

If Enable is set to 0x01 and the Host has not issued the HCI_LE_Set_Extended_Scan_Parameters command, the Controller shall either use vendor-specified parameters or return the error code *Command Disallowed* (0x0C).

The Filter_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (filtering duplicates enabled) to the Host or if the Link Layer should generate advertising reports for each packet received (filtering duplicates disabled). See [Vol 6] Part B, Section 4.4.3.5.

If the Filter_Duplicates parameter is set to 0x00, all advertisements received from advertisers shall be sent to the Host in advertising report events.

If the Filter_Duplicates parameter is set to 0x01, duplicate advertisements should not be sent to the Host in advertising report events until scanning is disabled.

If the Filter_Duplicates parameter is set to 0x02, duplicate advertisements in a single scan period should not be sent to the Host in advertising report events; this setting shall only be used if both Period and Duration are non-zero. If Filter_Duplicates is set to 0x02 and either Period or Duration to zero, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Duration parameter is zero or both the Duration parameter and Period parameter are non-zero, the Controller shall continue scanning until scanning is disabled by the Host issuing an HCI_LE_Set_Extended_Scan_Enable command with the Enable parameter set to 0x00 (Scanning is disabled). The Period parameter shall be ignored when the Duration parameter is zero.

If the Duration parameter is non-zero and the Period parameter is zero, the Controller shall continue scanning until the duration specified in the Duration parameter has expired.

If both the Duration and Period parameters are non-zero and the Duration is greater than or equal to the Period (comparing the times, not how they are represented), the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

When the Duration and Period parameters are non-zero, the Controller shall scan for the duration of the Duration parameter within a scan period specified by the Period parameter. After the scan period has expired, a new scan period shall begin and scanning shall begin again for the duration specified. The scan periods continue until the Host disables scanning.

If the HCI_LE_Set_Extended_Scan_Enable command with Enable set to 0x01 is sent while scanning is already enabled, the timers used for duration and period are reset to the new parameter values and a new scan period is started. Any change to the Filter_Duplicates setting or the random address shall take effect.

Disabling scanning when it is disabled has no effect.

Note: The duration of a scan period refers to the time spent scanning on both the primary and secondary advertising physical channels. However, expiry of the duration does not prevent the Link Layer from scanning for and receiving auxiliary packets of received advertisements.

If Enable is set to 0x01, the scanning parameters' Own_Address_Type parameter is set to 0x00 or 0x02, and the device does not have a public address, the Controller should return an error code which should be *Invalid HCI Command Parameters* (0x12).

If Enable is set to 0x01, the scanning parameters' Own_Address_Type parameter is set to 0x01 or 0x03, and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Scanning disabled
0x01	Scanning enabled
All other values	Reserved for future use

Filter_Duplicates: *Size: 1 octet*

Value	Parameter Description
0x00	Duplicate filtering disabled
0x01	Duplicate filtering enabled
0x02	Duplicate filtering enabled, reset for each scan period
All other values	Reserved for future use

Duration: *Size: 2 octets*

Value	Parameter Description
0x0000	Scan continuously until explicitly disable
N = 0xXXXX	Scan duration Range: 0x0001 to 0xFFFF Time = N × 10 ms Time Range: 10 ms to 655.35 s

Period: *Size: 2 octets*

Value	Parameter Description
0x0000	Scan continuously
N = 0xXXXX	Time interval from when the Controller started its last Scan_Duration until it begins the subsequent Scan_Duration. Range: 0x0001 to 0xFFFF Time = N × 1.28 sec Time Range: 1.28 s to 83,884.8 s

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Extended_Scan_Enable command succeeded
0x01 to 0xFF	HCI_LE_Set_Extended_Scan_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Extended_Scan_Enable command has completed, an HCI_Command_Complete event shall be generated.

Zero or more LE Extended Advertising Reports are generated by the Controller based on any advertising packets received and the duplicate filtering in effect. More than one advertising packet may be reported in each HCI_LE_Extended_Advertising_Report event.

At the end of a single scan (Duration non-zero but Period zero), an HCI_LE_Scan_Timeout event shall be generated.

7.8.66 LE Extended Create Connection command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Extended_Create_Connection [v2]	0x0085	Advertising_Handle, Subevent, Initiator_Filter_Policy, Own_Address_Type, Peer_Address_Type, Peer_Address, Initiating_PHYs, Scan_Interval[i], Scan_Window[i], Connection_Interval_Min[i], Connection_Interval_Max[i], Max_Latency[i], Supervision_Timeout[i], Min_CE_Length[i], Max_CE_Length[i]	*none*
HCI_LE_Extended_Create_Connection [v1]	0x0043	Initiator_Filter_Policy, Own_Address_Type, Peer_Address_Type, Peer_Address, Initiating_PHYs, Scan_Interval[i], Scan_Window[i], Connection_Interval_Min[i], Connection_Interval_Max[i], Max_Latency[i], Supervision_Timeout[i], Min_CE_Length[i], Max_CE_Length[i]	*none*

Description:

This command is used to create an ACL connection, with the local device in the Central role, to a connectable advertiser. The command is also used to create an ACL connection between a periodic advertiser and a synchronized device.

If a connection is created with the local device in the Peripheral role while this command is pending, then this command remains pending.

The Advertising_Handle parameter is used to identify the periodic advertising train.

The Subevent parameter is used to identify the subevent where a connection request shall be initiated from a periodic advertising train. The Host may use this subevent whether or not the Controller has requested data for it using the HCI_LE_Periodic_Advertising_Subevent_Data_Request event.

The Advertising_Handle and Subevent parameters shall be set to 0xFF if these parameters are not used. If the Host sets one but not both of these to 0xFF, then the Controller shall return an error which should use the error code *Invalid HCI Command Parameters* (0x12).

If the Advertising_Handle and Subevent parameters are set to values other than 0xFF, then the Initiator_Filter_Policy, Scan_Interval[i], and Scan_Window[i] parameters shall be ignored.

The Initiator_Filter_Policy parameter is used to determine whether the Filter Accept List is used and whether to process decision PDUs and other advertising PDUs. If the Filter Accept List is not used, the Peer_Address_Type and the Peer_Address parameters specify the address type and address of the advertising device to connect to for advertisements not using decision PDUs. If Initiator_Filter_Policy is set to 0x03, then devices on the Filter Accept List shall still be processed using the decision instructions (see Section 7.8.145).

The Own_Address_Type parameter indicates the type of address being used in the connection request packets.

The Peer_Address_Type parameter indicates the type of address used in the connectable advertisement sent by the peer.

The Peer_Address parameter indicates the Peer's Public Device Address, Random (static) Device Address, Non-Resolvable Private Address, or Resolvable Private Address depending on the Peer_Address_Type parameter.

The Initiating_PHYs parameter indicates the PHY(s) on which the advertising packets should be received on the primary advertising physical channel and the PHYs for which connection parameters have been specified. The Host may enable one or more initiating PHYs. If the Host specifies a PHY that is not supported by the Controller, including a bit that is reserved for future use, the latter should return the error code *Unsupported Feature or Parameter Value* (0x11). If the Host sets Advertising_Handle to a value other than 0xFF and does not include the PHY used for the specified periodic advertising train in Initiating_PHYs, the Controller shall return an error which should use

the error code *Invalid HCI Command Parameters* (0x12). The array elements of the arrayed parameters are ordered in the same order as the set bits in the Initiating_PHYs parameter, starting from bit 0. The number of array elements is determined by the number of bits set in the Initiating_PHYs parameter. When a connectable advertisement is received and a connection request is sent on one PHY, scanning on any other PHYs is terminated.

The Scan_Interval[i] and Scan_Window[i] parameters are recommendations from the Host on how long (Scan_Window[i]) and how frequently (Scan_Interval[i]) the Controller should scan (see [Vol 6] Part B, Section 4.5.3); however the frequency and length of the scan is implementation specific. If the requested scan cannot be supported by the implementation, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12). If bit 1 is set in Initiating_PHYs, the values for the LE 2M PHY shall be ignored.

The Connection_Interval_Min[i] and Connection_Interval_Max[i] parameters define the minimum and maximum allowed connection interval. The Connection_Interval_Min[i] parameter shall not be greater than the Connection_Interval_Max[i] parameter.

The Max_Latency[i] parameter defines the maximum allowed Peripheral latency (see [Vol 6] Part B, Section 4.5.1).

The Supervision_Timeout[i] parameter defines the link supervision timeout for the connection. The Supervision_Timeout[i] in milliseconds shall be larger than (1 + Max_Latency[i]) × Connection_Interval_Max[i] × 2, where Connection_Interval_Max[i] is given in milliseconds (see [Vol 6] Part B, Section 4.5.2).

The Min_CE_Length[i] and Max_CE_Length[i] parameters provide the Controller with the expected minimum and maximum length of the connection events. The Min_CE_Length[i] parameter shall be less than or equal to the Max_CE_Length[i] parameter. The Controller is not required to use these values.

Where the connection is made on a PHY whose bit is not set in the Initiating_PHYs parameter, the Controller shall use the Connection_Interval_Min[i], Connection_Interval_Max[i], Max_Latency[i], Supervision_Timeout[i], Min_CE_Length[i], and Max_CE_Length[i] parameters for an implementation-chosen PHY whose bit is set in the Initiating_PHYs parameter.

If the Host issues this command when another HCI_LE_Extended_Create_Connection command is pending in the Controller, the Controller shall return the error code *Command Disallowed* (0x0C).

If the local device is already connected to the same device address as the advertiser (including two different Resolvable Private Addresses that resolve to the same IRK),

then the Controller shall return an error which should use the error code *Connection Already Exists* (0x0B).

If the Own_Address_Type parameter is set to 0x00 and the device does not have a public address, the Controller should return an error code which should be *Invalid HCI Command Parameters* (0x12).

If the Own_Address_Type parameter is set to 0x01 and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Own_Address_Type parameter is set to 0x02, the Initiator_Filter_Policy parameter is set to 0x00, the Controller's resolving list did not contain a matching entry, and the device does not have a public address, the Controller should return an error code which should be *Invalid HCI Command Parameters* (0x12).

If the Own_Address_Type parameter is set to 0x02, the Initiator_Filter_Policy parameter is not set to 0x00, and the device does not have a public address, the Controller should return an error code which should be *Invalid HCI Command Parameters* (0x12).

If the Own_Address_Type parameter is set to 0x03, the Initiator_Filter_Policy parameter is set to 0x00, the Controller's resolving list did not contain a matching entry, and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Own_Address_Type parameter is set to 0x03, the Initiator_Filter_Policy parameter is not set to 0x00, and the random address for the device has not been initialized using the HCI_LE_Set_Random_Address command, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Initiating_PHYs parameter does not have at least one bit set for a PHY allowed for scanning on the primary advertising physical channel, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command and the Controller has insufficient resources to handle any more connections, the Controller shall return the error code *Rejected due to Limited Resources* (0x0D).

If the Controller does not support the Decision-Based Advertising Filtering feature and the Host issues this command with Initiator_Filter_Policy set to a value other than 0x00 or 0x01, the Controller shall return an error code which should be *Unsupported Feature or Parameter Value* (0x11).

Missing parameters:

When a version of this command is issued that does not include all the parameters, the following values shall be used for any missing parameters:

Parameter	Value
Advertising_Handle	0xFF
Subevent	0xFF

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Advertising_Handle identifying the periodic advertising train Range: 0x00 to 0xEF or 0xFF

Subevent: *Size: 1 octet*

Value	Parameter Description
0xXX	Subevent where the connection request is to be sent. Range: 0x00 to 0x7F or 0xFF

Initiator_Filter_Policy: *Size: 1 octet*

Value	Parameter Description
0x00	Filter Accept List is not used to determine which advertiser to connect to. Decision PDUs shall be ignored. Peer_Address_Type and Peer_Address shall be used.
0x01	Filter Accept List is used to determine which advertiser to connect to. Decision PDUs shall be ignored. Peer_Address_Type and Peer_Address shall be ignored.
0x02	Filter Accept List is not used to determine which advertiser to connect to. Only Decision PDUs shall be processed. Peer_Address_Type and Peer_Address shall be ignored.
0x03	Filter Accept List is used to determine which advertiser to connect to. All PDUs shall be processed. Peer_Address_Type and Peer_Address shall be ignored.
0x04	All decision PDUs shall be processed. Filter Accept List is used to determine which other PDUs to process. Peer_Address_Type and Peer_Address shall be ignored.
All other values	Reserved for future use

Own_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
0x02	Controller generates the Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, then use the public address.
0x03	Controller generates the Resolvable Private Address based on the local IRK from the resolving list. If the resolving list contains no matching entry, then use the random address from the most recent successful HCI_LE_Set_Random_Address command.
All other values	Reserved for future use

Peer_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address or Public Identity Address
0x01	Random Device Address or Random (static) Identity Address
All other values	Reserved for future use

Peer_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the device to be connected.

Initiating_PHYs: *Size: 1 octet*

Bit Number	Parameter Description
0	Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
1	Connection parameters for the LE 2M PHY are provided.
2	Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.
All other bits	Reserved for future use

Scan_Interval[i]: *Size: Bits set in Initiating_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	Time interval from when the Controller started its last scan until it begins the subsequent scan on the primary advertising physical channel. Range: 0x0004 to 0xFFFF Time = N × 0.625 ms Time Range: 2.5 ms to 40.959375 s

Scan_Window[i]: *Size: Bits set in Initiating_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	Duration of the scan on the primary advertising physical channel. Range: 0x0004 to 0xFFFF Time = N × 0.625 ms Time Range: 2.5 ms to 40.959375 s

Connection_Interval_Min[i]: *Size: Bits set in Initiating_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	Minimum value for the connection interval. This shall be less than or equal to Connection_Interval_Max[i]. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s
All other values	Reserved for future use

Connection_Interval_Max[i]: *Size: Bits set in Initiating_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum value for the connection interval. This shall be greater than or equal to Connection_Interval_Min[i]. Range: 0x0006 to 0x0C80 Time = N × 1.25 ms Time Range: 7.5 ms to 4 s
All other values	Reserved for future use

Max_Latency[i]: *Size: Bits set in Initiating_PHYs × 2 octets*

Value	Parameter Description
0xXXXX	Maximum Peripheral latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
All other values	Reserved for future use

Supervision_Timeout[i]: *Size: Bits set in Initiating_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	Supervision timeout for the LE Link. (See [Vol 6] Part B, Section 4.5.2) Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s
All other values	Reserved for future use

Min_CE_Length[i]: *Size: Bits set in Initiating_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	The minimum length of connection event recommended for this LE connection. Range: 0x0000 to 0xFFFF Time = N × 0.625 ms

Max_CE_Length[i]: *Size: Bits set in Initiating_PHYs × 2 octets*

Value	Parameter Description
N = 0xXXXX	The maximum length of connection event recommended for this LE connection. Range: 0x0000 to 0xFFFF Time = N × 0.625 ms

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Extended_Create_Connection command, the Controller sends the HCI_Command_Status event to the Host. An HCI_LE_Enhanced_Connection_Complete event shall be generated when a connection is created because of this command or the connection creation procedure is cancelled; until the event is generated, the command is considered pending. If a connection creation is discarded, then the error code *Connection Failed to be*

Established / Synchronization Timeout (0x3E) shall be used. If a connection is created, this event shall be immediately followed by an HCI_LE_Channel_Selection_Algorithm event.

7.8.67 LE Periodic Advertising Create Sync command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Periodic_Advertising_Create_-Sync	0x0044	Options, Advertising_SID, Advertiser_Address_Type, Advertiser_Address, Skip, Sync_Timeout, Sync_CTE_Type	*none*

Description:

This command is used to synchronize with a periodic advertising train from an advertiser and begin receiving periodic advertising packets.

This command may be issued whether or not scanning is enabled and scanning may be enabled and disabled (see Section 7.8.65) while this command is pending. However, synchronization can only occur when scanning is enabled. While scanning is disabled, no attempt to synchronize will take place.

The Options parameter is used to determine whether the Periodic Advertiser List is used, whether HCI_LE_Periodic_Advertising_Report events for this periodic advertising train are initially enabled or disabled, and whether duplicate reports are filtered or not. If the Periodic Advertiser List is not used, the Advertising_SID, Advertiser Address_Type, and Advertiser Address parameters specify the periodic advertising device to listen to; otherwise they shall be ignored.

The Advertising_SID parameter, if used, specifies the value that shall match the Advertising SID subfield in the ADI field of the received advertisement for it to be used to synchronize.

The Skip parameter specifies the maximum number of consecutive periodic advertising events that the receiver may skip after successfully receiving a periodic advertising packet.

The Sync_Timeout parameter specifies the maximum permitted time between successful receives. If this time is exceeded, synchronization is lost.

The Sync_CTE_Type parameter specifies whether to only synchronize to periodic advertising with certain types of Constant Tone Extension (a value of 0 indicates that

the presence or absence of a Constant Tone Extension is irrelevant). If the periodic advertising has the wrong type of Constant Tone Extension then:

- If bit 0 of Options is set, the Controller shall ignore this address and SID and continue to search for other periodic advertisements.
- Otherwise, the Controller shall cancel the synchronization with the error code *Unsupported Remote Feature* (0x1A).

If the Controller does not support the Connectionless CTE Receiver feature, then the Host should set Sync_CTE_Type to 0.

If the periodic advertiser changes the type of Constant Tone Extension after the scanner has synchronized with the periodic advertising, the scanner's Link Layer shall remain synchronized.

If the Host issues this command with the Sync_CTE_Type parameter set to any value other than zero but the Controller does not support the Connectionless CTE Receiver feature, then the Controller should return an error which should use the error code *Unsupported Feature or Parameter Value* (0x11). If the Controller does not return an error, then it should behave as if Sync_CTE_Type is set to zero.

If the Host sets all the non-reserved bits of the Sync_CTE_Type parameter to 1, the Controller shall return the error code *Command Disallowed* (0x0C).

Irrespective of the value of the Skip parameter, the Controller should stop skipping packets before the Sync_Timeout would be exceeded.

If the Host issues this command when another HCI_LE_Periodic_Advertising_Create_Sync command is pending, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command with bit 0 of Options not set and with Advertising_SID, Advertiser_Address_Type, and Advertiser_Address the same as those of a periodic advertising train that the Controller is already synchronized to, the Controller shall return the error code *Connection Already Exists* (0x0B).

If the Host issues this command and the Controller has insufficient resources to handle any more periodic advertising trains, the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If bit 1 of Options is set to 1 and the Controller supports the Periodic Advertising ADI Support feature, then the Controller shall ignore bit 2.

If bit 1 of Options is set to 0, bit 2 is set to 1, and the Controller does not support the Periodic Advertising ADI Support feature, then the Controller shall return an error which should use the error code *Unsupported Feature or Parameter Value* (0x11).

If bit 1 of the Options parameter is set to 1 and the Controller does not support the HCI_LE_Set_Periodic_Advertising_Receive_Enable command, the Controller shall return the error code *Connection Failed to be Established / Synchronization Timeout* (0x3E).

Command parameters:

Options: *Size: 1 octet*

Bit Number	Parameter Description
0	0: Use the Advertising_SID, Advertiser_Address_Type, and Advertiser_Address parameters to determine which advertiser to listen to 1: Use the Periodic Advertiser List to determine which advertiser to listen to.
1	0: Reporting initially enabled 1: Reporting initially disabled
2	0: Duplicate filtering initially disabled 1: Duplicate filtering initially enabled
All other bits	Reserved for future use

Advertising_SID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Advertising SID subfield in the ADI field used to identify the Periodic Advertising
All other values	Reserved for future use

Advertiser_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address or Public Identity Address
0x01	Random Device Address or Random (static) Identity Address
All other values	Reserved for future use

Advertiser_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the advertiser

Skip: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The maximum number of periodic advertising events that can be skipped after a successful receive Range: 0x0000 to 0x01F3

Sync_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Synchronization timeout for the periodic advertising train Range: 0x000A to 0x4000 Time = N × 10 ms Time Range: 100 ms to 163.84 s

Sync_CTE_Type: *Size: 1 octet*

Bit Number	Parameter Description
0	Do not sync to packets with an AoA Constant Tone Extension
1	Do not sync to packets with an AoD Constant Tone Extension with 1 µs slots
2	Do not sync to packets with an AoD Constant Tone Extension with 2 µs slots
3	Do not sync to packets with a type 3 Constant Tone Extension (currently reserved for future use)
4	Do not sync to packets without a Constant Tone Extension
All other bits	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the HCI_LE_Periodic_Advertising_Create_Sync command has been received, the Controller sends the HCI_Command_Status event to the Host. An HCI_LE_Periodic_Advertising_Sync_Established event shall be generated when the Controller starts receiving periodic advertising packets.

When the Controller receives periodic advertising packets then, if reporting is enabled, it sends HCI_LE_Periodic_Advertising_Report events to the Host.

If the Controller does not receive a periodic advertising packet within 6 periodic advertising events of first listening, then it shall generate an

HCI_LE_Periodic_Advertising_Sync_Established event that should have Status set to *Connection Failed to be Established / Synchronization Timeout* (0x3E).

Note: The HCI_LE_Periodic_Advertising_Sync_Established event can be sent as a result of synchronization being canceled by an HCI_LE_Periodic_Advertising_Create_Sync_Cancel command.

7.8.68 LE Periodic Advertising Create Sync Cancel command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Periodic_Advertising_Create_-Sync_Cancel	0x0045	*none*	Status

Description:

This command is used to cancel the HCI_LE_Periodic_Advertising_Create_Sync command while it is pending.

If the Host issues this command while no HCI_LE_Periodic_Advertising_Create_Sync command is pending, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Periodic_Advertising_Create_Sync_Cancel command succeeded
0x01 to 0xFF	HCI_LE_Periodic_Advertising_Create_Sync_Cancel command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Periodic_Advertising_Create_Sync_Cancel command has completed, the Controller sends an HCI_Command_Complete event to the Host.

After the HCI_Command_Complete is sent and if the cancellation was successful, the Controller sends an HCI_LE_Periodic_Advertising_Sync_Established event to the Host with the error code *Operation Cancelled by Host* (0x44).

7.8.69 LE Periodic Advertising Terminate Sync command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Periodic_Advertising_Terminate_-Sync	0x0046	Sync_Handle	Status

Description:

This command is used to stop reception of the periodic advertising train identified by the Sync_Handle parameter.

If the periodic advertising train corresponding to the Sync_Handle parameter does not exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

Following successful completion of this command the Sync_Handle is destroyed.

Command parameters:

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Periodic_Advertising_Terminate_Sync command succeeded
0x01 to 0xFF	HCI_LE_Periodic_Advertising_Terminate_Sync command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Periodic_Advertising_Terminate_Sync command has completed, an HCI_Command_Complete event shall be generated.

7.8.70 LE Add Device To Periodic Advertiser List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Add_Device_To_Periodic_-Advertiser_List	0x0047	Advertiser_Address_Type, Advertiser_Address, Advertising_SID	Status

Description:

This command is used to add an entry, consisting of a single device address and SID, to the Periodic Advertiser list stored in the Controller. Any additions to the Periodic Advertiser list take effect immediately. If the entry is already on the list, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command when an HCI_LE_Periodic_Advertising_Create_Sync command is pending, the Controller shall return the error code *Command Disallowed* (0x0C).

When a Controller cannot add an entry to the Periodic Advertiser list because the list is full, the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

Command parameters:

Advertiser_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address or Public Identity Address
0x01	Random Device Address or Random (static) Identity Address
All other values	Reserved for future use

Advertiser_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the advertiser

Advertising_SID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Advertising SID subfield in the ADI field used to identify the Periodic Advertising
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Add_Device_To_Periodic_Advertiser_List command succeeded
0x01 to 0xFF	HCI_LE_Add_Device_To_Periodic_Advertiser_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Add_Device_To_Periodic_Advertiser_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.71 LE Remove Device From Periodic Advertiser List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remove_Device_From_-Periodic_Advertiser_List	0x0048	Advertiser_Address_Type, Advertiser_Address, Advertising_SID	Status

Description:

This command is used to remove one entry from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

If the Host issues this command when an HCI_LE_Periodic_Advertising_Create_Sync command is pending, the Controller shall return the error code *Command Disallowed* (0x0C).

When a Controller cannot remove an entry from the Periodic Advertiser list because it is not found, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

Command parameters:

Advertiser_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address or Public Identity Address
0x01	Random Device Address or Random (static) Identity Address
All other values	Reserved for future use

Advertiser_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address, Random Device Address, Public Identity Address, or Random (static) Identity Address of the advertiser

Advertising_SID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Advertising SID subfield in the ADI field used to identify the Periodic Advertising
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Remove_Device_From_Periodic_Advertiser_List command succeeded
0x01 to 0xFF	HCI_LE_Remove_Device_From_Periodic_Advertiser_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Remove_Device_From_Periodic_Advertiser_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.72 LE Clear Periodic Advertiser List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Clear_Periodic_Advertiser_List	0x0049	*none*	Status

Description:

This command is used to remove all entries from the list of Periodic Advertisers in the Controller.

If this command is used when an HCI_LE_Periodic_Advertising_Create_Sync command is pending, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Clear_Periodic_Advertiser_List command succeeded
0x01 to 0xFF	HCI_LE_Clear_Periodic_Advertiser_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Clear_Periodic_Advertiser_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.73 LE Read Periodic Advertiser List Size command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Periodic_-Advertiser_List_Size	0x004A	*none*	Status, Periodic_Advertiser_List_Size

Description:

This command is used to read the number of Periodic Advertiser list entries (including those already stored there) that the Controller can store at the present time.

Note: The number of entries that can be stored is not fixed and the Controller can change it at any time (e.g., because the memory used to store the list can also be used for other purposes).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Periodic_Advertiser_List_Size command succeeded
0x01 to 0xFF	HCI_LE_Read_Periodic_Advertiser_List_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Periodic_Advertiser_List_Size: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	Total number of Periodic Advertiser list entries that can be stored in the Controller
0x00	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_Read_Periodic_Advertiser_List_Size command has completed, an HCI_Command_Complete event shall be generated.

7.8.74 LE Read Transmit Power command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Transmit_Power	0x004B	*none*	Status, Min_TX_Power, Max_TX_Power

Description:

This command is used to read the minimum and maximum transmit powers supported by the Controller across all supported PHYs.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Transmit_Power command succeeded
0x01 to 0xFF	HCI_LE_Read_Transmit_Power command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Min_TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm

Max_TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	Range: -127 to +20 Units: dBm

Event(s) generated (unless masked away):

When the HCI_LE_Read _Transmit_Power command has completed, an HCI_Command_Complete event shall be generated.

7.8.75 LE Read RF Path Compensation command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_RF_Path_-Compensation	0x004C	*none*	Status, RF_TX_Path_Compensation_Value, RF_RX_Path_Compensation_Value

Description:

This command is used to read the RF path compensation value parameters used in the Tx power level and RSSI calculation.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_RF_Path_Compensation command succeeded
0x01 to 0xFF	HCI_LE_Read_RF_Path_Compensation command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

RF_TX_Path_Compensation_Value: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Range: -128.0 dB (0xFB00) to 128.0 dB (0x0500) Units: 0.1 dB

RF_RX_Path_Compensation_Value: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Range: -128.0 dB (0xFB00) to 128.0 dB (0x0500) Units: 0.1 dB

Event(s) generated (unless masked away):

When the HCI_LE_Read_RF_Path_Compensation command has completed, an HCI_Command_Complete event shall be generated.

7.8.76 LE Write RF Path Compensation command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Write_RF_Path_-Compensation	0x004D	RF_TX_Path_Compensation_Value, RF_RX_Path_Compensation_Value	Status

Description:

This command is used to indicate the RF path gain or loss between the RF transceiver and the antenna contributed by intermediate components. A positive value means a net RF path gain and a negative value means a net RF path loss. The RF_TX_Path_Compensation_Value parameter shall be used by the Controller to calculate the radiative Tx power level used in HCI commands, HCI events, Advertising physical channel PDUs, and Link Layer Control PDUs using the following equation:

Radiative Tx power level = Tx power level at RF transceiver output + RF_TX_Path_Compensation_Value

For example, if the Tx power level is +4 (dBm) at RF transceiver output and the RF_TX_Path_Compensation_Value is -1.5 (dB), the radiative Tx power level is +4+ (-1.5) = 2.5 (dBm).

The RF_RX_Path_Compensation_Value parameter shall be used by the Controller to calculate the RSSI value reported to the Host using the following equation:

Rx power level at RF transceiver input = Rx power level at antenna + RF_RX_Path_Compensation_Value

For example, if the Rx power level is -45 (dBm) at RF transceiver input and the RF_RX_Path_Compensation_Value is -3.2 (dB), the Rx power level at antenna is -41.8 (dBm).

The default values for the RF path compensation are vendor-specific.

This command can be issued at any time. If this command is issued during an ongoing over-the-air RF activity, the Controller may apply the Tx path compensation immediately or after a vendor-specific delay.

The Controller shall apply a change to the Tx path compensation value either by leaving the power at the transceiver output unchanged and altering the radiative Tx power level or by altering the power at the transceiver output to maintain any previously chosen radiative Tx power level.

If the Host needs to maintain a specific radiative transmit power level for an advertising set, it should disable that set before issuing this command then, after the command

completes, reissue the HCI_LE_Set_Extended_Advertising_Parameters command for that set and then re-enable it.

Command parameters:

RF_TX_Path_Compensation_Value: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Range: -128.0 dB (0xFB00) to 128.0 dB (0x0500) Units: 0.1 dB

RF_RX_Path_Compensation_Value: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Range: -128.0 dB (0xFB00) to 128.0 dB (0x0500) Units: 0.1 dB

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Write_RF_Path_Compensation command succeeded
0x01 to 0xFF	HCI_LE_Write_RF_Path_Compensation command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Write_RF_Path_Compensation command has completed, an HCI_Command_Complete event shall be generated.

If the command leads to a change in the local radiative transmit power level for an LE ACL connection, then the Controller shall generate an HCI_LE_Transmit_Power_Reporting event if local reporting is enabled and shall initiate a Link Layer Power Change Indication procedure (see [Vol 6] Part B, Section 5.1.18) if remote reporting is enabled.

7.8.77 LE Set Privacy Mode command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Privacy_Mode	0x004E	Peer_Identity_Address_Type, Peer_Identity_Address, Privacy_Mode	Status

Description:

This command is used to allow the Host to specify the privacy mode to be used for a given entry on the resolving list. The effect of this setting is specified in [Vol 6] Part B, Section 4.7.

When an entry on the resolving list is removed, the mode associated with that entry shall also be removed.

This command shall not be used when address resolution is enabled in the Controller and:

- Advertising (other than periodic advertising) is enabled,
- Scanning is enabled, or
- an HCI_LE_Create_Connection, HCI_LE_Extended_Create_Connection, or HCI_LE_Periodic_Advertising_Create_Sync command is pending.

This command may be used at any time when address resolution is disabled in the Controller.

If the device is not on the resolving list, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Peer_Identity_Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Identity Address
0x01	Random (static) Identity Address
All other values	Reserved for future use

Peer_Identity_Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Identity Address or Random (static) Identity Address of the advertiser

Privacy_Mode: *Size: 1 octet*

Value	Parameter Description
0x00	Use Network Privacy Mode for this peer device (default)
0x01	Use Device Privacy Mode for this peer device
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Privacy_Mode command succeeded
0x01 to 0xFF	HCI_LE_Set_Privacy_Mode command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Privacy_Mode command has completed, an HCI_Command_Complete event shall be generated.

7.8.78 [This section is no longer used]

See Section 7.8.28 for the LE Receiver Test command.

7.8.79 [This section is no longer used]

See Section 7.8.29 for the LE Transmitter Test command.

7.8.80 LE Set Connectionless CTE Transmit Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Connectionless_CTE_-Transmit_Parameters	0x0051	Advertising_Handle, CTE_Length, CTE_Type, CTE_Count, Switching_Pattern_Length , Antenna_IDs[i]	Status

Description:

This command is used to set the type, length, and antenna switching pattern for the transmission of Constant Tone Extensions in any periodic advertising on the advertising set identified by the Advertising_Handle parameter.

The CTE_Count parameter specifies how many packets with a Constant Tone Extension are to be transmitted in each periodic advertising event. If the number of packets that would otherwise be transmitted is less than this, the Controller shall transmit sufficient AUX_CHAIN_IND PDUs with no AdvData to make up the number. However, if a change in circumstances since this command was issued means that the Controller can no longer schedule all of these packets, it should transmit as many as possible.

If the Host issues this command when Constant Tone Extensions have been enabled in the advertising set, the Controller shall return the error code *Command Disallowed* (0x0C).

The Switching_Pattern_Length and Antenna_IDs[i] parameters are only used when transmitting an AoD Constant Tone Extension and shall be ignored if CTE_Type specifies an AoA Constant Tone Extension.

If the CTE_Length parameter is greater than the maximum length of Constant Tone Extension supported, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host requests a type of Constant Tone Extension that the Controller does not support, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller is unable to schedule CTE_Count packets in each event, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the advertising set corresponding to the Advertising_Handle parameter does not exist, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If Switching_Pattern_Length is greater than the maximum length of switching pattern supported by the Controller (see Section 7.8.87), the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller determines that any of the Antenna_IDs[i] values do not identify an antenna in the device's antenna array, it shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Note: Some Controllers may be unable to determine which values do or do not identify an antenna.

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

CTE_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x14	Constant Tone Extension length in 8 µs units
All other values	Reserved for future use

CTE_Type: *Size: 1 octet*

Value	Parameter Description
0x00	AoA Constant Tone Extension
0x01	AoD Constant Tone Extension with 1 µs slots
0x02	AoD Constant Tone Extension with 2 µs slots
All other values	Reserved for future use

CTE_Count: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of Constant Tone Extensions to transmit in each periodic advertising interval Range: 0x01 to 0x10

Switching_Pattern_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x4B	The number of Antenna IDs in the pattern
All other values	Reserved for future use

Antenna_IDs[i]: *Size: Switching_Pattern_Length × 1 octet*

Value	Parameter Description
0xXX	Antenna ID in the pattern.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Connectionless_CTE_Transmit_Parameters command succeeded.
0x01 to 0xFF	HCI_LE_Set_Connectionless_CTE_Transmit_Parameters command failed. See [Vol 1] Part F for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Connectionless_CTE_Transmit_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.81 LE Set Connectionless CTE Transmit Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Connectionless_CTE_-Transmit_Enable	0x0052	Advertising_Handle, CTE_Enable	Status

Description:

This command is used to request that the Controller enables or disables the use of Constant Tone Extensions in any periodic advertising on the advertising set identified by Advertising_Handle.

In order to start sending periodic advertisements containing a Constant Tone Extension, the Host must also enable periodic advertising using the HCI_LE_Set_Periodic_Advertising_Enable command (see Section 7.8.63).

Note: Periodic advertising can only be enabled when advertising is enabled on the same advertising set, but can continue after advertising has been disabled.

If the Host issues this command before it has issued the HCI_LE_Set_Periodic_Advertising_Parameters command (see Section 7.8.61) for the advertising set, the Controller shall return the error code *Command Disallowed* (0x0C).

Once enabled, the Controller shall continue advertising with Constant Tone Extensions until either one of the following occurs:

- The Host issues an HCI_LE_Set_Connectionless_CTE_Transmit_Enable command with CTE_Enable set to 0x00 (disabling Constant Tone Extensions but allowing periodic advertising to continue).
- The Host issues an HCI_LE_Set_Periodic_Advertising_Enable command (see Section 7.8.63) with Enable set to 0x00 (disabling periodic advertising). If periodic advertising is re-enabled then it shall continue to contain Constant Tone Extensions.

If the Host issues this command before it has issued the HCI_LE_Set_Connectionless_CTE_Transmit_Parameters command for the advertising set, the Controller shall return the error code *Command Disallowed* (0x0C).

If the periodic advertising is on a PHY that does not allow Constant Tone Extensions, the Controller shall return the error code *Command Disallowed* (0x0C).

If the advertising set corresponding to the Advertising_Handle parameter does not exist, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

The Host may issue this command when advertising or periodic advertising is enabled in the advertising set.

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Identifier for the advertising set in which Constant Tone Extension is being enabled or disabled Range: 0x00 to 0xEF

CTE_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Advertising with Constant Tone Extension is disabled (default)
0x01	Advertising with Constant Tone Extension is enabled
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Connectionless_CTE_Transmit_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Set_Connectionless_CTE_Transmit_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Connectionless_CTE_Transmit_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.8.82 LE Set Connectionless IQ Sampling Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Connectionless_IQ_-Sampling_Enable	0x0053	Sync_Handle, Sampling_Enable, Slot_Durations, Max_Sampled_CTEs, Switching_Pattern_Length, Antenna_IDs[i]	Status, Sync_Handle

Description:

This command is used to request that the Controller enables or disables capturing IQ samples from the Constant Tone Extension of periodic advertising packets in the periodic advertising train identified by the Sync_Handle parameter. If that periodic advertising train does not exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

The Max_Sampled_CTEs parameter specifies the maximum number of Constant Tone Extensions in each periodic advertising event that the Controller should collect and report IQ samples from. The Controller should sample all Constant Tone Extensions up to this number.

If the Sampling_Enable parameter is set to 0x01 (sampling is enabled), the Controller starts attempting to capture IQ samples from the periodic advertisements.

Once sampling has been enabled, the Controller shall continue taking IQ samples until the Host issues an HCI_LE_Set_Connectionless_IQ_Enable command with Sampling_Enable set to 0x00 (sampling is disabled) or synchronization with the periodic advertising train is lost.

If Sampling_Enable is set to 0x00, Slot_Durations, Max_Sampled_CTEs, Switching_Pattern_Length, and Antenna_IDs shall be ignored.

The command is also used to set the antenna switching pattern and switching and sampling slot durations to be used while receiving the Constant Tone Extension.

If Slot_Durations is set to 0x01 and the Controller does not support 1 µs switching and sampling, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Slot_Durations, Switching_Pattern_Length, and Antenna_IDs parameters are only used when receiving an AoA Constant Tone Extension and do not affect the reception of an AoD Constant Tone Extension.

If Switching_Pattern_Length is greater than the maximum length of switching pattern supported by the Controller, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller determines that any of the Antenna_IDs[i] values do not identify an antenna in the device's antenna array, it shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Note: Some Controllers may be unable to determine which values do or do not identify an antenna.

If Sampling_Enable is set to 0x01 and the periodic advertising is on a PHY that does not allow Constant Tone Extensions, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF

Sampling_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Connectionless IQ sampling is disabled (default)
0x01	Connectionless IQ sampling is enabled
All other values	Reserved for future use

Slot_Durations: *Size: 1 octet*

Value	Parameter Description
0x01	Switching and sampling slots are 1 µs each
0x02	Switching and sampling slots are 2 µs each
All other values	Reserved for future use

Max_Sampled_CTEs: *Size: 1 octet*

Value	Parameter Description
0x00	Sample and report all available Constant Tone Extensions
0xXX	The maximum number of Constant Tone Extensions to sample and report in each periodic advertising interval Range: 0x01 to 0x10

Switching_Pattern_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x4B	The number of Antenna IDs in the pattern
All other values	Reserved for future use

Antenna_IDs[i]: *Size: Switching_Pattern_Length × 1 octet*

Value	Parameter Description
0xXX	Antenna ID in the pattern.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Connectionless_IQ_Sampling_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Set_Connectionless_IQ_Sampling_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising. Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Connectionless_IQ_Sampling_Enable command has completed, an HCI_Command_Complete event shall be generated.

HCI_LE_Connectionless_IQ_Report events are generated by the Controller based on the advertising packets received.

7.8.83 LE Set Connection CTE Receive Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Connection_CTE_-Receive_Parameters	0x0054	Connection_Handle, Sampling_Enable, Slot_Durations, Switching_Pattern_Length, Antenna_IDs[i]	Status, Connection_Handle

Description:

This command is used to enable or disable sampling received Constant Tone Extension fields on the connection identified by the Connection_Handle parameter and to set the antenna switching pattern and switching and sampling slot durations to be used.

If the Sampling_Enable parameter is set to 0x01, the Controller shall sample Constant Tone Extensions on the specified connection and report the samples to the Host. If it is set to 0x00, the Controller shall cease sampling on the specified connection; the remaining parameters shall be ignored.

If Slot_Durations is set to 0x01 and the Controller does not support 1 µs switching and sampling, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Slot_Durations, Switching_Pattern_Length, and Antenna_IDs parameters are only used when receiving an AoA Constant Tone Extension and do not affect the reception of an AoD Constant Tone Extension.

If Switching_Pattern_Length is greater than the maximum length of switching pattern supported by the Controller, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller determines that any of the Antenna_IDs[i] values do not identify an antenna in the device's antenna array, it shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Note: Some Controllers may be unable to determine which values do or do not identify an antenna.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Sampling_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Connection IQ sampling is disabled (default)
0x01	Connection IQ sampling is enabled
All other values	Reserved for future use

Slot_Durations: *Size: 1 octet*

Value	Parameter Description
0x01	Switching and sampling slots are 1 µs each
0x02	Switching and sampling slots are 2 µs each
All other values	Reserved for future use

Switching_Pattern_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x4B	The number of Antenna IDs in the pattern
All other values	Reserved for future use

Antenna_IDs[i]: *Size: Switching_Pattern_Length × 1 octet*

Value	Parameter Description
0xXX	Antenna ID in the pattern.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Connection_CTE_Receive_Parameters command succeeded.
0x01 to 0xFF	HCI_LE_Set_Connection_CTE_Receive_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Connection_CTE_Receive_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.84 LE Set Connection CTE Transmit Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Connection_CTE_-Transmit_Parameters	0x0055	Connection_Handle, CTE_Types, Switching_Pattern_Length, Antenna_IDs[i]	Status, Connection_Handle

Description:

This command is used to set the antenna switching pattern and permitted Constant Tone Extension types used for transmitting Constant Tone Extensions requested by the peer device on the connection identified by the Connection_Handle parameter.

If the Host issues this command when Constant Tone Extension responses have been enabled on the connection, the Controller shall return the error code *Command Disallowed* (0x0C).

If the CTE_Types parameter has a bit set for a type of Constant Tone Extension that the Controller does not support, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Switching_Pattern_Length and Antenna_IDs[i] parameters are only used when transmitting an AoD Constant Tone Extension and shall be ignored when CTE_Types does not have a bit set for an AoD Constant Tone Extension; they do not affect the transmission of an AoA Constant Tone Extension.

If Switching_Pattern_Length is greater than the maximum length of switching pattern supported by the Controller, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller determines that any of the Antenna_IDs[i] values do not identify an antenna in the device's antenna array, it shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Note: Some Controllers may be unable to determine which values do or do not identify an antenna.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

CTE_Types: *Size: 1 octet*

Bit Number	Parameter Description
0	Allow AoA Constant Tone Extension Response
1	Allow AoD Constant Tone Extension Response with 1 µs slots
2	Allow AoD Constant Tone Extension Response with 2 µs slots
All other values	Reserved for future use

Switching_Pattern_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x4B	The number of Antenna IDs in the pattern
All other values	Reserved for future use

Antenna_IDs[i]: *Size: Switching_Pattern_Length × 1 octet*

Value	Parameter Description
0xXX	Antenna ID in the pattern.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Connection_CTE_Transmit_Parameters command succeeded.
0x01 to 0xFF	HCI_LE_Set_Connection_CTE_Transmit_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Connection_CTE_Transmit_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.85 LE Connection CTE Request Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Connection_CTE_Request_-Enable	0x0056	Connection_Handle, Enable, CTE_Request_Interval, Requested_CTE_Length, Requested_CTE_Type	Status, Connection_Handle

Description:

This command is used to request the Controller to start or stop initiating the Constant Tone Extension Request procedure (see [Vol 6] Part B, Section 5.1.12) on a connection identified by the Connection_Handle parameter.

If the Host issues this command when the Controller is aware (e.g. through a previous feature exchange) that the peer device's Link Layer does not support the Connection CTE Response feature, the Controller shall return the error code *Unsupported Remote Feature* (0x1A). If the Host issues this command when the Controller is aware that the peer device's Link Layer does not support the requested CTE type, the Controller should return the error code *Unsupported Remote Feature* (0x1A).

If Enable is set to 0x00, the remaining parameters shall be ignored. Any Constant Tone Extension Request procedures that have already been initiated are not affected.

The CTE_Request_Interval parameter defines whether the Constant Tone Extension Request procedure is initiated only once or periodically. In the case of periodic operation, the procedure is initiated every CTE_Request_Interval. However, the Controller may delay initiating the procedure beyond the requested interval (e.g., in order to prioritize other activities).

The Requested_CTE_Length parameter indicates the minimum length of the Constant Tone Extension and the Requested_CTE_Type parameter indicates the type of Constant Tone Extension that the Controller shall request from the remote device.

A request is active on a connection from when the Host issues a successful command with Enable set to 0x01 until a command with Enable set to 0x00 has succeeded or, if CTE_Request_Interval was set to zero, until the single Link Layer procedure has been performed, whichever happens first.

If the Host issues this command with Enable set to 0x01 while a request is active for the specified connection, the Controller shall return the error code *Command Disallowed* (0x0C).

Note: The failed command will not affect the behavior of the Link Layer in respect of the currently-active request.

If the Host issues this command before issuing the HCI_LE_Set_Connection_CTE_Receive_Parameters command at least once on the connection, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command when the receiver PHY for the connection is not a PHY that allows Constant Tone Extensions, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host sets CTE_Request_Interval to a non-zero value less than *connSubrateFactor* × (*connPeripheralLatency* +1), the Controller shall return the error code *Command Disallowed* (0x0C).

If Enable is set to 0x01 and the receiver PHY for the connection changes to a PHY that does not allow Constant Tone Extensions, then the Controller shall automatically disable Constant Tone Extension requests as if the Host had issued this command with Enable set to 0x00.

Note: If the PHY changes back to a PHY that allows Constant Tone Extensions, then the Controller will not automatically re-enable Constant Tone Extension requests.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Disable Constant Tone Extension Request for the connection (default)
0x01	Enable Constant Tone Extension Request for the connection
All other values	Reserved for future use

CTE_Request_Interval: *Size: 2 octets*

Value	Parameter Description
0x0000	Initiate the Constant Tone Extension Request procedure once, at the earliest practical opportunity
0x0001 to 0xFFFF	Requested interval for initiating the Constant Tone Extension Request procedure in number of underlying connection events.

Requested_CTE_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x14	Minimum length of the Constant Tone Extension being requested in 8 µs units
All other values	Reserved for future use

Requested_CTE_Type: *Size: 1 octet*

Value	Parameter Description
0x00	AoA Constant Tone Extension
0x01	AoD Constant Tone Extension with 1 µs slots
0x02	AoD Constant Tone Extension with 2 µs slots
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Connection_CTE_Request_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Connection_CTE_Request_Enable command failed. See [Vol 1] Part F for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Connection_CTE_Request_Enable command has completed, an HCI_Command_Complete event shall be generated.

HCI_LE_Connection_IQ_Report events are generated by the Controller based on Constant Tone Extensions received, whether in packets containing an LL_CTE_RSP PDU or otherwise. If a packet is received containing an LL_CTE_RSP PDU but no Constant Tone Extension, or if the peer device rejects the request, an HCI_LE_CTE_Request_Failed event shall be generated.

7.8.86 LE Connection CTE Response Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Connection_CTE_Response_-Enable	0x0057	Connection_Handle, Enable	Status, Connection_Handle

Description:

This command is used to request the Controller to respond to LL_CTE_REQ PDUs with LL_CTE_RSP PDUs on the specified connection.

If the Host issues this command before issuing the HCI_LE_Set_Connection_CTE_Transmit_Parameters command at least once on the connection, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command when the transmitter PHY for the connection is not a PHY that allows Constant Tone Extensions, the Controller shall return the error code *Command Disallowed* (0x0C).

If the transmitter PHY for the connection changes to a PHY that does not allow Constant Tone Extensions, then the Controller shall automatically disable Constant Tone Extension responses.

Note: If the PHY changes back to a PHY that allows Constant Tone Extensions, then the Controller will not automatically re-enable Constant Tone Extension responses.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Disable Constant Tone Extension Response for the connection (default)
0x01	Enable Constant Tone Extension Response for the connection
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Connection_CTE_Response_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Connection_CTE_Response_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Connection_CTE_Response_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.8.87 LE Read Antenna Information command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Antenna_-Information	0x0058	*none*	Status, Supported_Switching_Sampling_Rates, Num_Antennae, Max_Switching_Pattern_Length, Max_CTE_Length

Description:

This command allows the Host to read the switching rates, the sampling rates, the number of antennae, and the maximum length of a transmitted Constant Tone Extension supported by the Controller.

If the Controller does not support antenna switching, the value of Max_Switching_Pattern_Length shall still be valid but will not be used by the Host.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Antenna_Information command succeeded.
0x01 to 0xFF	HCI_LE_Read_Antenna_Information command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Supported_Switching_Sampling_Rates: *Size: 1 octet*

Bit Number	Parameter Description
0	1 µs switching supported for AoD transmission
1	1 µs sampling supported for AoD reception
2	1 µs switching and sampling supported for AoA reception
3 to 7	Reserved for future use

Num_Antennae: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x4B	The number of antennae supported by the Controller
All other values	Reserved for future use

Max_Switching_Pattern_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x4B	Maximum length of antenna switching pattern supported by the Controller
All other values	Reserved for future use

Max_CTE_Length: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x14	Maximum length of a transmitted Constant Tone Extension supported in 8 µs units
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_Read_Antenna_Information command has completed, an HCI_Command_Complete event shall be generated.

7.8.88 LE Set Periodic Advertising Receive Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Periodic_Advertising_-Receive_Enable	0x0059	Sync_Handle, Enable	Status

Description:

This command will enable or disable reports for the periodic advertising train identified by the Sync_Handle parameter.

The Enable parameter determines whether reporting and duplicate filtering are enabled or disabled. If the value is the same as the current state, the command has no effect.

If the periodic advertising train corresponding to the Sync_Handle parameter does not exist, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If the Host sets both bits 0 and 1 of Enable and the Controller does not support the Periodic Advertising ADI Support feature, then the Controller shall return an error which should use the error code *Unsupported Feature or Parameter Value* (0x11).

Command parameters:

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF

Enable: *Size: 1 octet*

Bit Number	Parameter Description
0	Reporting enabled
1	Duplicate filtering enabled
All other bits	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Periodic_Advertising_Receive_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Set_Periodic_Advertising_Receive_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Periodic_Advertising_Receive_Enable command has completed, an HCI_Command_Complete event shall be generated.

7.8.89 LE Periodic Advertising Sync Transfer command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Periodic_Advertising_Sync_-Transfer	0x005A	Connection_Handle, Service_Data, Sync_Handle	Status, Connection_Handle

Description:

This command is used to instruct the Controller to send synchronization information about the periodic advertising train identified by the Sync_Handle parameter to a connected device.

The Service_Data parameter is a value provided by the Host for use by the Host of the peer device. It is not used by the Controller.

The connected device is identified by the Connection_Handle parameter.

If the periodic advertising train corresponding to the Sync_Handle parameter does not exist, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If the Connection_Handle parameter does not identify a current connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the remote device has not indicated support for the Periodic Advertising Sync Transfer - Recipient feature, the Controller shall return the error code *Unsupported Remote Feature* (0x1A).

Note: This command may successfully complete after the periodic advertising synchronization information is queued for transmission but before it is actually sent. No indication is given as to how the recipient handled the information.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Service_Data: *Size: 2 octets*

Value	Parameter Description
0xXXXX	A value provided by the Host

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Periodic_Advertising_Sync_Transfer command succeeded.
0x01 to 0xFF	HCI_LE_Periodic_Advertising_Sync_Transfer command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Periodic_Advertising_Sync_Transfer command has completed, an HCI_Command_Complete event shall be generated.

7.8.90 LE Periodic Advertising Set Info Transfer command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Periodic_Advertising_Set_Info_-Transfer	0x005B	Connection_Handle, Service_Data, Advertising_Handle	Status, Connection_Handle

Description:

This command is used to instruct the Controller to send synchronization information about the periodic advertising in an advertising set to a connected device.

The Advertising_Handle parameter identifies the advertising set. If the parameters in the advertising set have changed since the periodic advertising was first enabled, the current parameters – not the original ones – are sent.

The Service_Data parameter is a value provided by the Host to identify the periodic advertising train to the peer device. It is not used by the Controller.

The connected device is identified by the Connection_Handle parameter.

If the advertising set corresponding to the Advertising_Handle parameter does not exist, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If periodic advertising is not currently in progress for the advertising set, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Connection_Handle parameter does not identify a current connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the remote device has not indicated support for the Periodic Advertising Sync Transfer - Recipient feature, the Controller shall return the error code *Unsupported Remote Feature* (0x1A).

Note: This command may successfully complete after the periodic advertising synchronization information is queued for transmission but before it is actually sent. No indication is given as to how the recipient handled the information.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Service_Data: *Size: 2 octets*

Value	Parameter Description
0xXXXX	A value provided by the Host

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify an advertising set
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Periodic_Advertising_Set_Info_Transfer command succeeded.
0x01 to 0xFF	HCI_LE_Periodic_Advertising_Set_Info_Transfer command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Periodic_Advertising_Set_Info_Transfer command has completed, an HCI_Command_Complete event shall be generated.

7.8.91 LE Set Periodic Advertising Sync Transfer Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Periodic_Advertising_-Sync_Transfer_Parameters	0x005C	Connection_Handle, Mode, Skip, Sync_Timeout, CTE_Type	Status, Connection_Handle

Description:

This command is used to specify how the Controller will process periodic advertising synchronization information received from the device identified by the Connection_Handle parameter (the "transfer mode").

The Mode parameter specifies the action to be taken when periodic advertising synchronization information is received. If Mode is 0x00, the Controller will ignore the information. Otherwise it will notify the Host and synchronize to the periodic advertising. Mode also specifies whether periodic advertising reports are initially enabled or disabled and whether duplicates are filtered.

The Skip parameter specifies the number of consecutive periodic advertising packets that the receiver may skip after successfully receiving a periodic advertising packet.

The Sync_Timeout parameter specifies the maximum permitted time between successful receives. If this time is exceeded, synchronization is lost.

Irrespective of the value of the Skip parameter, the Controller should stop skipping packets before the Sync_Timeout would be exceeded.

The CTE_Type parameter specifies whether to only synchronize to periodic advertising with certain types of Constant Tone Extension. If the periodic advertiser changes the type of the Constant Tone Extension after the Controller has synchronized with the periodic advertising, it shall remain synchronized.

Note: A value of 0 (i.e. all bits clear) indicates that the presence or absence of a Constant Tone Extension is irrelevant.

This command does not affect any processing of any periodic advertising synchronization information already received from the peer device, whether or not the Controller has yet synchronized to the periodic advertising train it describes.

The parameter values provided by this command override those provided via the HCI_LE_Set_Default_Periodic_Advertising_Sync_Transfer_Parameters

command (Section 7.8.92) or any preferences previously set using the HCI_LE_Set_Periodic_Advertising_Sync_Transfer_Parameters command on the same connection.

If the Connection_Handle parameter does not identify a current connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host sets Mode to 0x03 and the Controller does not support the Periodic Advertising ADI Support feature, then the Controller shall return an error which should use the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host sets all the non-reserved bits of CTE_Type to 1, then the Controller should return an error using the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Mode: *Size: 1 octet*

Value	Parameter Description
0x00	No attempt is made to synchronize to the periodic advertising and no HCI_LE_Periodic_Advertising_Sync_Transfer_Received event is sent to the Host.
0x01	An HCI_LE_Periodic_Advertising_Sync_Transfer_Received event is sent to the Host. HCI_LE_Periodic_Advertising_Report events will be disabled.
0x02	An HCI_LE_Periodic_Advertising_Sync_Transfer_Received event is sent to the Host. HCI_LE_Periodic_Advertising_Report events will be enabled with duplicate filtering disabled.
0x03	An HCI_LE_Periodic_Advertising_Sync_Transfer_Received event is sent to the Host. HCI_LE_Periodic_Advertising_Report events will be enabled with duplicate filtering enabled.
All other values	Reserved for future use

Skip: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The number of periodic advertising packets that can be skipped after a successful receive Range: 0x0000 to 0x01F3

Sync_Timeout: *Size: 2 octets*

Value	Parameter Description
N=0xXXXX	Synchronization timeout for the periodic advertising train Range: 0x000A to 0x4000 Time = N × 10 ms Time Range: 100 ms to 163.84 s

CTE_Type: *Size: 1 octet*

Bit Number	Parameter Description
0	Do not sync to packets with an AoA Constant Tone Extension
1	Do not sync to packets with an AoD Constant Tone Extension with 1 µs slots
2	Do not sync to packets with an AoD Constant Tone Extension with 2 µs slots
4	Do not sync to packets without a Constant Tone Extension
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Periodic_Advertising_Sync_Transfer_Parameters command succeeded.
0x01 to 0xFF	HCI_LE_Set_Periodic_Advertising_Sync_Transfer_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Periodic_Advertising_Sync_Transfer_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.92 LE Set Default Periodic Advertising Sync Transfer Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Default_Periodic_-Advertising_Sync_Transfer_Parameters	0x005D	Mode, Skip, Sync_Timeout, CTE_Type	Status

Description:

This command is used to specify the initial value for the mode, skip, timeout, and Constant Tone Extension type (set by the HCI_LE_Set_Periodic_Advertising_Sync_Transfer_Parameters command; see Section 7.8.91) to be used for all subsequent connections over the LE transport.

The Mode parameter specifies the initial action to be taken. If Mode is 0x00, the Controller will ignore the information. Otherwise it will notify the Host and synchronize to the periodic advertising. Mode also specifies whether periodic advertising reports are initially enabled or disabled and whether duplicates are filtered.

The Skip parameter specifies the number of consecutive periodic advertising packets that the receiver may skip after successfully receiving a periodic advertising packet.

The Sync_Timeout parameter specifies the maximum permitted time between successful receives. If this time is exceeded, synchronization is lost.

The CTE_Type parameter specifies whether to only synchronize to periodic advertising with certain types of Constant Tone Extension. If the periodic advertiser changes the type of the Constant Tone Extension after the Controller has synchronized with the periodic advertising, it shall remain synchronized.

Note: A value of 0 (i.e. all bits clear) indicates that the presence or absence of a Constant Tone Extension is irrelevant.

This command does not affect any existing connection.

If the Host sets Mode to 0x03 and the Controller does not support the Periodic Advertising ADI Support feature, then the Controller shall return an error which should use the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host sets all the non-reserved bits of CTE_Type to 1, then the Controller should return an error using the error code *Command Disallowed* (0x0C).

Command parameters:

Mode: *Size: 1 octet*

Value	Parameter Description
0x00	No attempt is made to synchronize to the periodic advertising and no HCI_LE_Periodic_Advertising_Sync_Transfer_Received event is sent to the Host (default).
0x01	An HCI_LE_Periodic_Advertising_Sync_Transfer_Received event is sent to the Host. HCI_LE_Periodic_Advertising_Report events will be disabled.
0x02	An HCI_LE_Periodic_Advertising_Sync_Transfer_Received event is sent to the Host. HCI_LE_Periodic_Advertising_Report events will be enabled with duplicate filtering disabled.
0x03	An HCI_LE_Periodic_Advertising_Sync_Transfer_Received event is sent to the Host. HCI_LE_Periodic_Advertising_Report events will be enabled with duplicate filtering enabled.
All other values	Reserved for future use

Skip: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The number of periodic advertising packets that can be skipped after a successful receive Range: 0x0000 to 0x01F3

Sync_Timeout: *Size: 2 octets*

Value	Parameter Description
N=0xXXXX	Synchronization timeout for the periodic advertising train Range: 0x000A to 0x4000 Time = N × 10 ms Time Range: 100 ms to 163.84 s

CTE_Type: *Size: 1 octet*

Bit Number	Parameter Description
0	Do not sync to packets with an AoA Constant Tone Extension
1	Do not sync to packets with an AoD Constant Tone Extension with 1 µs slots
2	Do not sync to packets with an AoD Constant Tone Extension with 2 µs slots
4	Do not sync to packets without a Constant Tone Extension
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Default_Periodic_Advertising_Sync_Transfer_Parameters command succeeded.
0x01 to 0xFF	HCI_LE_Set_Default_Periodic_Advertising_Sync_Transfer_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Default_Periodic_Advertising_Sync_Transfer_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.93 [This section is no longer used]

See Section 7.8.37 for the LE Generate DHKey command.

7.8.94 LE Modify Sleep Clock Accuracy command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Modify_Sleep_Clock_Accuracy	0x005F	Action	Status

Description:

This command is used to request that the Controller changes its sleep clock accuracy for testing purposes. It should not be used under other circumstances.

The Action parameter specifies whether the sleep clock should be changed to one that is more accurate or one that is less accurate.

If Action is 0x00 and the Controller is already using its most accurate clock, or Action is 0x01 and the Controller is already using its least accurate clock, it shall return the error code *Limit Reached* (0x43).

If the Controller is unable to switch to a different clock accuracy because some other activity requires the current accuracy, it shall return the error code *Controller Busy* (0x3A).

If the Controller is unable to switch to a different sleep clock for any other reason, it shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Action: *Size: 1 octet*

Value	Parameter Description
0x00	Switch to a more accurate clock
0x01	Switch to a less accurate clock
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Modify_Sleep_Clock_Accuracy command succeeded
0x01 to 0xFF	HCI_LE_Modify_Sleep_Clock_Accuracy command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Modify_Sleep_Clock_Accuracy command has completed, an HCI_Command_Complete event shall be generated.

Note: The Controller might not have changed the clock when it returns the HCI_Command_Complete event indicating success, for example because it still needs to notify peers of the pending change.

7.8.95 [This section is no longer used]

7.8.96 LE Read ISO TX Sync command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_ISO_TX_Sync	0x0061	Connection_Handle	Status, Connection_Handle, Packet_Sequence_Number, TX_Time_Stamp, Time_Offset

Description:

This command is used to read the TX_Time_Stamp and Time_Offset of a transmitted SDU identified by the Packet_Sequence_Number on a CIS or BIS identified by the Connection_Handle parameter on the Central or Peripheral.

The Packet_Sequence_Number parameter contains the sequence number of a transmitted SDU.

The TX_Time_Stamp and Time_Offset parameters are described in [Vol 6] Part G, Section 3.3 and [Vol 6] Part G, Section 3.1 respectively. When the Connection_Handle identifies a CIS or BIS that is transmitting unframed PDUs, the value of Time_Offset returned shall be zero.

If the Host issues this command with a connection handle that does not exist, or the connection handle is not associated with a CIS or BIS, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command on an existing connection handle for a CIS or BIS that is not configured for transmitting SDUs, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command before an SDU has been transmitted by the Controller, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXX	Connection handle of the CIS or BIS Range: 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_Read_ISO_TX_Sync command succeeded.
0x01 to 0xFF	The HCI_LE_Read_ISO_TX_Sync command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXX	Connection handle of the CIS or BIS Range: 0x0000 to 0x0EFF

Packet_Sequence_Number: *Size: 2 octets*

Value	Parameter Description
0x0000 to 0xFFFF	The packet sequence number of an SDU

TX_Time_Stamp: *Size: 4 octets*

Value	Parameter Description
0x00000000 to 0xFFFFFFFF	The CIG reference point or BIG anchor point of a transmitted SDU derived using the Controller's free running reference clock (in microseconds).

Time_Offset: *Size: 3 octets*

Value	Parameter Description
0x000000 to 0xFFFFFF	The time offset, in microseconds, that is associated with a transmitted SDU.

Event(s) generated (unless masked away):

When the HCI_LE_Read_ISO_TX_Sync command has completed, an HCI_Command_Complete event shall be generated.

7.8.97 LE Set CIG Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_CIG_Parameters	0x0062	CIG_ID, SDU_Interval_C_To_P, SDU_Interval_P_To_C, Worst_Case_SCA, Packing, Framing, Max_Transport_Latency_C_To_P, Max_Transport_Latency_P_To_C, CIS_Count, CIS_ID[i], Max_SDU_C_To_P[i], Max_SDU_P_To_C[i], PHY_C_To_P[i], PHY_P_To_C[i], RTN_C_To_P[i] RTN_P_To_C[i]	Status, CIG_ID, CIS_Count, Connection_Handle[i]

Description:

This command is used by a Central's Host to create a CIG and to set the parameters of one or more CISes that are associated with a CIG in the Controller.

The CIG_ID parameter identifies a CIG. This parameter is allocated by the Central's Host and passed to the Peripheral's Host through the Link Layers during the process of creating a CIS. If the CIG_ID does not exist, then the Controller shall first create a new CIG. Once the CIG is created (whether through this command or previously), the Controller shall modify or add CIS configurations in the CIG that is identified by the CIG_ID and update all the parameters that apply to the CIG.

The SDU_Interval_C_To_P parameter specifies the time interval between the start of consecutive SDUs from the Central's Host for all the CISes in the CIG. This parameter shall be ignored for all CISes that are unidirectional from Peripheral to Central.

The SDU_Interval_P_To_C parameter specifies the time interval between the start of consecutive SDUs from the Peripheral's Host for all the CISes in the CIG. This parameter shall be ignored for all CISes that are unidirectional from Central to Peripheral.

The Worst_Case_SCA parameter shall be the worst-case sleep clock accuracy of all the Peripherals that will participate in the CIG. The Host should get the sleep clock accuracy from all the Peripherals before issuing this command. If the Host cannot get the sleep clock accuracy from all the Peripherals, it shall set the Worst_Case_SCA parameter to zero.

Note: The Worst_Case_SCA parameter can be used by the Link Layer to better allow for clock drift when scheduling the CISes in the CIG. For example, if a CIS has more than two subevents, the Link Layer of the Central can set the timing of the subevents such that the worst case drift in the Peripheral's clock will not exceed 2 × Sub_Interval. This prevents the Peripheral from synchronizing its timing to the wrong subevent (adjacent subevents cannot be on the same channel).

The Packing parameter indicates the preferred method of arranging subevents of multiple CISes. The subevents can be arranged in Sequential or Interleaved arrangement (see [Vol 6] Part B, Section 4.5.14.2). This is a recommendation to the Controller which the Controller may ignore. This parameter shall be ignored when there is only one CIS in the CIG.

The Framing parameter indicates the format of the CIS Data PDUs of the specified CISes' framing mode (see [Vol 6] Part G, Section 2) that the Host is requesting for the CIG. The Controller may use any framing mode permitted by [Vol 6] Part G, Table 2.1 but shall set the framing mode of all the CISes in the CIG to the same mode. This overrides any framing mode previously set for the CIG.

The Max_Transport_Latency_C_To_P parameter contains the maximum transport latency from the Central to the Peripheral, in milliseconds, as described in [Vol 6] Part G, Section 3.2.1 and [Vol 6] Part G, Section 3.2.2. This parameter shall be ignored for all CISes that are unidirectional from Peripheral to Central.

The Max_Transport_Latency_P_To_C parameter contains the maximum transport latency from the Peripheral to the Central, in milliseconds, as described in [Vol 6] Part G, Section 3.2.1 and [Vol 6] Part G, Section 3.2.2. This parameter shall be ignored for all CISes that are unidirectional from Central to Peripheral.

The CIS_Count parameter indicates the number of CIS configurations being modified or added by this command. The Controller shall set the CIS_Count return parameter equal to this.

The CIS_ID[i] parameter identifies a CIS and is set by the Central’s Host and passed to the Peripheral’s Host through the Link Layers during the process of establishing a CIS.

The Max_SDU_C_To_P[i] parameter identifies the maximum size of an SDU from the Central’s Host. If the CIS is unidirectional from Peripheral to Central, this parameter shall be set to 0. If a CIS configuration that is being modified has a data path set in

the Central to Peripheral direction and the Host has specified that Max_SDU_C_To_P[i] shall be set to zero, the Controller shall return the error code *Command Disallowed* (0x0C).

The Max_SDU_P_To_C[i] parameter identifies the maximum size of an SDU from the Peripheral's Host. If the CIS is unidirectional from Central to Peripheral, this parameter shall be set to 0. If a CIS configuration that is being modified has a data path set in the Peripheral to Central direction and the Host has specified that Max_SDU_P_To_C[i] shall be set to zero, the Controller shall return the error code *Command Disallowed* (0x0C).

The PHY_C_To_P[i] parameter identifies which PHY to use for transmission from the Central to the Peripheral. The Host shall set at least one bit in this parameter and the Controller shall pick a PHY from the bits that are set.

The PHY_P_To_C[i] parameter identifies which PHY to use for transmission from the Peripheral to the Central. The Host shall set at least one bit in this parameter and the Controller shall pick a PHY from the bits that are set.

The RTN_C_To_P[i] (Retransmission Number) parameter contains the number of times that a CIS Data PDU should be retransmitted from the Central to Peripheral before being acknowledged or flushed (irrespective of which CIS events the retransmission opportunities occur in). If the CIS is unidirectional from Peripheral to Central, this parameter shall be ignored. Otherwise, this parameter is a recommendation to the Controller which the Controller may ignore.

The RTN_P_To_C[i] parameter contains the number of times that a CIS Data PDU should be retransmitted from the Peripheral to Central before being acknowledged or flushed (irrespective of which CIS events the retransmission opportunities occur in). If the CIS is unidirectional from Central to Peripheral, this parameter shall be ignored. Otherwise, this parameter is a recommendation to the Controller which the Controller may ignore.

In each direction, if the Controller satisfies the recommendation, then every PDU will have at least RTN+1 opportunities for transmission (assuming that the initial transmission of that PDU happens at the earliest allowed subevent). The RTN value indicates that the Host is recommending that the Controller selects a combination of CIS parameters that satisfy the inequality:

$$\mathrm{NSE} \times \mathrm{FT} - \lfloor \mathrm{NSE} \div \mathrm{BN} \rfloor \times (\mathrm{BN} - 1) \geq \mathrm{RTN} + 1$$

If the Status parameter is non-zero, then the state of the CIG and its CIS configurations shall not be changed by the command. If the CIG did not already exist, it shall not be created.

If Status is zero, then the Controller shall set each Connection_Handle[i] to the connection handle corresponding to the CIS configuration specified in CIS_ID[i]. If the same CIS_ID is being reconfigured, the same connection handle shall be returned.

The connection handle of a CIS shall refer to the CIS when it exists and to the configuration of the CIS stored in a CIG when the CIG exists but the CIS with that CIS_ID does not.

If the Host issues this command when the CIG is not in the configurable state, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host attempts to create a CIG or set parameters that exceed the maximum supported resources in the Controller, the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If the Host attempts to set CIS parameters that exceed the maximum supported connections in the Controller, the Controller shall return the error code *Connection Limit Exceeded* (0x09).

If the Host sets, in the PHY_C_To_P[i] or PHY_P_To_C[i] parameters, a bit for a PHY that the Controller does not support, including a bit that is reserved for future use, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller does not support asymmetric PHYs and the Host sets PHY_C_To_P[i] to a different value than PHY_P_To_C[i], the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host specifies an invalid combination of CIS parameters, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12) or the error code *Unsupported Feature or Parameter Value* (0x11); it should return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

CIG_ID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify the CIG.
All other values	Reserved for future use

SDU_Interval_C_To_P: *Size: 3 octets*

Value	Parameter Description
0x0000FF to 0x0FFFFF	The interval, in microseconds, of periodic SDUs.
All other values	Reserved for future use

SDU_Interval_P_To_C: *Size: 3 octets*

Value	Parameter Description
0x0000FF to 0x0FFFFF	The interval, in microseconds, of periodic SDUs.
All other values	Reserved for future use

Worst_Case_SCA: *Size: 1 octet*

Value	Parameter Description
0x00	251 ppm to 500 ppm
0x01	151 ppm to 250 ppm
0x02	101 ppm to 150 ppm
0x03	76 ppm to 100 ppm
0x04	51 ppm to 75 ppm
0x05	31 ppm to 50 ppm
0x06	21 ppm to 30 ppm
0x07	0 ppm to 20 ppm
All other values	Reserved for future use

Packing: *Size: 1 octet*

Value	Parameter Description
0x00	Sequential
0x01	Interleaved
All other values	Reserved for future use

Framing: *Size: 1 octet*

Value	Parameter Description
0x00	Unframed PDUs
0x01	Framed PDUs, Segmentable mode

Value	Parameter Description
0x02	Framed PDUs, Unsegmented mode
All other values	Reserved for future use

Max_Transport_Latency_C_To_P: *Size: 2 octets*

Value	Parameter Description
0x0005 to 0x0FA0	Maximum transport latency, in milliseconds, from the Central's Controller to the Peripheral's Controller.
All other values	Reserved for future use

Max_Transport_Latency_P_To_C: *Size: 2 octets*

Value	Parameter Description
0x0005 to 0x0FA0	Maximum transport latency, in milliseconds, from the Peripheral's Controller to the Central's Controller.
All other values	Reserved for future use

CIS_Count: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x1F	Total number of CIS configurations in the CIG being added or modified.
All other values	Reserved for future use

CIS_ID[i]: *Size: CIS_Count × 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify a CIS
All other values	Reserved for future use

Max_SDU_C_To_P[i]: *Size: CIS_Count × 2 octets*

Value	Parameter Description
0x0000 to 0x0FFF	Maximum size, in octets, of the payload from the Central's Host

Max_SDU_P_To_C[i]: *Size: CIS_Count × 2 octets*

Value	Parameter Description
0x0000 to 0x0FFF	Maximum size, in octets, of the payload from the Peripheral's Host

PHY_C_To_P[i]: *Size: CIS_Count × 1 octet*

Bit Number	Parameter Description
0	The transmitter PHY of packets from the Central is LE 1M
1	The transmitter PHY of packets from the Central is LE 2M
2	The transmitter PHY of packets from the Central is LE Coded
All other bits	Reserved for future use

PHY_P_To_C[i]: *Size: CIS_Count × 1 octet*

Bit Number	Parameter Description
0	The transmitter PHY of packets from the Peripheral is LE 1M
1	The transmitter PHY of packets from the Peripheral is LE 2M
2	The transmitter PHY of packets from the Peripheral is LE Coded
All other bits	Reserved for future use

RTN_C_To_P[i]: *Size: CIS_Count × 1 octet*

Value	Parameter Description
0xXX	Number of times every CIS Data PDU should be retransmitted from the Central to the Peripheral

RTN_P_To_C[i]: *Size: CIS_Count × 1 octet*

Value	Parameter Description
0xXX	Number of times every CIS Data PDU should be retransmitted from the Peripheral to the Central

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_Set_CIG_Parameters.command succeeded
0x01 to 0xFF	The HCI_LE_Set_CIG_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

CIG_ID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify a CIG
All other values	Reserved for future use

CIS_Count: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x1F	Total number of CIS configurations added or modified by this command
All other values	Reserved for future use

Connection_Handle[i]: *Size: CIS_Count × 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS in the CIG. Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_CIG_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.98 LE Set CIG Parameters Test command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_CIG_Parameters_Test	0x0063	CIG_ID, SDU_Interval_C_To_P, SDU_Interval_P_To_C, FT_C_To_P, FT_P_To_C, ISO_Interval, Worst_Case_SCA, Packing, Framing, CIS_Count, CIS_ID[i], NSE[i], Max_SDU_C_To_P,[i], Max_SDU_P_To_C[i], Max_PDU_C_To_P,[i], Max_PDU_P_To_C[i], PHY_C_To_P,[i], PHY_P_To_C[i], BN_C_To_P,[i], BN_P_To_C[i]	Status, CIG_ID, CIS_Count, Connection_Handle[i]

Description:

This command should only be used for testing purposes.

The command is used by a Central's Host to create a CIG and to set the parameters of one or more CISes that are associated with a CIG in the Controller.

The CIG_ID parameter identifies a CIG. This parameter is allocated by the Central's Host and passed to the Peripheral's Host through the Link Layers during the process of creating a CIS. If the CIG_ID does not exist, then the Controller shall first create a new CIG. Once the CIG is created (whether through this command or previously), the Controller shall modify or add CIS configurations in the CIG that is identified by the CIG_ID and update all the parameters that apply to the CIG.

The SDU_Interval_C_To_P parameter specifies the time interval of periodic SDUs from the Central's Host.

The SDU_Interval_P_To_C parameter specifies the time interval of periodic SDUs from the Peripheral's Host.

The FT_C_To_P parameter identifies the maximum time for a payload from the Central to Peripheral to be transmitted and re-transmitted, after which it is flushed (see [Vol 6] Part B, Section 4.5.13.5). This parameter is expressed in multiples of ISO_Interval.

The FT_P_To_C parameter identifies the maximum time for a payload from the Peripheral to Central to be transmitted and re-transmitted, after which it is flushed (see [Vol 6] Part B, Section 4.5.13.5). This parameter is expressed in multiples of ISO_Interval.

The ISO_Interval parameter specifies the time between two consecutive CIS anchor points.

The CIS_Count parameter contains the number of CIS configurations being added or modified by this command. The Controller shall set the CIS_Count return parameter equal to this.

The CIS_ID[i] parameter identifies the CIS and is set by the Central's Host and passed to the Peripheral's Host through the Link Layers during the process of establishing a CIS.

The Worst_Case_SCA parameter is the worst-case sleep clock accuracy of all the Peripherals that will participate in the CIG. The Host should get the sleep clock accuracy from all the Peripherals before issuing this command. In case the Host cannot get the sleep clock accuracy from all the Peripherals, it shall set the Worst_Case_SCA parameter to zero.

Note: The Worst_Case_SCA parameter can be used by the Link Layer to better allow for clock drift when scheduling the CISes in the CIG. For example, if a CIS has more than two subevents, the Link Layer of the Central can set the timing of the subevents such that the worst case drift in the Peripheral's clock will not exceed 2 × Sub_Interval. This prevents the Peripheral from synchronizing its timing to the wrong subevent (adjacent subevents cannot be on the same channel).

The Packing parameter is used to indicate the preferred method of arranging subevents of multiple CISes. The subevents can be arranged in Sequential or Interleaved arrangement. This is a recommendation to the Controller which it may ignore. This parameter shall be ignored when there is only one CIS in the CIG.

The Framing parameter specifies the framing mode (see [Vol 6] Part G, Section 2) that the Controller shall use for all the CISes in the CIG. This overrides any framing mode previously set for the CIG.

The CIS_ID[i] parameter is used to identify a CIS.

The NSE[i] parameter identifies the maximum number of subevents for each CIS in a CIG event.

The Max_SDU_C_To_P[i] parameter identifies the maximum size of SDU from the Central's Host. If the CIS is unidirectional from Peripheral to Central, this parameter shall be set to 0. If a CIS configuration that is being modified has a data path set in the Central to Peripheral direction and the Host has specified that Max_SDU_C_To_P[i] shall be set to zero, the Controller shall return the error code *Command Disallowed* (0x0C). The minimum value of the Max_SDU_Size parameter in the ISO Transmit Test mode when the Payload_Type = 1 or 2 shall be 4 octets.

The Max_SDU_P_To_C[i] parameter identifies the maximum size of SDU from the Peripheral's Host. If the CIS is unidirectional from Central to Peripheral, this parameter shall be set to 0. If a CIS configuration that is being modified has a data path set in the Peripheral to Central direction and the Host has specified that Max_SDU_P_To_C[i] shall be set to zero, the Controller shall return the error code *Command Disallowed* (0x0C).The minimum value of the Max_SDU parameter in the ISO Transmit Test mode when the Payload_Type = 1 or 2 shall be 4 octets.

The Max_PDU_C_To_P[i] parameter identifies the maximum size PDU from the Central to Peripheral.

The Max_PDU_P_To_C[i] parameter identifies the maximum size PDU from the Peripheral to Central.

The PHY_C_To_P[i] parameter identifies the PHY to be used for transmission of packets from the Central to the Peripheral. The Host shall set only one bit in this parameter and the Controller shall use the PHY set by the Host.

The PHY_P_To_C[i] parameter identifies the PHY to be used for transmission of packets from the Peripheral to the Central. The Host shall set only one bit in this parameter and the Controller shall use the PHY set by the Host.

The BN_C_To_P[i] parameter identifies the burst number for Central to Peripheral (see [Vol 6] Part B, Section 4.5.13). If the CIS is unidirectional from Peripheral to Central, this parameter shall be set to zero.

The BN_P_To_C[i] parameter identifies the burst number for Peripheral to Central (see [Vol 6] Part B, Section 4.5.13). If the CIS is unidirectional from Central to Peripheral, this parameter shall be set to zero.

If the Status parameter is non-zero, then the state of the CIG and its CIS configurations shall not be changed by the command. If the CIG did not already exist, it shall not be created.

If Status is zero, then the Controller shall set Connection_Handle[i] to the connection handle corresponding to the CIS configuration specified in CIS_ID[i]. If the same CIS_ID is being reconfigured, the same connection handle shall be returned.

If the Host issues this command when the CIG is not in the configurable state, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host attempts to create a CIG or set parameters that exceed the maximum supported resources in the Controller, the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If the Host attempts to set CIS parameters that exceed the maximum supported connections in the Controller, the Controller shall return the error code *Connection Limit Exceeded* (0x09).

If the Host attempts to set an invalid combination of CIS parameters, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12) or the error code *Unsupported Feature or Parameter Value* (0x11); it should return the error code *Invalid HCI Command Parameters* (0x12).

If the Host sets, in the PHY_C_To_P[i] or PHY_P_To_C[i] parameters, a bit for a PHY that the Controller does not support, including a bit that is reserved for future use, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Controller does not support asymmetric PHYs and the Host sets PHY_C_To_P[i] to a different value than PHY_P_To_C[i], the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Command parameters:

CIG_ID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify the CIG.
All other values	Reserved for future use.

SDU_Interval_C_To_P: *Size: 3 octets*

Value	Parameter Description
0x0000FF to 0x0FFFFF	The interval, in microseconds, of periodic SDUs.
All other values	Reserved for future use.

SDU_Interval_P_To_C: *Size: 3 octets*

Value	Parameter Description
0x0000FF to 0x0FFFFF	The interval, in microseconds, of periodic SDUs.
All other values	Reserved for future use.

FT_C_To_P: *Size: 1 octet*

Value	Parameter Description
0xXX	The flush timeout in multiples of ISO_Interval for each payload sent from the Central to Peripheral. Range: 0x01 to 0xFF

FT_P_To_C: *Size: 1 octet*

Value	Parameter Description
0xXX	The flush timeout in multiples of ISO_Interval for each payload sent from the Peripheral to Central. Range: 0x01 to 0xFF

ISO_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Time between consecutive CIS anchor points. Range: 0x0004 to 0x0C80 Time = N × 1.25 ms Time Range: 5 ms to 4 s

Worst_Case_SCA: *Size: 1 octet*

Value	Parameter Description
0x00	251 ppm to 500 ppm
0x01	151 ppm to 250 ppm
0x02	101 ppm to 150 ppm
0x03	76 ppm to 100 ppm
0x04	51 ppm to 75 ppm
0x05	31 ppm to 50 ppm
0x06	21 ppm to 30 ppm

Value	Parameter Description
0x07	0 ppm to 20 ppm
All other values	Reserved for future use

Packing: *Size: 1 octet*

Value	Parameter Description
0x00	Sequential
0x01	Interleaved
All other values	Reserved for future use

Framing: *Size: 1 octet*

Value	Parameter Description
0x00	Unframed PDUs
0x01	Framed PDUs, Segmentable mode
0x02	Framed PDUs, Unsegmented mode
All other values	Reserved for future use

CIS_Count: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x1F	Total number of CIS configurations in the CIG being added or modified.
All other values	Reserved for future use

CIS_ID[i]: *Size: CIS_Count × 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify a CIS
All other values	Reserved for future use

NSE[i]: *Size: CIS_Count × 1 octet*

Value	Parameter Description
0x01 to 0x1F	Maximum number of subevents in each CIS event
All other values	Reserved for future use

Max_SDU_C_To_P[i]: *Size: CIS_Count × 2 octets*

Value	Parameter Description
0x0000 to 0x0FFF	Maximum size, in octets, of the payload from the Central's Host
All other values	Reserved for future use

Max_SDU_P_To_C[i]: *Size: CIS_Count × 2 octets*

Value	Parameter Description
0x0000 to 0x0FFF	Maximum size, in octets, of the payload from the Peripheral's Host
All other values	Reserved for future use

Max_PDU_C_To_P[i]: *Size: CIS_Count × 2 octets*

Value	Parameter Description
0x0000 to 0x00FB	Maximum size, in octets, of the payload from the Central's Link Layer to the Peripheral's Link Layer.
All other values	Reserved for future use

Max_PDU_P_To_C[i]: *Size: CIS_Count × 2 octets*

Value	Parameter Description
0x0000 to 0x00FB	Maximum size, in octets, of the payload from the Peripheral's Link Layer to the Central's Link Layer.
All other values	Reserved for future use

PHY_C_To_P[i]: *Size: CIS_Count × 1 octet*

Bit Number	Parameter Description
0	The transmitter PHY of packets from the Central is LE 1M
1	The transmitter PHY of packets from the Central is LE 2M
2	The transmitter PHY of packets from the Central is LE Coded
All other bits	Reserved for future use

PHY_P_To_C[i]: *Size: CIS_Count × 1 octet*

Bit Number	Parameter Description
0	The transmitter PHY of packets from the Peripheral is LE 1M
1	The transmitter PHY of packets from the Peripheral is LE 2M

Bit Number	Parameter Description
2	The transmitter PHY of packets from the Peripheral is LE Coded
All other bits	Reserved for future use

BN_C_To_P[i]: *Size: CIS_Count × 1 octet*

Value	Parameter Description
0x00	No isochronous data from the Central to the Peripheral
0x01 to 0x0F	The burst number for Central to Peripheral transmission
All other values	Reserved for future use

BN_P_To_C[i]: *Size: CIS_Count × 1 octet*

Value	Parameter Description
0x00	No isochronous data from the Peripheral to the Central
0x01 to 0x0F	The burst number for Peripheral to Central transmission
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_Set_CIG_Parameters_Test command succeeded
0x01 to 0xFF	The HCI_LE_Set_CIG_Parameters_Test command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

CIG_ID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify a CIG
All other values	Reserved for future use

CIS_Count: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x1F	Total number of CIS configurations in the CIG being added or modified.
All other values	Reserved for future use

Connection_Handle[i]: *Size: CIS_Count × 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS in the CIG. Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_CIG_Parameters_Test command has completed, an HCI_Command_Complete event shall be generated.

7.8.99 LE Create CIS command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Create_CIS	0x0064	CIS_Count, CIS_Connection_Handle[i], ACL_Connection_Handle[i]	*none*

Description:

This command is used by the Central's Host to create one or more CISes using the connections identified by the ACL_Connection_Handle arrayed parameter.

The CIS_Count parameter is the total number of CISes created by this command.

The CIS_Connection_Handle[i] parameter specifies the connection handle corresponding to the configuration of the CIS to be created and whose configuration is already stored in a CIG.

The ACL_Connection_Handle[i] parameter specifies the connection handle of the ACL connection associated with each CIS to be created. The list of the ACL_Connection_Handles shall be in the same order as the list of the CIS_Connection_Handles e.g., CIS_Connection_Handle[1] will connect to the Peripheral associated with the ACL_Connection_Handle[1].

If this command is issued on the Central before the devices have performed the Feature Exchange procedure, then the Controller shall complete that procedure before initiating the Connected Isochronous Stream Creation procedure (see [Vol 6] Part B, Section 5.1.15).

If any ACL_Connection_Handle[i] is not the handle of an existing ACL connection or any CIS_Connection_Handle[i] is not the handle of a CIS or CIS configuration, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host attempts to create a CIS that has already been created, the Controller shall return the error code *Connection Already Exists* (0x0B).

If two different elements of the CIS_Connection_Handle arrayed parameter identify the same CIS, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command before all the HCI_LE_CIS_Established events from the previous use of the command have been generated, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command on an ACL_Connection_Handle where the Controller is the Peripheral, the Controller shall return the error code *Command Disallowed* (0x0C).

Note: The order of the CIS connection handles in this command does not relate to the order of connection handles in the return parameters of the HCI_LE_Set_CIG_Parameters command or the HCI_LE_Set_CIG_Parameters_Test command.

If the Host issues this command when the Connected Isochronous Stream (Host Support) feature bit (see [Vol 6] Part B, Section 4.6.27) is not set, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host specified an invalid combination of parameters in the HCI_LE_Set_CIG_Parameters or HCI_LE_Set_CIG_Parameters_Test command that created the CIS configuration, but the Controller could not detect the problem without knowing the properties of the ACL connection associated with the CIS, then the Controller shall return an error which should use the error code *Unsupported Feature or Parameter Value* (0x11).

Note: If an error is reported in the HCI_Command_Status event, it means that no CIS is created and the Host cannot determine which CIS had the error. Therefore, in the case of an error that only affects one CIS of several, reporting the error in the HCI_LE_CIS_Established event for that CIS means that the remaining CISes are still created and the Host can determine which CIS had the error.

Command parameters:

CIS_Count: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Total number of CISes to be created.
All other values	Reserved for future use

CIS_Connection_Handle[i]: *Size: CIS_Count × 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS Range: 0x0000 to 0x0EFF

ACL_Connection_Handle[i]: *Size: CIS_Count × 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of an ACL connection Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Create_CIS command, the Controller sends the HCI_Command_Status event to the Host. An HCI_LE_CIS_Established event will be generated for each CIS when it is established or if it is disconnected or considered lost before being established; until all the events are generated, the command remains pending.

7.8.100 LE Remove CIG command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remove_CIG	0x0065	CIG_ID	Status, CIG_ID

Description:

This command is used by the Central's Host to remove the CIG identified by CIG_ID.

The CIG_ID parameter contains the identifier of the CIG.

This command shall delete the CIG_ID and also delete the Connection_Handles of the CIS configurations stored in the CIG.

This command shall also remove the isochronous data paths that are associated with the Connection_Handles of the CIS configurations, which is equivalent to issuing the HCI_LE_Remove_ISO_Data_Path command (see Section 7.8.110).

If the Host tries to remove a CIG which is in the active state, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command with a CIG_ID that does not exist, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

CIG_ID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Identifier of a CIG
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_Remove_CIG command succeeded
0x01 to 0xFF	The HCI LE Remove_CIG command failed. See [Vol 1] Part F, Controller Error Codes for a complete list of error codes and descriptions.

CIG_ID: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Identifier of a CIG
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_Remove_CIG command has completed, an HCI_Command_Complete event shall be generated.

7.8.101 LE Accept CIS Request command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Accept_CIS_Request	0x0066	Connection_Handle	*none*

Description:

This command is used by the Peripheral's Host to inform the Controller to accept the request for the CIS that is identified by the Connection_Handle.

The command shall only be issued after an HCI_LE_CIS_Request event has occurred. The event contains the Connection_Handle of the CIS.

If the Peripheral's Host issues this command with a Connection_Handle that does not exist, or the Connection_Handle is not for a CIS, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Peripheral's Host issues this command with a Connection_Handle for a CIS that has already been established or that already has an HCI_LE_Accept_CIS_Request or HCI_LE_Reject_CIS_Request command in progress, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Central's Host issues this command, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS Range: 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Accept_CIS_Request command, the Controller sends the HCI_Command_Status event to the Host. An HCI_LE_CIS_Established event will be generated when the CIS is established or is considered lost before being established.

7.8.102 LE Reject CIS Request command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Reject_CIS_Request	0x0067	Connection_Handle, Reason	Status, Connection_Handle

Description:

This command is used by the Peripheral's Host to inform the Controller to reject the request for the CIS that is identified by the Connection_Handle.

The command shall only be issued after an HCI_LE_CIS_Request event has occurred. The event contains the Connection_Handle of the CIS.

When this command succeeds, the Controller shall delete the Connection_Handle of the requested CIS.

The Reason parameter indicates the reason for rejecting the CIS request.

If the Peripheral's Host issues this command with a Connection_Handle that is not for a CIS, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Peripheral's Host issues this command with a Connection_Handle for a CIS that has already been established or that already has an HCI_LE_Accept_CIS_Request or HCI_LE_Reject_CIS_Request command in progress, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Central's Host issues this command, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS to be rejected Range: 0x0000 to 0x0EFF

Reason: *Size: 1 octet*

Value	Parameter Description
0xXX	Reason the CIS request was rejected. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_Reject_CIS_Request command succeeded.
0x01 to 0xFF	The HCI_LE_Reject_CIS_Request command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The connection handle of the CIS to be rejected Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Reject_CIS_Request command has completed, an HCI_Command_Complete event shall be generated.

7.8.103 LE Create BIG command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Create_BIG	0x0068	BIG_Handle, Advertising_Handle, Num_BIS, SDU_Interval, Max_SDU, Max_Transport_Latency, RTN, PHY, Packing, Framing, Encryption, Broadcast_Code	*none*

Description:

This command is used to create a BIG with one or more BISes (see [Vol 6] Part B, Section 4.4.6). All BISes in a BIG have the same value for all parameters.

The BIG_Handle contains the identifier of the BIG. This parameter is allocated by the Host and used by the Controller and the Host to identify a BIG.

The Advertising_Handle identifies the associated periodic advertising train of the BIG (see [Vol 6] Part B, Section 4.4.5.1).

The Num_BIS parameter contains the total number of BISes in the BIG.

The SDU_Interval parameter contains the time interval of the periodic SDUs.

The Max_SDU parameter contains the maximum size of an SDU.

The Max_Transport_Latency parameter is the maximum transport latency (in milliseconds) as described in [Vol 6] Part G, Section 3.2.1 and [Vol 6] Part G, Section 3.2.2. This includes pre-transmissions.

The RTN (Retransmission Number) parameter contains the number of times every PDU should be retransmitted, irrespective of which BIG events the retransmissions occur in. This is a recommendation to the Controller which the Controller may ignore.

The PHY parameter is a bit field that indicates the PHY used for transmission of PDUs of BISes in the BIG. The Host shall set at least one bit in this parameter and the

Controller shall pick a PHY from the bits set. If the Host sets, in the PHY parameter, a bit for a PHY that the Controller does not support, including a bit that is reserved for future use, then the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Packing parameter is used to indicate the preferred method of arranging subevents of multiple BISes. The subevents can be arranged in Sequential or Interleaved arrangement. This is a recommendation to the Controller which it may ignore. This parameter shall be ignored when there is only one BIS in the BIG.

The Framing parameter indicates the format of the BIS Data PDUs and the mode of framed PDUs that the Host is requesting the Controller to use on the specified BIG. The Controller may use any combination of format and mode permitted by [Vol 6] Part G, Table 2.1

The Encryption parameter identifies the encryption mode of the BISes. If the Encryption parameter is set to 1 (encrypted), then the Broadcast_Code is used in the encryption of payloads (see [Vol 6] Part B, Section 4.4.6.10).

The Broadcast_Code parameter is used to generate the encryption key for encrypting payloads of all BISes. When the Encryption parameter is set to 0 (unencrypted), the Broadcast_Code parameter shall be set to zero by the Host and ignored by the Controller.

If the Controller cannot create all BISes of the BIG or if Num_BIS exceeds the maximum value supported by the Controller, then it shall return the error code *Rejected due to Limited Resources* (0x0D).

If the Advertising_Handle does not identify a periodic advertising train, the periodic advertising train is associated with another BIG, or the periodic advertising train has responses and the Controller does not support that, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If the Host issues this command with a BIG_Handle for a BIG that is already created, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host specifies an invalid combination of BIG parameters, then the Controller shall return an error which should use the error code *Invalid HCI Command Parameters* (0x12).

If the length of the associated periodic advertising, with the BIGInfo added to the ACAD, is greater than the maximum that the Controller can transmit within the periodic advertising interval (if periodic advertising is currently enabled) or the Periodic_Advertising_Interval_Max for the advertising set (if currently disabled), then the Controller shall return an error and should use the error code *Packet Too Long* (0x45).

If advertising on the LE Coded PHY, then the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

Command parameters:

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify the BIG.
All other values	Reserved for future use

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify the periodic advertising train.
All other values	Reserved for future use

Num_BIS: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Total number of BISes in the BIG.
All other values	Reserved for future use

SDU_Interval: *Size: 3 octets*

Value	Parameter Description
0x0000FF to 0x0FFFFF	The interval, in microseconds, of periodic SDUs.
All other values	Reserved for future use

Max_SDU: *Size: 2 octets*

Value	Parameter Description
0x0001 to 0x0FFF	Maximum size of an SDU, in octets.
All other values	Reserved for future use

Max_Transport_Latency: *Size: 2 octets*

Value	Parameter Description
0x0005 to 0x0FA0	Maximum transport latency, in milliseconds.
All other values	Reserved for future use

RTN: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x1E	The number of times that every BIS Data PDU should be retransmitted.
All other values	Reserved for future use

PHY: *Size: 1 octet*

Bit Number	Parameter Description
0	The transmitter PHY of packets is LE 1M.
1	The transmitter PHY of packets is LE 2M.
2	The transmitter PHY of packets is LE Coded.
All other bits	Reserved for future use

Packing: *Size: 1 octet*

Value	Parameter Description
0x00	Sequential
0x01	Interleaved
All other values	Reserved for future use

Framing: *Size: 1 octet*

Value	Parameter Description
0x00	Unframed PDUs
0x01	Framed PDUs, Segmentable mode
0x02	Framed PDUs, Unsegmented mode
All other values	Reserved for future use

Encryption: *Size: 1 octet*

Value	Parameter Description
0x00	Unencrypted
0x01	Encrypted
All other values	Reserved for future use

Broadcast_Code: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	The code used to derive the session key that is used to encrypt and decrypt BIS payloads.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Create_BIG command, the Controller sends the HCI_Command_Status event to the Host. When the HCI_LE_Create_BIG command has completed, the HCI_LE_Create_BIG_Complete event is generated.

7.8.104 LE Create BIG Test command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Create_BIG_Test	0x0069	BIG_Handle, Advertising_Handle, Num_BIS, SDU_Interval, ISO_Interval, NSE, Max_SDU, Max_PDU, PHY, Packing, Framing, BN, IRC, PTO, Encryption, Broadcast_Code	*none*

Description:

This command should only be used for testing purposes.

The command is used to create one or more BISes of a BIG (see [Vol 6] Part B, Section 4.4.6). All BISes in the BIG have the same values for all parameters.

The BIG_Handle contains the identifier of the BIG. This parameter is allocated by the Host and used by the Controller and the Host to identify a BIG.

The Advertising_Handle identifies the associated periodic advertising train of the BIG.

The Num_BIS parameter contains the total number of BISes in the BIG.

The SDU_Interval parameter specifies the time interval of the periodic SDUs.

The ISO_Interval parameter contains the time duration between two consecutive BIG anchor points.

The NSE (Number of SubEvents) parameter contains the total number of subevents that are used to transmit BIS Data PDUs for each BIS in a BIG event. The NSE parameter shall be greater than or equal to IRC × BN.

The Max_SDU parameter contains the maximum size, in octets, of an SDU. The minimum value of the Max_SDU parameter in the ISO Transmit Test mode when the Payload_Type = 1 or 2 shall be 4.

The Max_PDU parameter contains the maximum size of every BIS Data PDU for every BIS in the BIG.

The PHY parameter is a bit field that indicates the PHY used for transmission of PDUs of BISes in the BIG. The Host shall set only one bit in this parameter and the Controller shall use the PHY set by the Host. If the Host sets, in the PHY parameter, a bit for a PHY that the Controller does not support, including a bit that is reserved for future use, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Packing parameter indicates the preferred method of arranging subevents of multiple BISes. The subevents can be arranged in Sequential or Interleaved arrangement. This is a recommendation to the Controller which it may ignore. This parameter shall be ignored when there is only one BIS in the BIG.

The Framing parameter indicates the format of the BIS Data PDUs and the mode of framed PDUs (see [Vol 6] Part G, Section 2) that the Controller shall use on the specified BIG.

The BN (Burst Number) parameter contains the number of new payloads for each BIS in a BIS event.

The IRC (Immediate Repetition Count) parameter contains the number of times the scheduled data packet is transmitted (see [Vol 6] Part B, Section 4.4.6). The IRC parameter shall be an integer in the range 1 to (NSE ÷ BN).

The PTO (Pre_Transmission_Offset) parameter contains the offset in number of ISO_Intervals for pre transmissions of data packets (see [Vol 6] Part B, Section 4.4.6).

The Encryption parameter identifies the encryption mode of the BISes in the BIG. If the Encryption parameter is set to 1 (encrypted), the Broadcast_Code is used in the encryption of payloads (see [Vol 6] Part B, Section 4.4.6).

The Broadcast_Code parameter is a 16-octet field that is used to generate the session key to encrypt payloads of all BISes in the BIG. When the Encryption parameter is set to 0 (unencrypted), all 16 octets of the Broadcast_Code parameter shall be set to zero by the Host and ignored by the Controller.

If the Controller cannot create all BISes of the BIG or if Num_BIS exceeds the maximum value supported by the Controller, it shall return the error code *Rejected due to Limited Resources* (0x0D).

If the Advertising_Handle does not identify a periodic advertising train, the periodic advertising train is associated with another BIG, or the periodic advertising train has responses and the Controller does not support that, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If the Host issues this command with a BIG_Handle for a BIG that is already created, the Controller shall return the error code *Command Disallowed* (0x0C).

If the value of the Max_PDU, NSE, BN, IRC or PTO parameters exceeds the values supported by the Controller, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host specifies an invalid combination of BIG parameters, the Controller shall return an error. If the value of the NSE parameter is not an integer multiple of BN, or NSE is less than (IRC × BN), or the parameters are not in the specified range, these errors shall use the error code *Unsupported Feature or Parameter Value* (0x11). The errors in all other circumstances should use the error code *Invalid HCI Command Parameters* (0x12).

If the length of the associated periodic advertising, with the BIGInfo added to the ACAD, is greater than the maximum that the Controller can transmit within the periodic advertising interval, then the Controller shall return an error and should use the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, then the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

Command parameters:

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify the BIG
All other values	Reserved for future use

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify the periodic advertising train
All other values	Reserved for future use

Num_BIS: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Total number of BISes in the BIG
All other values	Reserved for future use

SDU_Interval: *Size: 3 octets*

Value	Parameter Description
0x0000FF to 0x0FFFFF	The interval, in microseconds, of periodic SDUs.
All other values	Reserved for future use

ISO_Interval: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	The time between consecutive BIG anchor points. Range: 0x0004 to 0x0C80 Time = N × 1.25 ms Time Range: 5 ms to 4 s

NSE: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	The total number of subevents in each interval of each BIS in the BIG.
All other values	Reserved for future use

Max_SDU: *Size: 2 octets*

Value	Parameter Description
0x0001 to 0x0FFF	Maximum size, in octets, of an SDU
All other values	Reserved for future use

Max_PDU: *Size: 2 octets*

Value	Parameter Description
0x0001 to 0x00FB	Maximum size, in octets, of payload
All other values	Reserved for future use

PHY: *Size: 1 octet*

Bit Number	Parameter Description
0	The transmitter PHY of packets is LE 1M.
1	The transmitter PHY of packets is LE 2M.
2	The transmitter PHY of packets is LE Coded.
All other bits	Reserved for future use

Packing: *Size: 1 octet*

Value	Parameter Description
0x00	Sequential
0x01	Interleaved
All other values	Reserved for future use

Framing: *Size: 1 octet*

Value	Parameter Description
0x00	Unframed PDUs
0x01	Framed PDUs, Segmentable mode
0x02	Framed PDUs, Unsegmented mode
All other values	Reserved for future use

BN: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x07	The number of new payloads in each interval for each BIS.
All other values	Reserved for future use

IRC: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x0F	The number of times the scheduled payloads are transmitted in a given event.
All other values	Reserved for future use

PTO: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x0F	Offset used for pre-transmissions
All other values	Reserved for future use

Encryption: *Size: 1 octet*

Value	Parameter Description
0x00	Unencrypted
0x01	Encrypted
All other values	Reserved for future use

Broadcast_Code: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	The code used to derive the session key that is used to encrypt and decrypt BIS payloads.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Create_BIG_Test command, the Controller sends the HCI_Command_Status event to the Host. When the HCI_LE_Create_BIG_Test command has completed, the HCI_LE_Create_BIG_Complete event is generated.

7.8.105 LE Terminate BIG command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Terminate_BIG	0x006A	BIG_Handle, Reason	*none*

Description:

This command is used to terminate a BIG identified by the BIG_Handle parameter. The command also terminates the transmission of all BISes of the BIG, destroys the associated connection handles of the BISes in the BIG and removes the data paths for all BISes in the BIG.

The Reason parameter is used to indicate the reason why the BIG is to be terminated.

If the BIG_Handle does not identify a BIG, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If the Controller is not the Isochronous Broadcaster for the BIG identified by BIG_Handle, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify the BIG.
All other values	Reserved for future use

Reason: *Size: 1 octet*

Value	Parameter Description
0xXX	Reason the BIG is terminated. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Terminate_BIG command, the Controller sends the HCI_Command_Status event to the Host.

When the HCI_LE_Terminate_BIG command has completed, the HCI_LE_Terminate_BIG_Complete event will be generated.

If the Host attempts to terminate a BIG while the process of establishment of the BIG is in progress (i.e. HCI_LE_Create_BIG_Complete event has not been generated) the process of establishment shall stop and the Controller shall generate the HCI_LE_-Create_BIG_Complete event to the Host with the error code *Operation Cancelled by Host* (0x44).

7.8.106 LE BIG Create Sync command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_BIG_Create_Sync	0x006B	BIG_Handle, Sync_Handle, Encryption, Broadcast_Code, MSE, BIG_Sync_Timeout, Num_BIS, BIS[i]	*none*

Description:

This command is used to synchronize to a BIG described in the periodic advertising train specified by the Sync_Handle parameter.

The BIG_Handle parameter is assigned by the Host to identify the synchronized BIG.

The Encryption parameter indicates whether the Broadcast_Code parameter is valid.

The Broadcast_Code parameter is a 16-octet field that is used to generate the session key to encrypt or decrypt payloads of an encrypted BIS. Broadcast_Code shall be ignored by the Controller if Encryption is set to 0x00.

If Encryption is set to 0x00 for an encrypted BIG or is set to 0x01 for an unencrypted BIG, then the Controller shall return the error *Encryption Mode Not Acceptable* (0x25).

The MSE (Maximum Subevents) parameter is the maximum number of subevents that a Controller should listen to for data payloads in each interval for a BIS. The Controller may select any of the subevents to listen to.

The BIG_Sync_Timeout parameter specifies the maximum permitted time between successful receptions of BIS PDUs. If this time is exceeded, synchronization is lost. When the Controller establishes synchronization and if the BIG_Sync_Timeout set by the Host is less than 6 × ISO_Interval, the Controller shall set the timeout to 6 × ISO_Interval.

The Num_BIS parameter contains the number of BISes specified in the BIS arrayed parameter. The number of BISes requested may be less than the number of BISes in the BIG.

The BIS arrayed parameter is a list of BIS_Numbers corresponding to BIS(es) in the synchronized BIG. The list of BIS_Numbers shall be in ascending order and shall not contain any duplicates.

If the Sync_Handle does not exist, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If the Host sends this command with a BIG_Handle that is already allocated, the Controller shall return the error code *Command Disallowed* (0x0C).

If the information describing the BIG does not specify a PHY supported by the Controller or does not specify exactly one PHY, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Num_BIS parameter is greater than the total number of BISes in the BIG, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If MSE is less than the BN value for the BIS, then the Controller should return the error code *Invalid HCI Command Parameters* (0x12).

If the Host sends this command when the Controller is in the process of synchronizing to any BIG, i.e. the HCI_LE_BIG_Sync_Established event has not been generated, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Controller is unable to receive PDUs from the specified number of BISes in the synchronized BIG, it shall return the error code *Rejected Due To Limited Resources* (0x0D).

If the Controller is already synchronized to the BIG specified by Sync_Handle, it shall return an error which should use the error code *Command Disallowed* (0x0C).

Command parameters:

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Used to identify the BIG
All other values	Reserved for future use

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Identifier of the periodic advertising train Range: 0x0000 to 0x0EFF

Encryption: *Size: 1 octet*

Value	Parameter Description
0x00	Broadcast_Code invalid
0x01	Broadcast_Code valid
All other values	Reserved for future use

Broadcast_Code: *Size: 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	128-bit code used for deriving the session key for decrypting payloads of BISes in the BIG.

MSE: *Size: 1 octet*

Value	Parameter Description
0x00	The Controller can schedule reception of any number of subevents up to NSE.
0x01 to 0x1F	Maximum number of subevents that should be used to receive data payloads in each BIS event
All other values	Reserved for future use

BIG_Sync_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Synchronization timeout for the BIG Range: 0x000A to 0x4000 Time = N × 10 ms Time Range: 100 ms to 163.84 s

Num_BIS: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x1F	Total number of BISes to synchronize
All other values	Reserved for future use

BIS[i]: *Size: Num_BIS × 1 octet*

Value	Parameter Description
0x01 to 0x1F	BIS_Number for a BIS in the BIG
All other values	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_BIG_Create_Sync command, the Controller sends the HCI_Command_Status event to the Host. When the HCI_LE_BIG_Create_Sync command has completed, the HCI_LE_BIG_Sync_Established event will be generated.

If the Controller does not receive a BIS PDU within 6 BIS events of first listening, then it shall generate an HCI_LE_BIG_Sync_Established event that should have Status set to *Connection Failed to be Established / Synchronization Timeout* (0x3E).

7.8.107 LE BIG Terminate Sync command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_BIG_Terminate_Sync	0x006C	BIG_Handle	Status, BIG_Handle

Description:

This command is used to stop synchronizing or cancel the process of synchronizing to the BIG identified by the BIG_Handle parameter. The command also terminates the reception of BISes in the BIG specified in the HCI_LE_BIG_Create_Sync command, destroys the associated connection handles of the BISes in the BIG and removes the data paths for all BISes in the BIG.

If the Host issues this command with a BIG_Handle that does not exist, the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If the Host issues this command for a BIG which it is neither synchronized to nor in the process of synchronizing to, then the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Identifer of the BIG
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_BIG_Terminate_Sync command succeeded
0x01 to 0xFF	The HCI_LE_BIG_Terminate_Sync command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

BIG_Handle: *Size: 1 octet*

Value	Parameter Description
0x00 to 0xEF	Identifer of the BIG
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_BIG_Terminate_Sync command has completed, an HCI_Command_Complete event shall be generated.

If the Host attempts to terminate synchronization with a BIG while the process of synchronization with that BIG is in progress (i.e. HCI_LE_BIG_Sync_Established event has not been generated) the process of synchronization shall stop, and the Controller shall generate the HCI_LE_BIG_Sync_Established event to the Host with the error code *Operation Cancelled by Host* (0x44).

7.8.108 LE Request Peer SCA command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Request_Peer_SCA	0x006D	Connection_Handle	*none*

Description:

This command is used to read the Sleep Clock Accuracy (SCA) of the peer device.

The Connection_Handle parameter is the connection handle of the ACL connection.

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host sends this command and the peer device does not support the Sleep Clock Accuracy Updates feature, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11) in the HCI_LE_Request_Peer_SCA_Complete event.

If the Host issues this command when the Controller is aware (e.g., through a previous feature exchange) that the peer device's Link Layer does not support the Sleep Clock Accuracy Updates feature, the Controller shall return the error code *Unsupported Remote Feature* (0x1A).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the ACL Range 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Request_Peer_SCA command, the Controller sends the HCI_Command_Status event to the Host. When the HCI_LE_Request_Peer_SCA command has completed, the HCI_LE_Request_Peer_SCA_Complete event shall be generated.

7.8.109 LE Setup ISO Data Path command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Setup_ISO_Data_Path	0x006E	Connection_Handle, Data_Path_Direction, Data_Path_ID, Codec_ID, Controller_Delay, Codec_Configuration_Length, Codec_Configuration	Status, Connection_Handle

Description:

This command is used to identify and create the isochronous data path between the Host and the Controller for a CIS, CIS configuration, or BIS identified by the Connection_Handle parameter. This command can also be used to configure a codec for each data path. When a connection is created no data paths are set up for that connection. When the command has completed successfully, data shall be allowed to flow over the specified path in the specified direction irrespective of the state of the other direction or any other path.

The input and output directions are defined from the perspective of the Controller, so "input" refers to data flowing from the Host to the Controller.

If the Host issues this command more than once for the same Connection_Handle and direction before issuing the HCI_LE_Remove_ISO_Data_Path command for that Connection_Handle and direction, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command for a CIS on a Peripheral before it has issued the HCI_LE_Accept_CIS_Request command for that CIS, then the Controller shall return the error code *Command Disallowed* (0x0C).

The Data_Path_Direction parameter specifies the direction for which the data path is being configured.

The Data_Path_ID parameter specifies the data transport path used. When set to 0x00, the data path shall be over the HCI transport. When set to a value in the range 0x01 to 0xFE, the data path shall use a vendor-specific transport interface (e.g., a PCM interface) with logical transport numbers. The meanings of these logical transport numbers are vendor-specific.

If the Host issues this command for a vendor-specific data transport path that has not been configured, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host attempts to set a data path with a Connection Handle that does not exist or that is not for a CIS, CIS configuration, or BIS, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host attempts to set an output data path using a connection handle that is for an Isochronous Broadcaster, for an input data path on a Synchronized Receiver, or for a data path for the direction on a unidirectional CIS where BN is set to 0, the Controller shall return the error code *Command Disallowed* (0x0C).

The Codec_ID parameter specifies the coding format used over the air.

When Data_Path_Direction is set to 0x00 (input), the Controller_Delay parameter specifies the delay at the data source from the reference time of an SDU to the CIG reference point (see [Vol 6] Part B, Section 4.5.14.1) or BIG anchor point (see [Vol 6] Part B, Section 4.4.6.4). When Data_Path_Direction is set to 0x01 (output), Controller_Delay specifies the delay from the SDU_Synchronization_Reference to the point in time at which the Controller begins to transfer the corresponding data to the data path interface. The Host should use the HCI_Read_Local_Supported_Controller_Delay command to obtain a suitable value for Controller_Delay.

Note: Controller vendors may provide additional guidance to the Host on how to select a suitable Controller_Delay value from the range of values provided by the HCI_Read_Local_Supported_Controller_Delay command for various configurations of the data path interface.

The Codec_Configuration parameter specifies codec-specific configuration information for the specified direction.

If the Host issues this command with Codec_Configuration_Length non-zero and Codec_ID set to transparent air mode, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command with codec-related parameters that exceed the bandwidth and latency allowed on the established CIS or BIS identified by the Connection_Handle parameter, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command when the CIS or BIS identified by Connection_Handle is in ISO Test mode (see Section 7.8.111, Section 7.8.112, and [Vol 6] Part B, Section 7) for the specified Data_Path_Direction, then the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS or BIS Range: 0x0000 to 0x0EFF

Data_Path_Direction: *Size: 1 octet*

Value	Parameter Description
0x00	Input (Host to Controller)
0x01	Output (Controller to Host)
All other values	Reserved for future use

Data_Path_ID: *Size: 1 octet*

Value	Parameter Description
0x00	HCI
0x01 to 0xFE	Logical_Channel_Number. The meaning of the logical channel is vendor-specific.
0xFF	Reserved for future use

Codec_ID: *Size: 5 octets*

Value	Parameter Description
Octet 0	See Assigned Numbers for Coding Format
Octets 1 to 2	Company ID, see Assigned Numbers for Company Identifier. Shall be ignored if octet 0 is not 0xFF.
Octets 3 to 4	Vendor-defined codec ID. Shall be ignored if octet 0 is not 0xFF.

Controller_Delay: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Controller delay in microseconds Range: 0x000000 to 0x3D0900 Time range: 0 s to 4 s

Codec_Configuration_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	Length of codec configuration

Codec_Configuration: *Size: Codec_Configuration_Length octets*

Value	Parameter Description
Variable	Codec-specific configuration data

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Setup_ISO_Data_Path command succeeded
0x01 to 0xFF	HCI_LE_Setup_ISO_Data_Path command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS or BIS Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Setup_ISO_Data_Path command has completed, an HCI_Command_Complete event shall be generated.

7.8.110 LE Remove ISO Data Path command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remove_ISO_Data_Path	0x006F	Connection_Handle, Data_Path_Direction	Status, Connection_Handle

Description:

This command is used to remove the input and/or output data path(s) associated with a CIS, CIS configuration, or BIS identified by the Connection_Handle parameter.

The Data_Path_Direction parameter specifies which directions are to have the data path removed.

If the Host issues this command with a Connection_Handle that does not exist or is not for a CIS, CIS configuration, or BIS, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command for a data path that has not been set up (using the HCI_LE_Setup_ISO_Data_Path command), the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS or BIS. Range: 0x0000 to 0x0EFF

Data_Path_Direction: *Size: 1 octet*

Bit Number	Parameter Description
0	Remove input data path
1	Remove output data path
All other bits	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	The HCI_LE_Remove_ISO_Data_Path command succeeded
0x01 to 0xFF	The HCI_LE_Remove_ISO_Data_Path command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS or BIS Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Remove_ISO_Data_Path command has completed, an HCI_Command_Complete event shall be generated.

7.8.111 LE ISO Transmit Test command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_ISO_Transmit_Test	0x0070	Connection_Handle, Payload_Type	Status, Connection_Handle

Description:

This command should only be used in the ISO Test mode and only for testing purposes.

The command is used to configure an established CIS or BIS specified by the Connection_Handle parameter, and transmit test payloads which are generated by the Controller.

The Payload_Type parameter defines the configuration of SDUs in the payload.

If the Host issues this command with a connection handle that does not exist, or the Connection_Handle parameter is not associated with a CIS or a BIS, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command when the value of the transmit BN parameter of the CIS is set to zero, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host has set the input data path for the CIS or BIS identified by the connection handle, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the CIS or BIS Range 0x0000 to 0x0EFF

Payload_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Zero length payload
0x01	Variable length payload
0x02	Maximum length payload
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_ISO_Transmit_Test command succeeded
0x01 to 0xFF	HCI_LE_ISO_Transmit_Test command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS or BIS Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_ISO_Transmit_Test command has completed, an HCI_Command_Complete event shall be generated.

7.8.112 LE ISO Receive Test command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_ISO_Receive_Test	0x0071	Connection_Handle, Payload_Type	Status, Connection_Handle

Description:

This command should only be used in the ISO Test mode and only for testing purposes.

The command is used to configure an established CIS or a synchronized BIG specified by the Connection_Handle parameter to receive payloads.

When using this command for a BIS, the Host shall synchronize with a BIG using the HCI_LE_BIG_Create_Sync command before invoking this command.

The Payload_Type parameter defines the configuration of SDUs in the payload.

If the Host issues this command with a connection handle that is not for an established CIS or a BIS, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command when the value of the receive BN parameter of the CIS or BIS is set to zero, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host has set the output data path for the CIS or BIS identified by the Connection_Handle parameter, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS or BIS Range 0x0000 to 0x0EFF

Payload_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Zero length payload
0x01	Variable length payload

Value	Parameter Description
0x02	Maximum length payload
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_ISO_Receive_Test command succeeded
0x01 to 0xFF	HCI_LE_ISO_Receive_Test command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS or BIS Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_ISO_Receive_Test command has completed, an HCI_Command_Complete event shall be generated.

7.8.113 LE ISO Read Test Counters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_ISO_Read_Test_Counters	0x0072	Connection_Handle	Status, Connection_Handle, Received_SDU_Count, Missed_SDU_Count, Failed_SDU_Count

Description:

This command should only be used in the ISO Test mode and only for testing purposes.

The command is used to read the test counters (see [Vol 6] Part B, Section 7) in the Controller which is configured in ISO Receive Test mode for a CIS or BIS specified by the Connection_Handle. Reading the test counters does not reset the test counters.

The Received_SDU_Count, Missed_SDU_Count and Failed_SDU_Count parameters are set in the ISO Receive Test mode (see [Vol 6] Part B, Section 7.2).

If the Host issues this command with a Connection_Handle parameter that is not for an established CIS or a BIS, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command for a CIS or BIS that is not configured in the ISO Receive Test mode, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS or BIS Range 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_ISO_Read_Test_Counters command succeeded
0x01 to 0xFF	HCI_LE_ISO_Read_Test_Counters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	The connection handle of a CIS or BIS Range: 0x0000 to 0x0EFF

Received_SDU_Count: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Number in the Received_SDU_Count

Missed_SDU_Count: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Number in the Missed_SDU_Count

Failed_SDU_Count: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Number in the Failed_SDU_Count

Event(s) generated (unless masked away):

When the HCI_LE_ISO_Read_Test_Counters command has completed, an HCI_Command_Complete event shall be generated.

7.8.114 LE ISO Test End command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_ISO_Test_End	0x0073	Connection_Handle	Status, Connection_Handle, Received_SDU_Count, Missed_SDU_Count, Failed_SDU_Count

Description:

This command should only be used in the ISO Test mode and only for testing purposes.

The command is used to terminate the ISO Transmit and/or Receive Test mode for a CIS or BIS specified by the Connection_Handle parameter but does not terminate the CIS or BIS.

When the Host terminates the ISO Test mode for a CIS or BIS that is set to ISO Transmit Test mode only, the test counters in the return parameters shall be set to zero.

When the Host terminates the ISO Test mode for a CIS or BIS that is set to the ISO Receive Test mode, the return parameters contain the values of the test counters as defined in [Vol 6] Part B, Section 7.

If the Host issues this command with a Connection_Handle that is not for an established CIS or a BIS, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command for a CIS or BIS that is not configured in the ISO Transmit or Receive Test mode, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS or BIS Range 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_ISO_Test_End command succeeded
0x01 to 0xFF	HCI_LE_ISO_Test_End command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS or BIS Range: 0x0000 to 0x0EFF

Received_SDU_Count: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Number in the Received_SDU_Count

Missed_SDU_Count: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Number in the Missed_SDU_Count

Failed_SDU_Count: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Number in the Failed_SDU_Count

Event(s) generated (unless masked away):

When the HCI_LE_ISO_Test_End command has completed, an HCI_Command_Complete event shall be generated.

7.8.115 LE Set Host Feature command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Host_Feature [v2]	0x0097	Bit_Number, Bit_Value	Status
HCI_LE_Set_Host_Feature [v1]	0x0074	Bit_Number, Bit_Value	Status

Description:

This command is used by the Host to set or clear a bit controlled by the Host in the Link Layer FeatureSet stored in the Controller (see [Vol 6] Part B, Section 4.6).

The Bit_Number parameter specifies the bit position in the FeatureSet.

The Bit_Value parameter specifies whether the feature is enabled or disabled.

If Bit_Number specifies a feature bit that is not controlled by the Host, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If Bit_Value is set to 0x01 and Bit_Number specifies a feature bit that requires support of a feature that the Controller does not support, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host issues this command while the Controller has a connection to another device, the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Bit_Number [v1]: *Size: 1 octet*

Value	Parameter Description
0xXX	Bit position in the FeatureSet

Bit_Number [v2]: *Size: 2 octets*

Value	Parameter Description
0x0000 to 0x07BF	Bit position in the FeatureSet
All other values	Reserved for future use

Bit_Value: *Size: 1 octet*

Value	Parameter Description
0x00	The Host feature is disabled and so the bit in the FeatureSet shall be set to 0
0x01	The Host feature is enabled and so the bit in the FeatureSet shall be set to 1
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Host_Feature command succeeded
0x01 to 0xFF	HCI_LE_Set_Host_Feature command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Host_Feature command has completed, an HCI_Command_Complete event shall be generated.

7.8.116 LE Read ISO Link Quality command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_ISO_Link_Quality	0x0075	Connection_Handle	Status, Connection_Handle, TX_UnACKed_Packets, TX_Flushed_Packets, TX_Last_Subevent_Packets, Retransmitted_Packets, CRC_Error_Packets, RX_Unreceived_Packets, Duplicate_Packets

Description:

This command returns the values of various counters related to link quality that are associated with the isochronous stream specified by the Connection_Handle parameter.

This command may be issued on both the Central and Peripheral if the connection handle identifies a CIS and on the Synchronized Receiver if the connection handle identifies a BIS.

Each of the remaining return parameters shall contain the current value of the corresponding counter; all the values shall be recorded at the same moment. Each counter shall be a 32-bit unsigned value, shall be initialized to zero when the isochronous stream is created, and shall be incremented by one as described below. If a counter is not associated with the type of isochronous stream specified, the value of the parameter shall be ignored.

Counter	Associated Streams	When Incremented
TX_UnACKed_Packets	CIS	The Link Layer does not receive an acknowledgment for a CIS Data PDU that it transmitted at least once by its flush point (see [Vol 6] Part B, Section 4.5.13.5).
TX_Flushed_Packets	CIS	The Link Layer does not transmit a specific payload by its flush point.
TX_Last_Subevent_-Packets	CIS in Peripher-al role	The Link Layer transmits a CIS Data PDU in the last subevent of a CIS event.
Retransmitted_Packets	CIS	The Link Layer retransmits a CIS Data PDU.
CRC_Error_Packets	CIS and BIS	The Link Layer receives a packet with a CRC error.

Counter	Associated Streams	When Incremented
RX_Unreceived_-Packets	CIS and BIS	The Link Layer does not receive a specific payload by its flush point (on a CIS) or the end of the event it is associated with (on a BIS; see [Vol 6] Part B, Section 4.4.6.6).
Duplicate_Packets	CIS	The Link Layer receives a retransmission of a CIS Data PDU.

Table 7.4: Isochronous streams link quality counters

If the Connection_Handle parameter does not identify a current CIS connection or a BIS that the Controller is synchronized to, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS or BIS Range 0x0000 to 0x0EFF

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_ISO_Link_Quality command succeeded
0x01 to 0xFF	HCI_LE_Read_ISO_Link_Quality command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of a CIS or BIS Range: 0x0000 to 0x0EFF

TX_UnACKed_Packets: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Value of the Tx_UnACKed_Packets counter

TX_Flushed_Packets: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Value of the Tx_Flushed_Packets counter

TX_Last_Subevent_Packets: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Value of the Tx_Last_Subevent_Packets counter

Retransmitted_Packets: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Value of the Retransmitted_Packets counter

CRC_Error_Packets: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Value of the CRC_Error_Packets counter

RX_Unreceived_Packets: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Value of the Rx_Unreceived_Packets counter

Duplicate_Packets: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Value of the Duplicate_Packets counter

Event(s) generated (unless masked away):

When the HCI_LE_Read_ISO_Link_Quality command has completed, an HCI_Command_Complete event shall be generated.

7.8.117 LE Enhanced Read Transmit Power Level command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Enhanced_Read_-Transmit_Power_Level	0x0076	Connection_Handle, PHY	Status, Connection_Handle, PHY, Current_TX_Power_Level, Max_TX_Power_Level

Description:

This command is used to read the current and maximum transmit power levels of the local Controller on the ACL connection identified by the Connection_Handle parameter and the PHY indicated by the PHY parameter.

If the Host sets PHY to a value that the Controller does not support, including a value that is reserved for future use, the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Connection_Handle parameter does not identify a current ACL connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	LE 1M PHY
0x02	LE 2M PHY
0x03	LE Coded PHY with S=8 data coding
0x04	LE Coded PHY with S=2 data coding
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Enhanced_Read_Transmit_Power_Level command succeeded.
0x01 to 0xFF	HCI_LE_Enhanced_Read_Transmit_Power_Level command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	LE 1M PHY
0x02	LE 2M PHY
0x03	LE Coded PHY with S=8 data coding
0x04	LE Coded PHY with S=2 data coding
All other values	Reserved for future use

Current_TX_Power_Level: *Size: 1 octet*

Value	Parameter Description
0xXX	Current transmit power level Range: -127 to 20 Units: dBm
0x7F	Current transmit power level is unavailable

Max_TX_Power_Level: *Size: 1 octet*

Value	Parameter Description
0xXX	Maximum transmit power level Range: -127 to 20 Units: dBm

Event(s) generated (unless masked away):

When the HCI_LE_Enhanced_Read_Transmit_Power_Level command has completed, an HCI_Command_Complete event shall be generated.

7.8.118 LE Read Remote Transmit Power Level command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Remote_Transmit_-Power_Level	0x0077	Connection_Handle, PHY	*none*

Description:

This command is used to read the transmit power level used by the remote Controller on the ACL connection that is identified by the Connection_Handle parameter and the PHY indicated by the PHY parameter.

The local Controller may use the remote transmit power level value obtained from a prior Power Change Indication or Power Control Request procedure (see [Vol 6] Part B, Section 5.1.17 and [Vol 6] Part B, Section 5.1.18). If the Controller chooses not to use these prior values, or if no prior value is available for one or more of the remote transmit power level, maximum transmit power level, or minimum transmit power level, the local Controller shall initiate a new Power Control Request procedure to obtain the remote transmit power level.

If the Host sets PHY to a value that the Controller does not support, including a value that is reserved for future use, the Controller shall return the error code *Unsupported Feature* or *Parameter Value* (0x11).

If the Connection_Handle parameter does not identify a current ACL connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	LE 1M PHY
0x02	LE 2M PHY
0x03	LE Coded PHY with S=8 data coding
0x04	LE Coded PHY with S=2 data coding

Value	Parameter Description
All other values	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Read_Remote_Transmit_Power_Level command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has determined the remote transmit power, it shall generate an HCI_LE_Transmit_Power_Reporting event with Reason 0x02.

7.8.119 LE Set Path Loss Reporting Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Path_Loss_Reporting_-Parameters	0x0078	Connection_Handle, High_Threshold, High_Hysteresis, Low_Threshold, Low_Hysteresis, Min_Time_Spent	Status, Connection_Handle

Description:

This command is used to set the path loss threshold reporting parameters for the ACL connection identified by the Connection_Handle parameter.

The path loss threshold-based mechanism is described in [Vol 6] Part B, Section 4.5.16. For each zone boundary, the upwards boundary shall equal the threshold plus the hysteresis and the downwards boundary shall equal the threshold minus the hysteresis.

If the Host issues this command with High_Threshold+High_Hysteresis greater than 0xFF or with Low_Threshold less than Low_Hysteresis, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command with Low_Threshold greater than High_Threshold or with Low_Threshold+Low_Hysteresis greater than High_Threshold–High_Hysteresis, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

The Min_Time_Spent parameter indicates the minimum time that the Controller shall observe the path loss has crossed the threshold before the Controller generates an event for the threshold crossing. The Host should specify a suitable value based on the connection interval, subrate factor, and Peripheral latency.

If the Host issues this command when path loss monitoring is enabled, the Controller shall override the existing path loss threshold reporting parameters with the parameters provided in this command.

The High_Threshold and the Low_Threshold parameters are common to all PHYs supported by the Controller. However, the Host can reissue this command with suitable parameters whenever a PHY switch is detected.

If the Connection_Handle parameter does not identify a current ACL connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

High_Threshold: *Size: 1 octet*

Value	Parameter Description
0xXX	High threshold for the path loss Units: dB
0xFF	High Threshold unused

High_Hysteresis: *Size: 1 octet*

Value	Parameter Description
0xXX	Hysteresis value for the high threshold Units: dB

Low_Threshold: *Size: 1 octet*

Value	Parameter Description
0xXX	Low threshold for the path loss Units: dB

Low_Hysteresis: *Size: 1 octet*

Value	Parameter Description
0xXX	Hysteresis value for the low threshold Units: dB

Min_Time_Spent: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum time, in number of connection events, to be observed once the path loss crosses the threshold before an event is generated.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Path_Loss_Reporting_Parameters command succeeded.
0x01 to 0xFF	HCI_LE_Set_Path_Loss_Reporting_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Path_Loss_Reporting_Parameters command has completed, an HCI_Command_Complete event shall be generated.

If the Host issues this command when path loss monitoring is enabled, and if the new parameters mean that the path loss is now in a different zone, an HCI_LE_Path_Loss_Threshold event shall be generated as soon as possible irrespective of the Min_Time_Spent parameter and the timer shall be reset.

If the Host issues this command with High_Threshold parameter set to 0xFF, then the Controller shall not generate an HCI_LE_Path_Loss_Threshold event with Zone_Entered set to 0x02.

7.8.120 LE Set Path Loss Reporting Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Path_Loss_Reporting_-Enable	0x0079	Connection_Handle, Enable	Status, Connection_Handle

Description:

This command is used to enable or disable path loss reporting for the ACL connection identified by the Connection_Handle parameter.

If the Enable parameter is set to 0x01 and no prior LE Power Control Request procedure has been initiated on the ACL connection, then the Controller may need to initiate a new LE Power Control Request procedure on that ACL.

Path loss reporting is disabled when the connection is first created.

If the Host issues this command before it has issued the HCI_LE_Set_Path_Loss_Reporting_Parameters command on this connection, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Connection_Handle parameter does not identify a current ACL connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Enabling path loss monitoring when it is already enabled or disabling path loss monitoring when it is already disabled has no effect.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Reporting disabled
0x01	Reporting enabled
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Path_Loss_Reporting_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Set_Path_Loss_Reporting_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Path_Loss_Reporting_Enable command has completed, an HCI_Command_Complete event shall be generated.

When reporting is enabled and was previously disabled, the Controller shall generate an HCI_LE_Path_Loss_Threshold event as soon as it has a reliable measurement of the path loss. If the Controller has to query the remote Controller for its transmit power level, then it shall generate this event within $T_{path\_loss\_enable}$ from the time it receives a response to its query. Otherwise, the Controller shall generate this event within $T_{path\_loss\_enable}$ from the time the command is issued. $T_{path\_loss\_enable}$ shall be Min_Time_Spent + 6 connection events or, if longer, 2 connection events where the Controller actually receives a packet from the peer, where Min_Time_Spent is specified by the HCI_LE_Set_Path_Loss_Reporting_Parameters command.

After the initial event on reporting being enabled, the Controller shall generate this event each time it determines that the path loss has moved to a different zone and stayed in that zone for Min_Time_Spent.As stated in [Vol 6] Part B, Section 4.5.16, two consecutive events must not indicate the same zone.

7.8.121 LE Set Transmit Power Reporting Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Transmit_Power_-Reporting_Enable	0x007A	Connection_Handle, Local_Enable, Remote_Enable	Status, Connection_Handle

Description:

This command is used to enable or disable the reporting to the local Host of transmit power level changes in the local and remote Controllers for the ACL connection identified by the Connection_Handle parameter.

If the Remote_Enable parameter is set to 0x01 and no prior LE Power Control Request procedure has been initiated on the ACL connection, then the Controller shall initiate a new LE Power Control Request procedure on that ACL.

Reporting is disabled when the connection is first created.

If the Connection_Handle parameter does not identify a current ACL connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Local_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Disable local transmit power reports
0x01	Enable local transmit power reports
All other values	Reserved for future use

Remote_Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Disable remote transmit power reports
0x01	Enable remote transmit power reports
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Transmit_Power_Reporting_Enable command succeeded.
0x01 to 0xFF	HCI_LE_Set_Transmit_Power_Reporting_Enable command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Transmit_Power_Reporting_Enable command has completed, an HCI_Command_Complete event shall be generated.

When local reporting is enabled, the Controller shall generate an HCI_LE_Transmit_Power_Reporting event with Reason 0x00 each time the local transmit power level is changed.

When remote reporting is enabled, the Controller shall generate an HCI_LE_Transmit_Power_Reporting event with Reason 0x01 each time it becomes aware that the remote transmit power level has changed.

7.8.122 LE Set Data Related Address Changes command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Data_Related_Address_-Changes	0x007C	Advertising_Handle, Change_Reasons	Status

Description:

This command specifies circumstances when the Controller shall refresh any Resolvable Private Address used by the advertising set identified by the Advertising_Handle parameter, whether or not the address timeout period has been reached. This command may be used while advertising is enabled.

The Change_Reasons parameter specifies the reason(s) for refreshing addresses. The default when an advertising set is created, or if legacy advertising commands (see Section 3.1.1) are used, is for all bits to be clear.

If extended advertising commands (see Section 3.1.1) are being used and the advertising set corresponding to the Advertising_Handle parameter does not exist, or if no command specified in Table 3.2 has been used, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If legacy advertising commands are being used, the Controller shall ignore the Advertising_Handle parameter.

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Change_Reasons: *Size: 1 octet*

Bit Number	Parameter Description
0	Change the address whenever the advertising data changes.
1	Change the address whenever the scan response data changes.
All other bits	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Data_Related_Address_Changes command succeeded
0x01 to 0xFF	HCI_LE_Set_Data_Related_Address_Changes command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Data_Related_Address_Changes command has completed, an HCI_Command_Complete event shall be generated.

7.8.123 LE Set Default Subrate command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Default_Subrate	0x007D	Subrate_Min, Subrate_Max, Max_Latency, Continuation_Number, Supervision_Timeout	Status

Description:

This command is used by the Host to set the initial values for the acceptable parameters for subrating requests, as defined by the HCI_LE Subrate_Request command (see Section 7.8.124), for all future ACL connections where the Controller is the Central. This command does not affect any existing connection.

The parameters have the same meanings as those in the HCI_LE_Subrate_Request command.

If the Host issues this command with Subrate_Max × (Max_Latency + 1) greater than 500, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command with Subrate_Max less than Subrate_Min, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command with Continuation_Number greater than or equal to Subrate_Max, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Subrate_Min: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum subrate factor allowed in requests by a Peripheral Range: 0x0001 to 0x01F4 Default: 0x0001

Subrate_Max: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum subrate factor allowed in requests by a Peripheral Range: 0x0001 to 0x01F4 Default: 0x0001

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum Peripheral latency allowed in requests by a Peripheral, in units of subrated connection intervals Range: 0x0000 to 0x01F3 Default: 0x0000

Continuation_Number: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum number of underlying connection events to remain active after a packet containing a Link Layer PDU with a non-zero Length field is sent or received in requests by a Peripheral Range: 0x0000 to 0x01F3 Default: 0x0000

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Maximum supervision timeout allowed in requests by a Peripheral Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s Default: 0x0C80 (32 s)

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Default_Subrate command succeeded.
0x01 to 0xFF	HCI_LE_Set_Default_Subrate command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Set_Default_Subrate command, the Controller sends the HCI_Command_Complete event to the Host.

7.8.124 LE Subrate Request command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Subrate_Request	0x007E	Connection_Handle, Subrate_Min, Subrate_Max, Max_Latency, Continuation_Number, Supervision_Timeout	*none*

Description:

This command is used by a Central or a Peripheral to request a change to the subrating factor and/or other parameters (see [Vol 6] Part B, Section 4.5.1) applied to an existing connection using the Connection Subrate Update procedure.

The Subrate_Min and Subrate_Max parameters specify the range of acceptable subrating factors being requested.

The Max_Latency parameter specifies the maximum Peripheral latency in units of subrated connection events. The same maximum shall apply irrespective of the subrating factor actually chosen.

The Continuation_Number parameter specifies the number of underlying connection intervals to remain active after a packet (other than an empty packet) is transmitted or received.

The Supervision_Timeout parameter specifies the link supervision timeout for the connection. The Supervision_Timeout, in milliseconds, shall be greater than 2 × current connection interval × Subrate_Max × (Max_Latency + 1).

If this command is issued on the Central, the following rules shall apply when the Controller initiates the Connection Subrate Update procedure (see [Vol 6] Part B, Section 5.1.19):

- The Peripheral latency shall be less than or equal to Max_Latency.
- The subrate factor shall be between Subrate_Min and Subrate_Max.
- The continuation number shall be equal to the lesser of Continuation_Number and (subrate factor - 1).
- The connection supervision timeout shall be equal to Supervision_Timeout.

If this command is issued on the Central, it also sets the acceptable parameters for requests from the Peripheral (see [Vol 6] Part B, Section 5.1.20). The

acceptable parameters set by this command override those provided via the HCI_LE_Set_Default_Subrate command or any values set by previous uses of this command on the same connection.

If this command is issued on the Central before the devices have performed the Feature Exchange procedure, then the Controller shall complete that procedure before initiating the Connection Subrate Update procedure.

If this command is issued on the Peripheral, the following rules shall apply when the Controller initiates the Connection Subrate Request procedure:

- The Peripheral latency shall be less than or equal to Max_Latency.
- The minimum and maximum subrate factors shall be between Subrate_Min and Subrate_Max.
- The continuation number shall be equal to the lesser of Continuation_Number and (maximum subrate factor - 1).
- The connection supervision timeout shall be equal to Supervision_Timeout.

If the Connection_Handle parameter does not identify a current ACL connection, the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command with parameters such that Subrate_Max × (Max_Latency + 1) is greater than 500 or the current connection interval × Subrate_Max × (Max_Latency + 1) is greater than or equal to half the Supervision_Timeout parameter, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command with Subrate_Max less than Subrate_Min, the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command with Continuation_Number greater than or equal to Subrate_Max, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Central's Host issues this command when the Connection Subrating (Host Support) bit is not set in the Peripheral's FeatureSet, the Controller shall return the error code *Unsupported Remote Feature* (0x1A).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection handle of the ACL Range: 0x0000 to 0x0EFF

Subrate_Min: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum subrate factor to be applied to the underlying connection interval Range: 0x0001 to 0x01F4

Subrate_Max: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum subrate factor to be applied to the underlying connection interval Range: 0x0001 to 0x01F4

Max_Latency: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum Peripheral latency for the connection in units of subrated connection intervals Range: 0x0000 to 0x01F3

Continuation_Number: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum number of underlying connection events to remain active after a packet containing a Link Layer PDU with a non-zero Length field is sent or received Range: 0x0000 to 0x01F3

Supervision_Timeout: *Size: 2 octets*

Value	Parameter Description
N = 0xXXXX	Supervision timeout for this connection Range: 0x000A to 0x0C80 Time = N × 10 ms Time Range: 100 ms to 32 s

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Subrate_Request command, the Controller sends the HCI_Command_Status event to the Host. An HCI_LE_Subrate_Change event shall be generated when the Connection Subrate Update procedure has completed.

7.8.125 LE Set Periodic Advertising Subevent Data command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Periodic_Advertising_-Subevent_Data	0x0082	Advertising_Handle, Num_Subevents_With_Data, Subevent[i], Response_Slot_Start[i], Response_Slot_Count[i], Subevent_Data_Length[i], Subevent_Data[i]	Status, Advertising_Handle

Description:

This command is used by the Host to set the data for one or more subevents of PAwR in reply to an HCI_LE_Periodic_Advertising_Subevent_Data_Request event. The data for a subevent shall be transmitted only once.

When using more than one instance of this command to provide data, the Host may provide the data in any order. For example, if providing data for subevents 0 and 1 in separate commands, the first command can contain either subevent.

The Advertising_Handle parameter identifies the advertising set whose periodic advertising subevent data is being set. If the corresponding advertising set does not already exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42). If the corresponding advertising set exists but has not been configured for Periodic Advertising with Responses, then the Controller shall return the error code *Command Disallowed* (0x0C).

The Num_Subevents_With_Data parameter is the number of subevent data contained in the parameter arrays.

The Subevent[i] parameter identifies the subevent of the PAwR that is being set. If the Host provides a subevent value that is outside of the range of subevents requested using the HCI_LE_Periodic_Advertising_Subevent_Data_Request event, then the Controller shall return the error code *Command Disallowed* (0x0C). If two elements of the array specify the same subevent, then the Controller shall return an error code which should be *Invalid HCI Command Parameters* (0x12).

The Response_Slot_Start[i] and Response_Slot_Count[i] parameters identify the starting response slot and the number of response slots that are expected to be used in this subevent.

Note: If the Host does not expect any responses in a subevent, then it can set Response_Slot_Count[i] for that subevent to 0. If the Host expects one or more responses in a future subevent, then it can set Response_Slot_Start[i] and Response_Slot_Count[i] for that subevent appropriately either in the same command or a subsequent use of this command.

The Subevent_Data_Length[i] parameter determines the length of the Subevent_Data that is significant.

The Subevent_Data[i] parameter contains the advertising data to be transmitted in the subevent of the advertising set. If the combined data length is greater than the maximum that the Controller can transmit within the current subevent interval, then all data shall be discarded and the Controller shall return the error code *Packet Too Long* (0x45). If advertising on the LE Coded PHY, then the S=8 coding shall be assumed unless the current advertising parameters require the use of S=2 for an advertising physical channel, in which case the S=2 coding shall be assumed for that advertising physical channel.

If the Subevent_Data cannot be transmitted because, for example, the subevent where this data would have been sent has already passed or is too early, then the Controller shall return the error code *Too Late* (0x46) or *Too Early* (0x47) and discard the data.

If the Host sends this command without the Controller having issued an HCI_LE_Periodic_Advertising_Subevent_Data_Request event, or sends it twice for the same subevent of the same periodic advertising event, then the Controller shall return an error which should use the error code *Command Disallowed* (0x0C).

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify a periodic advertising train Range: 0x00 to 0xEF

Num_Subevents_With_Data: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x0F	Number of subevent data in the command.
All other values	Reserved for future use

Subevent[i]: *Size: Num_Subevents_With_Data × 1 octet*

Value	Parameter Description
0xXX	The subevent index of the data contained in this command. Range: 0x00 to 0x7F

Response_Slot_Start[i]: *Size: Num_Subevents_With_Data × 1 octet*

Value	Parameter Description
0xXX	The first response slots to be used in this subevent.

Response_Slot_Count[i]: *Size: Num_Subevents_With_Data × 1 octet*

Value	Parameter Description
0xXX	The number of response slots to be used.

Subevent_Data_Length[i]: *Size: Num_Subevents_With_Data × 1 octet*

Value	Parameter Description
0 to 251	The number of octets in the Subevent_Data parameter.
All other values	Reserved for future use

Subevent_Data[i]: *Size: SUM (Subevent_Data_Length[i]) octets*

Value	Parameter Description
Variable	Advertising data formatted as defined in [Vol 3] Part C, Section 11.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Periodic_Advertising_Subevent_Data command succeeded.
0x01 to 0xFF	HCI_LE_Set_Periodic_Advertising_Subevent_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify a periodic advertising train Range: 0x00 to 0xEF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Periodic_Advertising_Subevent_Data command has completed, an HCI_Command_Complete event shall be generated.

7.8.126 LE Set Periodic Advertising Response Data command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Periodic_Advertising_-Response_Data	0x0083	Sync_Handle, Request_Event, Request_Subevent, Response_Subevent, Response_Slot, Response_Data_Length, Response_Data	Status, Sync_Handle

Description:

This command is used by the Host to set the data for a response slot in a specific subevent of the PAwR identified by the Sync_Handle. The data for a response slot shall be transmitted only once.

The Request_Event parameter identifies the periodic advertising event in which the periodic advertising packet that the Host is responding to was received.

The Request_Subevent parameter identifies the subevent in which the periodic advertising packet that the Host is responding to was received.

The Response_Subevent parameter identifies the subevent that the response shall be sent in.

The Response_Slot parameter identifies the response slot in the subevent identified by the Response_Subevent parameter in which this response data is to be transmitted.

The Response_Data_Length specifies the length of the Response_Data that is significant.

The Response_Data contains the advertising data to be transmitted in the response slot. If the Response_Data_Length is greater than the maximum that the Controller can transmit within the response slot, then the Response_Data shall be discarded and the Controller shall return the error code *Packet Too Long* (0x45). If the periodic advertising train is on the LE Coded PHY, then the S=8 coding shall be assumed.

If the response slot identified by the Response_Slot parameter has passed by the time this command is received by the Controller, the Controller shall return the error code *Too Late* (0x46) and discard the Response_Data parameter.

If Response_Subevent exceeds numSubevents of the periodic advertising train, or the Controller is not synchronized with the subevent, then the Controller should return the error code *Command Disallowed* (0x0C).

Command parameters:

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the PAwR train Range: 0x0000 to 0x0EFF

Request_Event: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The value of *paEventCounter* (see [Vol 6] Part B, Section 4.4.2.1) for the periodic advertising packet that the Host is responding to

Request_Subevent: *Size: 1 octet*

Value	Parameter Description
0xXX	The subevent for the periodic advertising packet that the Host is responding to

Response_Subevent: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify the subevent of the PAwR train. Range: 0x00 to 0x7F

Response_Slot: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify the response slot of the PAwR train. Range: 0x00 to 0xFF

Response_Data_Length: *Size: 1 octet*

Value	Parameter Description
0 to 251	The number of octets in the Response_Data parameter.
All other values	Reserved for future use

Response_Data: *Size: Response_Data_Length octets*

Value	Parameter Description
Variable	Response data formatted as defined in [Vol 3] Part C, Section 11.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Periodic_Advertising_Response_Data command succeeded.
0x01 to 0xFF	HCI_LE_Periodic_Advertising_Response_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train. Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Periodic_Advertising_Response_Data command has completed, an HCI_Command_Complete event shall be generated.

7.8.127 LE Set Periodic Sync Subevent command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Periodic_Sync_-Subevent	0x0084	Sync_Handle, Periodic_Advertising_Properties, Num_Subevents_To_Sync, Subevent[i]	Status, Sync_Handle

Description:

This command is used to instruct the Controller to synchronize with a subset of the subevents within a PAwR train identified by the Sync_Handle parameter, listen for packets sent by the peer device and pass any received data up to the Host. If the Controller is synchronized with any subevents that are not in the subset of subevents in this command, then the Controller shall no longer synchronize with those subevents.

The Periodic_Advertising_Properties parameter indicates which fields should be included in the AUX_SYNC_SUBEVENT_RSP PDUs.

The Num_Subevents_To_Sync parameter identifies the number of values in the sub-events parameter.

The Subevents arrayed parameter identifies the subevents that the Controller shall synchronize with.

Command parameters:

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the PAwR train Range: 0x0000 to 0x0EFF

Periodic_Advertising_Properties: *Size: 2 octets*

Bit Number	Parameter Description
6	Include TxPower in the advertising PDU
All other bits	Reserved for future use

Num_Subevents_To_Sync: *Size: 1 octet*

Value	Parameter Description
0xXX	Number of subevents. Range: 0x01 to 0x80

Subevent[i]: *Size: Num_Subevents_To_Sync × 1 octet*

Value	Parameter Description
0xXX	The subevent to synchronize with. Range 0x00 to 0x7F

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Periodic_Sync_Subevent command succeeded.
0x01 to 0xFF	HCI_LE_Set_Periodic_Sync_Subevent command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Sync_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Sync_Handle identifying the periodic advertising train Range: 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_Set_Periodic_Sync_Subevent command has completed, an HCI_Command_Complete event shall be generated.

7.8.128 LE Read All Local Supported Features command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_All_Local_Supported_-Features	0x0087	*none*	Status, Max_Page, LE_Features

Description:

This command requests the supported LE features for the Controller.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_All_Local_Supported_Features command succeeded.
0x01 to 0xFF	HCI_LE_Read_All_Local_Supported_Features command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions

Max_Page: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of the highest-numbered page of the supported LE features that contains at least one bit set to 1. Range: 0x00 to 0x0A

LE_Features: *Size: 248 octets*

Value	Parameter Description
0xXX...XX	Bit Mask List of the supported LE features. See [Vol 6] Part B, Section 4.6.

Event(s) generated (unless masked away):

When the HCI_LE_Read_All_Local_Supported_Features command has completed, an HCI_Command_Complete event shall be generated.

7.8.129 LE Read All Remote Features command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_All_Remote_Features	0x0088	Connection_Handle, Pages_Requested	*none*

Description:

This command requests, from the remote device identified by the Connection_Handle, the features used on the connection and the features supported by the remote device. For details see [Vol 6] Part B, Section 4.6.

This command may be issued on both the Central and Peripheral.

The Pages_Requested parameter specifies the highest-numbered page of features that the Host requires. The Controller shall obtain all pages up to the lesser of Pages_Requested and the highest page number on the remote device that contains at least one bit set to 1, and may obtain some or all higher-numbered pages.

If a connection already exists between the two devices and the features have already been fetched on that connection, then the Controller may use a cached copy of the features.

If the Host issues this command when another HCI_LE_Read_All_Remote_Features command is pending in the Controller, then the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Pages_Requested: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of the highest-numbered page of features that the Host requires and the Controller shall obtain. Range: 0x00 to 0x0A

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Read_All_Remote_Features command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has completed the procedure to determine the remote features or has determined that it will be using a cached copy, the Controller shall send an HCI_LE_Read_All_Remote_Features_Complete event to the Host.

The HCI_LE_Read_All_Remote_Features_Complete event contains the status of this command and the parameters describing the features supported by the remote device.

7.8.130 LE CS Read Local Supported Capabilities command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Read_-Local_Supported_-Capabilities	0x0089	*none*	Status, Num_Config_Supported, Max_Consecutive_Procedures_Supported, Num_Antennae_Supported, Max_Antenna_Paths_Supported, Roles_Supported, Modes_Supported, RTT_Capability, RTT_AA_Only_N, RTT_Sounding_N, RTT_Random_Sequence_N, NADM_Sounding_Capability, NADM_Random_Capability, CS_SYNC_PHYs_Supported, Subfeatures_Supported, T_IP1_Times_Supported, T_IP2_Times_Supported, T_FCS_Times_Supported, T_PM_Times_Supported, T_SW_Time_Supported, TX_SNR_Capability

Description:

This command allows a Host to read the CS capabilities that are supported by the local Controller. This command may be used along with the local supported features to provide additional details of the supported CS capabilities.

The Num_Config_Supported parameter indicates the number of CS configurations that are supported by the Controller.

The Max_Consecutive_Procedures_Supported parameter indicates the maximum number of consecutive CS procedures that are supported by the local Controller.

The Num_Antennae_Supported parameter indicates the number of antenna elements that are available for CS tone exchanges.

The Max_Antenna_Paths_Supported parameter indicates the maximum number of antenna paths that are supported by the local Controller for CS tone exchanges.

The Roles_Supported parameter indicates the CS roles that are supported by the local Controller.

The Modes_Supported parameter indicates the optional CS modes that are supported by the local Controller.

The RTT_Capability, RTT_AA_Only_N, RTT_Sounding_N, and the RTT_Random_Sequence_N parameters indicate the time-of-flight accuracy as described in [Vol 6] Part B, Section 2.4.2.44.

The NADM_Sounding_Capability and NADM_Random_Capability parameters indicate the support by the local Controller for reporting Normalized Attack Detector Metric (NADM) when a CS_SYNC with a sounding sequence or random sequence is received.

The CS_SYNC_PHYs_Supported parameter indicates the optional transmit and receive PHYs that are supported by the local Controller for CS_SYNC exchanges as described in [Vol 6] Part H, Section 4.3.

The Subfeatures_Supported parameter indicates which of the following optional subfeatures are supported by the local Controller:

- A Frequency Actuation Error of zero for all allowed CS channels relative to mode-0 transmissions when in the reflector role as described in [Vol 6] Part A, Section 3.5.
- Channel Selection Algorithm #3c as described in [Vol 6] Part H, Section 4.1.4.2.
- Phase-based ranging from a sounding sequence as described in [Vol 6] Part H, Section 3.3.1.

The T_IP1_Times_Supported, T_IP2_Times_Supported, T_FCS_Times_Supported, T_PM_Times_Supported, and T_SW_Time_Supported parameters indicate the supported optional time durations used in CS steps as described in [Vol 6] Part H, Section 4.3.

The TX_SNR_Capability parameter indicates the supported SNR levels used for the CS_SYNC packets used in mode-1 and mode-3 steps as described in [Vol 6] Part A, Section 3.1.3.

If the Host issues this command when the Channel Sounding (Host Support) feature bit (see [Vol 6] Part B, Section 4.6.33.4) is not set, then the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_CS_Read_Local_Supported_Capabilities command succeeded
0x01 to 0xFF	HCI_LE_CS_Read_Local_Supported_Capabilities command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Num_Config_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Number of CS configurations supported per connection
All other values	Reserved for future use

Max_Consecutive_Procedures_Supported: *Size: 2 octets*

Value	Parameter Description
0x0000	Support for both a fixed number of consecutive CS procedures and for an indefinite number of CS procedures until termination.
0x0001 to 0xFFFF	Maximum number of consecutive CS procedures supported.

Num_Antennae_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Number of antennae supported
All other values	Reserved for future use

Max_Antenna_Paths_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Maximum number of antenna paths supported
All other values	Reserved for future use

Roles_Supported: *Size: 1 octet*

Bit Number	Parameter Description
0	Initiator
1	Reflector
All other bits	Reserved for future use

Modes_Supported: *Size: 1 octet*

Bit Number	Parameter Description
0	Mode-3
All other bits	Reserved for future use

RTT_Capability: *Size: 1 octet*

Bit Number	Parameter Description
0	If set to 1, then the value reflected in the RTT_AA_Only_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_AA_Only_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_AA_Only_N field is set to 0, then the bit shall be ignored.
1	If set to 1, then the value reflected in the RTT_Sounding_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_Sounding_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_Sounding_N field is set to 0, then the bit shall be ignored.
2	If set to 1, then the value reflected in the RTT_Random_Sequence_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_Random_Sequence_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_Random_Sequence_N field is set to 0, then the bit shall be ignored.
All other bits	Reserved for future use

RTT_AA_Only_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT AA-only not supported
0x01 to 0xFF	Number of CS_SYNC exchanges needed to satisfy the precision requirements

RTT_Sounding_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT Sounding not supported
0x01 to 0xFF	Number of CS_SYNC exchanges needed to satisfy the precision requirements

RTT_Random_Sequence_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT Random Sequence not supported
0x01 to 0xFF	Number of CS_SYNC exchanges needed to satisfy the time-of-flight precision requirements

NADM_Sounding_Capability: *Size: 2 octets*

Bit Number	Parameter Description
0	Support for Phase-based Normalized Attack Detector Metric when a CS_SYNC with sounding sequence is received
All other bits	Reserved for future use

NADM_Random_Capability: *Size: 2 octets*

Bit Number	Parameter Description
0	Support for Phase-based Normalized Attack Detector Metric when a CS_SYNC with random sequence is received
All other bits	Reserved for future use

CS_SYNC_PHYs_Supported: *Size: 1 octet*

Bit Number	*Parameter Description*
1	LE 2M PHY
2	LE 2M 2BT PHY
All other bits	Reserved for future use

Subfeatures_Supported: *Size: 2 octets*

Bit Number	Parameter Description
1	CS with a Frequency Actuation Error of zero relative to mode-0 transmissions in the reflector role
2	CS Channel Selection Algorithm #3c

Bit Number	Parameter Description
3	CS phase-based ranging from an RTT sounding sequence
All other bits	Reserved for future use

T_IP1_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported
6	80 µs supported
All other bits	Reserved for future use

T_IP2_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported
6	80 µs supported
All other bits	Reserved for future use

T_FCS_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	15 µs supported
1	20 µs supported
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported

Bit Number	Parameter Description
6	80 µs supported
7	100 µs supported
8	120 µs supported
All other values	Reserved for future use

T_PM_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
All other values	Reserved for future use

T_SW_Time_Supported: *Size: 1 octet*

Value	Parameter Description
0x00, 0x01, 0x02, 0x04, or 0x0A	Time in microseconds for the antenna switch period of the CS tones
All other values	Reserved for future use

TX_SNR_Capability: *Size: 1 octet*

Bit Number	Parameter Description
0	18 dB supported
1	21 dB supported
2	24 dB supported
3	27 dB supported
4	30 dB supported
All other bits	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_CS_Read_Local_Supported_Capabilities command has completed, an HCI_Command_Complete event shall be generated.

7.8.131 LE CS Read Remote Supported Capabilities command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Read_Remote_Supported_-Capabilities	0x008A	Connection_Handle	*none*

Description:

This command allows a Host to query the CS capabilities that are supported by the remote Controller. If no Channel Sounding Capability Exchange procedure has been initiated on the ACL connection specified by the Connection_Handle and if no prior HCI_LE_CS_Write_Cached_Remote_Supported_Capabilities command has been issued by the Host, then the Controller shall initiate a Channel Sounding Capabilities Exchange procedure on the ACL. Otherwise, the Controller may use a cached copy of the capabilities of the remote device.

If this command is issued on the Central or Peripheral before the devices have performed the Feature Exchange procedure, then the Controller of the Central or Peripheral shall complete that procedure before initiating the Channel Sounding Capability Exchange procedure (see [Vol 6] Part B, Section 5.1.24).

If the Host issues this command when the local or remote Channel Sounding (Host Support) feature bit (see [Vol 6] Part B, Section 4.6.33.4) is not set, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

The Host may store a copy of the remote device's capabilities and write the remote capabilities in the local Controller when it reconnects to the same remote device by using the HCI_LE_CS_Write_Cached_Remote_Supported_Capabilities command.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF
All other values	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_CS_Read_Remote_Supported_Capabilities command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has completed the Channel Sounding Capability Exchange procedure with the remote Controller or has a cached copy of the capabilities of the remote Controller, the Controller shall generate an HCI_LE_CS_Read_Remote_Supported_Capabilities_Complete event.

7.8.132 LE CS Write Cached Remote Supported Capabilities command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Write_-Cached_Remote_-Supported_Capabilities	0x008B	Connection_Handle, Num_Config_Supported, Max_Consecutive_Procedures_Supported, Num_Antennae_Supported, Max_Antenna_Paths_Supported, Roles_Supported, Modes_Supported, RTT_Capability, RTT_AA_Only_N, RTT_Sounding_N, RTT_Random_Sequence_N, NADM_Sounding_Capability, NADM_Random_Capability, CS_SYNC_PHYs_Supported, Subfeatures_Supported, T_IP1_Times_Supported, T_IP2_Times_Supported, T_FCS_Times_Supported, T_PM_Times_Supported, T_SW_Time_Supported, TX_SNR_Capability	Status, Connection_Handle

Description:

This command allows a Host to write the cached copy of the CS capabilities that are supported by the remote Controller for the connection identified by the Connection_Handle parameter.

The Num_Config_Supported parameter indicates the number of CS configurations that are supported by the remote Controller.

The Max_Consecutive_Procedures_Supported parameter indicates the maximum number of consecutive CS procedures that are supported by the remote Controller.

The Num_Antennae_Supported parameter indicates the number of antenna elements that are available for CS tone exchanges.

The Max_Antenna_Paths_Supported parameter indicates the maximum number of antenna paths that are supported by the local Controller for CS tone exchanges.

The Roles_Supported parameter indicates the CS roles that are supported by the remote Controller.

The Modes_Supported parameter indicates the optional CS modes that are supported by the remote Controller.

The RTT_Capability, RTT_AA_Only_N, RTT_Sounding_N, and the RTT_Random_Sequence_N parameters indicate the time-of-flight accuracy as described in [Vol 6] Part B, Section 2.4.2.44.

The NADM_Sounding_Capability and NADM_Random_Capability parameters indicate the support by the remote Controller for reporting Normalized Attack Detector Metric (NADM) when a CS_SYNC with a sounding sequence or random sequence is received.

The CS_SYNC_PHYs_Supported parameter indicates the optional transmit and receive PHYs that are supported by the remote Controller for CS_SYNC exchanges as described in [Vol 6] Part H, Section 4.3.

The Subfeatures_Supported parameter indicates which of the following optional subfeatures are supported by the remote Controller:

- A Frequency Actuation Error of zero for all allowed CS channels relative to mode-0 transmissions when in the reflector role as described in [Vol 6] Part A, Section 3.5.
- Channel Selection Algorithm #3c as described in [Vol 6] Part H, Section 4.1.4.2.
- Phase-based ranging from a sounding sequence as described in [Vol 6] Part H, Section 3.3.1.

The T_IP1_Times_Supported, T_IP2_Times_Supported, T_FCS_Times_Supported, T_PM_Times_Supported, and T_SW_Time_Supported parameters indicate the supported optional time durations used in CS steps as described in [Vol 6] Part H, Section 4.3.

The TX_SNR_Capability parameter indicates the supported SNR levels used for the CS_SYNC packets used in mode-1 and mode-3 steps as described in [Vol 6] Part A, Section 3.1.3.

If the Host issues this command after an LL_CS_CAPABILITIES_REQ or LL_CS_CAPABILITIES_RSP PDU has been received from the remote Controller, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command after a CS configuration has been created in the local Controller, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command when the Channel Sounding (Host Support) feature bit (see [Vol 6] Part B, Section 4.6.33.4) is not set, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF
All other values	Reserved for future use

Num_Config_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Number of CS configurations supported per connection
All other values	Reserved for future use

Max_Consecutive_Procedures_Supported: *Size: 2 octets*

Value	Parameter Description
0x0000	Support for both a fixed number of consecutive CS procedures and for an indefinite number of CS procedures until termination.
0x0001 to 0xFFFF	Maximum number of consecutive CS procedures supported.

Num_Antennae_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Number of antennae supported
All other values	Reserved for future use

Max_Antenna_Paths_Supported: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Maximum number of antenna paths supported
All other values	Reserved for future use

Roles_Supported: *Size: 1 octet*

Bit Number	Parameter Description
0	Initiator
1	Reflector
All other bits	Reserved for future use

Modes_Supported: *Size: 1 octet*

Bit Number	Parameter Description
0	Mode-3
All other bits	Reserved for future use

RTT_Capability: *Size: 1 octet*

Bit Number	Parameter Description
0	If set to 1, then the value reflected in the RTT_AA_Only_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_AA_Only_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_AA_Only_N field is set to 0, then the bit shall be ignored.
1	If set to 1, then the value reflected in the RTT_Sounding_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_Sounding_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_Sounding_N field is set to 0, then the bit shall be ignored.
2	If set to 1, then the value reflected in the RTT_Random_Sequence_N field refers to the 10 ns time-of-flight precision requirement. Otherwise, the RTT_Random_Sequence_N field refers to the 150 ns time-of-flight precision requirement. If the RTT_Random_Sequence_N field is set to 0, then the bit shall be ignored.
All other bits	Reserved for future use

RTT_AA_Only_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT AA-only not supported
0x01 to 0xFF	Number of CS_SYNC exchanges needed to satisfy the precision requirements

RTT_Sounding_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT Sounding not supported
0x01 to 0xFF	Number of CS_SYNC exchanges needed to satisfy the precision requirements

RTT_Random_Sequence_N: *Size: 1 octet*

Value	Parameter Description
0x00	RTT Random Sequence not supported
0x01 to 0xFF	Number of CS_SYNC exchanges needed to satisfy the time-of-flight precision requirements

NADM_Sounding_Capability: *Size: 2 octets*

Bit Number	Parameter Description
0	Support for Phase-based Normalized Attack Detector Metric when a CS_SYNC with sounding sequence is received
All other bits	Reserved for future use

NADM_Random_Capability: *Size: 2 octets*

Bit Number	Parameter Description
0	Support for Phase-based Normalized Attack Detector Metric when a CS_SYNC with random sequence is received
All other bits	Reserved for future use

CS_SYNC_PHYs_Supported: *Size: 1 octet*

Bit Number	Parameter Description
1	LE 2M PHY
2	LE 2M 2BT PHY
All other bits	Reserved for future use

Subfeatures_Supported: *Size: 2 octets*

Bit Number	Parameter Description
1	CS with a Frequency Actuation Error of zero relative to mode-0 transmissions in the reflector role
2	CS Channel Selection Algorithm #3c

Bit Number	Parameter Description
3	CS phase-based ranging from an RTT sounding sequence
All other bits	Reserved for future use

T_IP1_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported
6	80 µs supported
All other bits	Reserved for future use

T_IP2_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported
6	80 µs supported
All other bits	Reserved for future use

T_FCS_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	15 µs supported
1	20 µs supported
2	30 µs supported
3	40 µs supported
4	50 µs supported
5	60 µs supported

Bit Number	Parameter Description
6	80 µs supported
7	100 µs supported
8	120 µs supported
All other values	Reserved for future use

T_PM_Times_Supported: *Size: 2 octets*

Bit Number	Parameter Description
0	10 µs supported
1	20 µs supported
All other values	Reserved for future use

T_SW_Time_Supported: *Size: 1 octet*

Value	Parameter Description
0x00, 0x01, 0x02, 0x04, or 0x0A	Time in microseconds for the antenna switch period of the CS tones
All other values	Reserved for future use

TX_SNR_Capability: *Size: 1 octet*

Bit Number	Parameter Description
0	18 dB supported
1	21 dB supported
2	24 dB supported
3	27 dB supported
4	30 dB supported
All other bits	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_CS_Write_Cached_Remote_Supported_Capabilities command succeeded
0x01 to 0xFF	HCI_LE_CS_Write_Cached_Remote_Supported_Capabilities command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range: 0x0000 to 0x0EFF
All other values	Reserved for future use

Event(s) generated (unless masked away):

When the HCI_LE_CS_Write_Cached_Remote_Supported_Capabilities command has completed, an HCI_Command_Complete event shall be generated.

7.8.133 LE CS Security Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Security_Enable	0x008C	Connection_Handle	*none*

Description:

This command is used by a Host to start or restart the Channel Sounding Security Start procedure in the local Controller for the ACL connection identified by the Connection_Handle parameter.

If the Host issues this command on a Connection_Handle where the Controller is the Peripheral, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the connection identified by the Connection_Handle parameter is not encrypted, then the Controller shall return the error code *Insufficient Security* (0x2F).

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command when the Channel Sounding (Host Support) feature bit (see [Vol 6] Part B, Section 4.6.33.4) is not set, then the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_CS_Security_Enable command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has completed the Channel Sounding Security Start procedure with the remote Controller, the Controller shall generate an LE_CS_Security_Enable_Complete event.

7.8.134 LE CS Set Default Settings command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Set_Default_Settings	0x008D	Connection_Handle, Role_Enable, CS_SYNC_Antenna_Selection, Max_TX_Power	Status, Connection_Handle

Description:

This command is used by a Host to set default CS settings in the local Controller for the connection identified by the Connection_Handle parameter. The default settings specify that all roles are disabled in a Controller and CS_SYNC_Antenna_Selection is set to 0x01.

The Role_Enable parameter is used to enable or disable the CS roles in the local Controller. If the Host issues this command to disable a Role for which a valid CS configuration is present, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

The CS_SYNC_Antenna_Selection parameter indicates the antenna identifiers to be used for transmitting and receiving CS_SYNC packets.

If the Role_Enable parameter is used to enable an unsupported role or the CS_SYNC_Antenna_Selection parameter indicates an unsupported antenna identifier, then the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Max_TX_Power parameter is used to set the maximum output power, EIRP, to be used for all CS transmissions. If the value provided in this parameter is higher than the maximum output power supported by the Controller, then the Controller shall use the maximum output power that it supports. If the Controller is unable to use the exact output power requested by the Host, then the Controller shall use an output power that is lower but closest to the requested value.

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Role_Enable: *Size: 1 octet*

Bit Number	Parameter Description
0	Initiator role is enabled
1	Reflector role is enabled
All other values	Reserved for future use

CS_SYNC_Antenna_Selection: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Antenna identifier to be used for CS_SYNC packets by the local Controller
0xFD	Antenna identifiers to be used, in repetitive order {0x01, 0x01, ..., Num_Antennae_Supported, Num_Antennae_Supported} for CS_SYNC packets by the local Controller, where Num_Antennae_Supported is the number of antenna elements available for CS tone exchanges
0xFE	Antenna identifiers to be used, in repetitive order from 0x01 to Num_Antennae_Supported, for CS_SYNC packets by the local Controller, where Num_Antennae_Supported is the number of antenna elements available for CS tone exchanges
0xFF	Host does not have a recommendation
All other values	Reserved for future use

Max_TX_Power: *Size: 1 octet*

Value	Parameter Description
0xXX	The maximum transmit power level to be used for all CS transmissions Range: -127 to 20 Units: dBm
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_CS_Set_Default_Settings command succeeded
0x01 to 0xFF	HCI_LE_CS_Set_Default_Settings command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_CS_Set_Default_Settings command has completed, an HCI_Command_Complete event shall be generated.

7.8.135 LE CS Read Remote FAE Table command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Read_Remote_FAE_Table	0x008E	Connection_Handle	*none*

Description:

This command is used by a Host to read the per-channel mode-0 Frequency Actuation Error table of the remote Controller.

If the remote Controller supports a Frequency Actuation Error of zero relative to its mode-0 transmissions in the reflector role (No_FAE bit set as described in [Vol 6] Part B, Section 2.4.2.44), then the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

The Host may store a copy of the remote device's Frequency Actuation Error table and write the remote Frequency Actuation Error table in the local Controller when it reconnects to the same remote device by using the HCI_LE_CS_Write_Cached_Remote_FAE_Table command.

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_CS_Read_Remote_FAE_Table command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has completed the Channel Sounding Mode-0 FAE Table Request procedure with the remote Controller, the Controller shall generate an LE_CS_Read_Remote_FAE_Table_Complete event.

7.8.136 LE CS Write Cached Remote FAE Table command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Write_Cached_Remote_-FAE_Table	0x008F	Connection_Handle, Remote_FAE_Table	Status, Connection_Handle

Description:

This command is used by a Host to write a cached copy of the per-channel mode-0 Frequency Actuation Error table of the remote device in the local Controller.

If the remote Controller supports a Frequency Actuation Error of zero relative to its mode-0 transmissions in the reflector role (No_FAE bit set as described in [Vol 6] Part B, Section 2.4.2.44), then the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host issues this command after an LL_CS_FAE_RSP PDU has been received from the remote Controller, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command after a CS configuration has been created in the local Controller, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0x0000 to 0x0EFF	Connection_Handle
0x0FFF	Use for CS Test command
All other values	Reserved for future use

Remote_FAE_Table: *Size: 72 octets*

Value	Parameter Description
Variable	Per-channel mode-0 Frequency Actuation Error table of the local Controller as described in [Vol 6] Part B, Section 2.4.2.52.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_CS_Write_Cached_Remote_FAE_Table command succeeded
0x01 to 0xFF	HCI_LE_CS_Write_Cached_Remote_FAE_Table command failed. See [Vol 1} Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_CS_Write_Cached_Remote_FAE_Table command has completed, an HCI_Command_Complete event shall be generated.

7.8.137 LE CS Create Config command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Create_Config	0x0090	Connection_Handle, Config_ID, Create_Context, Main_Mode_Type, Sub_Mode_Type, Min_Main_Mode_Steps, Max_Main_Mode_Steps, Main_Mode_Repetition, Mode_0_Steps, Role, RTT_Type, CS_SYNC_PHY, Channel_Map, Channel_Map_Repetition, Channel_Selection_Type, Ch3c_Shape, Ch3c_Jump, Reserved	*none*

Description:

This command is used by a Host to create a new CS configuration or update an existing CS configuration with the identifier Config_ID on the connection identified by the Connection_Handle in the local and/or the remote Controller.

When the Create_Context parameter is set to 0x00, the CS configuration is written only in the local Controller. Otherwise when set to 0x01, the CS configuration is written in both the local and remote Controllers using the Channel Sounding Configuration procedure.

The Main_Mode_Type and the Sub_Mode_Type parameters indicate the CS modes (see [Vol 6] Part H, Table 4.11 of [Vol 6] Part H, Section 4.4.2 for valid combinations) to be used during the CS procedure for the specified CS configuration.

The Min_Main_Mode_Steps and Max_Main_Mode_Steps parameters indicate the range of main mode CS steps to be executed before a submode CS step is executed during the CS procedure. When the Sub_Mode_Type parameter is set to 0xFF, the Min_Main_Mode_Steps and Max_Main_Mode_Steps parameters are reserved for future use.

The Main_Mode_Repetition parameter indicates the number of main mode CS steps repeated from the last CS subevent at the beginning of the current CS subevent.

The Mode_0_Steps parameter indicates the number of mode-0 CS steps to be included at the beginning of each CS subevent.

The Role parameter indicates the CS role for the local Controller for the specified CS configuration. The RTT_Type parameter indicates the RTT variant to be used during the CS procedure, and the CS_SYNC_PHY parameter indicates the PHY to be used for CS_SYNC exchanges during the CS procedure for the specified CS configuration.

The Channel_Map parameter indicates the channels to be used or unused during the CS procedure, and the Channel_Map_Repetition parameter indicates the number of times the channels specified by Channel_Map are to be repeated for non-mode-0 steps during the CS procedure (see [Vol 6] Part H, Section 4.1.4).

The Channel_Selection_Type parameter indicates the Channel Selection Algorithm to be used during the CS procedure for non-mode-0 steps. When the Channel_Selection_Type is set to 0x01, the Ch3c_Shape and the Ch3c_Jump parameters shall each be set to the selected shape and channels to be skipped as described in [Vol 6] Part H, Section 4.1.4.2. Otherwise, the Ch3c_Shape and the Ch3c_Jump parameters shall be ignored.

If the Host issues this command with parameters that are not supported by the local or remote Controllers, then the Controller shall return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host issues this command with a Role not enabled by a prior HCI_LE_CS_Set_Default_Settings command or with a set of parameters that are considered an invalid configuration according to [Vol 6] Part H, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command before a Channel Sounding Capability Exchange procedure has been completed or an HCI_LE_CS_Write_Cached_Remote_Supported_Capabilities command has been issued for the connection identified by the Connection_Handle parameter, then the Controller may autonomously initiate the Channel Sounding Capability Exchange procedure. Otherwise, the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host issues this command to update a CS configuration identified by the Config_ID parameter that is already enabled using the HCI_LE_CS_Procedure_Enable command, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Config_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	CS configuration identifier Range: 0 to 3
All other values	Reserved for future use

Create_Context: *Size: 1 octet*

Value	Parameter Description
0x00	Write CS configuration in local Controller only
0x01	Write CS configuration in both local and remote Controller using Channel Sounding Configuration procedure
All other values	Reserved for future use

Main_Mode_Type: *Size: 1 octet*

Value	Parameter Description
0x01	Mode-1
0x02	Mode-2
0x03	Mode-3
All other values	Reserved for future use

Sub_Mode_Type: *Size: 1 octet*

Value	Parameter Description
0x01	Mode-1
0x02	Mode-2

Value	Parameter Description
0x03	Mode-3
0xFF	Unused
All other values	Reserved for future use

Min_Main_Mode_Steps: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	Minimum number of CS main mode steps to be executed before a submode step is executed
All other values	Reserved for future use

Max_Main_Mode_Steps: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	Maximum number of CS main mode steps to be executed before a submode step is executed
All other values	Reserved for future use

Main_Mode_Repetition: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x03	The number of main mode steps taken from the end of the last CS subevent to be repeated at the beginning of the current CS subevent directly after the last mode-0 step of that event
All other values	Reserved for future use

Mode_0_Steps: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x03	Number of CS mode-0 steps to be included at the beginning of each CS subevent
All other values	Reserved for future use

Role: *Size: 1 octet*

Value	Parameter Description
0x00	Initiator
0x01	Reflector
All other values	Reserved for future use

RTT_Type: *Size: 1 octet*

Value	Parameter Description
0x00	RTT AA-only
0x01	RTT with 32-bit sounding sequence
0x02	RTT with 96-bit sounding sequence
0x03	RTT with 32-bit random sequence
0x04	RTT with 64-bit random sequence
0x05	RTT with 96-bit random sequence
0x06	RTT with 128-bit random sequence
All other values	Reserved for future use

CS_SYNC_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	LE 1M PHY
0x02	LE 2M PHY
0x03	LE 2M 2BT PHY
All other values	Reserved for future use

Channel_Map: *Size: 10 octets (79 bits meaningful)*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXX	This parameter contains 80 1-bit fields. The nth such field (in the range 0 to 78) contains the value for the CS channel index n. Channel n is enabled for CS procedure = 1 Channel n is disabled for CS procedure = 0 Channels n = 0, 1, 23, 24, 25, 77, and 78 shall be ignored and shall be set to zero. At least 15 channels shall be enabled. The most significant bit (bit 79) is reserved for future use.

Channel_Map_Repetition: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	The number of times the map represented by the Channel_Map field is to be cycled through for non-mode-0 steps within a CS procedure
All other values	Reserved for future use

Channel_Selection_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Use Channel Selection Algorithm #3b for non-mode-0 CS steps
0x01	Use Channel Selection Algorithm #3c for non-mode-0 CS steps
All other values	Reserved for future use

Ch3c_Shape: *Size: 1 octet*

Value	Parameter Description
0x00	Use Hat shape for user-specified channel sequence
0x01	Use X shape for user-specified channel sequence
All other values	Reserved for future use

Ch3c_Jump: *Size: 1 octet*

Value	Parameter Description
0x02 to 0x08	Number of channels skipped in each rising and falling sequence
All other values	Reserved for future use

Reserved: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved, shall be set to 0x00

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_CS_Create_Config command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has completed the Channel Sounding Configuration procedure with the remote Controller or when the Create_Context parameter is set to 0x00, the Controller shall generate an LE_CS_Config_Complete event.

7.8.138 LE CS Remove Config command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Remove_Config	0x0091	Connection_Handle, Config_ID	*none*

Description:

This command is used to remove a CS configuration identified by Config_ID from the local Controller for the connection identified by the Connection_Handle parameter. When the Host issues this command, the local Controller shall initiate a Channel Sounding Configuration procedure to remove the CS configuration from both the local and remote device. The Controller shall delete any CS procedure related parameters set using the HCI_LE_CS_Set_Procedure_Parameters command for the CS configuration identified by Config_ID.

If the CS configuration corresponding to Config_ID does not exist, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command when one or more CS procedures have been enabled using the HCI_LE_CS_Procedure_Enable command, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Config_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	CS configuration identifier Range: 0 to 3
All other values	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_CS_Remove_Config command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has completed the Channel Sounding Configuration procedure to disable the configuration, the Controller shall generate an LE_CS_Config_Complete event.

7.8.139 LE CS Set Channel Classification command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Set_Channel_Classification	0x0092	Channel_Classification	Status

Description:

This command is used by a Host to update the channel classification based on its local information. This channel classification persists until overwritten with a subsequent HCI_LE_CS_Set_CS_Channel_Classification command or until the Controller is reset. The Controller may combine the channel classification information provided by the Host along with local channel classification information to send an updated CS channel map to the remote Controller.

If this command is used, then the Host should send updates within 10 seconds of knowing that the CS channel classification has changed.

If the Host issues this command less than 1 second after the previous time it issued this command, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the Channel_Classification parameter enables channels that are reserved for future use or enables fewer than 15 channels, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Channel_Classification: *Size: 10 octets (79 bits meaningful)*

Value	Parameter Description
0xXXXXXXXXXXXXXXXXXXXX	This parameter contains 80 1-bit fields. The nth such field (in the range 0 to 78) contains the value for the CS channel index n. Channel n is enabled for CS procedure = 1 Channel n is disabled for CS procedure = 0 Channels n = 0, 1, 23, 24, 25, 77, and 78 shall be reserved for future use and shall be set to zero. At least 15 channels shall be enabled. The most significant bit (bit 79) is reserved for future use.

Return parameters:

Status: Size: *1 octet*

Value	Parameter Description
0x00	HCI_LE_CS_Set_Channel_Classification command succeeded
0x01 to 0xFF	HCI_LE_CS_Set_Channel_Classification command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_CS_Set_Channel_Classification command has completed, an HCI_Command_Complete event shall be generated.

7.8.140 LE CS Set Procedure Parameters command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Set_Procedure_-Parameters	0x0093	Connection_Handle, Config_ID, Max_Procedure_Len, Min_Procedure_Interval, Max_Procedure_Interval, Max_Procedure_Count, Min_Subevent_Len, Max_Subevent_Len, Tone_Antenna_Config_Selection, PHY, Tx_Power_Delta, Preferred_Peer_Antenna, SNR_Control_Initiator, SNR_Control_Reflector	Status, Connection_Handle

Description:

This command is used by a Host to set the parameters for the scheduling of one or more CS procedures by the local Controller, with the remote device for the CS configuration identified by Config_ID and the connection identified by the Connection_Handle parameter.

The Max_Procedure_Len parameter indicates the maximum duration of each CS procedure. The Min_Procedure_Interval and Max_Procedure_Interval parameters indicate the minimum and maximum interval period between consecutive CS procedures. The Max_Procedure_Count parameter indicates the maximum number of consecutive CS procedures to be scheduled as part of this measurement. If Max_Procedure_Count is set to 1, then Min_Procedure_Interval and Max_Procedure_Interval shall be ignored.

The Min_Subevent_Len and Max_Subevent_Len parameters indicate the minimum and maximum duration of each CS subevent during the CS procedure.

The values for Min_Procedure_Interval, Max_Procedure_Interval, Min_Subevent_Len, and Max_Subevent_Len are recommendations to the Controller which it may ignore.

The Tone_Antenna_Config_Selection parameter indicates the Antenna Configuration Index to be used in the CS procedure.

The power delta value Tx_Power_Delta indicates the recommended difference between the remote device's power level for the CS tones and CS_SYNC packets, and the power level for the PHY indicated by the PHY parameter. If the resulting power level goes below the minimum or goes above the maximum supported transmit power levels of the remote device, then the Controller may adjust the requested power delta value.

The Preferred_Peer_Antenna parameter indicates the preferred peer-ordered antenna elements to be used by the remote device for the antenna configuration denoted by the Tone_Antenna_Config_Selection parameter. The number of bits set in this field shall be greater than or equal to the number of antenna elements denoted by the Tone_Antenna_Config_Selection parameter.

The SNR_Control_Initiator parameter indicates the SNR control adjustment for the CS_SYNC transmissions of the initiator.

The SNR_Control_Reflector parameter indicates the SNR control adjustment for the CS_SYNC transmissions of the reflector.

If the Host issues this command with parameters that exceed the CS capabilities or any coexistence constraints, then the Controller shall return the error code *Rejected Due to Limited Resources* (0x0D).

If the CS configuration corresponding to Config_ID does not exist or is removed using the HCI_LE_CS_Remove_Config command, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command when a CS procedure measurement is already enabled for the specified Config_ID in the Controller using the HCI_LE_CS_Procedure_Enable command, then the Controller shall return the error code *Command Disallowed* (0x0C).

The parameters specified by this command for the CS configuration identified by the Config_ID parameter become invalid after the Host issues the HCI_LE_CS_Remove_Config command for the given Config_ID.

If the number of channels available for Channel Sounding before the start of a new CS procedure measurement is less than 15, then the Controller shall return the error code *Insufficient Channels* (0x48).

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Config_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	CS configuration identifier Range: 0 to 3

Max_Procedure_Len: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum duration for each CS procedure Range: 0x0001 to 0xFFFF Time = N × 0.625 ms Time range: 0.625 ms to 40.959375 s

Min_Procedure_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Minimum number of connection events between consecutive CS procedures Range: 0x0001 to 0xFFFF

Max_Procedure_Interval: *Size: 2 octets*

Value	Parameter Description
0xXXXX	Maximum number of connection events between consecutive CS procedures Range: 0x0001 to 0xFFFF

Max_Procedure_Count: *Size: 2 octets*

Value	Parameter Description
0x0000	CS procedures to continue until disabled
0xXXXX	Maximum number of CS procedures to be scheduled

Min_Subevent_Len: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Minimum suggested duration for each CS subevent in microseconds Range: 1250 µs to 3.999999 s

Max_Subevent_Len: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	Maximum suggested duration for each CS subevent in microseconds Range: 1250 µs to 3.999999 s

Tone_Antenna_Config_Selection: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x07	Antenna Configuration Index as described in [Vol 6] Part A, Section 5.3
All other values	Reserved for future use

PHY: *Size: 1 octet*

Value	Parameter Description
0x01	LE 1M PHY
0x02	LE 2M PHY
0x03	LE Coded PHY with S=8 data coding
0x04	LE Coded PHY with S=2 data coding
All other values	Reserved for future use

Tx_Power_Delta: *Size: 1 octet*

Value	Parameter Description
0xXX	Transmit power delta, in signed dB, to indicate the recommended difference between the remote device's power level for the CS tones and CS_SYNC packets and the existing power level for the PHY indicated by the PHY parameter
0x80	Host does not have a recommendation for transmit power delta

Preferred_Peer_Antenna: *Size: 1 octet*

Bit Number	Parameter Description
0	Use first ordered antenna element
1	Use second ordered antenna element
2	Use third ordered antenna element
3	Use fourth ordered antenna element
All other values	Reserved for future use

SNR_Control_Initiator: *Size: 1 octet*

Value	Parameter Description
0x00	SNR control adjustment of 18 dB.
0x01	SNR control adjustment of 21 dB.
0x02	SNR control adjustment of 24 dB.
0x03	SNR control adjustment of 27 dB.
0x04	SNR control adjustment of 30 dB.
0xFF	SNR control is not to be applied.
All other values	Reserved for future use

SNR_Control_Reflector: *Size: 1 octet*

Value	Parameter Description
0x00	SNR control adjustment of 18 dB.
0x01	SNR control adjustment of 21 dB.
0x02	SNR control adjustment of 24 dB.
0x03	SNR control adjustment of 27 dB.
0x04	SNR control adjustment of 30 dB.
0xFF	SNR control is not to be applied.
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_CS_Set_Procedure_Parameters command succeeded
0x01 to 0xFF	HCI_LE_CS_Set_Procedure_Parameters command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Event(s) generated (unless masked away):

When the HCI_LE_CS_Set_Procedure_Parameters command has completed, an HCI_Command_Complete event shall be generated.

7.8.141 LE CS Procedure Enable command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Procedure_Enable	0x0094	Connection_Handle, Config_ID, Enable	*none*

Description:

This command is used by a Host to enable or disable the scheduling of CS procedures by the local Controller, with the remote device for the connection identified by the Connection_Handle parameter.

If the Host issues this command to enable a CS configuration identified by the Config_ID parameter before a corresponding HCI_LE_CS_Set_Procedure_Parameters command has been issued for the same Config_ID, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the CS configuration corresponding to Config_ID does not exist (or has been removed using the HCI_LE_CS_Remove_Config command), then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the CS procedure parameters associated with the given Config_ID exceed any scheduling or coexistence constraints at the time this command is issued, then the Controller shall return the error code *Connection Rejected Due to Limited Resources* (0x0D).

If the Host issues this command to enable a CS configuration identified by the Config_ID parameter that is already enabled using the HCI_LE_CS_Procedure_Enable command, then the Controller shall return the error code *Command Disallowed* (0x0C).

If the number of channels available for Channel Sounding before the start of a new CS procedure measurement is less than 15, then the Controller shall return the error code *Insufficient Channels* (0x48).

If the Host sends this command with a Connection_Handle that does not exist, or the Connection_Handle is not for an ACL, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Connection_Handle Range 0x0000 to 0x0EFF

Config_ID: *Size: 1 octet*

Value	Parameter Description
0xXX	CS configuration identifier Range: 0 to 3
All other values	Reserved for future use

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	CS procedures are to be disabled
0x01	CS procedures are to be enabled
All other values	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_CS_Procedure_Enable command, the Controller shall send the HCI_Command_Status event to the Host. When the locally initiated Channel Sounding Start procedure has completed or when the Controller has received the LL_CS_IND PDU, it shall generate an LE_CS_Procedure_Enable_Complete event. When the Host has issued a command to disable an active CS procedure, the Controller shall generate an LE_CS_Procedure_Enable_Complete event after any pending CS subevent results have been sent to the Host and the LL_CS_TERMINATE_RSP PDU has been successfully sent or received.

7.8.142 LE CS Test command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Test	0x0095	Main_Mode_Type, Sub_Mode_Type, Main_Mode_Repetition, Mode_0_Steps, Role, RTT_Type, CS_SYNC_PHY, CS_SYNC_Antenna_Selection, Subevent_Len, Subevent_Interval, Max_Num_Subevents, Transmit_Power_Level, T_IP1_Time, T_IP2_Time, T_FCS_Time, T_PM_Time, T_SW_Time, Tone_Antenna_Config_Selection, Reserved, SNR_Control_Initiator, SNR_Control_Reflector, DRBG_Nonce, Channel_Map_Repetition, Override_Config, Override_Parameters_Length Override_Parameters_Data	Status

Description:

This command is used to start a CS test where the Implementation Under Test (IUT) is placed in the role of either the initiator or reflector. The first mode-0 channel in the list is used as the starting channel for the test. At the beginning of any test, the IUT in the reflector role shall listen on the first mode-0 channel until it receives the first transmission from the initiator. Similarly, with the IUT in the initiator role, the tester will start by listening on the first mode-0 channel and the IUT shall transmit on that

channel for the first half of the first CS step. Thereafter, the parameters of this command describe the required transmit and receive behavior for the CS test.

This command is used to schedule a single CS procedure that consists of one or more CS subevents. After the channels contained in the Channel map or the Channel array in case of an override have been used the number of times indicated by Channel_Map_-Repetition to schedule CS steps, or the maximum number of allowed steps in a CS procedure has been reached, or the maximum number of subevents indicated by the Max_Num_Subevents parameter has been reached, or the maximum number of allowed subevents in a CS procedure has been reached, the CS procedure will end.

The Main_Mode_Type and the Sub_Mode_Type parameters indicate the CS modes to be used during the CS procedure for the specified CS configuration.

The Main_Mode_Repetition parameter indicates the number of main mode CS steps repeated from the last CS subevent at the beginning of the current CS subevent.

The Mode_0_Steps parameter indicates the number of mode-0 CS steps to be included at the beginning of each CS subevent.

The Role parameter indicates the CS role for the local Controller.

The RTT_Type parameter indicates the RTT type and payload length to be used during the CS procedure.

The CS_SYNC_PHY parameter indicates the PHY to be used for CS_SYNC exchanges during the CS procedure.

The CS_SYNC_Antenna_Selection parameter indicates the antenna identifier to be used for transmitting and receiving CS_SYNC packets.

The Subevent_Len parameter indicates the maximum length of a CS subevent.

The Subevent_Interval parameter indicates the gap between the start of consecutive CS subevents. When Subevent_Interval is set to zero, the Subevent_Len parameter is ignored, and only one CS subevent is executed in the CS test.

The Max_Num_Subevents parameter indicates the maximum number of subevents that are in the procedure. If Max_Num_Subevents is set to 0x00, then the Max_Num_Subevents parameter is ignored.

The Transmit_Power_Level parameter indicates the transmit power level used for the CS procedure.

The T_IP1_Time, T_IP2_Time, T_FCS_Time, T_PM_Time, and T_SW_Time parameters indicate the time durations used in CS steps as described in [Vol 6] Part H, Section 4.3.

The Tone_Antenna_Config_Selection parameter indicates the Antenna Configuration Index used during antenna switching during the tone phases of CS steps as described in [Vol 6] Part A, Section 5.3.

The SNR_Control_Initiator parameter indicates the SNR control adjustment for the CS_SYNC transmissions of the initiator.

The SNR_Control_Reflector parameter indicates the SNR control adjustment for of the CS_SYNC transmissions of the reflector.

The DRBG_Nonce parameter specifies octets 14 and 15 of the initial value of the DRBG nonce, V_{DRBG}, used in calls to the random bit generation function described in [Vol 6] Part E, Section 3.1.6. The remaining octets of the initial nonce value V_{DRBG} are set to 0x00. All octets of the initial temporal key K_{DRBG} are set to 0x00. The most significant bit of this parameter is stored in the most significant bit of the octet 14 of the DRBG nonce. The least significant bit of this parameter is stored in the least significant bit of octet 15 of the DRBG nonce.

The Channel_Map_Repetition field shall indicate the number of times the Channel_Map is cycled through for non-mode-0 steps within a CS procedure. The Channel_Map_Repetition field shall be greater than or equal to 1. The Channel_Map content is selected based on the setting of the Override_Config bit 0 as described below.

The Override_Config parameter indicates which CS parameters are not derived from the DRBG but determined from the Override_Parameters_Data parameter in this command.

If the Override_Config bit 2 corresponding to CS submode insertion is not set, then the number of main mode CS steps to be executed before a submode CS step during the CS procedure is determined using DRBG with following default values:

- Min_Main_Mode_Steps: 6
- Max_Main_Mode_Steps: 10

If the Override_Config bit 10 corresponding to the Stable Phase test is set, then the procedure is replaced with the Stable Phase test as described in [Vol 6] Part F, Section 2.4.

The Override_Parameters_Data is a variable sized object with a length indicated by Override_Parameters_Length parameter whose contents are determined by the bits set in the Override_Config parameter.

An ongoing CS test can be stopped using the HCI_LE_CS_Test_End command (see Section 7.8.143).

The CS test is considered complete when all the results of the CS procedure initiated by the CS test have been reported to the Host.

If the Host issues this command when a CS test is already enabled using the HCI_LE_CS_Test command and has not completed, then the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

Main_Mode_Type: *Size: 1 octet*

Value	Parameter Description
0x01	Mode-1
0x02	Mode-2
0x03	Mode-3
All other values	Reserved for future use

Sub_Mode_Type: *Size: 1 octet*

Value	Parameter Description
0x01	Mode-1
0x02	Mode-2
0x03	Mode-3
0xFF	Unused
All other values	Reserved for future use

Main_Mode_Repetition: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x03	The number of main mode steps taken from the end of the last CS subevent to be repeated at the beginning of the current CS subevent directly after the last mode-0 step of that event
All other values	Reserved for future use

Mode_0_Steps: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x03	Number of CS mode-0 steps to be included at the beginning of the test CS subevent
All other values	Reserved for future use

Role: *Size: 1 octet*

Value	Parameter Description
0x00	Initiator
0x01	Reflector
All other values	Reserved for future use

RTT_Type: *Size: 1 octet*

Value	Parameter Description
0x00	RTT AA Only
0x01	RTT with 32-bit sounding sequence
0x02	RTT with 96-bit sounding sequence
0x03	RTT with 32-bit random sequence
0x04	RTT with 64-bit random sequence
0x05	RTT with 96-bit random sequence
0x06	RTT with 128-bit random sequence
All other values	Reserved for future use

CS_SYNC_PHY: *Size: 1 octet*

Value	Parameter Description
0x01	LE 1M PHY
0x02	LE 2M PHY
0x03	LE 2M 2BT PHY
All other values	Reserved for future use

CS_SYNC_Antenna_Selection: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x04	Antenna identifier to be used for CS_SYNC packets, including mode-0 packets
All other values	Reserved for future use

Subevent_Len: *Size: 3 octets*

Value	Parameter Description
0xXXXXXX	CS subevent length in units of microseconds Range: 1250 µs to 3.999999 s
All other values	Reserved for future use

Subevent_Interval: *Size: 2 octets*

Value	Parameter Description
0x0000	Single CS subevent
0xXXXX	Gap between the start of two consecutive CS subevents Units: 0.625 ms

Max_Num_Subevents: *Size: 1 octet*

Value	Parameter Description
0x00	The Max_Num_Subevents parameter is ignored when determining the number of subevents in the procedure.
0x01 to 0x20	The maximum allowed number of subevents in the procedure.
All other values	Reserved for future use.

Transmit_Power_Level: *Size: 1 octet*

Value	Parameter Description
0xXX	Set transmitter to the specified or nearest transmit power level Range: -127 to +20 Units: dBm
0x7E	Set transmitter to minimum transmit power level
0x7F	Set transmitter to maximum transmit power level
All other values	Reserved for future use

T_IP1_Time: *Size: 1 octet*

Value	Parameter Description
0x0A, 0x14, 0x1E, 0x28, 0x32, 0x3C, 0x50, or 0x91	Interlude time in microseconds between the CS_SYNC packets used in mode-0 and mode-1 steps
All other values	Reserved for future use

T_IP2_Time: *Size: 1 octet*

Value	***Parameter Description***
0x0A, 0x14, 0x1E, 0x28, 0x32, 0x3C, 0x50, or 0x91	Interlude time in microseconds between the CS tones
All other values	Reserved for future use

T_FCS_Time: *Size: 1 octet*

Value	Parameter Description
0x0F, 0x14, 0x1E, 0x28, 0x32, 0x3C, 0x50, 0x64, 0x78, or 0x96	Time in microseconds for frequency changes
All other values	Reserved for future use

T_PM_Time: *Size: 1 octet*

Value	Parameter Description
0x0A, 0x14, or 0x28	Time in microseconds for the phase measurement period of the CS tones
All other values	Reserved for future use

T_SW_Time: *Size: 1 octet*

Value	Parameter Description
0x00, 0x01, 0x02, 0x04, or 0x0A	Time in microseconds for the antenna switch period of the CS tones
All other values	Reserved for future use

Tone_Antenna_Config_Selection: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x07	Antenna Configuration Index used during antenna switching during the tone phases of CS steps as described in [Vol 6] Part A, Section 5.3
All other values	Reserved for future use

Reserved: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved, shall be set to 0x00

SNR_Control_Initiator: *Size: 1 octet*

Value	Parameter Description
0x00	SNR control adjustment of 18 dB.
0x01	SNR control adjustment of 21dB.
0x02	SNR control adjustment of 24 dB.
0x03	SNR control adjustment of 27 dB.
0x04	SNR control adjustment of 30 dB.
0xFF	SNR control is not to be applied.
All other values	Reserved for future use

SNR_Control_Reflector: *Size: 1 octet*

Value	Parameter Description
0x00	SNR control adjustment of 18 dB.
0x01	SNR control adjustment of 21dB.
0x02	SNR control adjustment of 24 dB.
0x03	SNR control adjustment of 27 dB.
0x04	SNR control adjustment of 30 dB.
0xFF	SNR control is not to be applied.
All other values	Reserved for future use

DRBG_Nonce: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The DRBG_Nonce value determines octets 14 and 15 of the initial value of the DRBG nonce.

Channel_Map_Repetition: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved for future use.
0x01 to 0xFF	The number of times the channels indicated by the Channel_Map or the Channel field in the Override_Parameters_Data parameter is cycled through for non-mode-0 steps within a CS procedure. This value shall be greater than or equal to 1.

Override_Config: *Size: 2 octets*

Bit Number	Parameter Description
0	If the bit is set to 1, then the channel sequence for the subevent is determined by the values of Channel_Length and Channel[i] parameters. If bit is set to 0, then the channel sequence for the subevent is determined by the values of Channel_Map, Channel_Selection_Type, Ch3c_Shape, and Ch3c_Jump.
2	The number of main mode CS steps to be executed before a submode CS step is executed during the CS procedure is determined by the value of Main_Mode_Steps parameter.
3	The transmission of tone extensions within each Mode-2 or Mode-3 step is determined by the value of T_PM_Tone_Ext parameter.
4	The Tone antenna permutation index for each Mode-2 or Mode-3 step is determined by the value of Tone_Antenna_Permutation parameter.
5	The CS Access Address of all packets sent by the initiator is determined by CS_SYNC_AA_Initiator parameter. The CS Access Address of all packets sent by the reflector is determined by CS_SYNC_AA_Reflector parameter.
6	The Marker positions for each CS_SYNC packet with a marker is determined by the value of SS_Marker1_Position and SS_Marker2_Position parameters.
7	The Marker value for each marker within a CS_SYNC packet is determined by SS_Marker_Value parameter.
8	The payload of the CS_SYNC packet is determined by the value of CS_SYNC_Payload_Pattern parameter.
10	Stable Phase test
All other bits	Reserved for future use

Override_Parameters_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	The Length of the Override_Parameters_Data variable object field.

Override_Parameters_Data: *Size: Override_Parameters_Length octets*

Value	Parameter Description
Variable	Variable set of parameters which are present dependent on the bits set in the Override_Config parameter.

The contents of the Override_Parameters_Data parameter is defined in sequence as follows

- When bit 0 of Override_Config is set, include the following parameters

  Channel_Length,

  Channel[i]
- When bit 0 of Override_Config is not set, include the following parameters
  - Channel_Map,
  - Channel_Selection_Type,
  - Ch3c_Shape,
  - Ch3c_Jump
- When bit 2 of Override_Config is set, include the following parameters

  Main_Mode_Steps
- When bit 3 of Override_Config is set, include the following parameters

  T_PM_Tone_Ext
- When bit 4 of Override_Config is set, include the following parameters

  Tone_Antenna_Permutation
- When bit 5 of Override_Config is set, include the following parameters

  CS_SYNC_AA_Initiator,

  CS_SYNC_AA_Reflector
- When bit 6 of Override_Config is set, include the following parameters

  SS_Marker1_Position,

  SS_Marker2_Position
- When bit 7 of Override_Config is set, include the following parameters

  SS_Marker_Value
- When bit 8 of Override_Config is set, include the following parameters

  CS_SYNC_Payload_Pattern,

  CS_SYNC_User_Payload

The parameters of the Override_Parameters_Data object are described below.

The Channel_Length and Channel[i] parameters indicate the channels to be used during the CS procedure for both mode-0 and non-mode-0 CS steps. The Channel[i] list is used independently for mode-0 and non-mode-0 steps.

The Channel_Map parameter shall indicate the CS channels to be used or unused in the CS procedure.

The Channel_Selection_Type parameter shall indicate which Channel Selection Algorithm to use when calculating the channel sequence for the CS procedure. The Ch3c_Shape parameter shall indicate which shape to use when calculating Channel Selection Algorithm #3c as described in [Vol 6] Part H, Section 4.1.4.2. If the Channel_Selection_Type parameter is not set to Channel Selection Algorithm #3c, then the Ch3c_Shape parameter shall be ignored.

The Ch3c_Jump parameter shall indicate which CSChannelJump value to use when calculating Channel Selection Algorithm #3c as described in [Vol 6] Part H, Section 4.1.4.2. If the Channel_Selection_Type parameter is not set to Channel Selection Algorithm #3c, then the Ch3c_Jump parameter shall be ignored.

The Main_Mode_Steps parameter indicates the number of main mode CS steps to be executed before a submode CS step is executed during the CS procedure.

The T_PM_Tone_Ext parameter indicates whether a CS tone extension follows a CS tone in the initiator and the reflector sides.

The Tone_Antenna_Permutation parameter indicates the Antenna Permutation Index used during antenna switching during the tone phases of CS steps as described in [Vol 6] Part H, Section 4.7.5.

The CS_SYNC_AA_Initiator and the CS_SYNC_AA_Reflector parameters indicate the access address used for CS_SYNC packets on the initiator and reflector sides. The least significant bit corresponds to the most significant bit of the CS Access Address.

When RTT_Type specifies a sounding sequence being used, the SS_Marker1_Position parameter indicates the bit number where the first marker of the sounding sequence starts, the SS_Marker2_Position indicates the bit number where the second marker of the sounding sequence starts, and the SS_Marker_Value parameter indicates the value of the sounding sequence marker.

When RTT_Type specifies a random sequence being used, a payload with the pattern indicated by the CS_SYNC_Payload_Pattern parameter is used. When the CS_SYNC_Payload_Pattern indicates a user payload to be used, then the CS_SYNC_User_Payload parameter indicates the payload used in CS packets. Otherwise, the CS_SYNC_User_Payload parameter is set to all zeros.

Channel_Length: *Size: 1 octet*

Value	Parameter Description
0x01 to 0x48	Number of channels used in the pattern
All other values	Reserved for future use

Channel[i]: *Size: Channel_Length × 1 octet*

Value	Parameter Description
0xXX	List of channels used in the pattern

Channel_Map: *Size: 10 octets*

Value	Parameter Description
0xXXXX	The channel map indicating which channels shall be used and unused within the CS procedure. Every channel is represented by a bit positioned according to the CS channel index [Vol 6] Part H, Section 1. The format of the field is identical to the ChM field in the LL_CS_CONFIG_REQ PDU (see [Vol 6] Part B, Section 2.4.2.45)

Channel_Selection_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Channel Selection Algorithm #3b
0x01	Channel Selection Algorithm #3c
All other values	Reserved for future use.

Ch3c_Shape: *Size:1 octet*

Value	Parameter Description
0x00	Hat Shape
0x01	“X” Shape
All other values	Reserved for future use

Ch3c_Jump: *Size:1 octet*

Value	Parameter Description
0x02 to 0x08	CSChannelJump
All other values	Reserved for future use

Main_Mode_Steps: *Size: 1 octet*

Value	Parameter Description
0x01 to 0xFF	The number of CS main mode steps to be executed before a submode step is executed
All other values	Reserved for future use

T_PM_Tone_Ext: *Size: 1 octet*

Value	Parameter Description
0x00	Initiator and reflector tones sent without tone extension
0x01	Initiator tone sent with extension; reflector tone sent without extension
0x02	Initiator tone sent without extension; reflector tone sent with extension
0x03	Initiator and reflector tones sent with extension
0x04	Loop through values 0x00 to 0x03 above. Applicable for mode-2 and mode-3 steps only.
All other values	Reserved for future use

Tone_Antenna_Permutation: *Size: 1 octet*

Value	Parameter Description
0x00 to 0x17	Antenna Permutation Index used during antenna switching during the tone phases of CS steps as described in [Vol 6] Part H, Section 4.7.5
0xFF	Loop through all valid Antenna Permutation Indices starting from the lowest index
All other values	Reserved for future use

CS_SYNC_AA_Initiator: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Access Address used in CS_SYNC packets sent by the initiator

CS_SYNC_AA_Reflector: *Size: 4 octets*

Value	Parameter Description
0xXXXXXXXX	Access Address used in CS_SYNC packets sent by the reflector

SS_Marker1_Position: *Size: 1 octet*

Value	Parameter Description
0 to 63	Bit number where the first marker in the sounding sequence starts. The bit number shall be between 0 and 28 when RTT_Type indicates a 32-bit sounding sequence.
All other values	Reserved for future use

SS_Marker2_Position: *Size: 1 octet*

Value	Parameter Description
67 to 92	Bit number where the second marker in the sounding sequence starts. The bit number shall be between 67 and 92 when RTT_Type indicates a 96-bit sounding sequence.
0xFF	Sounding sequence or second marker is not present
All other values	Reserved for future use

SS_Marker_Value: *Size: 1 octet*

Value	Parameter Description
0x00	Use pattern '0011' (in transmission order) as the sounding sequence marker
0x01	Use pattern '1100' (in transmission order) as the sounding sequence marker
0x02	Loop through pattern '0011' and '1100' (in transmission order)
All other values	Reserved for future use

CS_SYNC_Payload_Pattern: *Size: 1 octet*

Value	Parameter Description
0x00	PRBS9 sequence '11111111100000111101...' (in transmission order) as described in [Vol 6] Part F, Section 4.1.5
0x01	Repeated ‘11110000’ sequence
0x02	Repeated ‘10101010’ sequence
0x03	PRBS15 sequence as described in [Vol 6] Part F, Section 4.1.5
0x04	Repeated ‘11111111’ sequence
0x05	Repeated ‘00000000’ sequence
0x06	Repeated ‘00001111’ sequence
0x07	Repeated ‘01010101’ sequence
0x80	Use CS_SYNC_User_Payload
All other values	Reserved for future use

CS_SYNC_User_Payload: *Size: 16 octets*

Value	Parameter Description
0xXX..XX	Payload for CS_SYNC packets. The least significant bit corresponds to the most significant bit of the CS Payload. When the sequence is less than 16 octets, the least significant octets shall be padded with zeros accordingly.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_CS_Test command succeeded
0x01 to 0xFF	HCI_LE_CS_Test command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_CS_Test command has completed, an HCI_Command_Complete event shall be generated. The Controller shall either generate the LE_CS_Subevent_Result event once or generate the LE_CS_Subevent_Result_Continue event multiple times to send results from the completed CS steps to the Host.

7.8.143 LE CS Test End command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_CS_Test_End	0x0096	*none*	*none*

Description:

This command is used to stop any CS test that is in progress.

If the Host issues this command when there is no prior CS test initiated using the HCI_LE_CS_Test command or when a prior CS test has already been completed, then the Controller shall return the error code *Command Disallowed* (0x0C).

Command parameters:

None.

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_CS_Test_End command, the Controller shall send the HCI_Command_Status event to the Host. When the Controller has successfully sent all the pending CS subevent results to the Host, the Controller shall generate an LE_CS_Test_End_Complete event.

7.8.144 LE Set Decision Data command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Decision_Data	0x0080	Advertising_Handle, Decision_Type_Flags, Decision_Data_Length, Decision_Data	Status

Description:

This command is used to set the decision data used by the specified advertising set in those advertising PDUs that contain decision data. This command may be issued at any time after an advertising set identified by the Advertising_Handle parameter has been created, regardless of whether advertising in that set is enabled or disabled. When an advertising set is created, Decision_Type_Flags shall be set to zero and there shall be zero octets of decision data.

If advertising is currently enabled for the specified advertising set, the Controller shall use the new decision data in subsequent extended advertising events for this advertising set. If an extended advertising event is in progress when this command is issued, the Controller may use the old or new decision data for that event.

If advertising is currently disabled for the specified advertising set, the decision data shall be kept by the Controller and used once advertising is enabled for that set. The decision data shall be discarded when the advertising set is removed.

The Decision_Type_Flags and Decision_Data parameters specify the decision data to be used with the advertising set.

If the advertising set corresponding to the Advertising_Handle parameter does not exist, then the Controller shall return the error code *Unknown Advertising Identifier* (0x42).

If the value of the Decision_Data_Length parameter is not large enough to contain the subfields specified in Decision_Type_Flags, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Advertising_Handle: *Size: 1 octet*

Value	Parameter Description
0xXX	Used to identify an advertising set Range: 0x00 to 0xEF

Decision_Type_Flags: *Size: 1 octet*

Bit Number	Parameter Description
0	A Resolvable Tag subfield is present in the decision data
All other bits	Reserved for future use

Decision_Data_Length: *Size: 1 octet*

Value	Parameter Description
0xXX	The number of octets in the Decision_Data parameter Range: 0 to 8

Decision_Data: *Size: Decision_Data_Length octets*

Value	Parameter Description
	Decision data as defined in [Vol 6] Part B, Section 2.3.1.11 Note: This parameter has a variable length.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Decision_Data command succeeded
0x01 to 0xFF	HCI_LE_Set_Decision_Data command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Decision_Data command has completed, an HCI_Command_Complete event shall be generated.

7.8.145 LE Set Decision Instructions command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Set_Decision_Instructions	0x0081	Num_Tests, Test_Flags[i], Test_Field[i], Test_Parameters[i]	Status

Description:

This command is used to set the decision instructions used when listening for advertisements containing decision PDUs (when either scanning or initiating a new connection). The Controller shall support at least 8 tests in the decision instructions.

This command may be used while scanning or initiating is in progress. If so, the new decision instructions shall take effect before the HCI_Command_Complete event is sent to the Host and the change shall not take place while the decision instructions are being used to process a decision PDU (that is, each PDU is processed using either the old decision instructions or the new ones, but not a mixture).

The Num_Tests parameter specifies the number of individual tests in the decision instructions.

If either Num_Tests is 0 or bit 0 of Test_Flags[0] is 0, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If Num_Tests is greater than the maximum that the Controller supports, then the Controller shall return the error code *Limit Reached* (0x43).

Decision procedure

The Controller shall use the following procedure to apply the decision instructions specified by this command to each received ADV_DECISION_IND PDU and either accept or reject it.

For each test in the instructions, the Controller shall apply that test to the received PDU to reach a pass or fail result as follows:

1. Use the value of Test_Field[i] to determine whether the “relevant field” is present in the PDU. This is some property, usually a specific field or subfield, of the ADV_DECISION_IND PDU (it is still called the relevant field in this description even if it is not a field).
2. If the relevant field is not present, then use the value of bit 3 of Test_Flags[i] to determine the result of the test.

3. If the relevant field is present, then carry out the specific check for that field described below, using Test_Parameters[i] to provide any additional parameters needed. Use the value of bit 1 of Test_Flags[i] (if the check passed) or the value of bit 2 of Test_Flags[i] (if the check failed) to determine the result of the test.

Note: The effect of steps 2 and 3 is that each combination of values of bits 1 to 3 of Test_Flags[i] has the overall behavior shown in Table 7.5.

Bit of Test_Flags[i]			**The test passes if and only if:**
1	**2**	**3**	
0	0	0	Never
0	0	1	The decision data does not contain the relevant field
0	1	0	The decision data contains the relevant field and the check fails
0	1	1	Either the decision data contains the relevant field and the check fails, OR the decision data does not contain the relevant field
1	0	0	The decision data contains the relevant field and the check passes
1	0	1	Either the decision data contains the relevant field and the check passes, OR the decision data does not contain the relevant field
1	1	0	The decision data contains the relevant field, irrespective of whether the check passes
1	1	1	Always

Table 7.5: Conditions to pass a test based on the Test_Flags[i] value

The Controller shall partition the list of tests into test groups based on bit 0 of Test_Flags[i]: if the bit is 0, then test i is in the same group as test i – 1; if the bit is 1, then test i is in a different group from all lower-numbered tests. A test group shall be classified as passing if all the tests in that group pass and failing if any of the tests in that group fail. See example 1 below.

An ADV_DECISION_IND PDU shall be accepted if any of the test groups pass when applied to the PDU.

The specific check for each relevant field is as follows:

- If the relevant field is the Resolvable Tag, then the check passes if the Resolvable Tag resolves against the 128-bit key provided in Test_Parameters[i] as shown in Figure 7.7.

Octets 0 to 15
Key

Figure 7.7: Interpretation of Test_Parameters[i] for tests on the Resolvable Tag

- If the relevant field is the Arbitrary Data, then Test_Parameters[i] has the format given in Figure 7.8.

Octets 0 to 7	Octets 8 to 15
Mask	Target

Figure 7.8: Interpretation of Test_Parameters[i] for tests on the Arbitrary Data

The Controller shall append all-zero octets to the Arbitrary Data as necessary to make the length equal to 8 octets. The Controller shall then apply a bitwise AND to that value and Mask; the check passes if the result of this equals Target.

For example, if Test_Parameters[i] is the sequence of octets [FF FF F0 F0 CC CC 55 55 01 02 00 00 00 00 00 00], then an Arbitrary Data of [01 02 03 04] will pass the check whereas [01 02 03 04 63 33] will fail because the fifth octet does not match.

- If the relevant field is the RSSI field, then Test_Parameters[i] has the format given in Figure 7.9.

Octet 0	Octet 1	Octets 2 to 15
MinRSSI	MaxRSSI	RFU

Figure 7.9: Interpretation of Test_Parameters[i] for tests on the RSSI

The check passes if the RSSI value is between MinRSSI and MaxRSSI (both are signed values in dBm).

- If the relevant field is the AdvA field, then Test_Parameters[i] has the format given in Figure 7.10 and the check depends on the value of the Check field as shown in Table 7.6.

Octet 0	Octet 1	Octets 2 to 7	Octet 8	Octets 9 to 14	Octet 15
Check	Address 1 type	Address 1 address	Address 2 type	Address 2 address	RFU

Figure 7.10: Interpretation of Test_Parameters[i] for tests on the AdvA field

Value	Meaning
0	The check passes if the AdvA field is for a device in the Filter Accept List. The Addresses are ignored.
1	The check passes if the AdvA field specifies the same device as Address 1. Address 2 is ignored.
2	The check passes if the AdvA field specifies the same device as Address 1 or as Address 2.
All other values	Reserved for future use.

Table 7.6: Interpretation of the Check field for tests on the AdvA field

The value of the Address type fields shall be 0x00 for a public address and 0x01 for a random address.

To compare the AdvA field with an Address field, the AdvA is first resolved if it is a resolvable private address and is then compared with the address and type of the Address field; the check passes if they are the same. For example, if the Address Type field is 0x00 and the Address address field is the sequence of octets [22 33 44 55 66 77], then the check passes only if the AdvA field specifies the public address 0x776655443322 or a resolvable private address that resolves to that address.

- If the relevant field is the path loss, then Test_Parameters[i] has the format given in Figure 7.11.

Octet 0	Octet 1	Octets 2 to 15
MinLoss	MaxLoss	RFU

Figure 7.11: Interpretation of Test_Parameters[i] for tests on the path loss

The check passes if the path loss, calculated as the difference between the value of the TxPower field and the RSSI value for the received PDU, is between MinLoss and MaxLoss (both are unsigned values in dB).

- If the relevant field is the AdvMode field, then Test_Parameters[i] has the format given in Figure 7.12 and the check depends on the value of the EventType field as shown in Table 7.7.

Octet 0	Octets 1 to 15
EventType	RFU

Figure 7.12: Interpretation of Test_Parameters[i] for tests on the AdvMode field

The check passes if the appropriate bit of the EventType field is 1.

Bit Number	Pass Criteria
0	The check passes for non-connectable non-scannable undirected events
1	The check passes for connectable undirected events
2	The check passes for scannable undirected events
All other bits	Reserved for future use

Table 7.7: Interpretation of the EventType field for tests on the AdvMode field

- If the relevant field is vendor-specific, then the check to be applied and the interpretation of Test_Parameters[i] are also vendor-specific.

Example 1

In this example, the decision instructions consist of the two tests in Table 7.8:

Test	Test_Flags	Test_Field	Test_Parameters
0	0b0011	0	Key
1	0b0010	6	0x05 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00

Table 7.8: Example 1 test instructions

These instructions form a single test group. Test 0 passes if there is a Resolvable Tag field in the PDU that resolves against the key provided, while test 1 passes if the advertising is undirected and non-connectable.

Therefore a PDU will be accepted if it resolves against the key and is undirected but not connectable.

If the Test_Flags for test 1 were changed to 0b0011, the two tests would each form their own test group. A PDU would then be accepted if it resolved against the key or is undirected and non-connectable.

Example 2

In this example, the decision instructions consist of the three tests in Table 7.9:

Test	Test_Flags	Test_Field	Test_Parameters
0	0b0011	20	0xFF 0xFF 0xFF 0xFF 0x00 0x00 0x00 0x00 0x41 0x42 0x43 0x44 0x00 0x00 0x00 0x00
1	0b0011	36	0xFF 0xFF 0xFF 0xFF 0x00 0x00 0x00 0x00 0x45 0x46 0x47 0x48 0x00 0x00 0x00 0x00
2	0b0011	52	0xFF 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x4A 0x00 0x00 0x00 0x00 0x00 0x00 0x00

Table 7.9: Example 2 test instructions

These instructions each form their own test group, so a PDU will be accepted if any of the tests pass.

- Test 0 passes if the Arbitrary Data is exactly four octets long, consisting of “ABCD”.
- Test 1 passes if the Arbitrary Data is at least four octets long and begins with “EFGH”.
- Test 2 passes if the Arbitrary Data is at most four octets long and begins with “J”.

Example 3

In this example, the decision instructions consist of the five tests in Table 7.10:

Test	Test_Flags	Test_Field	Test_Parameters
0	0b1001	0	Ignored
1	0b1010	8	0x50 0x64 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00 0x00
2	0b0010	36	0xFF 0xFF 0xFF 0xFF 0x00 0x00 0x00 0x00 0x43 0x44 0x57 0x46 0x00 0x00 0x00 0x00
3	0b0011	0	Key
4	0b0010	18	0xDF 0xDF 0x00 0x00 0x00 0x00 0x00 0x00 0x42 0x54 0x00 0x00 0x00 0x00 0x00 0x00

Table 7.10: Example 3 test instructions

These instructions form two test groups, one consisting of tests 0 to 2 and the other of tests 3 and 4.

Test 0 passes if there is no Resolvable Tag field in the PDU.

Test 1 passes if the calculated path loss is between 80 dB and 100 dB or if the loss cannot be calculated (if the value of Test_Flags[1] had been 0b0010, test 1 would fail if the loss could not be calculated).

Test 2 passes if the Arbitrary Data is at least 4 octets long and begins with “CDWF”.

Test 3 passes if there is a Resolvable Tag field in the PDU and that tag resolves against the specified key.

Test 4 passes if the Arbitrary Data consists of exactly two octets, which are “bt” in either case (because the bit distinguishing case is masked out for these two octets).

Therefore:

- A PDU not containing a Resolvable Tag will be accepted if it contains Arbitrary Data beginning with “CDWF” and the path loss (if available) is within certain bounds.
- A PDU containing a Resolvable Tag will be accepted if the tag resolves against the key in Test_Parameters[3] and it is followed by one of “BT”, “Bt”, “bT”, or “bt”.

Command parameters:

Num_Tests: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved for future use
0x01 to 0xFF	The number of tests in the decision instructions

Test_Flags[i]: *Size: Num_Tests × 1 octet*

Bit Number	Parameter Description
0	Start of new test group
1	Test passes if the decision data contains the relevant field and the check passes
2	Test passes if the decision data contains the relevant field and the check fails
3	Test passes if the decision data does not contain the relevant field
All other bits	Reserved for future use

Test_Field[i]: *Size: Num_Tests × 1 octet*

Value	Parameter Description
0	The relevant field is the Resolvable Tag subfield
6	The relevant field is the AdvMode field (which is always present)
7	The relevant field is the RSSI field
8	The relevant field is the path loss computed from the TxPower field and the RSSI value for the received PDU; if this cannot be computed, the decision data is deemed not to contain the relevant field
9	The relevant field is the AdvA field
17 to 24	N = the relevant field is the Arbitrary Data, but only if it contains exactly N – 16 octets; for any other length, the decision data is treated as if it does not contain the relevant field
33 to 40	N = the relevant field is the Arbitrary Data, but only if it contains at least N – 32 octets; if it contains fewer octets, the decision data is treated as if it does not contain the relevant field
49 to 56	N = the relevant field is the Arbitrary Data, but only if it contains at least one and at most N – 48 octets; if it contains more octets, the decision data is treated as if it does not contain the relevant field
240 to 255	Vendor-specific
All other values	Reserved for future use

Test_Parameters[i]: *Size: Num_Tests × 16 octets*

Value	Parameter Description
0xXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXX	Specific parameters for the test. The meaning of this parameter depends on the value of Test_Field[i].

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Set_Decision_Instructions command succeeded
0x01 to 0xFF	HCI_LE_Set_Decision_Instructions command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Set_Decision_Instructions command has completed, an HCI_Command_Complete event shall be generated.

7.8.146 LE Add Device To Monitored Advertisers List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Add_Device_To_Monitored_-Advertisers_List	0x0098	Address_Type, Address, RSSI_Low_Threshold, RSSI_High_Threshold, Timeout	Status

Description:

This command is used to add a single device to a list of devices monitored while scanning.

The Address_Type and Address parameters are used to identify an advertising device.

The RSSI_Low_Threshold parameter is set to the RSSI value below which an HCI_LE_Monitored_Advertisers_Report event shall be generated when the associated timer expires for that device.

The RSSI_High_Threshold parameter is set to the RSSI value equal to or above which an HCI_LE_Monitored_Advertisers_Report event may be triggered for that device.

The Timeout parameter is set to the timeout time in seconds for the device.

If the device is already in the Monitored Advertisers List, then the Controller shall not add the device to the Monitored Advertisers List again and shall return success.

If the Controller cannot add a device to the Monitored Advertisers List because there is no space available, then the Controller shall return the error code *Memory Capacity Exceeded* (0x07).

If RSSI_High_Threshold is less than RSSI_Low_Threshold, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
All other values	Reserved for future use

Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address or Random Device Address of the device to be added to the list of monitored devices.

RSSI_Low_Threshold: *Size: 1 octet*

Value	Parameter Description
0xXX	Range -127 to +20 Units: dBm

RSSI_High_Threshold: *Size: 1 octet*

Value	Parameter Description
0xXX	Range -127 to +20 Units: dBm

Timeout: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved for future use
0x01 to 0xFF	Time (in seconds) that the device from which advertisements are received has an RSSI value that remains below the RSSI_Low_Threshold before an event is generated.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Add_Device_To_Monitored_Advertisers_List command succeeded.
0x01 to 0xFF	HCI_LE_Add_Device_To_Monitored_Advertisers_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Add_Device_To_Monitored_Advertisers_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.147 LE Remove Device From Monitored Advertisers List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Remove_Device_From_-Monitored_Advertisers_List	0x0099	Address_Type, Address	Status

Description:

This command is used to remove a single device from the Monitored Advertisers List.

The Address_Type and Address parameters are used to identify an advertising device.

When a Controller cannot remove a device from the Monitored Advertisers List because it is not found, it shall return the error code *Invalid HCI Command Parameters* (0x12).

Command parameters:

Address_Type: *Size: 1 octet*

Value	Parameter Description
0x00	Public Device Address
0x01	Random Device Address
All other values	Reserved for future use

Address: *Size: 6 octets*

Value	Parameter Description
0xXXXXXXXXXXXX	Public Device Address or Random Device Address of the device to be removed from the Monitored Advertisers List.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Remove_Device_From_Monitored_Advertisers_List command succeeded.
0x01 to 0xFF	HCI_LE_Remove_Device_From_Monitored_Advertisers_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Remove_Device_From_Monitored_Advertisers_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.148 LE Clear Monitored Advertisers List command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Clear_Monitored_Advertisers_List	0x009A	*none*	Status

Description:

This command is used to remove all devices from the Monitored Advertisers List.

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Clear_Monitored_Advertisers_List command succeeded.
0x01 to 0xFF	HCI_LE_Clear_Monitored_Advertisers_List command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Clear_Monitored_Advertisers_List command has completed, an HCI_Command_Complete event shall be generated.

7.8.149 LE Enable Monitoring Advertisers command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Enable_Monitoring_Advertisers	0x009C	Enable	Status

Description:

This command is used by a Host to request the Controller to enable or disable the monitoring of advertisers in the Monitored Advertisers List and generate the HCI_LE_Monitored_Advertisers_Report event when necessary.

When the Enable parameter is set to 0x01, all entries in the Monitored Advertisers List shall be marked as not awaiting an RSSI value above the RSSI high threshold and their timers shall be reset. The Enable parameter may be set to 0x01 at any time as a method of restarting monitoring. When the Enable parameter is set to 0x00 monitoring is disabled.

Command parameters:

Enable: *Size: 1 octet*

Value	Parameter Description
0x00	Disable
0x01	Enable
All other values	Reserved for future use

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Enable_Monitoring_Advertisers command succeeded.
0x01 to 0xFF	HCI_LE_Enable_Monitoring_Advertisers command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Event(s) generated (unless masked away):

When the HCI_LE_Enable_Monitoring_Advertisers command has completed, an HCI_Command_Complete event shall be generated.

After monitoring is enabled using the HCI_LE_Enable_Monitoring_Advertisers command, HCI_LE_Monitored_Advertisers_Report events shall be generated as required.

7.8.150 LE Read Monitored Advertisers List Size command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Read_Monitored_Advertisers_-List_Size	0x009B	*none*	Status, Number

Description:

This command is used to read the total number of entries in the Monitored Advertisers List that the Controller can store.

Note: The number of entries that can be stored is not fixed and the Controller can change it at any time (e.g., because the memory used to store the Monitored Advertisers List can also be used for other purposes).

Command parameters:

None.

Return parameters:

Status: *Size: 1 octet*

Value	Parameter Description
0x00	HCI_LE_Read_Monitored_Advertisers_List_Size command succeeded.
0x01 to 0xFF	HCI_LE_Read_Monitored_Advertisers_List_Size command failed. See [Vol 1] Part F, Controller Error Codes for a list of error codes and descriptions.

Number: *Size: 1 octet*

Value	Parameter Description
0x00	Reserved for future use
0x01 to 0xFF	Number of entries allowed in the Monitored Advertisers List.

Event(s) generated (unless masked away):

When the HCI_LE_Read Monitored_Advertisers_List_Size command has completed, an HCI_Command_Complete event shall be generated.

7.8.151 LE Frame Space Update command

Command	OCF	Command Parameters	Return Parameters
HCI_LE_Frame_Space_Update	0x009D	Connection_Handle, Frame_Space_Min, Frame_Space_Max, PHYS, Spacing_Types	*none*

Description:

This command allows the Host to request a change to one or more frame space values. This command may be issued on both the Central and the Peripheral.

The Frame_Space_Min and Frame_Space_Max parameters indicate the minimum and maximum allowed frame space values that the Controller should use, respectively. The Frame_Space_Min parameter shall not be greater than the Frame_Space_Max parameter.

The PHYS and Spacing_Types parameters indicate which frame space values are to be updated. At least one bit shall be set in the PHYS parameter and at least one bit shall be set in the Spacing_Types parameter.

The actual parameter values selected by the Link Layer may be different from the parameter values provided by the Host through this command.

If the Host issues this command with Frame_Space_Max less than the frame space value, then the Controller shall ignore the value provided by the Host and shall use the frame space value in use as the Frame_Space_Max.

If the Connection_Handle parameter does not identify an active ACL connection, then the Controller shall return the error code *Unknown Connection Identifier* (0x02).

If the Host issues this command with Frame_Space_Max less than Frame_Space_Min, then the Controller shall return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command with no bits set in the PHYS or the Spacing_Types parameter, then the Controller shall reject the command and return the error code *Invalid HCI Command Parameters* (0x12).

If the Host issues this command with a bit set in the PHYS or the Spacing_Types parameter that the Controller does not support, then the Controller shall reject the command and return the error code *Unsupported Feature or Parameter Value* (0x11).

If the Host issues this command with a bit set in the PHYS or the Spacing_Types parameter that the remote device does not support, then the Controller shall reject the command and return the error code *Unsupported Remote Feature* (0x1A). The Controller can determine this either because it receives a corresponding error response from the remote device or because it has checked the features supported by the remote device.

Command parameters:

Connection_Handle: *Size: 2 octets (12 bits meaningful)*

Value	Parameter Description
0xXXXX	Used to identify a connection handle. Range: 0x0000 to 0x0EFF

Frame_Space_Min: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The minimum requested frame space value, in microseconds Range: 0x0000 to 0x2710

Frame_Space_Max: *Size: 2 octets*

Value	Parameter Description
0xXXXX	The maximum requested frame space value, in microseconds Range: 0x0000 to 0x2710

PHYS: *Size: 1 octet*

Bit Number	Parameter Description
0	LE 1M
1	LE 2M
2	LE Coded PHY
All other bits	Reserved for future use

Spacing_Types: *Size: 2 octets*

Bit Number	Parameter Description
0	T_IFS_ACL_CP
1	T_IFS_ACL_PC
2	T_MCES

Bit Number	Parameter Description
3	T_IFS_CIS
4	T_MSS_CIS
All other bits	Reserved for future use

Return parameters:

None.

Event(s) generated (unless masked away):

When the Controller receives the HCI_LE_Frame_Space_Update command, the Controller shall send the HCI_Command_Status event to the Host. When the HCI_LE_Frame_Space_Update command has completed, an HCI_LE_Frame_Space_Update_Complete event shall be generated.

Appendix A [This Appendix is no longer used]

Appendix B Removed commands and events

Table B.1 lists commands that have been removed from the specification. The OGF/OCF combinations in this table are previously used (see [Vol 1] Part E, Section 2.4).

OGF	OCF	Removed command name
0x01	0x0007	Add SCO Connection command
0x01	0x0035	Create Physical Link command
0x01	0x0036	Accept Physical Link command
0x01	0x0037	Disconnect Physical Link command

Part A

PHYSICAL LAYER SPECIFICATION

This Part describes the Bluetooth Low Energy physical layer.

CONTENTS

1 SCOPE

Bluetooth Low Energy (LE) devices operate in the unlicensed 2.4 GHz ISM (Industrial Scientific Medical) band. A frequency hopping transceiver is used to combat interference and fading.

Two modulation schemes are defined. The mandatory modulation scheme (“1 Msym/s modulation”) uses a shaped, binary FM to minimize transceiver complexity. The symbol rate is 1 Msym/s. An optional modulation scheme (“2 Msym/s modulation”) is similar but uses a symbol rate of 2 Msym/s.

The 1 Msym/s modulation supports two PHYs:

- LE 1M, with uncoded data at 1 Mb/s;
- LE Coded, with the Access Address, Coding Indicator, and TERM1 coded at 125 kb/s and the payload coded at either 125 kb/s or 500 kb/s.

A device shall support the LE 1M PHY. Support for the LE Coded PHY is optional.

The 2 Msym/s modulation supports two PHYs:

- LE 2M, with uncoded data at 2 Mb/s with BT=0.5.
- LE 2M 2BT, with uncoded data at 2 Mb/s with BT=2.0. This PHY may only be used with the Channel Sounding feature.

A device may optionally support Channel Sounding (CS). The modulation requirements for LE 1M, an optional LE 2M, and an optional LE 2M 2BT also apply to any CS_SYNC packet (see [Vol 6] Part H, Section 2). The CS tone transmitter and receiver requirements are specified in Section 3.4 and Section 6, respectively.

CS uses an additional modulation scheme known as amplitude-shift keying (ASK). When using ASK, symbols are sent by transmitting a fixed-amplitude carrier wave at a fixed frequency for a specific time duration.

A Time Division Duplex (TDD) scheme is used on all PHYs. The specification defines the requirements for a Bluetooth radio for the Low Energy radio.

Requirements are defined for two reasons:

- Provide compatibility between radios used in the system
- Define the quality of the system

An LE radio shall have a transmitter or a receiver, or both.

The LE radio shall fulfill the stated requirements for the operating conditions declared by the equipment manufacturer (see Section A.1).

The Bluetooth SIG maintains regulatory content associated with Bluetooth technology in the 2.4 GHz ISM band on its web site, at https://www.bluetooth.com/regulatory-requirements/.

2 FREQUENCY BANDS AND CHANNEL ARRANGEMENT

The LE system operates in the 2.4 GHz ISM band at 2400 MHz to 2483.5 MHz. The LE system uses 40 RF channels with center frequencies at a 2 MHz spacing from 2402 MHz to 2480 MHz.

An LE system supporting CS uses 72 RF channels for CS exchanges. These RF channels have center frequencies at 2402 + k MHz, where k is an integer from 2 to 22 and 26 to 76.

3 TRANSMITTER CHARACTERISTICS

The requirements stated in this section are given as power levels at the antenna connector of the LE device; this is also referred to as the radiative transmit power level of the device. If the device does not have a connector, a reference antenna with 0 dBi gain is assumed. Power level values used in HCI commands, HCI events, Advertising physical channel PDUs, and Link Layer Control PDUs shall be assumed to be the radiative transmit power level of the device unless specified otherwise.

Due to the difficulty in making accurate radiated measurements, systems with an integral antenna should provide a temporary antenna connector during LE PHY qualification testing.

For a transmitter, the radiative transmit power level at the maximum power setting shall be between 0.01 mW (-20 dBm) and 100 mW (+20 dBm).

Using high transmit power in use cases where short ranges could be encountered can cause the receiver on the remote device to be saturated and result in link failure. The LE Power Control Request feature can be used to adjust a connected remote device's transmit power level based on the receiver's signal level. When the LE Power Control Request feature is used on a connection with long connection intervals, devices should use reliable RSSI measurements from recent connection events to determine whether or not to send power control requests. When a device is capable of adjusting its transmit power level using the LE Power Control Request feature, the difference between any two adjacent transmit power levels supported by the radio design should be no greater than 8 dB. When the LE Power Control Request feature is not supported by either the local or remote device, implementers should avoid use of high output power in such scenarios or employ a mechanism for switching between two or more transmit power levels in an attempt to establish, re-establish, or maintain connections.

The output power control of a device may be changed locally, for example to optimize the power consumption or reduce interference to other equipment.

Bluetooth devices are classified into power classes based on the radiative transmit power level at the maximum power setting the LE PHY supports (P_{max}), as defined in Table 3.1.

Power Class	Requirements
1	100 mW (+20 dBm) ≥ P_{max} > 10 mW (+10 dBm)
1.5	10 mW (+10 dBm) ≥ P_{max} > 2.5 mW (+4 dBm)

Power Class	Requirements
2	2.5 mW (+4 dBm) ≥ P_{max} > 1 mW (0 dBm)
3	1 mW (0 dBm) ≥ P_{max} ≥ 0.01 mW (-20 dBm)

Table 3.1: LE PHY power classes

3.1 Modulation characteristics

The modulation is Gaussian Frequency Shift Keying (GFSK) with a bandwidth-bit period product BT=0.5. The modulation index shall be between 0.45 and 0.55. A binary one shall be represented by a positive frequency deviation, and a binary zero shall be represented by a negative frequency deviation.

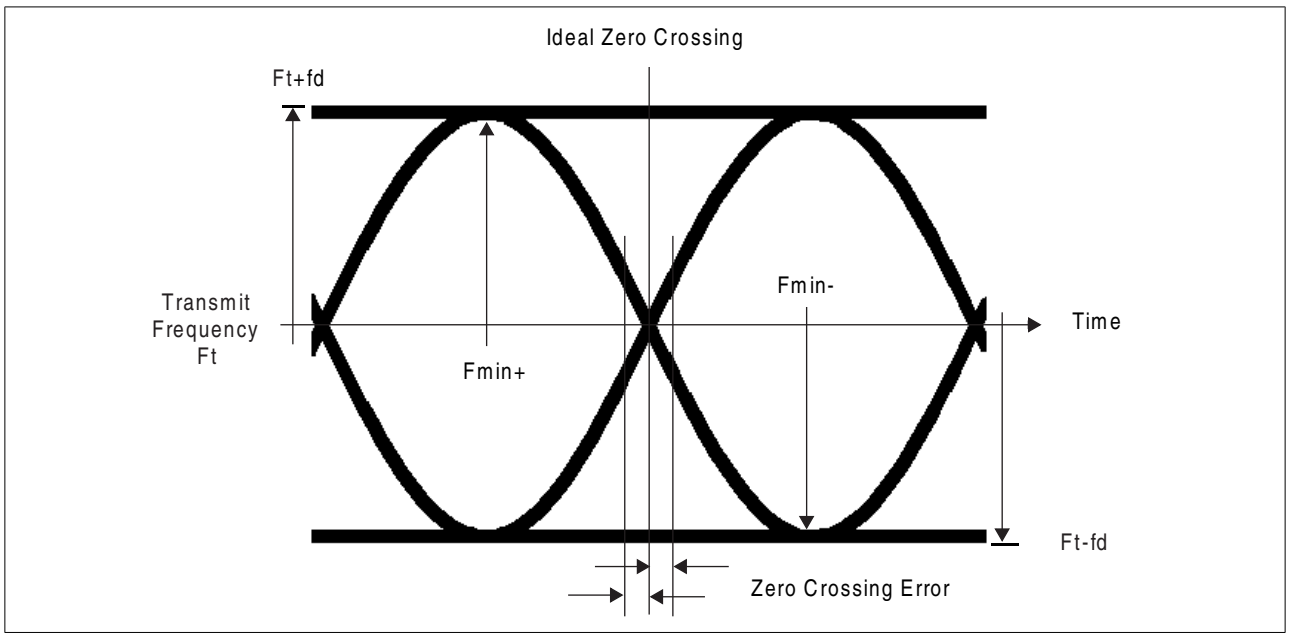

Figure 3.1: GFSK parameters definition

For each transmission the minimum frequency deviation,

$$F_{min} = \min \{ |F_{min+}| , F_{min-} \}$$

which corresponds to a 1010 sequence, shall be no smaller than ±80% of the frequency deviation with respect to the transmit frequency, which corresponds to a 00001111 sequence.

The minimum frequency deviation shall never be less than 185 kHz when transmitting at 1 megasymbol per second (Msym/s) symbol rate and never be less than 370 kHz when transmitting at 2 Msym/s symbol rate. The symbol timing accuracy shall be better than ±50 ppm.

The zero crossing error is the time difference between the ideal symbol period and the measured crossing time. This shall be less than $\pm\frac{1}{8}$ of a symbol period.

See Figure 3.1 for the definitions of some symbols and terms in these requirements.

3.1.1 Stable modulation index

An LE device with a transmitter that has a stable modulation index may inform the receiving LE device of this fact through the feature support mechanism (see [Vol 6] Part B, Section 4.6). The modulation index for these transmitters shall be between 0.495 and 0.505. A device shall only state that it has a stable modulation index if that applies to all LE transmitter PHYs it supports.

A transmitter that does not have a stable modulation index is said to have a standard modulation index.

3.1.2 Modulation characteristics of Channel Sounding steps

During Channel Sounding steps where a CS_SYNC packet is present (see [Vol 6] Part H, Section 2) and the LE 2M 2BT PHY is used, the modulation characteristics are identical to those described in Section 3.1 with the following exceptions:

- The 2 Msym/s transmission rate shall be used with a bandwidth-bit period product BT=2.0.
- The minimum frequency deviation at the center of the symbol shall never be less than 420 kHz.

3.1.3 SNR control for Channel Sounding steps

An LE device may have a transmitter that is capable of adjusting its SNR output within a given range for the transmission of CS_SYNC packets used in mode-1 and mode-3 steps. There are five different SNR levels defined in Table 3.2, each identified by an SNR Output Index (SOI).

SNR Output Index (SOI)	SNR Output Level (dB)	Mandatory/Optional/Conditional
0	18	C.1
1	21	C.1
2	24	C.1
3	27	C.1
4	30	C.1
C.1: A device that supports SNR output control shall support at least one output index/level listed in Table 3.2.		

Table 3.2: SNR output control levels

Let $\hat{x}(k,t)$ be the continuous version of the observed CS_SYNC packet transmitted by the IUT at step *k*, as defined in [Vol 6] Part H, Section 3.1.1. Let $\hat{\varphi}(k,t)$ be the phase of the observed $\hat{x}(k,t)$.

Let $\varphi_{ideal}(k,t)$ represent the phase trajectory generated from the modulated bit sequence at step *k*, using the modulation rules described in Section 3.1.2.

Let $SNR_{TX}^{desired}$ be the configured SNR value for the IUT.

Let T represent the integration period for the entire CS_SYNC packet transmitted at step *k*.

Let τ_0, f_0, and φ_0 represent the best fit timing, frequency, and phase alignment respectively between the observed signal transmitted by the IUT and $\varphi_{ideal}(k,t)$.

The IUT transmitter SNR is then computed using equation:

$$SNR_{TX}(k) = \max_{\tau_0, f_0, \varphi_0}\left(-10log_{10}\left(\frac{1}{\tau}\int_0^{\tau}\left|e^{\varphi_{ideal}(k,t)} - e^{\hat{\varphi}(k,t-\tau_0)} \times e^{-j(2\pi f_0 t + \varphi_0)}\right|^2 dt\right)\right)$$

The SNR control error can be computed:

$$SNR_{TX}^{error}(k) = \left|SNR_{TX}^{desired} - SNR_{TX}(k)\right|$$

The SNR control error shall satisfy:

$$SNR_{TX}^{error}(k) \leq 3 \text{ dB}$$

and the standard deviation of the randomness of the added error shall satisfy:

$$std\left(SNR_{TX}^{error}(k)\right) \geq 0.25 \text{ dB}$$

for 95% of the steps.

3.2 Spurious emissions

3.2.1 Modulation spectrum

For products that transmit modulated packets and also follow the requirements of FCC part 15.247, the minimum 6 dB bandwidth of the transmitter spectrum shall be at least 500 kHz using a resolution bandwidth of 100 kHz.

3.2.2 In-band spurious emission

An adjacent channel power is specified for channels at least 2 MHz from the carrier when transmitting with1 Msym/s modulation (applies to the LE 1M and LE Coded PHYs)

or at least 4 MHz from the carrier when transmitting with 2 Msym/s modulation (applies to the LE 2M and LE 2M 2BT PHYs). This adjacent channel power is defined as the sum of the measured power in a 1 MHz bandwidth.

The spectrum measurement shall be performed with a 100 kHz resolution bandwidth and an average detector. The device shall transmit on an RF channel with the center frequency M and the adjacent channel power shall be measured on a 1 MHz RF frequency N. The transmitter shall transmit a pseudo random data pattern in the payload throughout the test.

Frequency offset	Spurious Power
2 MHz (|M-N| = 2)	-20 dBm
3 MHz or greater (|M-N| ≥ 3)	-30 dBm

Table 3.3: Transmit spectrum mask when transmitting with 1 Msym/s modulation

Frequency offset	Spurious Power
4 MHz (|M-N| = 4)	-20 dBm
5 MHz (|M-N| = 5)	-20 dBm
6 MHz or greater (|M-N| ≥ 6)	-30 dBm

Table 3.4: Transmit spectrum mask when transmitting with 2 Msym/s modulation

Exceptions are allowed in up to three bands of 1 MHz width, centered on a frequency which is an integer multiple of 1 MHz. These exceptions shall have an absolute value of -20 dBm or less.

3.2.3 Out-of-band spurious emission

The equipment manufacturer is responsible for the ISM out-of-band spurious emissions requirements in the intended countries of sale.

3.3 Radio frequency tolerance

The deviation of the center frequency during the packet shall not exceed ±150 kHz, including both the initial frequency offset and drift. The frequency drift during any packet shall be less than 50 kHz. The drift rate shall be less than 400 Hz/µs.

The limits on the transmitter center frequency drift within a packet is shown in Table 3.5.

Parameter	Frequency Drift
Maximum drift	±50 kHz
Maximum drift rate[1]	400 Hz/µs

Table 3.5: Maximum allowable frequency drifts in a packet

[1]The maximum drift rate is allowed anywhere in a packet.

3.4 Stable phase

Devices supporting the CS feature shall support the generation of an RF signal with a phase that is stable during the period of T_PM_MEAS. T_PM_MEAS shall be equal to the CS step mode-2 duration as defined in [Vol 6] Part H, Section 4.3.3 using the maximum values allowed for the following:

- Phase measurement period
- Antenna switch period
- Ramp-down period
- Interlude periods
- Number of antenna paths

This requirement shall also be applicable to the CS tone duration defined for CS step mode-3 as described in [Vol 6] Part H, Section 4.3.4.

Let ϕ[*n*] be the unwrapped phase of the signal, where unwrap refers to the operation that corrects the radian phase of the array elements by adding multiples of ±2 pi when absolute jumps between consecutive array elements are larger than pi. Also, let ϕ[*n*] be sampled at a 1 µs interval during the period of T_PM_MEAS (in microseconds), where N is equal to (T_PM_MEAS in microseconds), and where n is an integer in the range of 1 to N.

Let Δϕ be the phase detrend factor for the absolute unwrapped phase signal, defined as:

$$\Delta\phi = \frac{6}{N^3 - N}\left(2\sum_{i=1}^{N} i \,.\, \phi[i] - \left(N+1\right)\sum_{i=1}^{N}\phi\left[i\right]\right)$$

So that the detrended phase is expressed as:

$$\phi_d[n] = \phi[n] - n\,\Delta\phi$$

Let $\overline{\phi_d}$ be the mean value of the detrended sequence, expressed as:

$$\overline{\phi_d} = \frac{1}{N}\sum_{i=1}^{N}\phi_d[n]$$

So, the final, zero-mean, detrended phase vector is given by:

$$\phi_{zmd}[n] = \phi_d[n] - \overline{\phi_d}$$

Following these definitions, 95% of the absolute values of $\phi_{zmd}[n]$ shall be 20 degrees or less.

3.5 Frequency measurement and generation in Channel Sounding

The structure for CS subevents is defined in [Vol 6] Part H, Section 4.4. Each CS subevent contains $K + M$ CS steps, $k = 1, \ldots, K + M$. The first M steps within the subevent are CS mode-0 steps as defined in [Vol 6] Part H, Section 4.3.1, and are followed by K non-mode-0 steps. Each non-mode-0 step that has CS tones contains P phase measurement periods, where $1 \leq P \leq$ (N_AP plus any added CS tone extensions). N_AP is defined in Section 5.3 and CS tone extensions are defined in [Vol 6] Part H, Section 4.3.

Denote the expected start and end times of the CS tone transmitted by a device for the kth step in phase measurement period p, as $t_{CT,1}^{TX}[k,p]$ and $t_{CT,2}^{TX}[k,p]$, respectively, if a transmitted CS tone exists within that step and phase measurement period. Within this phase measurement period, the time $t = 0$ corresponds to the start of the first scheduled transmission within a CS subevent.

Denote $f_0[k]$ as the nominal frequency of the CS Channel for step k as defined in Section 2.

Denote $f[k,p]$ as the average frequency of the transmitted CS tone during the interval $\left[t_{CT,1}^{TX}[k,p], t_{CT,2}^{TX}[k,p]\right]$.

3.5.1 Fractional frequency offset

The fractional frequency offset (FFO) is the frequency offset normalized by the carrier frequency. The FFO for the kth mode-0 step within a subevent is denoted as $FFO[k]$, and is given by

$$FFO[k] = 10^6 \frac{f[k,1] - f_0[k](1 + 10^{-6} \times FAE[k])}{f_0[k](1 + 10^{-6} \times FAE[k])} ppm, \qquad k = 1, \ldots, M$$

where $FAE[k]$ is the value of the FFO actuation error (FAE) for the CS channel used in step k taken from the mode-0 FFO actuation error table of the local Controller. The FAE

is communicated by the reflector and represents a known additional fractional frequency offset error on mode-0 channels.

The value of each FAE for each CS channel shall satisfy -4 ppm ≤ *FAE* ≤ 3.96875 ppm. For all CS mode-0 steps, the absolute value of *FFO*[*k*] shall be less than 50 ppm.

For all CS mode-0 steps within a subevent, the values of |*FFO*[*k*] − *FFO*[1]| shall be less than 1 ppm for 2 ≤ *k* ≤ *M*.

The receiving device of a mode-0 CS tone may estimate and report the FFO of the transmitting device of the mode-0 CS tone. In this case, the FFO is given by

$$FFO_{RX}\left[k\right] = 10^{6}\frac{f_{RX}\left[k\right] - f_{0}\left[k\right]\left(1 + 10^{-6} \times FAE\left[k\right]\right)}{f_{0}\left[k\right]\left(1 + 10^{-6} \times FAE\left[k\right]\right)} ppm, \qquad k = 1, \ldots, M$$

where $f_{RX}[k]$ is the receiving device's estimate of the average frequency of the received CS tone in step k. The receiving device should compensate for its own local frequency actuation error (LFAE) as defined in Section 6.3, as part of its $FFO_{RX}[k]$ estimate. The term FFO_{RX^*} is used to refer to the estimated FFO derived from all mode-0 CS tones within a CS subevent.

3.5.2 Expected transmitted frequencies

The FFO for a CS subevent, FFO_E, is defined as the value of *FFO*[1] for the device transmitting the CS tone during the first mode-0 step of a subevent.

The expected transmit frequency of the CS device for the *k*th step is given by

$$f_{E}\left[k\right] = f_{0}\left[k\right]\left(1 + 10^{-6} FFO_{E}\right)$$

where *k* = *M* + 1, …, *K* + *M*.

For the non-mode-0 steps *M* + 1 ≤ *k* ≤ *M* + *K*, and for each phase measurement period 1 ≤ *p* ≤ *P*[*k*], the average transmitted frequency *f*[*k*, *p*] shall satisfy

$$|f[k, \mathrm{p}] - f_{E}[k]| < 10\mathrm{kHz}$$

for 95% of CS tone transmissions within non-mode-0 steps.

The center frequency of the transmitted CS_SYNC packet within any non-mode-0 step shall not deviate by more than 20 kHz with respect to the expected transmit frequency $f_E[k]$, for 95% of CS_SYNC transmissions within non-mode-0 steps.

The center frequency of the transmitted CS_SYNC packet within any mode-0 step 1 ≤ *k* ≤ *M* shall not deviate by more than 20 kHz with respect to the average frequency of the transmitted CS tone *f*[*k*, 1], for 95% of CS_SYNC transmissions within mode-0 steps.

4 RECEIVER CHARACTERISTICS

The reference sensitivity level referred to in this section is -70 dBm. The packet error rate corresponding to the defined bit error ratio (BER) shall be used in all receiver characteristic measurements.

4.1 Actual sensitivity level

The actual sensitivity level is defined as the receiver input level for which the BER specified in Table 4.1 is achieved.

Maximum Supported Payload Length (bytes)	BER (%)
1 to 37	0.1
38 to 63	0.064
64 to 127	0.034
128 to 255	0.017

Table 4.1: Actual sensitivity BER by maximum payload length

The actual sensitivity level of the receiver for a given PHY shall be as specified in Table 4.2. This shall apply when receiving signals specified in Section 3 together with any combination of the following allowed parameter variations:

- Initial frequency offset
- Frequency drift
- Symbol rate
- Frequency deviation

PHY	Sensitivity (dBm)
LE Uncoded PHYs	≤ -70
LE Coded PHY with S=2 coding	≤ -75
LE Coded PHY with S=8 coding	≤ -82

Table 4.2: Receiver sensitivity for a given PHY

4.2 Interference performance

The interference performance shall be measured with a wanted signal of -67 dBm on the LE Uncoded PHYs, -72 dBm on the LE Coded PHY with S=2 coding, or -79 dBm on the LE Coded PHY with S=8 coding. If the frequency of an interfering signal is outside of the band 2400 MHz to 2483.5 MHz, the out-of-band blocking specification

(see Section 4.3) shall apply. Both the desired and the interfering signal shall be reference signals as specified in Section 4.6. The BER shall be ≤0.1% for all the signal-to-interference ratios listed in Table 4.3, Table 4.4, Table 4.5, and Table 4.6.

These measurements are made using the LE 1M and LE 2M PHYs.

Frequency of Interference	Ratio
Co-Channel interference, $C/I_{co\text{-}channel}$	21 dB
Adjacent (1 MHz) interference[1], $C/I_{1\ MHz}$	15 dB
Adjacent (2 MHz) interference[1], $C/I_{2\ MHz}$	-17 dB
Adjacent (≥3 MHz) interference[1], $C/I_{\geq 3\ MHz}$	-27 dB
Image frequency interference[1 2 3], C/I_{Image}	-9 dB
Adjacent (1 MHz) interference to in-band image frequency[1], $C/I_{Image\pm 1MHz}$	-15 dB

Table 4.3: Interference performance for LE 1M PHY

Frequency of Interference	Ratio
Co-Channel interference, $C/I_{co\text{-}channel}$	21 dB
Adjacent (2 MHz) interference[1], $C/I_{2\ MHz}$	15 dB
Adjacent (4 MHz) interference[1], $C/I_{4\ MHz}$	-17 dB
Adjacent (≥6 MHz) interference[1], $C/I_{\geq 6\ MHz}$	-27 dB
Image frequency interference[1 2 4], C/I_{Image}	-9 dB
Adjacent (2 MHz) interference to in-band image frequency[1], $C/I_{Image\pm 2MHz}$	-15 dB

Table 4.4: Interference performance for LE 2M PHY

Frequency of Interference	Ratio
Co-Channel interference, $C/I_{co\text{-}channel}$	12 dB
Adjacent (1 MHz) interference[1], $C/I_{1\ MHz}$	6 dB
Adjacent (2 MHz) interference[1], $C/I_{2\ MHz}$	-26 dB
Adjacent (≥3 MHz) interference[1], $C/I_{\geq 3\ MHz}$	-36 dB
Image frequency interference[1 2 3], C/I_{Image}	-18 dB
Adjacent (1 MHz) interference to in-band image frequency[1], $C/I_{Image\pm 1MHz}$	-24 dB

Table 4.5: Interference performance for the LE Coded PHY with S=8 coding (125 kb/s data rate)

Frequency of Interference	Ratio
Co-Channel interference, $C/I_{co\text{-}channel}$	17 dB
Adjacent (1 MHz) interference[1], $C/I_{1\ MHz}$	11 dB
Adjacent (2 MHz) interference[1], $C/I_{2\ MHz}$	-21 dB

Frequency of Interference	Ratio
Adjacent (≥3 MHz) interference[1], $C/I_{\geq 3\ MHz}$	-31 dB
Image frequency interference[1 2 3], C/I_{Image}	-13 dB
Adjacent (1 MHz) interference to in-band image frequency[1], $C/I_{Image\pm 1MHz}$	-19 dB

Table 4.6: Interference performance for the LE Coded PHY with S=2 coding (500 kb/s data rate)

Notes:

1. If two adjacent frequency specifications from Table 4.3, Table 4.4, Table 4.5, or Table 4.6 (as appropriate) are applicable to the same frequency, the more relaxed specification applies.
2. In-band image frequency.
3. If the image frequency ≠ n×1 MHz, then the image reference frequency is defined as the closest n×1 MHz frequency for integer n.
4. If the image frequency ≠ n×2 MHz, then the image reference frequency is defined as the closest n×2 MHz frequency for integer n.

Any frequencies where the requirements are not met are called spurious response RF channels. Five spurious response RF channels are allowed with a distance of ≥2 MHz from the wanted signal when receiving with 1 Msym/s modulation and a distance of ≥4 MHz when receiving with 2 Msym/s modulation; different spurious response channels are allowed for the two modulation schemes. This excludes the image frequency with both 1 Msym/s and 2 Msym/s modulation, the image frequency ±1MHz with 1 Msym/s modulation, and the image frequency ±2 MHz with 2 Msym/s modulation. On these spurious response RF channels, a relaxed interference requirement C/I = -17 dB shall be met by both 1 Msym/s and 2 Msym/s modulation transmitters.

4.3 Out-of-band blocking

The out-of-band blocking applies to interfering signals outside the band 2400 MHz to 2483.5 MHz. The out-of-band suppression (or rejection) shall be measured with a wanted signal 3 dB over the reference sensitivity level. The interfering signal shall be a continuous wave signal. The desired signal shall be a reference signal as specified in Section 4.6, with a center frequency of 2426 MHz. The BER shall be ≤ 0.1%. The out-of-band blocking shall fulfill the following requirements:

Interfering Signal Frequency	Interfering Signal Power Level	Measurement resolution
30 MHz to 2000 MHz	-30 dBm	10 MHz
2003 MHz to 2399 MHz	-35 dBm	3 MHz

Interfering Signal Frequency	Interfering Signal Power Level	Measurement resolution
2484 MHz to 2997 MHz	-35 dBm	3 MHz
3000 MHz to 12.75 GHz	-30 dBm	25 MHz

Table 4.7: Out-of-band suppression (or rejection) requirements

Up to 10 exceptions are permitted, which are dependent upon the given RF channel and are centered at a frequency which is an integer multiple of 1 MHz:

- For at least 7 of these spurious response frequencies, a reduced interference level of at least -50 dBm is allowed in order to achieve the required BER ≤ 0.1%.
- For a maximum of 3 of the spurious response frequencies, the interference level may be lower.

4.4 Intermodulation characteristics

The actual sensitivity performance, BER ≤ 0.1%, shall be met under the following conditions:

- The wanted signal shall be at a frequency f_0 with a power level 6 dB over the reference sensitivity level. The wanted signal shall be a reference signal as specified in Section 4.6.
- A static sine wave signal shall be at a frequency f_1 with a power level of -50 dBm.
- An interfering signal shall be at a frequency f_2 with a power level of -50 dBm. The interfering signal shall be a reference signal as specified in Section 4.6.

When receiving with 1 Msym/s modulation, frequencies f_0, f_1 and f_2 shall be chosen such that $f_0 = 2 \times f_1 - f_2$ and

$| f_2 - f_1 |$ = n × 1 MHz, where n can be 3, 4, or 5.

When receiving with 2 Msym/s modulation, frequencies f_0, f_1 and f_2 shall be chosen such that

$f_0 = 2 \times f_1 - f_2$ and

$| f_2 - f_1 |$ = n × 2 MHz, where n can be 3, 4, or 5.

The system shall fulfill at least one of the three alternatives (n=3, 4, or 5); different modulation schemes can use different alternatives.

4.5 Maximum usable level

The maximum usable input level the receiver can operate at shall be greater than -10 dBm, and the BER shall be less than or equal to 0.1% at -10 dBm input power. The input signal shall be a reference signal as specified in Section 4.6.

4.6 Reference signal definition

The reference signal for LE is defined as:

Modulation = GFSK
Modulation index = 0.5 ± 1% for standard modulation index, 0.5 ± 0.5% for stable modulation index
BT = 0.5 ± 1%
Data Bit Rate =

- 1 Mb/s ±1 ppm for the LE 1M PHY
- 2 Mb/s ±1 ppm for the LE 2M PHY
- 125 kb/s ±1 ppm for the LE Coded PHY when using S=8 coding
- 500 kb/s ±1 ppm for the LE Coded PHY when using S=2 coding

Modulating Data for wanted signal = PRBS9
Modulating Data for interfering signal = PRBS15
Frequency accuracy better than ±1 ppm

4.7 Stable modulation index

An LE device may have a receiver that can take advantage of the fact that the remote device indicates support for the Stable Modulation Index - Transmitter feature (see [Vol 6] Part B, Section 4.6). Such a receiver is said to have stable modulation index support.

4.8 Received Signal Strength Indication

If a device supports Received Signal Strength Indication (RSSI) the accuracy should be ±6 dB. If the device is aware that the RSSI varies across frequencies, then it should update the RSSI value of a packet depending on the frequency that the packet was received on before using the value, e.g., before reporting it to the Host.

5 ANTENNA SWITCHING

5.1 Antenna Switching for AoA/AoD

A device may support an antenna array consisting of two or more antennae that are controlled by a switch. The device switches between the antennae either while receiving the Constant Tone Extension of a packet (see [Vol 6] Part B, Section 2.1.5) (Angle of Arrival method) or while transmitting the Constant Tone Extension of a packet (Angle of Departure method). The switching takes place during time periods called switch slots. The first 4 µs of the Constant Tone Extension are termed the guard period and the next 8 µs are termed the reference period. The receiving Link Layer captures IQ samples during the reference period and during time periods called sample slots.

When a Controller that supports two or more antennae transmits a packet containing an AoD Constant Tone Extension or receives a packet containing an AoA Constant Tone Extension, it shall switch the antennae according to the switching pattern configured by its Host.

The first antenna in the pattern shall be used during the reference period (see [Vol 6] Part B, Section 2.5.1 for the Constant Tone Extension format). The second antenna in the pattern shall be used during the first sample slot, the third antenna during the second sample slot, and so on. The same antenna ID may appear more than once in the pattern. The antenna in use shall only be changed during the guard period and switch slots.

If the pattern specified by the Host is exhausted before the last sample slot, it shall be restarted from the beginning (this can happen more than once); that is, the first antenna in the pattern is used in the sample slot following that used for the last antenna in the pattern. If the pattern has not been completely used by the end of the Constant Tone Extension, any remaining terms shall be ignored.

The Controller shall support the antenna switching pattern lengths specified in Table 5.1. It may support other lengths.

Number of antennae	Mandatory supported lengths of antenna switching pattern
2	1 to 4
3	1 to 8
≥ 4	1 to 12

Table 5.1: Mandatory supported lengths of antenna switching pattern

5.2 Receiver characteristics for AoA/AoD

A receiver shall meet the requirements of Section 5.2.2 when the test switching pattern specified in Section 5.2.3 is used. The definitions in Section 5.2.1 shall apply throughout those sections.

5.2.1 Definitions

$i = \sqrt{-1}$

All angles are measured in radians.

Arg(*x*) is the principal value of the argument, or phase angle, of the complex number *x*, in the range $(-\pi, \pi]$.

principal(*a*) is the principal value of the real angle *a* That is, it equals $a + 2\pi k$ where *k* is an integer chosen so that $-\pi < principal(a) \leq \pi$.
